CERTIFICATE OF FINAL INSPECTION AND ACCEPTANCE

PROJECT NAME: HEAP LEACH PAD.
PROJECT NUMBER: C7001143 **DATE:** June 26/19
OWNER: VICTORIA GOLD
LOCATION: EAGLE GOLD

Scope of Installation(s): THE WORK
Area/Layer: _____ Area Inspected: ☐ Partial or ☑ Complete
Dimensions: APPROX 132,000 m². AREA HAS BEEN INSTALLED WITH GCL UNDERLAY AND 80MIL LLDPE PRIMARY LAYER. ALL MATERIALS HAVE BEEN INSTALLED, WELDED, REPAIRED & TESTED IN ACCORDANCE to SPECIFICATIONS.

Part 1 – LAYFIELD CANADA LTD.

I, Iain Konechny, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield's QC program and the terms and conditions of the contract.

Layfield Representative:
Name: Iain Konechny
Title: Supervisor
Date: June 26/19 **Signature:** _____

Part 2 – OWNER (or Representative)

I, Scott Dimitroff, a duly appointed representative of TetraTech, do hereby take over and accept the installation(s) described above, and confirm that the work has been completed in accordance with the project specifications and the terms of the conditions of the contract.

I have evaluated and measured the work together with the Layfield representative, and agree that the measurements shown are both true and correct, and that the installation has met our approval.

Owners Representative:
Name: Scott Dimitroff

INSTALLATION WARRANTY

Layfield Reference No. : (Job #) CT001143

LAYFIELD CANADA LTD. (LAYFIELD) hereby warrants to Victoria Gold Corp; (the Customer) that the work performed by LAYFIELD on the Installation described as Phase 1A heap Leach Pad will:

1. Meet the field seam specifications set out in the contract between LAYFIELD and the Customer (as amended by LAYFIELD's quotation), all workmanship to meet the requirements of LAYFIELD's Field Installation Quality Assurance program, and be free of defects at the time of completion of the Installation; and

2. Be free of installation defects from the date of the completion of the Installation (June 26, 2019), for a period of One year so long as the completed Installation is used for the purposes and in the manner for which the Installation was designed.

Should damage or defects within the scope of the aforesaid warranties occur, LAYFIELD shall repair the damage or defects, PROVIDED THAT the area to be repaired must first be made ready by the Customer and be in a clean, dry, unencumbered condition, free from all water, soil, sludge, residuals, and liquids of any kind.

To enable LAYFIELD to investigate and determine the cause of any alleged damage or defect, notice and details of any claim hereunder must be presented in writing to LAYFIELD within thirty (30) days after the alleged damage or defect was first noticed or observed. Failure to provide such notice and details shall invalidate all warranties provided hereunder.

The liability of LAYFIELD under the aforesaid warranties are subject to the following conditions:

a. LAYFIELD's only obligation shall be to repair or replace any defective workmanship and in no event shall LAYFIELD be liable for any amount in excess of the cost of the Installation;

b. No allowance will be made for repairs, replacements or alterations made by the Customer unless with the prior written consent of LAYFIELD;

c. The warranties hereunder extend only to the Customer and are not transferable;

d. The warranties hereunder shall not apply to any damage or defects resulting from misuse, mechanical abuse by machinery, equipment or persons, excessive pressures or stresses, exposure of the completed Installation of harmful chemicals, unusual weather conditions, casualty catastrophe such as (but not limited to) earthquake, flood, hail, tornado, or any other act of God;

e. Under no circumstances shall LAYFIELD be liable for any special, direct, indirect, or consequential damages including the loss of use of the Installation howsoever caused;

f. All liner materials provided for the Installation are covered by a separate warranty provided by Solmax, and LAYFIELD shall not be liable for material failure claims hereunder;

g. The warranties hereunder are given in lieu of all other warranties, express, implied, statutory, or otherwise, and the Customer expressly waives all other warranties and claims whatsoever except those specifically given herein, and the Customer acknowledges that the warranties hereunder are accepted in preference to and to the exclusion of any or all other warranties; and

h. An Installation Warranty will <u>not</u> be provided for lining projects unless the installation is completed by LAYFIELD personnel or designated LAYFIELD subcontractors.

CERTIFICATE OF SUBGRADE SURFACE INSPECTION

PROJECT NAME: EAGLE Gold Land Farm
PROJECT NUMBER: CT001143
OWNER/CONTRACTOR: Victoria Gold / JOS Mining
LOCATION: Eagle Gold, YK

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the soil subgrade surface described below, and:

- ☑ *found it to be an acceptable surface on which to install geomembrane; OR*
- ☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☐Partial or ☑Complete): ~1742m²
Dimensions of Subgrade Inspection: 26m · 67m
Anchor Trench Dimensions: 0.5m · 1m deep: wide
Comments:

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:

Date: 2019-04-06
Signature:
Name: BRADLEY McLEOD
Title: QC Technician

OWNERS REPRESENTATIVE:

I, the undersigned, a duly appointed representative of the Owner, hereby understand the soil subgrade surface inspection described above and authorize Layfield to proceed with deployment of geosynthetics on the subgrade provided.

Date: 2019-04-16
Signature:
Name: Kati Rogers
Title: CQA Technician
Company: Tetra Tech

CERTIFICATE OF FINAL INSPECTION AND ACCEPTANCE

PROJECT NAME: Eagle Gold Land Farm
PROJECT NUMBER: CT001143 **DATE:** 2019-04-09
OWNER: Victoria Gold
LOCATION: Eagle Gold, YK

Scope of Installation(s): **THE WORK**
Area/Layer: Land Farm, Area Inspected: ☐ Partial or ☑ Complete
Dimensions: 26m · 67m, LP16 underlay installed. HDPE 60 mil installed & tested. Two layers of LP16 overlay installed.

Part 1 – LAYFIELD CANADA LTD.

I, BRADLEY MCLEOD, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield's QC program and the terms and conditions of the contract.

Layfield Representative:
Name: BRADLEY MCLEOD

INSTALLATION WARRANTY

Layfield Reference No. : (Job #) CT001143

LAYFIELD CANADA LTD. (LAYFIELD) hereby warrants to Victoria Gold Corp; (the Customer) that the work performed by LAYFIELD on the Installation described as Land farm will:

1. Meet the field seam specifications set out in the contract between LAYFIELD and the Customer (as amended by LAYFIELD's quotation), all workmanship to meet the requirements of LAYFIELD's Field Installation Quality Assurance program, and be free of defects at the time of completion of the Installation; and

2. Be free of installation defects from the date of the completion of the Installation (April 9, 2019), for a period of One year so long as the completed Installation is used for the purposes and in the manner for which the Installation was designed.

Should damage or defects within the scope of the aforesaid warranties occur, LAYFIELD shall repair the damage or defects, PROVIDED THAT the area to be repaired must first be made ready by the Customer and be in a clean, dry, unencumbered condition, free from all water, soil, sludge, residuals, and liquids of any kind.

To enable LAYFIELD to investigate and determine the cause of any alleged damage or defect, notice and details of any claim hereunder must be presented in writing to LAYFIELD within thirty (30) days after the alleged damage or defect was first noticed or observed. Failure to provide such notice and details shall invalidate all warranties provided hereunder.

The liability of LAYFIELD under the aforesaid warranties are subject to the following conditions:

a. LAYFIELD's only obligation shall be to repair or replace any defective workmanship and in no event shall LAYFIELD be liable for any amount in excess of the cost of the Installation;

b. No allowance will be made for repairs, replacements or alterations made by the Customer unless with the prior written consent of LAYFIELD;

c. The warranties hereunder extend only to the Customer and are not transferable;

d. The warranties hereunder shall not apply to any damage or defects resulting from misuse, mechanical abuse by machinery, equipment or persons, excessive pressures or stresses, exposure of the completed Installation of harmful chemicals, unusual weather conditions, casualty catastrophe such as (but not limited to) earthquake, flood, hail, tornado, or any other act of God;

e. Under no circumstances shall LAYFIELD be liable for any special, direct, indirect, or consequential damages including the loss of use of the Installation howsoever caused;

f. All liner materials provided for the Installation are covered by a separate warranty provided by Solmax, and LAYFIELD shall not be liable for material failure claims hereunder;

g. The warranties hereunder are given in lieu of all other warranties, express, implied, statutory, or otherwise, and the Customer expressly waives all other warranties and claims whatsoever except those specifically given herein, and the Customer acknowledges that the warranties hereunder are accepted in preference to and to the exclusion of any or all other warranties; and

h. An Installation Warranty will <u>not</u> be provided for lining projects unless the installation is completed by LAYFIELD personnel or designated LAYFIELD subcontractors.

CERTIFICATE OF INSPECTION
OF SOIL SUBGRADE SURFACE

PROJECT NAME: Dublin Vault
PROJECT NUMBER: CT001143
OWNER/CONTRACTOR: Victoria Gold
LOCATION: Eagle Gold,

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the soil subgrade surface described below, and:

☑ *found it to be an acceptable surface on which to install geomembrane; OR*

☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☐ Partial or ☑ Complete): 18 X 16
Dimensions of Subgrade Inspection: 18 x 16
Anchor Trench Dimensions: included in dementions
Comments: bits of water flowing threw subgrade.

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:

Date: June 23 2019
Signature:
Name: Thomas Howald
Title: Tech

OWNERS REPRESENTATIVE:

I, the undersigned, a duly appointed representative of the Owner, hereby understand the soil subgrade surface inspection described above and authorize Layfield to proceed with deployment of geosynthetics on the subgrade provided.

Date: June 23/19
Signature:
Name: Scott Dunfee
Title: QA Monitor
Company: tetra Tech

INSTALLATION WARRANTY

Layfield Reference No. : (Job #) CT001143

LAYFIELD CANADA LTD. (LAYFIELD) hereby warrants to Victoria Gold Corp; (the Customer) that the work performed by LAYFIELD on the Installation described as Dublin Vault will:

1. Meet the field seam specifications set out in the contract between LAYFIELD and the Customer (as amended by LAYFIELD's quotation), all workmanship to meet the requirements of LAYFIELD's Field Installation Quality Assurance program, and be free of defects at the time of completion of the Installation; and

2. Be free of installation defects from the date of the completion of the Installation (June 23, 2019), for a period of One year so long as the completed Installation is used for the purposes and in the manner for which the Installation was designed.

Should damage or defects within the scope of the aforesaid warranties occur, LAYFIELD shall repair the damage or defects, PROVIDED THAT the area to be repaired must first be made ready by the Customer and be in a clean, dry, unencumbered condition, free from all water, soil, sludge, residuals, and liquids of any kind.

To enable LAYFIELD to investigate and determine the cause of any alleged damage or defect, notice and details of any claim hereunder must be presented in writing to LAYFIELD within thirty (30) days after the alleged damage or defect was first noticed or observed. Failure to provide such notice and details shall invalidate all warranties provided hereunder.

The liability of LAYFIELD under the aforesaid warranties are subject to the following conditions:

a. LAYFIELD's only obligation shall be to repair or replace any defective workmanship and in no event shall LAYFIELD be liable for any amount in excess of the cost of the Installation;

b. No allowance will be made for repairs, replacements or alterations made by the Customer unless with the prior written consent of LAYFIELD;

c. The warranties hereunder extend only to the Customer and are not transferable;

d. The warranties hereunder shall not apply to any damage or defects resulting from misuse, mechanical abuse by machinery, equipment or persons, excessive pressures or stresses, exposure of the completed Installation of harmful chemicals, unusual weather conditions, casualty catastrophe such as (but not limited to) earthquake, flood, hail, tornado, or any other act of God;

e. Under no circumstances shall LAYFIELD be liable for any special, direct, indirect, or consequential damages including the loss of use of the Installation howsoever caused;

f. All liner materials provided for the Installation are covered by a separate warranty provided by Solmax, and LAYFIELD shall not be liable for material failure claims hereunder;

g. The warranties hereunder are given in lieu of all other warranties, express, implied, statutory, or otherwise, and the Customer expressly waives all other warranties and claims whatsoever except those specifically given herein, and the Customer acknowledges that the warranties hereunder are accepted in preference to and to the exclusion of any or all other warranties; and

h. An Installation Warranty will <u>not</u> be provided for lining projects unless the installation is completed by LAYFIELD personnel or designated LAYFIELD subcontractors.

CERTIFICATE OF FINAL INSPECTION AND ACCEPTANCE

PROJECT NAME: HEAP leach pond ADR Trench
PROJECT NUMBER: CT001143 **DATE:** 2019-04-28
OWNER: Victoria Gold
LOCATION: Eagle Gold, YK

Scope of Installation(s): **THE WORK**
Area/Layer: _____ Area Inspected: ☐ Partial or ☑ Complete
Dimensions: Approx 84m by 13.5m, total area of ~1134m², One layer of 60mil LLDPE DST liner. All panels and seams tested. All details and repairs tested

Part 1 – LAYFIELD CANADA LTD.

I, BRADLEY McLEOD, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield's QC program and the terms and conditions of the contract.

Layfield Representative:
Name: BRADLEY McLEOD
Title: QC Technician
Date: 2019-04-28 **Signature:** [signature]

Part 2 – OWNER (or Representative)

I, Scott Denfield, a duly appointed representative of Tetra Tech, do hereby take over and accept the installation(s) described above, and confirm that the work has been completed in accordance with the project specifications and the terms of the conditions of the contract.

I have evaluated and measured the work together with the Layfield representative, and agree that the measurements shown are both true and correct, and that the installation has met our approval.

Owners Representative:
Name: Scott Denfield
Title: Project Technologist
Company: Tetra Tech
Date: April 30, 2019 **Signature:** [signature]

Comments: Mapped out liner placement and QC/ details for all 2019 work.

CERTIFICATE OF SUBGRADE SURFACE INSPECTION

PROJECT NAME: Gold Eagle Misc Heapleach Ditch ADR TRENCH
PROJECT NUMBER: CE-001143
OWNER/CONTRACTOR: JDS MINING / VICTORIA GOLD
LOCATION: EAGLE MINE VICTORIA GOLD, YUKON

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the soil subgrade surface described below, and:

- ☑ *found it to be an acceptable surface on which to install geomembrane; OR*
- ☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☐ Partial or ☑ Complete): _____
Dimensions of Subgrade Inspection: ~ 84m by 135m
Anchor Trench Dimensions: N/A
Comments: _____

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:

Date: 04/24/19
Signature: _____
Name: DAVID BURNS
Title: QAQC TECHNICIAN

OWNERS REPRESENTATIVE:

I, the undersigned, a duly appointed representative of the Owner, hereby understand the soil subgrade surface inspection described above and authorize Layfield to proceed with deployment of geosynthetics on the subgrade provided.

Date: April 30, 2019
Signature: _____
Name: SCOTT DIXON

INSTALLATION WARRANTY

Layfield Reference No. : (Job #) CT001143

LAYFIELD CANADA LTD. (LAYFIELD) hereby warrants to Victoria Gold Corp; (the Customer) that the work performed by LAYFIELD on the Installation described as ADR Trench will:

1. Meet the field seam specifications set out in the contract between LAYFIELD and the Customer (as amended by LAYFIELD's quotation), all workmanship to meet the requirements of LAYFIELD's Field Installation Quality Assurance program, and be free of defects at the time of completion of the Installation; and

2. Be free of installation defects from the date of the completion of the Installation (April 28, 2019), for a period of One year so long as the completed Installation is used for the purposes and in the manner for which the Installation was designed.

Should damage or defects within the scope of the aforesaid warranties occur, LAYFIELD shall repair the damage or defects, PROVIDED THAT the area to be repaired must first be made ready by the Customer and be in a clean, dry, unencumbered condition, free from all water, soil, sludge, residuals, and liquids of any kind.

To enable LAYFIELD to investigate and determine the cause of any alleged damage or defect, notice and details of any claim hereunder must be presented in writing to LAYFIELD within thirty (30) days after the alleged damage or defect was first noticed or observed. Failure to provide such notice and details shall invalidate all warranties provided hereunder.

The liability of LAYFIELD under the aforesaid warranties are subject to the following conditions:

a. LAYFIELD's only obligation shall be to repair or replace any defective workmanship and in no event shall LAYFIELD be liable for any amount in excess of the cost of the Installation;

b. No allowance will be made for repairs, replacements or alterations made by the Customer unless with the prior written consent of LAYFIELD;

c. The warranties hereunder extend only to the Customer and are not transferable;

d. The warranties hereunder shall not apply to any damage or defects resulting from misuse, mechanical abuse by machinery, equipment or persons, excessive pressures or stresses, exposure of the completed Installation of harmful chemicals, unusual weather conditions, casualty catastrophe such as (but not limited to) earthquake, flood, hail, tornado, or any other act of God;

e. Under no circumstances shall LAYFIELD be liable for any special, direct, indirect, or consequential damages including the loss of use of the Installation howsoever caused;

f. All liner materials provided for the Installation are covered by a separate warranty provided by Solmax, and LAYFIELD shall not be liable for material failure claims hereunder;

g. The warranties hereunder are given in lieu of all other warranties, express, implied, statutory, or otherwise, and the Customer expressly waives all other warranties and claims whatsoever except those specifically given herein, and the Customer acknowledges that the warranties hereunder are accepted in preference to and to the exclusion of any or all other warranties; and

h. An Installation Warranty will not be provided for lining projects unless the installation is completed by LAYFIELD personnel or designated LAYFIELD subcontractors.

LAYFIELD
ENVIRONMENTAL CONTAINMENT

CERTIFICATE OF FINAL INSPECTION AND ACCEPTANCE

PROJECT NAME: Eagle Gold Liner work
PROJECT NUMBER: ctool321 **DATE:** Aug 30 2019
OWNER: Vic Gold
LOCATION: 90 day Sump, Elsa YK

Scope of Installation(s): **THE WORK**
Area/Layer: 21m x21m 90 day sump Area Inspected: ☐ Partial or ☒ Complete
Dimensions: 21m x21m

Part 1 – LAYFIELD CANADA LTD.

I, Fred Crossman, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield's QC program and the terms and conditions of the contract.

Layfield Representative:

Name: Fred Crossman
Title: Technician
Date: Aug 30 2019 **Signature:** FC

Part 2 – OWNER (or Representative)

I, _____, a duly appointed representative of _____ _____, do hereby take over and accept the installation(s) described above, and confirm that the work has been completed in accordance with the project specifications and the terms of the conditions of the contract.

I have evaluated and measured the work together with the Layfield representative, and agree that the measurements shown are both true and correct, and that the installation has met our approval.

LAYFIELD
ENVIRONMENTAL CONTAINMENT

CERTIFICATE OF INSPECTION OF SOIL SUBGRADE SURFACE

PROJECT NAME: Eagle gold mine, Heap leach Pad
PROJECT NUMBER: CT001321
OWNER/CONTRACTOR: JDS
LOCATION: Victoria mine

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the soil subgrade surface described below, and:

- ☑ *found it to be an acceptable surface on which to install geomembrane; OR*
- ☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☑ Partial or ☐ Complete): inspected Bridging area.
Dimensions of Subgrade Inspection: 1m X 12m
Anchor Trench Dimensions: N/A
Comments: cut back liner, inspected depth of erosion, then installed a liner cap strip to prevent bridging.

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:

Date: Aug 18 2019
Signature:
Name: Thomas Howald
Title: QC/tech.

OWNERS REPRESENTATIVE:

I, the undersigned, a duly appointed representative of the Owner, hereby understand the soil subgrade surface inspection described above and authorize Layfield to proceed with deployment of geosynthetics on the subgrade provided.

REMARKS

QC TECH Thomas Howald

SUPERVISOR Fred Crossman

SUBMISSION DATE Septemeber 2, 2019

SHEET NUMBER 2 of 3

LAYFIELD
ENVIRONMENTAL CONTAINMENT

CERTIFICATE OF FINAL INSPECTION AND ACCEPTANCE

PROJECT NAME: Eagle gold mine Heap leach Pad
PROJECT NUMBER: CT00 1321 **DATE:** Aug 18, 2019
OWNER: JDS
LOCATION: Heap leach pad

Scope of Installation(s): **THE WORK**
Area/Layer: Primary Area Inspected: ☑ Partial or ☐ Complete
Dimensions: 1M X 12m (Panels 140, 138)

Part 1 – LAYFIELD CANADA LTD.

I, Thomas Howald, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield's QC program and the terms and conditions of the contract.

Layfield Representative:
Name: Thomas Howald
Title: QC/Tech
Date: Aug 18 2019 **Signature:**

Part 2 – OWNER (or Representative)

I, Scott Dimitroff, a duly appointed representative of TetraTech, do hereby take over and accept the installation(s) described above, and confirm that the work has been completed in accordance with the project specifications and the terms of the conditions of the contract.

I have evaluated and measured the work together with the Layfield representative, and agree that the measurements shown are both true and correct, and that the installation has met our approval.

Owners Representative:
Name: Scott Dimitroff
Title: QA Monitor
Company: TetraTech
Date: Aug. 19, 2019 **Signature:**

Certificate of Analysis

Shipped To: SOLMAX
2801 BOUL MARIE-VICTORIN
VARENNES QC J3X 1P7
CANADA

Recipient: Giguere
Fax:

Delivery #: 89715248
PO #: 117170
Weight: 186200.000 LB
Ship Date: 07/30/2018
Package: BULK
Mode: Hopper Car
Car #: CITX703193
Seal No: 112216

Product:
MARLEX 7104 POLYETHYLENE in Bulk
Additive levels have been tested and meet minimum the specification for this lot.
As a result, Standard OIT (by ASTM D 3895) is greater than 120 minutes (nominal value, not tested on every lot).

Lot Number: CJG810150

Property	Test Method	Value	Unit
Melt Index	ASTM D1238	0.34	g/10min
Density	D1505	0.919	g/cm3

The data set forth herein have been carefully compiled by Chevron Phillips Chemical Company LP (CPChem).
However, there is no warranty of any kind, either expressed or implied, applicable to its use, and the user assumes all risk and liability in connection therewith.

October 16, 2018
Layfield Canada Ltd.
17720 - 129 Avenue NW
Edmonton, AB, T5V 0C4

Ref. : Eagle Gold Project, AB
Customer P.O. # E30758
Product : TN 350-2-6

We hereby certify that the TN 350-2-6 drainage geocomposite, meets or exceeds the project requirements as stated in the specifications. The properties listed in this section are:

Property	Test Method	Unit	Value	Qualifier
Geonet[3]				
Thickness	ASTM D 5199	mil	350	MAV[6]
Carbon Black	ASTM D 4218	%	2.0	MAV
Tensile Strength	ASTM D 7179	lbs/in	100	MAV
Melt Flow	ASTM D 1238[2]	g/10 min	1.0	Maximum
Density	ASTM D 1505	g/cm^3	0.94	MAV
Transmissivity[1a]	ASTM D 4716	m^2/sec	6.0×10^{-3}	MAV
Composite				
Ply Adhesion	ASTM D 7005	lb/in	0.5	MAV
Transmissivity[1b]	ASTM D 4716	m^2/sec	2.0×10^{-3}	MAV
Geotextile[3 & 4]				
Fabric Weight	ASTM D 5261	oz/yd^2	6.0	MARV[5]
Grab Strength	ASTM D 4632	lbs	160	MARV
Grab Elongation	ASTM D 4632	%	50	MARV
Trap Tear Strength	ASTM D 4533	lbs	65	MARV
CBR Puncture	ASTM D 6241	lbs	450	MARV
Water Flow Rate	ASTM D 4491	gpm/ft^2	125	MARV
Permittivity	ASTM D 4491	sec^{-1}	1.63	MARV
AOS	ASTM D 4751	US Sieve	70	MaxARV
UV Resistance	ASTM D 4355	%/hrs	70/500	MARV

Notes:

1a. Transmissivity measured using water at 21 ± 2 °C (70 ± 4 °F) with a gradient of 0.1 and a confining pressure of 25,000 psf between steel plates after 15 minutes.

1b. Transmissivity measured using water at 21 ± 2 °C (70 ± 4 °F) with a gradient of 0.1 and a confining pressure of 25,000 psf between steel plates after 15 minutes.

2. Condition 190/2.16

3. Geotextile and Geonet properties are prior to lamination.

4. Geotextile data is provided by the supplier.

5. MARV is statistically defined as mean minus two standard deviations and it is the value which is exceeded by 97.5% of all the test data.

6. Minium average value

Sincerely,

Rajesh Patel

POLYETHYLENE RESIN CERTIFICATION

Customer Name : Layfield Canada Ltd.
Project Name : Eagle Gold Project, AB
Geocomposite Manufacturer : SKAPS Industries
Geocomposite Production Plant : Commerce, GA
Geocomposite Brand Name : TN 350-2-6

We hereby certify the following test results for the above referenced product/project:

Resin Manufacturer	Resin Lot Number	Property	Test Method	Units	Resin Manufacturer Value	Tested Value*
ExxonMobil Chemical	ECUX 881070	Density	ASTM D1505	g/cm^3	0.9480	0.9478
		Melt flow Index	ASTM D1238[(a)]	g/10 min	0.21	0.19
ExxonMobil Chemical	ECUX 880160	Density	ASTM D1505	g/cm^3	0.9480	0.9482
		Melt flow Index	ASTM D1238[(a)]	g/10 min	0.12	0.15

(a) Condition 190/2.16

* Data from SKAPS Quality Control

*571 Industrial Parkway, Commerce, GA 30529 * Ph : 706-336-7000 * Fax : 706-336-7007 * Email : contact@skaps.com*

October 16, 2018
Layfield Canada Ltd.
17720 - 129 Avenue NW
Edmonton, AB, T5V 0C4

Ref. : Eagle Gold Project, AB
Customer P.O. # E30758
Product : TN 220-2-8

We hereby certify that the TN 220-2-8 drainage geocomposite, meets or exceeds the project requirements as stated in the specifications. The properties listed in this section are:

Property	Test Method	Unit	Value	Qualifier
Geonet[3]				
Thickness	ASTM D 5199	mil	200	MAV[6]
Carbon Black	ASTM D 4218	%	2.0	MAV
Tensile Strength	ASTM D 7179	lbs/in	45	MAV
Melt Flow	ASTM D 1238[2]	g/10 min	1.0	Maximum
Density	ASTM D 1505	g/cm^3	0.94	MAV
Transmissivity[1]	ASTM D 4716	m^2/sec	1.0×10^{-3}	MAV
Composite				
Ply Adhesion	ASTM D 7005	lb/in	0.5	MAV
Geotextile[3 & 4]				
Fabric Weight	ASTM D 5261	oz/yd^2	8.0	MARV[5]
Grab Strength	ASTM D 4632	lbs	220	MARV
Grab Elongation	ASTM D 4632	%	50	MARV
CBR Puncture	ASTM D 6241	lbs	575	MARV
Water Flow Rate	ASTM D 4491	gpm/ft^2	95	MARV
Permittivity	ASTM D 4491	sec^{-1}	1.26	MARV
AOS	ASTM D 4751	US Sieve	80	MaxARV
UV Resistance	ASTM D 4355	%/hrs	70/500	MARV

Notes:

1. *Transmissivity measured using water at 21 ± 2 °C (70 ± 4 °F) with a gradient of 0.1 and a confining pressure of 10,000 psf between steel plates after 15 minutes.*
2. *Condition 190/2.16*
3. *Geotextile and Geonet properties are prior to lamination.*
4. *Geotextile data is provided by the supplier.*
5. *MARV is statistically defined as mean minus two standard deviations and it is the value which is exceeded by 97.5% of all the test data.*
6. *Minium average value*

Sincerely,
Rajesh Patel
Rajesh Patel
QA Manager

POLYETHYLENE RESIN CERTIFICATION

Customer Name : Layfield Canada Ltd.
Project Name : Eagle Gold Project, AB
Geocomposite Manufacturer : SKAPS Industries
Geocomposite Production Plant : Commerce, GA
Geocomposite Brand Name : TN 220-2-8

We hereby certify the following test results for the above referenced product/project:

Resin Manufacturer	Resin Lot Number	Property	Test Method	Units	Resin Manufacturer Value	Tested Value*
ExxonMobil Chemical	ECUX 880160	Density	ASTM D1505	g/cm^3	0.9480	0.9482
		Melt flow Index	ASTM D1238[(a)]	g/10 min	0.12	0.15

(a) Condition 190/2.16

* Data from SKAPS Quality Control

*571 Industrial Parkway, Commerce, GA 30529 * Ph : 706-336-7000 * Fax : 706-336-7007 * Email : contact@skaps.com*

BentoLiner Manufacturing Certification

Sales Order: 84739

Customer: Layfield Canada Ltd

Project: Layfield/Eagle Gold Heap Leach Facility

Product Type: BLI-075-06N-06W-D-60 BentoLiner NWL

The GCL purchased and shipped for the above referenced project does meet or exceed the project specifications.

The GCL supplied to this project has been continuously inspected for the presence of needles and is certified to be needle free.

BentoLiner Manufacturing Certification

Sales Order: 84739

Customer: Layfield Canada Ltd

Project: Layfield/Eagle Gold Heap Leach Facility

Product Type: BLI-075-06N-06W-D-60 BentoLiner NWL

The GCL purchased and shipped for the above referenced project does meet or exceed the project specifications.

The GCL supplied to this project has been continuously inspected for the presence of needles and is certified to be needle free.

Chuck Taylor
Laboratory Technician

Quality Assurance Laboratory Test Results

Project: Layfield/Eagle Gold Heap Leach Facility
Sales Order: 84739
Product: BLI-075-06N-06W-D-60 BentoLiner NWL

Required Testing: ASTM D5887 - Standard Test Method for Measurement of Index Flux Through Saturated Geosynthetic Clay Liner Specimens Using a Flexible Wall Permeameter

Frequency: 1/270,000sf

Effective Stress: 5psi

Daily Lot	Roll Number	Production Date	Index Flux ($m^3/m^2/sec$)	Hydraulic Conductivity (cm/sec)

BentoLiner Manufacturing Certification

Sales Order: 84739

Customer: Layfield Canada Ltd

Project: Layfield/Eagle Gold Heap Leach Facility

Product Type: BLI-075-06N-06W-D-60 BentoLiner NWL

The GCL purchased and shipped for the above referenced project does meet or exceed the project specifications.

The GCL supplied to this project has been continuously inspected for the presence of needles and is certified to be needle free.

BentoLiner Manufacturing Certification

Sales Order: 84739

Customer: Layfield Canada Ltd

Project: Layfield/Eagle Gold Heap Leach Facility

Product Type: BLI-075-06N-06W-D-60 BentoLiner NWL

The GCL purchased and shipped for the above referenced project does meet or exceed the project specifications.

The GCL supplied to this project has been continuously inspected for the presence of needles and is certified to be needle free.

Chuck Taylor
Laboratory Technician

Quality Assurance Laboratory Test Results

Project: Layfield/Eagle Gold Heap Leach Facility
Sales Order: 84739
Product: BLI-075-06N-06W-D-60 BentoLiner NWL

Required Testing: ASTM D5887 - Standard Test Method for Measurement of Index Flux Through Saturated Geosynthetic Clay Liner Specimens Using a Flexible Wall Permeameter

Frequency: 1/270,000sf

Effective Stress: 5psi

Daily Lot	Roll Number	Production Date	Index Flux ($m^3/m^2/sec$)	Hydraulic Conductivity (cm/sec)

BentoLiner Manufacturing Certification

Sales Order: 84739

Customer: Layfield Canada Ltd

Project: Layfield/Eagle Gold Heap Leach Facility

Product Type: BLI-075-06N-06W-D-60 BentoLiner NWL

The GCL purchased and shipped for the above referenced project does meet or exceed the project specifications.

The GCL supplied to this project has been continuously inspected for the presence of needles and is certified to be needle free.

Subject: FW: HLF Shaping

Hi guys. Below is a heat map showing the slopes for a grading plan JDS has come up with. The area above 940 in the center valley under the pipe trench is more of an estimate as this area is frozen and final shape will depend on ice excavation. The rest of the Heap area above 940 is already thawed so there would be no reason they could not make the shape below. The vast majority meets the design criteria (2.5:1 or less). The 950-960 elevation looks to be up to 2:1 but that was approved so I think its ok. There are small bits that are 1.5:1 (red on the map) but they are so small I assume they are probably artifacts and these areas can be shaped at least at a 2:1.

Let me know if you have any issues with this shaping as far as liner placement goes.

Thanks.

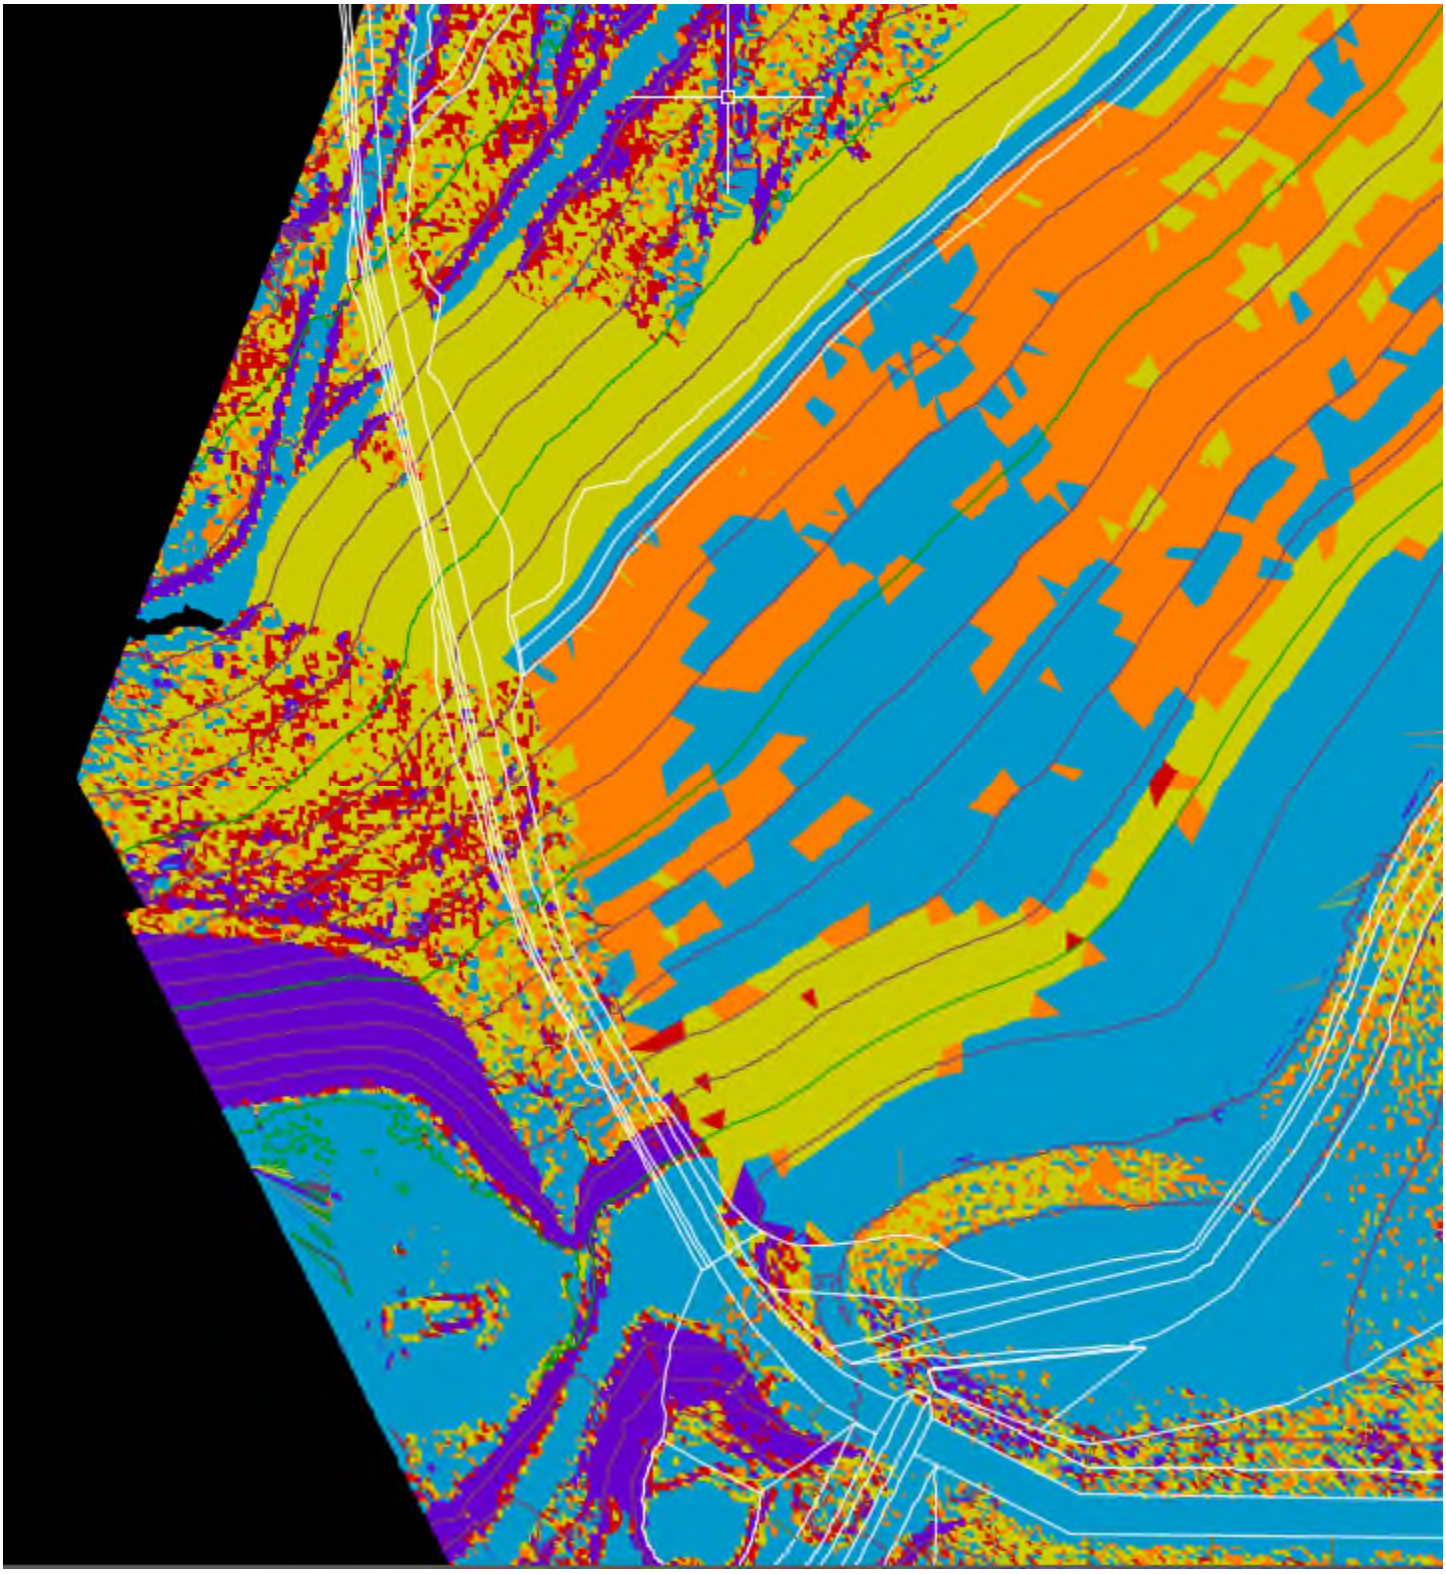
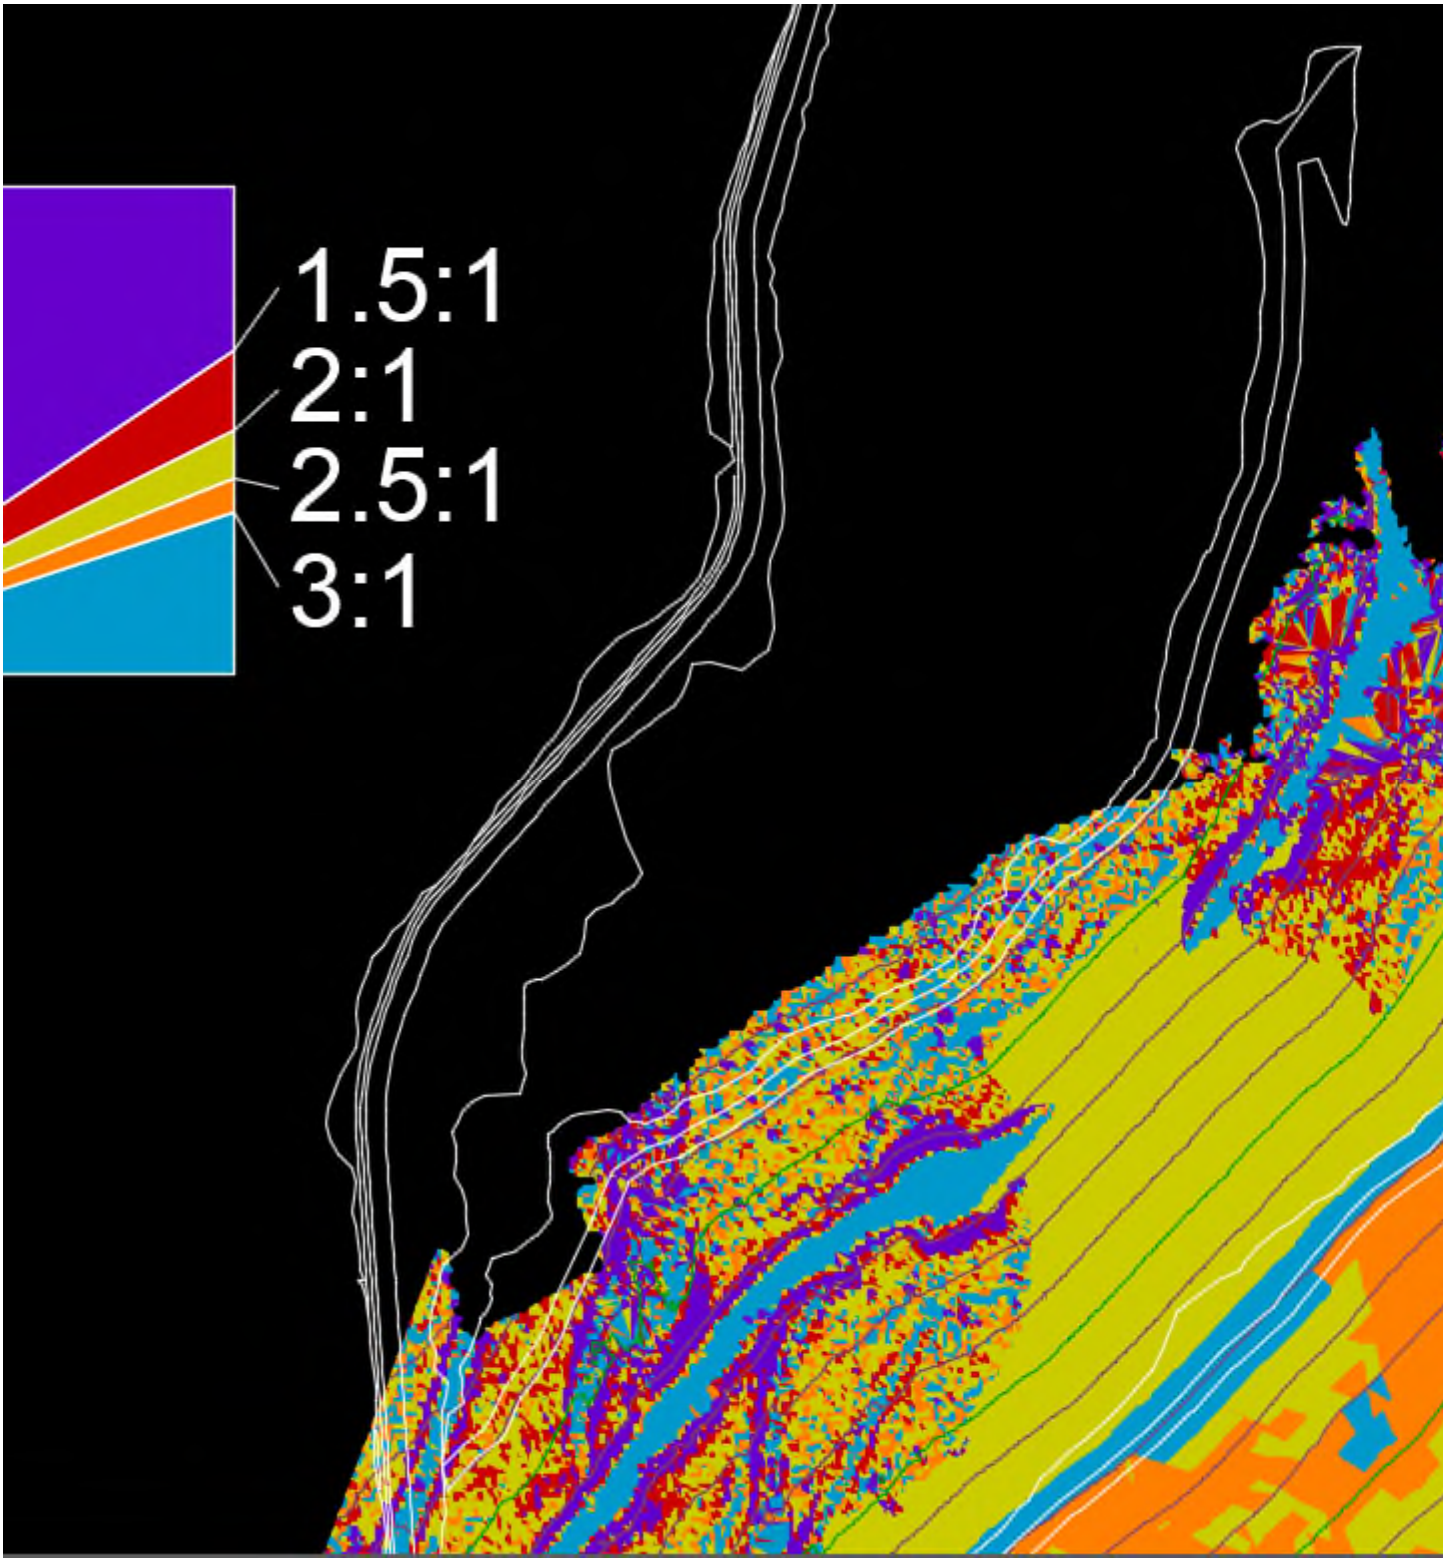
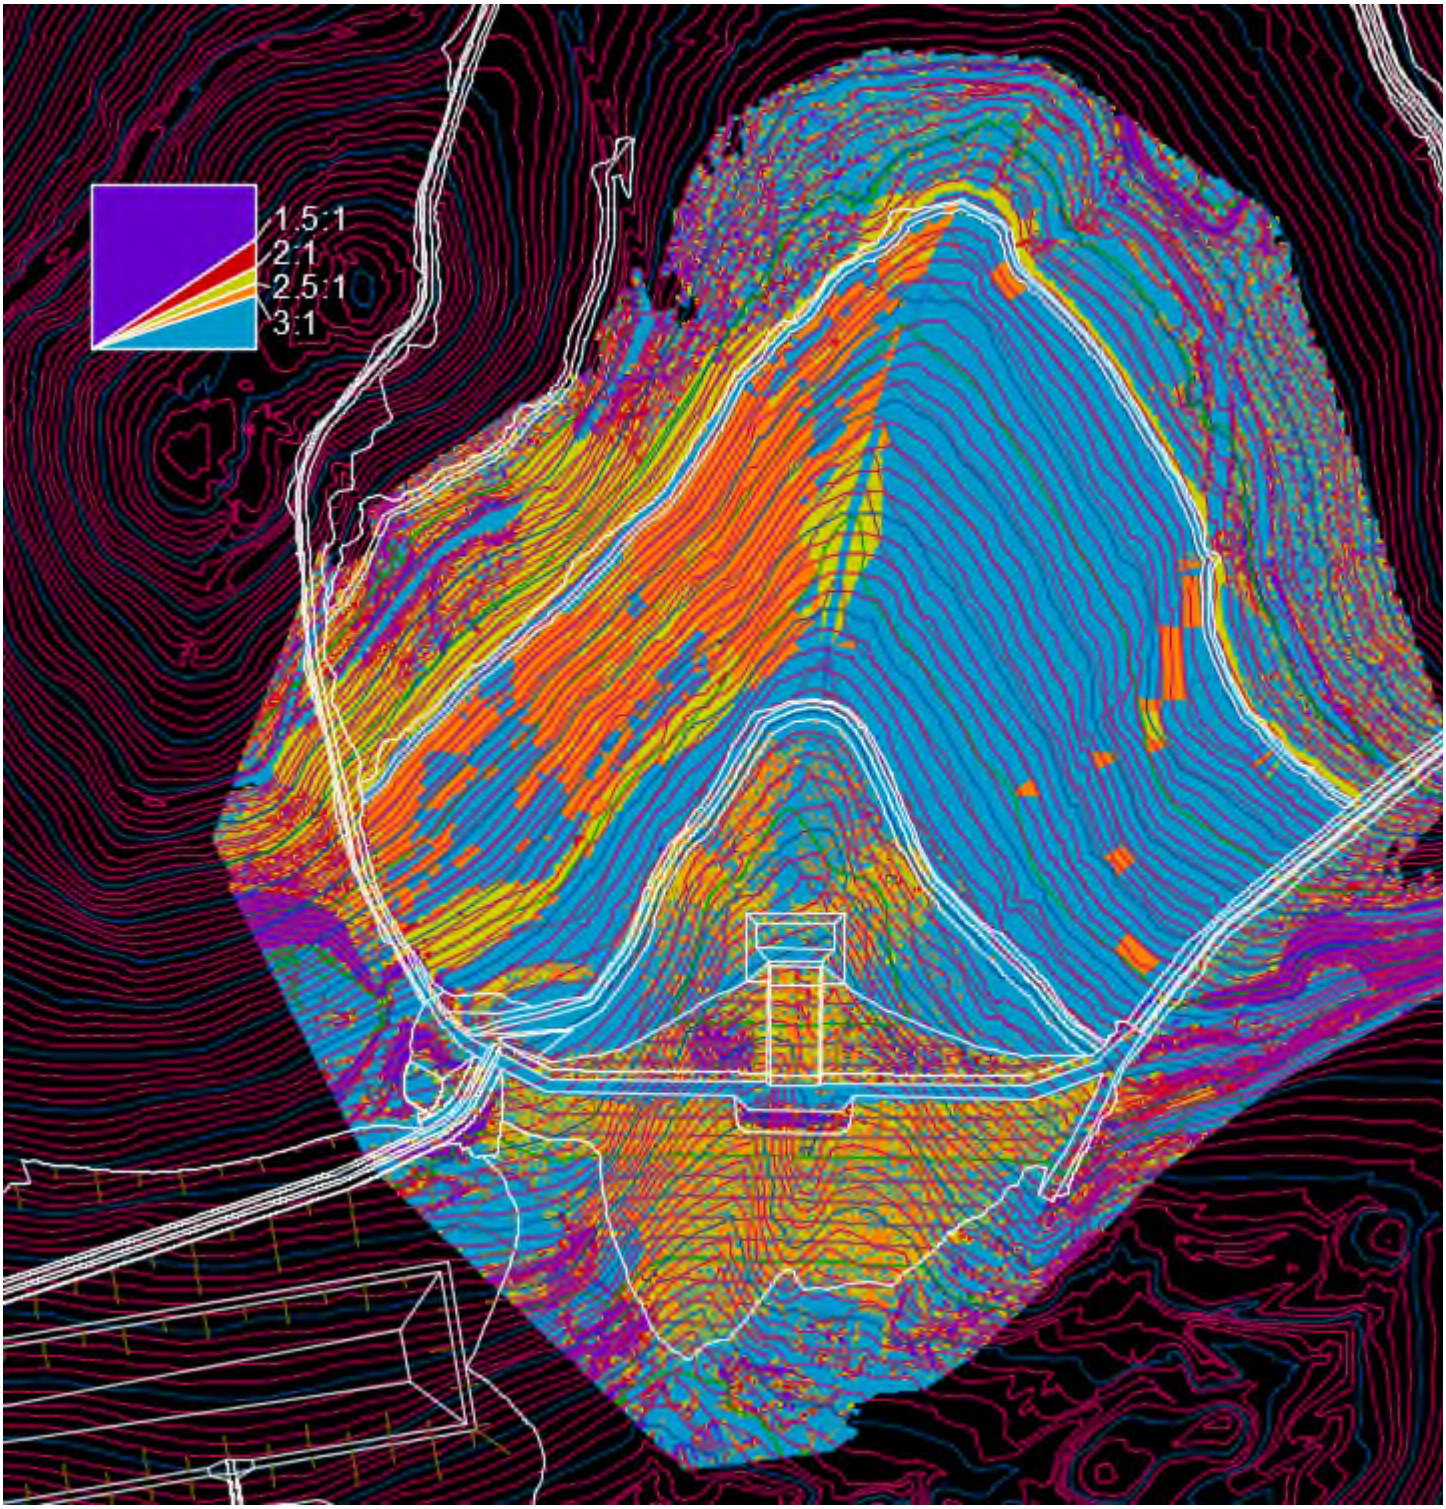
Subject: RE: HLF Shaping



Roy,



Here are some screen shots of the latest JDS grading with a slope range map. The first image shows the color legend on the top left corner (colors are new on here for more detailed analysis). Yellow areas are probably what you want to look at as they can be very large up-to-2:1 sloped areas.



I took some cross sections through this surface and the original ground and it looks like they daylighted this grading correctly and the design can be tied into EG outside of the pad limits.

Let me know what else you need or if you want to do a screen share to look at things in more detail.

Subject: RE: HLF Shaping

Hi guys. The general layout provided looks ok. However, our designer, Dustin, is going to verify some of the steeper looking areas on the west side. We would also have to ensure that cuts in the Phase 1 pad area do not undercut the natural slopes above and pose a failure risk. It likely would not result in a major material cleanup effort if that happened but it could affect water/ice control efforts.

Something to note that will affect this shape is the ice rich frozen ground found in the center valley. This ice rich region was initially discovered in the July test pitting (and noted in previous test pitting done back in 2011, 2016, ect). What we are doing now is delineating it to determine how much excavation is needed. It looks like some of the ice has melted away, especially on the side slopes so we are looking at potentially just having over excavation in the center valley. The good news is that a lot of the ice found during shaping on west side and near the spillway has either melted away or been removed during shaping.

Thanks

Re: BGC-RFI-019: Closure Sump Steel Plate Detail

BGC requests JDS provide acknowledgment of receipt of the following design detail clarification.

The pipework contractor (Heavy North) asked for clarification regarding the size, location and orientation of the steel protection plate to be installed in the closure sump as show in Detail 33 on Drawing EGHLF XD-05-04and Detail 37 on Drawing EGHLF XD-05-05. The configuration of the Closure Pipe Casings was modified per BGC-RFI-013. As a result the Closure Pipe Casings have been shifted up and away from the HLF Embankment face as show in **Figure 1**. This requies modification of the position of the steel plate. **Figure 2** shows the revised configuration. The steel plate will be positioned at the north edge of the sump at a 20 degree angle from horizontal, as shown. The dimensions of the steel plate are 3m long by 1.2m wide with a 25 cm 90 degree angle. This revised orientation requires a modification to the closure sump pipe drainage loop (see **Figure 3**). This RFI supercedes RFI-015.

Re: Liner Test Pad Procedure

1.0 INTRODUCTION AND OBJECTIVE

A test pad was constructed to define acceptable haulage, placement and spreading procedures for overliner drain fill (ODF) over the Heap Leach Facility (HLF) liner system using the proposed equipment. The HLF design incorporates two separate liner systems. The test pad was constructed over two days (August 18th and 19th) and supervised by Troy Meyer, P.Eng. of BC. The lining system for the In-Heap Pond areas are comprised of the following, from top to bottom:

- A min. 1m thick layer of overliner drain fill (ODF) with imbedded perforated drainage piping
- A 2.0mm (80-mil) LLDPE double-textured primary liner
- A geonet that is part of the LDRS and located between the primary and secondary liners
- A 1.5mm (60-mil) low-linear density polyethylene (LLDPE) secondary liner
- A geosynthetic clay liner (GCL)
- Prepared subgrade beneath the GCL.

The lining system for the HLF pad (up-gradient of the In-Heap Pond) are comprised of the following, from top to bottom:

- A min. 0.6m thick layer of overliner drain fill (ODF with imbedded perforated drainage piping
- A 2.0mm (80-mil) LLDPE double-textured liner
- A geosynthetic clay liner (GCL)
- Prepared subgrade beneath the GCL.

A dedicated access/haul road on the liner is planned to allow construction of the sump components and ODF behind the dam. It is envisioned that this road will be constructed of a thickened section of ODF with a geotextile cushion placed between the ODF and liner. To best simulate the construction of the ODF layer, three test pad sections were constructed:

- Section A - 1.5m layer of ODF over 2 layers of geotextile
- Section B – 1.0m layer of ODF over 2.0mm liner over GCL
- Section C - 0.6m layer of ODF over 2.0mm liner over GCL

The Sections B and C pads allows evaluation of both the single and double liner systems to be constructed at the HLF, while the Section A pad allows evaluation of the planned ODF haul road over the liner.

2.0 TEST PAD MATERIALS AND EQUIPMENT

2.1. Material 4 – ODF

The Overliner Drain Fill (ODF) for the leach pad liner cover fill shall consist of free-draining granular material with 38-mm maximum particle size and a maximum of 5 percent fines passing the No. 200 ASTM sieve size (0.075-mm). No moisture conditioning or compaction is required. The ODF material shall be placed in such a manner as to reduce segregation and protect the liner from damage and keep compaction of the ODF material to a minimum. The ODF above the geomembrane will be placed in a single lift by suitable dozer and truck equipment, as approved by the Engineer.

2.2. Geosynthetics

The geomembrane for the test pad was Solmax (RT) 2.0mm LLDPE. The GCL was GSE NWL 60. The geotextile was 12 oz non-woven. Data sheets for the material used in the test pad are included in Attachment A.

2.3. Equipment

JDS indicated the primary equipment planned for ODF construction is 40T rock trucks and D6 dozers. Data sheets for the equipment used in the test pad are included in Attachment A. The test pad was also trafficked with a CAT 3250 trackhoe excavator and a 30T dump truck during construction.

3.0 TEST PAD CONSTRUCTION AND EXECUTION

The constructed test fill configuration with liner sample locations is depicted in Figure 1. The configuration was developed to simulate haul traffic operations with stopping and turning on the haul road portion (Section A).

The surface was prepared by spreading subgrade material with a dozer and packing and smoothing with the excavator bucket. The material was imported from the ADR borrow area and was broken and weathered rock fragments in a matrix of sand and silt (**Photos 1 and 2 in Attachment B**).

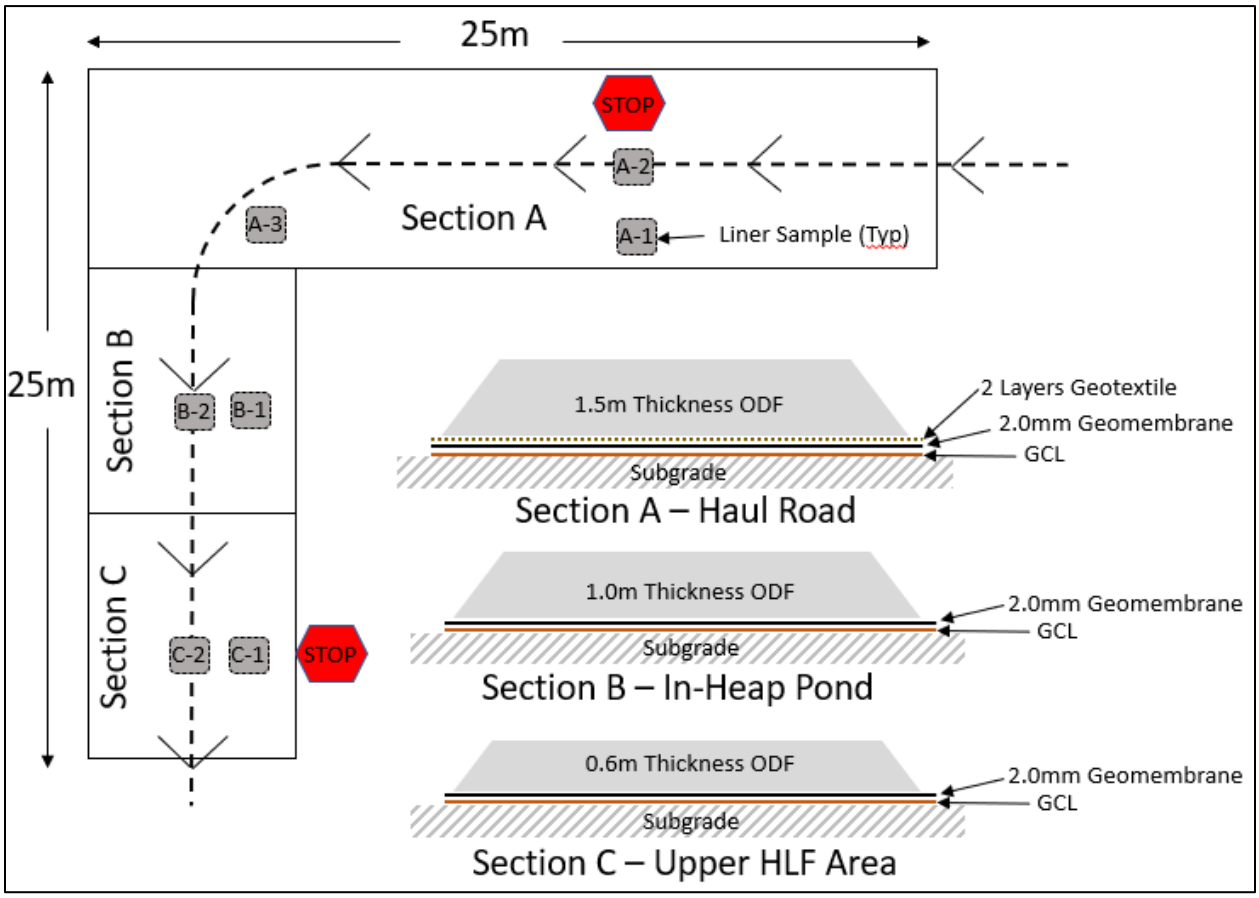

Figure 1: Liner test pad configuration and sampling locations.

Deployment of the geosynthetics was then performed (**Photos 3 through 9**), and the ODF thickness was checked by survey (**Photo 10**).

A loaded haul truck were then trafficked over the pad as shown in Figure 1 with speeds envisioned for actual construction (**Photo 12**). Two full stops and a turn with the loaded haul truck was incorporated in the Section A pad to simulate operations along the access road. A total of 10 passes were made over the pad with the loaded haul truck.

4.0 POST CONSTRUCTION EVALUATION AND TESTING

The loaded haul truck was able to traffic the surface without slipping or excessive rutting or ODF lateral displacement. After completion of the test pad trafficking, the surface of the ODF was visually inspected (**Photo 13**) and the liner was carefully uncovered with an excavator (**Photo 14**) with the last foot hand dug.

Photos 15 through 20 present the condition of the liner and subgrade. Light to moderate dimpling and scratching was observed on liner Sample C-1 (directly under truck tire track). All other

samples exhibited only light dimpling, which relaxed significantly within a few hours of uncovering. No deep scratches, gouges, abrasion, or holes were observed in any samples. No damage was observed in any of the GCL samples.

5.0 CONCLUSIONS AND RECOMMENDATIONS

The liner test pad results indicate that the proposed materials and equipment will result in a low risk of liner puncture damage during construction with placement of a single lift as thin as 0.6m. Cushioning from 2 layers of geotextile appears adequate for protecting the liner under repeated haul truck traffic at slow speeds.

The test pad did not simulate construction on slopes. Care must be tacked to avoid tearing the liner due to slippage on slopes. ODF must be placed from downhill to uphill. Haul truck speeds, braking and turning during drain cover fill placement must be strictly controlled to prevent damage to the underlying geomembrane and pipework. Turning equipment in place should be avoided.

The cover fill thickness should be increased to a minimum of 1.5m in concentrated traffic areas or across collection pipes, as required, to prevent damage to the geomembrane and pipework. Haul traffic on the cover fill surface shall be spread out as much as practical to prevent over-compaction of the cover fill in localized areas.

PRODUCT DATA SHEET

GSE BentoLiner NWL-60 Geosynthetic Clay Liner

GSE BentoLiner "NWL-60" is a heavily needlepunched reinforced composite geosynthetic clay liner (GCL) comprised of a uniform layer of granular sodium bentonite encapsulated between a nonwoven and a scrim-nonwoven geotextile for dimensional stability. The product is intended for steep slopes and high load applications where increased internal shear strength is required.

[*]

AT THE CORE:

This composite clay liner is intended for steep slopes and high load applications where increased internal shear strength is required.

GEOTEX® BY PROPEX

Product Data
GEOTEX® 801

GEOTEX® 801 is a polypropylene, staple fiber, needlepunched nonwoven geotextile produced by Propex, and will meet the following Minimum Average Roll Values (MARV) when tested in accordance with the methods listed below. The fibers are needled to form a stable network that retains dimensional stability relative to each other. The geotextile is resistant to ultraviolet degradation and to biological and chemical environments normally found in soils.

GEOTEX 801 conforms to the property values listed below[1]. Propex performs internal Manufacturing Quality Control (MQC) tests that have been accredited by the Geosynthetic Accreditation Institute – Laboratory Accreditation Program (GAI-LAP). This product is NTPEP approved for AASHTO standards.

PROPERTY	TEST METHOD	MARV[2] ENGLISH	MARV[2] METRIC
ORIGIN OF MATERIALS			
% U.S. Manufactured Inputs		100%	100%
% U.S. Manufactured		100%	100%
MECHANICAL			
Tensile Strength (Grab)	ASTM D-4632	205 lbs	912 N
Elongation	ASTM D-4632	50%	50%
CBR Puncture	ASTM D-6241	525 lbs	2336 N
Trapezoidal Tear	ASTM D-4533	80 lbs	356 N
ENDURANCE			
UV Resistance % Retained at 500 hrs	ASTM D-4355	70%	70%
HYDRAULIC			
Apparent Opening Size (AOS)[3]	ASTM D-4751	80 US Std. Sieve	0.180 mm
Permittivity	ASTM D-4491	1.5 sec^{-1}	1.5 sec^{-1}
Water Flow Rate	ASTM D-4491	110 gpm/ft^2	4482 $l/min/m^2$

ROLL SIZES	12.5 ft x 360 ft 15 ft x 300 ft	3.81 m x 109.8 m 4.57 m x 91.5 m

NOTES:
1. The property values listed above are effective 04/2011 and are subject to change without notice.
2. Values shown are in weaker principal direction. Minimum average roll values (MARV) are calculated as the typical minus two standard deviations. Statistically, it yields a 97.7% degree of confidence that any samples taken from quality assurance testing will exceed the value reported.
3. Maximum average roll value.

Stroke	149 mm	5.9 in
Displacement	9.3 L	567 in^3

- Rated power occurs at 2,000 rpm.
- Maximum power occurs at 1,600 rpm.
- Net power advertised is the power available at the engine flywheel when the engine is equipped with a fan at maximum speed, air cleaner, muffler and alternator.
- No deratings required up to 2286 m (7,500 ft) automatic derating occurs.
- All non road Tier 4, Stage IIIB and IV, Japan 2011 and 2014 (Tier 4 Interim and Tier 4 Final) and Korea Tier 4 diesel engines are required to use only Ultra Low Sulfur Diesel (ULSD) fuels containing 15 ppm (mg/kg) sulfur or less. Biodiesel blends up to B20 (20% blend by volume) are acceptable when blended with 15 ppm (mg/kg) sulfur or less ULSD. B20 should meet ASTM D7467 specification (biodiesel blend stock should meet Cat biodiesel spec, ASTM D6751 or EN 14214). Cat DEO-ULS™ or oils that meet the Cat ECF-3, API CJ-4, and ACEA E9 specification are required. Consult your OMM for further machine specific fuel recommendations.
- Diesel Exhaust Fluid (DEF) used in Cat Selective Catalytic Reduction (SCR) systems must meet the requirements outlined in the International Organization for Standardization (ISO) standard 22241.

Standards

ROPS/FOPS	ROPS meets ISO 3471:2008, FOPS meets ISO 3449:2005 Level II
Brakes	Brakes meet the International Standard ISO 10265:2008
Cab	Meets appropriate standards as listed below

- The declared dynamic operator sound pressure level is 76 dB(A) when "ISO 6396:2008" is used to measure the value for an enclosed cab. The measurement was conducted at 70% of the maximum engine cooling fan speed. The sound level may vary at different engine cooling fan speeds. The cab was properly installed and maintained. The measurement was conducted with the cab doors and the cab windows closed. The cab was properly installed and maintained.
- **Sound Level Information for Machines in European Union Countries and in Countries that Adopt the "European Union Directives"** – The information below applies to only the machine configurations that have the "CE" mark on the Product Identification Plate.
- The declared dynamic operator sound pressure level is 75 dB(A) when "ISO 6396:2008" is used to measure the value for an enclosed cab. The measurement was conducted at 70% of the maximum engine cooling fan speed. The sound level may vary at different engine cooling fan speeds. The cab was properly installed and maintained. The measurement was conducted with the cab doors and the cab windows closed. The cab was properly installed and maintained.
- Hearing protection is recommended when operating with an open operator station and cab (when not properly maintained or doors/windows open) for extended periods or in noisy environment.
- The declared exterior sound power level is 111 dB(A) when the value is measured according to the dynamic test procedures and the conditions that are specified in "ISO 6395:2008." The measurement was conducted at 70% of the maximum engine cooling fan speed. The sound level may vary at different engine cooling fan speeds.

NOTES

1. Testing frequency based on standard roll dimension and one batch is approximately 180,000 lbs (or one railcar).
2. Machine Direction (MD) and Cross Machine Direction (XMD or TD) average values should be on the basis of 5 specimens each direction.
3. ASTM D7466 is identical to GRI-GM12.
8. Correlation table is available for ASTM D792 vs ASTM D1505. Both methods give the same results.
9. Correlation table is available for ASTM D1603 vs ASTM D4218. Both methods give the same results.

* All values are nominal test results, except when specified as minimum or maximum.

Subject: RE: Eagle Gold - geotextile seams

Hey Troy,

I am responding to this old email just to refresh our memory from the bidding stage

Now that the Solmax RT has passed and we are getting it ordered, I thought I should send the data sheet for the LLDPE RT material to verify we are still ok with the GM-13 and GM-17 specs as per email below.

Regards,

Jason

Subject: RE: Eagle Gold - GRI standard liner price

1. GRI values will be ok
2. Seam efficiencies for woven geotextiles must be at least 80% as measured by the grab tensile test, or at least 50% when measured by wide width tensile strength equipment.

Subject: FW: Eagle Gold - GRI standard liner price

Hi Troy,

I hope your wife's surgery went well, and things are progressing alright.

Two things we would like clarification on.

1. wrt to the BGC liner specs vs GRI GM 13 and GM 17. Some of the values in the BGC spec are higher than the GRI manufacturer standards for GM 13 and GM 17. Can you confirm that the higher values are required? You specification table is below, and the **red** values are from the GSI standards

Table 4-1. Geomembrane properties.

Tested Property	Test Method	Frequency	Minimum Average Value			
			1.50 mm HDPE Textured	2.0 mm HDPE Textured	1.50 mm LLDPE Textured	2.0 mm LLDPE Textured
Thickness, (minimum average), mm Lowest individual reading	ASTM D 5994	every roll	1.50 1.28	2.00 1.70	1.50 1.28	2.00 1.70
Density, g/cm^3 (min.)	ASTM D 1505	90,000 kg	0.940	0.940	0.939	0.939
Tensile Properties (each direction) Strength at Break, N/mm Strength at Yield, N/mm Elongation at Break, % Elongation at Yield, %	ASTM D 6693, Type IV Dumbbell, 50 mm/min G.L.=50mm G.L.= 33 mm	9,000 kg	23.1 **(22)** 23.1 **(16)** 350 **(100)** 13 **(12)**	30.8 **(29)** 30.8 **(53)** 350 **(100)** 13 **(12)**	29.4 **(16)** 400 **(250)**	39.2 **(21)** 400 **(250)**
Tear Resistance, N	ASTM D 1004	20,000 kg	200	267 **(249)**	160 **(150)**	222 **(200)**
Puncture Resistance, N	ASTM D 4833	20,000 kg	534	667 **(534)**	310 **(300)**	400

Tested Property	Test Method	Frequency	Minimum Average Value			
Carbon Black Content, % (Range)	ASTM D 1603*/4218	9,000 kg	2.0 - 3.0	2.0 - 3.0	2.0 - 3.0	2.0 - 3.0
Carbon Black Dispersion	ASTM D 5596	20,000 kg	Note	Note	Note	Note
Asperity Height, mm	ASTM D 7466	second roll	0.51	0.46	0.51	0.46
Oxidative Induction Time, min	ASTM D 3895, 200°C; O_2, 1 atm	90,000 kg	>140	>140	>140	>140

2. BGC Spec, in section 4.3.2 (for installation of Geotextile) has the following:

   All joints shall have a 0.15 m minimum overlap and shall be heat fused or sewn. The integrity of each seam is important. As a means of regulating the fusion machines, frequent samples of seams will be tested for grab strength. *Minimum grab strength of 80 percent of the fabric strength, as defined above, will be required*. Any machine that produces failing samples shall be repaired or removed from the Work.

   The supplier indicates this 80% non-woven geotextile seam strength is not possible.

If necessary, are you available for a call with the potential vendor in the next couple of days?

Regards,

Jason:
The results from the Solmax RT geomembrane meet the project requirements.
The RT product actually performs better than the XRT product in this liner system and loading condition.

Subject: RE: Eagle - Geomembrane Shear Testing Jun21 update

Hi Troy,
I'll make sure to take lots of before and after photos of the different liners that we are going to test and will note any dumpling after shearing.
Please confirm the number of tests we need on each liner and the loads.
Previous loads were
200kPa,
400kPa,
800kPa
And I'm assuming the same set up as before - subgrade, GCL (GSE BentoLiner NWL-60), Geomembrane(RT 40mil LLDPE and then XRT 80mil HDPE material), PT material.

Thanks,

Dave

Subject: Re: Eagle - Geomembrane Shear Testing Jun21 update

Greg I think this approach is good and this additional testing should get us to a final product selection and approval. Given the firm subgrade I don't think the thinner liner will dimple too much more than the 80 mil. The dimpling from the gravel can sometimes affect results. I think given the timeline we should test the 40 mil and pay attention to the dimpling compared to the 80 mil.
Any thoughts David?

Hi Chris – we have been working with Solmax to review asperity height options as they relate to BGC's interface requirements. Solmax has requested project requirements for interface shear, however in speaking with Troy, they don't have a documented project spec for this – they just need to test samples and see if they pass. Solmax has noticed that previous BGC interface test reports show some variability in testing speed (displacement rate), and that this can impact results. We have recommended that Solmax speak direct with BGC to review the testing protocol being used – so that test results from this next round of tests are well understood (and so that further discussion, if required, can key in on specific items). We have been told by the technical rep at Solmax that interface shear testing results can vary up to 30-40% - which is why it makes sense for Solmax to speak directly to BGC in regards to testing protocol.

So in the absence of clear project interface requirements (which Solmax could review and recommend a product), Solmax is sending 2 additional samples (today) into BGC Fredericton for interface testing. These samples will be their RT (rough texture) & XRT (extra rough texture) series of products, which they feel will yield good results.

- The RT sample available is a 40mil LLDPE material and they have indicated that normally the thickness is irrelevant on the shear test
- The XRT sample is an 80mil HDPE material – which Solmax feels the HDPE will have minimal impact on test results versus LLDPE
- Troy – can you please confirm that these 2 samples indicated above are ok? Otherwise there may be significant lead times to source out precise samples for this interface shear testing.

Jason has left a voicemail with David Oldford at BGC Fredericton, to confirm whether they have enough GCL remaining to complete these 2 additional tests.

Again, all materials for the Event Pond & In-Heap Pond have been approved with expected delivery on site starting mid/late July.

Regards,
Greg

Subject: RE: Eagle - Geomembrane Shear Testing

Just to keep everyone up to date, we have spoken with Solmax and also with BGC to review the project requirements & options. We are pursuing alternate product options with higher asperity, and gathering information on their cost impacts.
As indicated in the attached email, the Layfield sample from last November was higher than normal in asperity (this was not intentional, it just happened based on the small production run to expedite a sample of non-stock material for that first interface shear test). By chance, this sample has barely passed Troy's requirements for the Heap Leach pad. Troy has also confirmed that these stringent interface shear requirements are only required for the Heap Leach Pads, therefore the procurement of 80mil LLDPE DST for the critical path Event Pond and In-Heap Pond can continue as planned (with industry standard GRI GM17 liner).
The recent sample supplied by Solmax does meet the physical spec properties outlined in the project spec. The interface shear pass/fail criteria are not included in the project spec for us to review & comment, however Troy has indicated that the Layfield sample test report can be used as the minimum project requirements for the Heap Pad area. What complicates the matter further is that this is a non-stock product with a unique asperity– and the manufacturing requirements to get

samples produced for further precise testing will require considerable time & cost to produce an order of size - to dial in the manufacturing equipment to such stringent tolerances (to produce the unique product that can be replicated with confidence on a large quantity order). Our plan is to work with Solmax when they run the standard 80mil LLDPE DST products for the Event Pond and the In-Heap Pond in mid July, and hope they can run the required high-asperity sample options at the end of this production run.

Greg

Jason:
The preliminary results of the multi-interface testing with Solmax LLDPE are attached. These are still under internal BGC review.
Our evaluation of the results indicates that this Solmax geomembrane does not meet the project requirements. A comparison of the results for the Layfield and Solmax products is provided below. Both the peak and residual interface strength values are lower for the Solmax product. Since the failure interface was between the liner and the GCL, we believe the difference is due to more aggressive (rougher) texturing on the Layfield liner compared to the Solmax liner.

Perhaps the Solmax can be made with more aggressive texturing? The adhesion between the textured liner and the GCL is dictating the results.

Hi All,

Following up on the geomembrane shear testing program schedule.

Have the samples been received at the lab?
If so, do we have an estimated date for the results?

Time is obviously critical here for purchasing of the liner.

Thanks,
Chris

Re: BGC-RFI-020: HLF VALID Liner Testing

BGC requests JDS provide acknowledgment of receipt of the following design specification clarification.

The project specifications call for Leak Location (or approved equal) for post-installation damage utilizing spark testing technology in the HLF in-heap pond. EPCM-RFI-022 approved vacuum (VALID) testing in place of spark testing. VALID testing is not possible once the liner is covered with Overliner Drain Fill (ODF). The current project schedule will not likely allow opportunity to fully place ODF in acceptable conditions (see BGC-RFI-016 regarding cold temperature liner system installation). The risk of leaving the liner exposed over the winter is significant with a high probability of damage due to environmental stress cracking from wind and snow induced loading and movement at temperatures below minus 25 degrees C. BGC made StrataGold aware of these risks and the decision was made to place ODF on the liner as soon as possible after incremental placement of the 2.0 mm LLDPE top liner to protect the liner over winter. VALID testing may be completed on the portion of the liner exposed and not yet covered with ODF once the top liner is completed. The final decision to complete the VALID testing will be made at that time.

LAYFIELD
ENVIRONMENTAL CONTAINMENT

Technical Note: Vacuum Acoustic Leak IDentification (VALID™) Testing

Overview:

The potential for damage to the liner during liner installation is inevitable. At Layfield we recognize that no matter how careful one is during the liner installation, discontinuities in the liner can occur from accidental damages. Over the years we have witnessed damages to the liner caused by poor installation techniques, subgrade imperfections and post installation damages. There are a number of leak location methods available for testing the integrity of geomembranes. These methods can be used immediately after installation as a final check of quality; or, as part of a maintenance program in the future. Electrical leak location is perhaps the most common method for leak testing on geomembrane containment systems.

Our VALID system however is based on acoustic principles wherein discontinuities in the liner can be detected by our acoustic sensors.

There are currently two types of containment systems utilized by the industry: 1.Single lined containment, 2. Double lined containment. Our VALID testing is designed for Double lined containment applications where the liquid contained is generally considered to be harmful and the impact of such leaks can be costly and can cause severe damage to the environment.

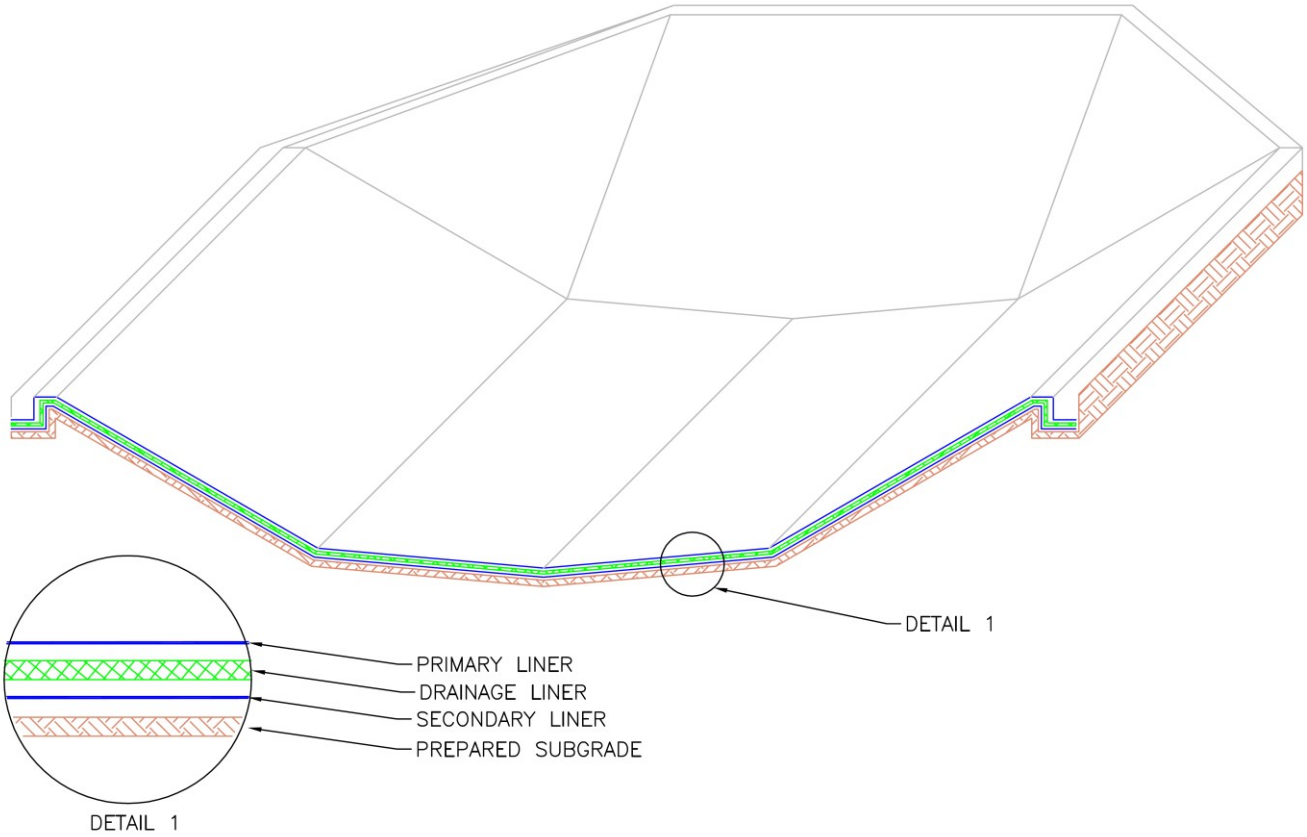

Figure 1. Schematic of a double lined pond

VALID Description

VALID is the only method currently available that can test two layers of a double lined system in a single pass! It is designed to test both the primary and secondary liners in a double lined system simultaneously using a single survey. In the VALID method, the top and bottom geomembranes are joined at the perimeter bywelding or mechanical means. Then a vacuum is applied to the interstitial space between the geomembranes. The top surface of the geomembrane is scanned with ultrasonic microphones that pick up the distinctive sounds of a vacuum leak. Vacuum leaks can be detected in the primary or the secondary liner with this method. The VALID method works best on clean, dry geomembrane and does not require a conductive subgrade. It is also one of the most efficient to find discontinuities in a containment system.

Existing Methods

In other leak test methods the layers in a double lined system have to be independently tested prior to putting the containment system in service. Once the secondary layer has been placed and tested, the installation of drainage layer and primary liner follows. The installation of these two geosynthetic layers above the secondary geomembrane liner can cause accidental damages to the secondary layer.

One of the issues associated with other types of leak survey methods is the testing of the primary (top) liner. To test the primary liner using other methods[1], you will need to create a conductive media in leak detection zone. A conductive media can be created by using:

a. Conductive geotextile
b. Clay layer (composite liner system)
c. Flood the leak zone/interstitial space with water

These come with additional cost of materials and can add substantial costs towards leak testing.

Picture 1. Soil Survey Method

Picture 2. Water Survey Method

VALID testing works on the principle of detecting ultrasonic frequencies as air is pulled through holes in the liner. One of unique aspects of VALID testing is that it can detect leaks in the primary liner layer and the secondary liner layer at the same time with a single scan. Since the detection of leakage is done by sound, the location of the leak can be located in either geomembrane layer by changes in the volume of the signal.

One or more vacuum trucks are used (depending on the size of the containment) to apply vacuum to the interstitial zone through an induction board welded to the top of the primary liner. The surface of the lined area is then systematically scanned for leaks using a calibrated sensor.

1 Arc Testing, Water puddle/water lance, Water survey (need water on top), Soil survey (need soil on top)

In comparison to conventional electrical leak testing methods, VALID testing does not require that water be placed in the pond or in the leak detection zone to be effective, nor does VALID testing require the additional cost of a conductive geomembrane.

Pic 3. A truck pulling vacuum

Pic 4. Fitting to the primary liner

Pic 5. Hole found in the secondary liner

VALID System Requirements

The design of the pond needs to incorporate certain features for a VALID test scan.

- The containment area to be tested should be dry.
- At minimum, the liner system must be a double lined system and the primary and secondary liner layers must be sealed around the perimeter. Typically these are systems with a primary and secondary geomembrane. However a primary geomembrane with a low permeability soil acting as the secondary liner may also be suitable.
- There must be an interstitial space for leak monitoring. This space should incorporate a geonet or geocomposite layer suitable for the leak detection requirements of the pond.
- Induction boards must be installed into the top geomembrane. A layer of the geonet/geocomposite must extend all the way to the location of these induction boards.
- Geomembrane vents (if required) cannot be installed in the primary liner until after the VALID testing is completed. If vents are already in place, they must be sealed prior to beginning VALID testing.

Pic 6. Seaming of the primary and secondary layer, Ultrasonic meter showing strong signal indicating potential leak

Comparison of existing tests methods for a newly constructed dual- lined containment

Re: BGC-RFI-028: PLS Sump and Piping Configuration

BGC requests JDS provide acknowledgment of receipt of the following design clarification. This RFI supersedes BGC-RFI-013.

In discussions between BGC, JDS and Heavy North regarding the construction approach for PLS pipe risers installations, a preferred approach was jointly developed to better match the proposed equipment while protecting the installed pipes and geosynthetic liner system.

The approach will involve conventional equipment (dozer and excavator) traffic within the pipe corridor, as opposed to using a crane or side-boom. This approach requires a modification to the pipe and liner arrangement to ensure protection of the liner system and placed LDRS pipes. Design drawings EGHLF XD-05-01 through 05-04. **Figure 1** presents the revised section through the pipe corridor (looking downstream) on the face of the HLF embankment. This section replaces Detail 28 on Drawing XD-05-03. The PLS pipes will be placed on the embankment face from access points on placed ODF from bottom to top.

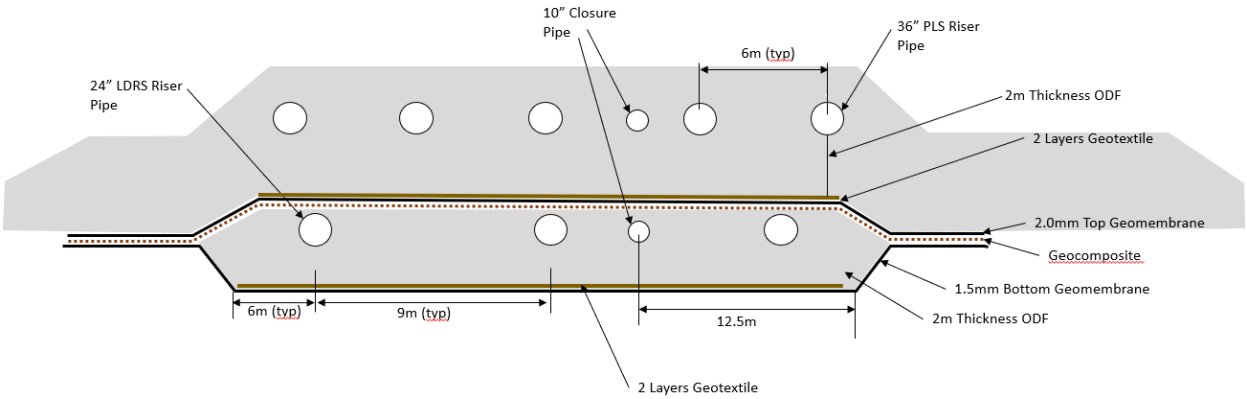

Figure 1: Revised Detail 28, Drawing EGHLF-XD-05-03.

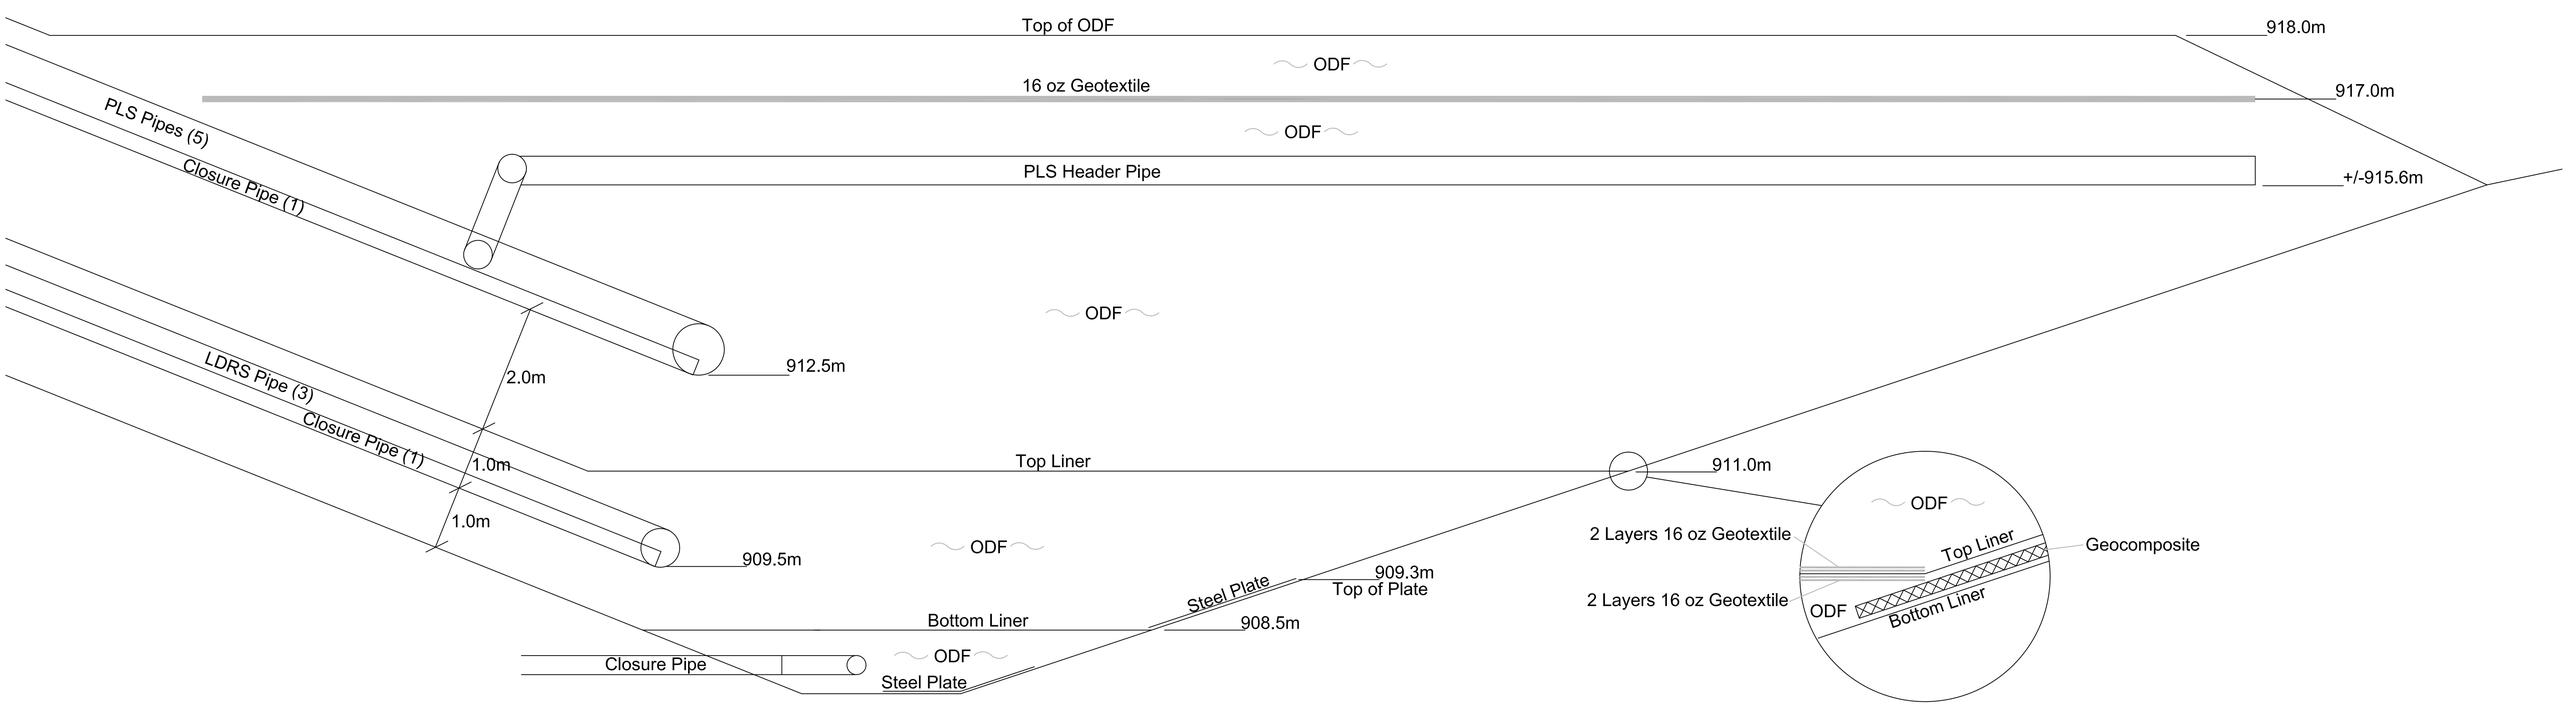

A 2m thick layer of ODF will be placed beneath the riser pipes. The outward shift of the PLS pipes will be accommodated at the bottom by adjusting the dimensions of the PE pipe network in the PLS sump as shown on **Figure 2**. This figure replaces Detail 33 of EGHLF-XD-05-04. A layer of 16 oz. geotextile must be placed at Elevation 917.0m within the ODF over the PLS pipework. This layer is for operational filtering purposes. The top ODF elevation is now 918.0m.

A field test pad has been conducted (BGC Field Memo FM-007) to demonstrate the protection of the liner with ODF thickness from 0.6m to 1.5m and traffic from loaded 40T rock trucks, CAT 3250 trackhoe excavator and D6 dozer. The proposed equipment for pipe placement includes a CAT 349F and Linkbelt 490 excavator (data sheets attached). Based on our estimates of the maximum ground pressure exerted from this equipment with the PLS hammerhead pipes, a minimum of 2m thickness ODF underlain by 2 non-woven geotextile layers to cushion the geomembrane liner will be required. Other equipment must be approved by BGC prior to use. Equipment movement must be slow and turning on the access roads built over the liner will not be allowed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

BGC-RFI-016

To:	**Jean-Francois Maille (JDS)** **Calvin Goldschmidt (JDS)**	**Project:**	**Eagle Gold HLF**
Company:	**JDS**	**Project No.**	**0792021**
From:	**Troy Meyer (BGC)**	**Date:**	**September 27, 2018**
Copied:	**Roy Morlan, Dan Granda (BGC)** **Scott Dimitroff, Kate Rogers (Tetra Tech), Chad Messervey (Layfield)**	**Record:**	**BGC-RFI-016**

Re: BGC-RFI-016: Geomembrane and ODF Placement in Freezing Conditions

BGC requests JDS provide acknowledgment of receipt of the following technical specification clarification.

Section 4.1.7.2 of the project technical specifications addresses placement of liner in cold weather:

> *No seaming shall be conducted if the temperature measured at 15 cm above the geomembrane is lower than 5°C or above 38°C, without written acceptance by the Engineer. When the temperature is below 10°C, the Installer shall preheat the weld zone by a hot air device.*

The following guidance is provided and shall replace the above specification:

Cold weather installations should follow guidelines as outlined in GRI GM9: *Standard Practice for Cold Weather Seaming of Geomembranes.* No geomembrane material shall be seamed when liner (sheet) temperatures are less than 0 degrees C (32 degrees F) unless the following conditions are complied with:

1. Seaming of the geomembrane at material temperatures below 0 degrees C (32 degrees F) is allowed if the Geomembrane Installer (Layfield) can demonstrate to the Owner's Representatives (Tetra Tech and BGC), using pre-qualification test seams, that field seams comply with the project specifications, the safety of the crew is ensured, and geomembrane material can be fabricated (i.e. pipeboots, penetrations, repairs, etc.) at sub-freezing temperatures.
2. The Geomembrane Installer shall submit to the Owner's Representative for approval, detailed procedures for seaming at low temperatures, including the following:
    a. Preheating of the geomembrane, if necessary.
    b. The provision of a tent or other device if necessary to prevent heat losses during seaming and rapid heat losses subsequent to seaming.

c. Number of test welds to determine appropriate seaming parameters

Trial welds shall always be done in the environment (temperature) and geometry in which production welding is to be done.

Freezing temperatures can cause geomembrane sheets to crack when unrolled, folded, impacted or loaded. Geomembranes when unrolled or folded in cold weather should not crack, craze, or distort in texture. A sheet temperature of minus 10 degrees C (14 degrees F) is the lower limit that a geomembrane shall be unrolled unless it is shown otherwise to the satisfaction of the Owner's Representative.

Section 3.8.1.2 of the project technical specifications addresses placement of Overliner Drain Fill (ODF) on the installed liner. A sheet temperature of minus 10 degrees C (14 degrees F) is the lower limit that ODF shall be placed on the geomembrane unless it is shown otherwise to the satisfaction of the Owner's Representative.

Subject: RE: BGC-RFI-016 - Geomembrane and ODF Placement in Freezing Conditions

Hello Troy,

I will submit our cold weather installation procedure too you shortly for review.

We are confident that we are able to weld in temperatures below 0 degrees by adjusting our temperatures and speeds accordingly. Please note that preheating the geomembrane or using tents does not work but we will have no issue showing tetra tech and BGC on site with trial welds and seam testing that installation is still possible in cold temperatures

Below is just a quick chart for you information on handling different types materials in relation to the Cold weather deployment

Table1. Cold Temperature Handling Guide

Material	Tested Value (ASTM Method)	Practical Low Temp. Handling Limit
Regular PVC 20 mil	-26°C, -15°F (D1790)	-5°C, +23°F

Regular PVC 30 mil and up	-30°C, -22°F (D1790)	-5°C, +23°F
HAZGARD 100 30mil (U)	-30°C, -22°F (D1790)	-5°C, +23°F
HAZGARD 250 38mil (S)	-40°C, -40°F (D2136)	-15°C, +5°F
HAZGARD 1000 (S)	-40°C, -40°F (D2136)	-20°C, -4°F
HAZGARD 5000 HT (S)	-30°C, -22°F (D2136))	-10°C, +14°F
HDPE 60mil	-70°C, -94°F (D746)	-25°C, -13°F (Welding Limited)
EPDM 45mil	-45°C, -49°F (D746)	+5°C, +41°F (Issues with sealant tape)

This ... national standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.

Designation: D2136 – 02 (Reapproved 2012)

Standard Test Method for Coated Fabrics—Low-Temperature Bend Test[1]

This standard is issued under the fixed designation D2136; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the U.S. Department of Defense.

1. Scope

1.1 Fabrics coated with rubber or rubber-like materials display increased stiffening when exposed to decreasing ambient temperatures. This test method describes a simple pass/fail procedure whereby material flexibility at a specified low temperature can be determined. Failure is indicative of unacceptability of the coated fabric for use at that temperature.

1.2 The values stated in SI units are to be regarded as standard. The values given in parentheses are for information only.

1.3 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.* For specific precautionary statement see 8.1.

2. Referenced Documents

2.1 *ASTM Standards:*[2]

D751 Test Methods for Coated Fabrics

2.2 *ASTM Adjuncts:*

Bending Fixture Drawings[3]

3. Summary of Test Method

3.1 Specimens cut from the coated fabric are conditioned at a selected low temperature for a specified duration. While remaining exposed at that temperature, they are then individually placed in a bending apparatus and bent through a specified angle. Failure of the coated fabric is indicated by fracture of the specimen or the appearance of surface cracks in the coating.

4. Significance and Use

4.1 This test method evaluates the ability of coated fabrics to withstand a prescribed bend at an established low temperature. Fabrics coated with polymeric materials are used in many applications requiring low temperature flexing. Data obtained using this test method may be used to predict in-use behavior only in applications in which the conditions of deformation are similar to those specified in this test method. This test method has been found useful for specification purposes but does not necessarily indicate the lowest temperature at which the material may be used.

5. Apparatus

5.1 *Low-Temperature Chamber*—The chamber in which the test specimens are exposed to low temperature shall be sufficient in size to contain the bending fixture used for testing the specimens and to permit the operation of the fixture to bend the specimens without removal from the chamber. The chamber shall also have sufficient work space to permit the conditioning of test specimens in accordance with Section 8 of this test method. It shall be capable of maintaining a uniform atmosphere of cold dry air or any suitable gas at specified temperatures within a tolerance of ±1°C (±1.8°F).

5.2 *Bending Fixture*[3]—The basic requirements for the device used for bending the test specimens are shown in Fig. 1 and Fig. 2. Dimensions and mass shall conform to Fig. 2.

5.3 *Glass Plates*—A sufficient number of glass plates approximately 125 by 175 mm (5 by 7 in.) shall be used when conditioning all test specimens. All test specimens shall be placed between glass plates during the exposure period to eliminate any curling or bending. The thickness of the glass plates shall be of such size as to permit ease of handling.

5.4 *Gloves*—A pair of gloves shall be required for handling test specimens within the low-temperature chamber.

5.5 *Lubrication*—A suitable low-temperature grease, if needed, should be applied to the trigger release and hinge pin of the bending apparatus to prevent stiffening during the conditioning period.

---

[1] This test method is under the jurisdiction of ASTM Committee D11 on Rubber and is the direct responsibility of Subcommittee D11.37 on Coated Fabrics, Rubber Threads and Seals.

Current edition approved Dec. 1, 2012. Published February 2013. Originally approved in 1962. Last previous edition approved in 2007 as D2136 – 02 (2007). DOI: 10.1520/D2136-02R12.

RAPID, RELIABLE TEST RESULTS

The specialists at SAGEOS understand deadlines and work with clients to provide accurate results in the time required. Their services meet the highest standards of quality. SAGEOS has been awarded several certifications including: the ISO 9001:2000, the ISO17025 (SCC) for over 600 tests and GAI-LAP for more than 120 tests.

COMMITTED TO THEIR CLIENTS

The specialists at SAGEOS are driven by values of integrity, excellence, and customer service. They not only respond rapidly and accurately to lab testing requests and data interpretation but also offer clients complete support throughout the entire testing or development process, providing solutions along the way. SAGEOS understands how sensitive information can be and guarantees strict confidentiality in treating every file, every sample and every test result.

From analytical equipment to prototyping machinery and fire resistance laboratories, SAGEOS boasts the most advanced technology in geosynthetics testing, analysis and R&D.

GroupeCTTGroup

SAGEOS is a division of the CTT Group; a not-for-profit technology transfer center specialized in technical textiles, geosynthetics and flexible advanced materials.

The CTT Group employs 65 professionals:

- Ph.D. and M.Sc.A. scientists and researchers specializing in Chemistry, Civil Engineering/Geotechnical, Materials/Physics, Mechanical/Composites, Plastics/Polymers and Textiles;
- Engineers with backgrounds in Textiles, Mechanical, Electrical, Civil, Geotechnical, Electronic, Polymers, and Microbiology;
- Technicians holding technical degrees in Civil, Textile, Polymer, Pharmaceutical and other related fields.

SERVICES

CHARACTERIZATION AND PERFORMANCE

- Physical: Mechanical, abrasion and bending
- Chemistry: Fibre analysis, finishing products
- Optical and electronic microscopy
- Creep, long term properties
- Durability resistance to accelerated aging
- Testing in controlled thermal environment (-70°C to +250°C)
- Volatile organic compounds (VOCs)
- Toxicity

CERTIFICATION, CONFORMANCE AND THIRD PARTY EVALUATIONS

- Standards & specifications compliance assessment
- Analysis of the causes of failure / forensic investigations
- Testing for ICC or CCMC evaluations
- CE Marking

RESEARCH & DEVELOPMENT

- Eligible for federal and provincial programs in R&D funding (Canada)
- Assistance in finding R&D funding (Canada)

EQUIPMENT & RESOURCES

STATE-OF-THE-ART EQUIPMENT

- Tensile and compression testing machines: long spans, 0.5kN to 300kN capacity, Demgen clamps, Instron and Zwick
- Tensile testing machines with high resolution contact extensometers, Zwick, video extensometers, Instron and Zwick
- Environmental chambers for testing at high / low temperature (-70°C to +250°C)
- Accelerated creep testing chambers (TTS / SIM)
- Multiaxial elongation and Hydrostatic Pressure, up to 5000kPa
- Several Impact Resistance Tests (Izod, Gardner, Dart...)
- Shear box / friction tester
- Porometer and several Opening size Measurement techniques (dry, wet, hydrodynamic sieving)
- Transmissivity, standard and radial
- Gradient Ratio cell
- Vapor Permeability
- Gas transmission rate
- GCL Permeability, with harsh and chemically corrosive liquids
- UV exposure: Xenon arc (4 units), Fluorescent (4 units), Carbon arc
- Stress-cracking / SP-NCTL (100+ specimens)
- Chemical compatibility tanks, testing per EPA 9090
- Microscopic Analysis (Electronic, Optic)
- OIT and HP-OIT
- Comprehensive polymer science laboratory (FTIR-ATR, DSC, with Cooling Unit [-70°C], TGA, DSC, HPLC-MS, GC-MS, Ionic Chromatography, ICP)
- Dynamic Mechanical Analyser, DMA
- Volatile Organic Compounds sampling chambers
- Spectrophotometer UV – Near Infrared
- Thermal Conductivity Analyser
- Thermal Imaging Camera

PROTOTYPING AND SMALL SCALE PRODUCTION UNITS

- Non-Woven (Needle-Punched) with several finishing options
- Woven textiles
- 3D Weaving, 3D textiles / Dry 3D preforms
- Plasma Treatment
- Narrow Weaving Machine equipped with Jacquard Head
- Flat Knitting Machine
- E-embroidery Machine
- Warp Knitting Machine
- Smart textiles Design
- Surface treatment / Polymers (dyeing and finishing)
- Coating and lamination

FIRE RESISTANCE LABORATORY

- Fire Resistance Evaluations: Accredited by ISO 17025 Transport Canada
- Radiant Panel (ASTM E162)
- Vertical Flame Test (Federal Aviation Regulation)
- Smoke Density (ASTM E662)
- Flooring Radiant Panel Test (ASTM E648)

Cold Weather Seaming Protocols

Welding can be completed in colder temperatures provided some additional procedures are followed and the trial welds (prequalification welds) are performed in the same environment as the main production seams. The trial welds are very important, as they will verify that the welding equipment has been properly set to meet the site and ambient temperature conditions. Below are some of additional guidelines to follow for the various temperature ranges. The onsite superintendent shall also have the experience to determine whether satisfactory seams can be achieved given the weather and site conditions.

Temperatures between 0˚C and -10˚C: The welding procedure on this temperature range is the same as warm weather welding procedures; however you may require slight adjustments to the welding units' temperature and/or speed settings. When the weather is clear and sunny and the wind is minimal, only very slight adjustments may be required, but when it is overcast, windy and cooler considerable adjustments may be required.

Temperatures between -10˚C and -20˚C+: Additional care must be taken to ensure that the welding units are operating properly in the cold and that the welding temperatures and speeds are adjusted to accommodate the colder temperatures. During the seaming operation, the technician will monitor the welding unit to ensure that the set welding speeds and temperatures are maintained throughout the length of the seam. No welding can take place when it is raining, sleeting, snowing and the moisture caused from these conditions cannot be removed to ensure that the seam areas are 100% dry during the seaming procedure. Extra care must be taken when working when wet, snowy or icy conditions prevail as the liner becomes very slippery under these conditions and is a safety concern. Removal of snow and ice can be completed using various types of low impact snow blowers, brushes, or plastic shovels that will have minimal impact on liner itself

Preparation of the Geomembrane Surfaces to be Seamed

• Extra precautions must be made if it is snowing, sleeting or hailing on the geomembrane in the area to be seamed.

• In the area to be seamed, all frost must be removed from the opposing surfaces of the geomembrane sheets in the regions where the actual seaming is to be performed. The residual moisture left after removing frost must be wiped dry. This can prove more difficult to on textured geomembranes where the texturing extends to the roll edges or roll ends.

• The application of heat to remove moisture using a hand held hot air device may be used; however care must be exercised to prevent excessive heat being applied to the liner. It is recommended an assessment is made by performing a trial seam using the same equipment in the exact site and temperature conditions.

• The specific area to be seamed must be free of soil particles and other foreign matter.

• Take measures for thermal fusion welding that the underside of the lower sheet should also be free of frost and moisture so that the lower drive wheels of the device can move freely and do not slip. It may be necessary to use a rub sheet beneath the area being seamed to separate the geomembrane from frozen soil subgrade. Various materials have been used for rub sheets including smooth membranes, smooth films and even certain types of geotextiles.

• For fillet extrusion welding the thermal tacking of the sheets together should proceed as with similar welding at temperatures above freezing.

Thermal Fusion Seaming (e.g., using a hot wedge welding device)

• In general, the rate of seaming, i.e., the speed of the hot wedge device, is usually slower than when seaming at temperatures above 0°C (32°F). Furthermore, the rate should decrease with decreasing sheet temperature.

• Additional trial seams may be required in colder temperatures. These will be performed at the discretion of the supervisor on site.

• Cold temperature seaming may also require more destructive tests on production seams than when welding above freezing. For example, in addition to the CQA plan written around above freezing temperatures, additional destructive seam samples may be taken at the end(s) of each continuous production seams. *Note 3: The actual schedule for destructive test samples is at the discretion of the CQA Engineer.*

Extrusion Fillet Seaming

• The necessary grinding of the geomembrane surfaces in preparation of placing extradite should be no further ahead of the extrusion gun than 20 minutes.

• In general, the rate of seaming, i.e., the speed of travel, is slower than when seaming at temperatures above 0° (32°F). Furthermore, the rate should decrease with decreasing sheet temperatures.

• Additional trial seams may be required in colder temperatures. These will be performed at the discretion of the supervisor on site.

• Cold temperature seaming may also require more destructive tests on production seams than when welding above freezing. For example, in addition to the CQA plan written around above freezing temperatures, additional destructive seam samples may be taken at the end(s) of each continuous production seam. *Note 4: The actual schedule for destructive test samples is at the discretion of the CQA Engineer.*

Seam Testing

• In general, destructive testing of seams (both shear and peel) made in cold temperatures should follow the same protocol and test methods as for temperatures above freezing.

• Seam tests from trial seams should be taken to a field trailer or other heated enclosure to allow the seam to acclimatize to the designated test temperature (20 degrees Celsius) and tested accordingly. However, seam tests from trial seams which are tested with a tensiometer on-site at temperatures less than freezing is sometimes unavoidable. Weather conditions can change often throughout the day, the supervisor and on site engineer can decide to increase trial seems and destructs as deemed necessary.

Subject: RE: BGC-RFI-016 - Geomembrane and ODF Placement in Freezing Conditions

Hey Troy,

Its hard to say what is riskier. I have asked solmax if they have any recommendations as it is Solmax liner on site. But as far as doing backfill we don't like to see it at any temperature past -20. The biggest risk for leaving this exposed in the Yukon, in my opinion, is depending on how cold it gets and the wind creating some uplift you can get environmental stress cracking which would be a big mess.

I am not in the office right now so Ill see if we have anything for recommendations I can send you in the morning

Regards,

Jason

Subject: RE: BGC-RFI-016 - Geomembrane and ODF Placement in Freezing Conditions

Jason:
Thanks. Any thoughts on low temperature limit for placement of the overliner gravel? Is the risk higher if we try to cover in low temps or leave it exposed over winter.?

Subject: RE: BGC-RFI-016 - Geomembrane and ODF Placement in Freezing Conditions

Hello Troy,

I will submit our cold weather installation procedure too you shortly for review.

We are confident that we are able to weld in temperatures below 0 degrees by adjusting our temperatures and speeds accordingly. Please note that preheating the geomembrane or using tents does not work but we will have no issue showing tetra tech and BGC on site with trial welds and seam testing that installation is still possible in cold temperatures

Below is just a quick chart for you information on handling different types materials in relation to the Cold weather deployment

Table1. Cold Temperature Handling Guide

Material	Tested Value (ASTM Method)	Practical Low Temp. Handling Limit
Regular PVC 20 mil	-26°C, -15°F (D1790)	-5°C, +23°F
Regular PVC 30 mil and up	-30°C, -22°F (D1790)	-5°C, +23°F
HAZGARD 100 30mil (U)	-30°C, -22°F (D1790)	-5°C, +23°F
HAZGARD 250 38mil (S)	-40°C, -40°F (D2136)	-15°C, +5°F
HAZGARD 1000 (S)	-40°C, -40°F (D2136)	-20°C, -4°F
HAZGARD 5000 HT (S)	-30°C, -22°F (D2136))	-10°C, +14°F
HDPE 60mil	-70°C, -94°F (D746)	-25°C, -13°F (Welding Limited)

EPDM 45mil	-45°C, -49°F (D746)	+5°C, +41°F (Issues with sealant tape)

Title: Cold Temp Handling Guide

Summary: **Although it is preferable to avoid installing lining materials in cold temperatures, occasionally it can not be avoided. Cold weather usually requires a modification of installation techniques, or may involve substitution of materials to ones which have superior cold weather handling capabilities.**

Details:

Plastic lining materials are designed for installation in moderate temperatures. Most lining materials become rigid and brittle in the cold climates and seaming, handling, and testing require additional care. In most cases it is better to wait for a break in the weather rather than to attempt an installation in cold/poor weather. If site conditions or construction schedules require installation in cold temperatures please take into account the information in this Tech Note, and call Layfield prior to proceeding.

There are a number of complications that may result from installing geomembrane in cold weather. First of all, most lining materials become progressively stiffer and become much more difficult to handle. It becomes more difficult to place the liners over complex subgrades and attaching stiff liners to pipes and appurtenances can be very difficult if not impossible.

Lining materials that are designed to be backfilled often have low temperature handling restrictions. A regular flexible PVC lining material may crack if folded and impacted at less than -10°C (0°F). This PVC lining material was designed to be backfilled, and relies on the backfill to prevent movement at very low temperatures. Once backfilled, the lining is prevented from flexing and much lower temperatures can be handled. HDPE is a very difficult to handle in cold weather and normally has a has a practical welding restriction of -25°C (-13°F). Other materials with a low temperature handling restriction are Polyurethane (ester based types) and the unsupported grade of Arctic Liner (U). A practical guide to the handling of lining materials is contained in Table 1.

Table1. Cold Temperature Handling Guide

Material	Tested Value (ASTM Method)	Practical Low Temp. Handling Limit
Regular PVC 20 mil	-26°C, -15°F (D1790)	-5°C, +23°F

Regular PVC 30 mil and up	-30°C, -22°F (D1790)	-5°C, +23°F
HAZGARD 100 30mil (U)	-30°C, -22°F (D1790)	-5°C, +23°F
HAZGARD 250 38mil (S)	-40°C, -40°F (D2136)	-15°C, +5°F
HAZGARD 1000 (S)	-40°C, -40°F (D2136)	-20°C, -4°F
HAZGARD 5000 HT (S)	-30°C, -22°F (D2136))	-10°C, +14°F
HDPE 60mil	-70°C, -94°F (D746)	-25°C, -13°F (Welding Limited)
EPDM 45mil	-45°C, -49°F (D746)	+5°C, +41°F (Issues with sealant tape)

Some lining materials may have been designed to be left exposed but may not be appropriate to your location. Exposed linings employing some materials may not be practical in northern Canada, Alaska, the Prairies, the Canadian Shield, and many parts of the northern Midwest States. **As a general rule of thumb, a liner should not be left exposed where the temperature can be expected to go below its practical handling temperature.**

All lining materials are tested for cold temperature performance. The tests used vary by material, each type of material may have a different test. Only when we gain experience by handling lining materials in the field can we gauge how the test values relate to field results. There are many problems associated with field installations that will affect the comparison between the tested value and field performance. One of the most dramatic changes is caused by solar heating. Even on a -30°C (-20°F) day dark lining materials can reach a surface temperature of over +30°C (+80°F) through solar heating. By waiting until later in the day, a liner can often be placed in otherwise prohibitive temperatures. Cloud cover, wind, snow, and ice can all reduce the ability to handle the liner in cold temperatures.

Seaming of lining materials in adverse weather conditions can be a real challenge. Solvent bonding techniques used for PVC and Arctic Liner welding cease to work at temperatures below +10°C (+45°F). At temperatures below this the solvent does not evaporate fast enough to create a good bond. Application of heat to a solvent bonded seam until the liner is warm to the touch will normally create a good seam (Caution; Solvents are inflammable and extreme care should be taken whenever heat is applied in the vicinity of solvents). Glues and tapes used for repairs are also subject to cold temperature limitations and may not work at less than +10°C (45°F).

Heat welded seaming of lining materials can take place at much lower temperatures. In cold weather installations the presence of moisture in the form of snow, frost, or ice is a bigger problem than actual ambient temperature. Most heat welding techniques do not make good welds when moisture in present. The material most sensitive to this is HDPE which must be completely dry before welding begins. In practical application this usually means waiting until the sun has driven the frost off the liner later in the day before welding. Extreme cold weather can also lead to problems with HDPE in that the seams can be cooled too quickly which can lead to internal stresses in the seams. HDPE installations are typically limited to temperatures above -25°C (-13°F) and can usually only proceed on sunny days at these temperatures.

Heat welding of Polyurethane, Arctic Liner (U) and (S), XR-5, Hypalon, and and Polypropylenes can take place at lower temperatures than gluing or solvent bonding. Usually a hand-held hot air welder is used, and frost and moisture are driven off with the hot air as the weld is made. Cold temperature welding is normally limited to repairs and short joints because it is a slow and labor intensive process.

Probably the most important practical limit to cold temperature installations is the requirement that backfill be finely divided and free flowing. Use of backfill that is frozen, or that contains lumps of frozen fill or ice is not recommended as it can cause damage to the liner. Often it is the freezing of the backfill which brings the winter lining project to a halt. The use of tarpaulins and heaters to keep backfill dry and unfrozen may help extend the temperature range of the project.

In placing backfill it is important to remember that the lining material becomes more sensitive as the temperature drops. Extreme care needs to be taken in placing backfill at low temperatures so that the fill is not dropped, or otherwise permitted to “shock” the liner. Dumping the backfill on an area off the liner and then rolling into place is the preferred method. Please see the Layfield's Tech Note on Backfill for further details.

If installation must go ahead in extreme cold then there are a number of techniques that may help. First of all, keep the liner panel warm until the moment before installation. Keep the panel in a heated building or under a tarpaulin with a heater. Use a heater directed at the panel to keep the liner material a few degrees above the air temp. Do not attempt to place the liner on an overcast day or on a day with extremely high wind chills. Heat your backfill so that it is warm and free flowing. The final technique to install liners in extreme cold weather is to use a low temp material. Table 2 contains a list of materials that are suitable for extended cold temp installation.

Table 2. Low Temperature Materials

Material	Tested Value (ASTM Method)	Practical Low Temp. Handling Limit
Arctic Liner**NT**® 30mil (U)	-50°C, -58°F (D1790)	-30°C, -22°F

Reinforced Polyethylene (RPE)	-55°C, -67°F (D2136)	-40°C, -40°F
Enviro Liner 20, 30mil (U)	-40°C, -40°F (D746)	-30°C, -20°F
GeoFlex (U)	-40°C, -40°F (D1790)	-30°C, -22°F
HAZGARD 535	-40°C, -40°F (D746)	-30°C, -22°F

Subject: Guidance for cold weather liner covering
Attachments: 2mm LLDPE DST (RT) Solmax data sheet.pdf; Cold Temp Handling Guide - Layfield.pdf

Chris:
Further to our discussion this morning.
The literature says that LLDPE geomembrane remains flexible (retains full ductility) at temperatures well below freezing to about -25°C with a low temperature brittleness of -70°C according to ASTM D-746. This is consistent with Layfield's cold temp handling guide (attached) sets the handling limit for HDPE at -25°C, which also states "*As a general rule of thumb, a liner should not be left exposed where the temperature can be expected to go below its practical handling temperature*." I would like to hear Layfield's opinion on the risks of leaving the LLDPE liner exposed and the testing recommended to "re-approve" the liner next year if we leave it exposed.

Our current guidance in RFI016: *A sheet temperature of minus 10 degrees C (14 degrees F) is the lower limit that ODF shall be placed on the geomembrane unless it is shown otherwise to the satisfaction of the Owner's Representative.* I suggest that we develop a field method for evaluating the lower temp limit to place ODF without damage to the liner. I believe that the movement of liner wrinkles ahead of the ODF placement will be the main concern. Perhaps we can use a simple test of bending a scrap piece of liner that has the same sheet temp as the liner in the ODF placement area? I'm open to suggestions.

Revision 6: Oct. 3, 2011
Revision schedule is on pg. 12

GRI Test Method GM19*

Standard Specification for

Seam Strength and Related Properties of Thermally Bonded Polyolefin Geomembranes

This specification was developed by the Geosynthetic Research Institute (GRI), with the cooperation of the member organizations for general use by the public. It is completely optional in this regard and can be superseded by other existing or new specifications on the subject matter in whole or in part. Neither GRI, the Geosynthetic Institute, nor any of its related institutes, warrant or indemnifies any materials produced according to this specification either at this time or in the future.

1. Scope

1.1 This specification addresses the required seam strength and related properties of thermally bonded polyolefin geomembranes; in particular, high density polyethylene (HDPE), linear low density polyethylene both nonreinforced (LLDPE) and scrim reinforced (LLDPE-R) and flexible polypropylene both nonreinforced (fPP) and scrim reinforced (fPP-R).

1.2 Numeric values of seam strength and related properties are specified in both shear and peel modes.

Note 1: This specification does not address the test method details or specific testing procedures. It refers to the relevant ASTM test methods where applicable.

1.3 The thermal bonding methods focused upon are hot wedge (single and dual track) and extrusion fillet.

*This GRI standard is developed by the Geosynthetic Research Institute through consultation and review by the member organizations. This specification will be reviewed at least every 2-years, or on an as-required basis. In this regard it is subject to change at any time. The most recent revision date is the effective version.

Copyright © 2002, 2003, 2005 Geosynthetic Institute
All rights reserved

Note 2: Other acceptable, but less frequently used, methods of seaming are hot air and ultrasonic methods. They are inferred as being a subcategory of hot wedge seaming.

1.4 This specification also suggests the distance between destructive seam samples to be taken in the field, i.e., the sampling interval. However, project-specific conditions will always prevail in this regard.

1.5 This specification is only applicable to laboratory testing.

1.6 This specification does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

GM20 Selecting Variable Intervals for Taking Geomembrane Destructive Seam Samples Using Control Charts
GM25 Test Property and Testing Frequency for Scrim Reinforced Linear Low Density Polyethylene Geomembranes

3. Definition

3.1 Geomembrane, n – An essentially impermeable geosynthetic composed of one or more synthetic sheets used for the purpose of liquid, gas or solid containment.

3.2 Hot Wedge Seaming – A thermal technique which melts the two opposing geomembrane surfaces to be seamed by running a hot metal wedge or knife between them. Pressure is applied to the top or bottom geomembrane, or both, to form a continuous bond. Seams of this type can be made with dual bond tracks separated by a nonbonded gap. These seams are referred to as dual hot wedge seams or double-track seams.

3.3 Hot Air Seaming – This seaming technique introduces high-temperature air or gas between two geomembrane surfaces to facilitate localized surface melting. Pressure is applied to the top or bottom geomembrane, forcing together the two surfaces to form a continuous bond.

3.4 Ultrasonic Seaming - A thermal technique which melts the two opposing geomembrane surfaces to be seamed by running a ultrasonically vibrated metal wedge or knife between them. Pressure is applied to the top or bottom geomembrane, or both, to form a continuous bond. Some seams of this type are made with dual bond tracks separated by a nonbonded gap. These seams are referred to as dual-track seams or double-track seams.

3.5 Extrusion Fillet Seaming – This seaming technique involves extruding molten resin at the edge of an overlapped geomembrane on another to form a continuous bond. A depreciated method called "extrusion flat" seaming extrudes the molten resin between the two overlapped sheets. In all types of extrusion seaming the surfaces upon which the molten resin is applied must be suitably prepared, usually by a slight grinding or buffing.

4. Significance and Use

4.1 The various methods of field fabrication of seams in polyolefin geomembranes are covered in existing ASTM standards mentioned in the referenced document section. What is not covered in those documents is the numeric values of strength and related properties that the completed seam must meet, or exceed. This specification provides this information insofar as minimum, or maximum, property values are concerned when the field fabricated seams are sampled and laboratory tested in shear and peel. The specification also provides guidance as to what spacing intervals the samples should be taken at typical field installation projects.

5. Sample and Specimen Preparation

5.1 The spacing for taking field seam samples for destructive testing is to be 1 per 500 feet (1 per 150 m) of seam length, or as by directed by the construction quality

assurance inspector. As the project continues and data is accumulated, however, this sampling interval should be varied according to the procedures set forth in either GRI-GM14 or GRI-GM20. Following this procedure three different situations can result.

5.1.1 Good seaming with fewer rejected test results than the preset historic average can result in a sequential increase in the spacing interval, i.e., one per greater than 500 ft. (one per greater than 150 m).

5.1.2 Poor seaming with more rejected test results than the preset historic average can result in a sequential decrease in the spacing interval, i.e., one per less than 500 ft. (one per less than 150 m).

5.1.3 Average seaming with approximately the same test results as the preset historic average will result in the spacing interval remaining the same, i.e., one per 500 ft. (one per 150 m).

Note 3: The method of attributes in GRI-GM14 or the method of control charts in GRI-GM20 are two of various statistical strategies that might be used to vary sampling frequency.

5.2 The size of field seam samples is to be according to the referenced test method, e.g., ASTM D6392 or site-specific CQA plan.

5.3 The individual test specimens taken from the field seam samples are to be tested according to the referenced test method, i.e., ASTM D6392 for HDPE, LLDPE and fPP, and ASTM D751 (modified to a 150 mm + seam width gage length) for fPP-R. The specimens are to be conditioned prior to testing according to these same test methods and evaluated accordingly.

6. Assessment of Seam Test Results

6.1 HDPE seams – For HDPE seams (both smooth and textured), the strength of four out of five 1.0 inch (25 mm) wide strip specimens in shear should meet or exceed the values given in Tables 1(a) and 1(b). The fifth must meet or exceed 80% of the given values. In addition, the shear percent elongation, calculated as follows, should exceed the values given in Tables 1(a) and 1(b):

$$E = \frac{L}{L_o}(100) \qquad (1)$$

where

E = elongation (%)
L = extension at end of test (in. or mm)
L_o = original average length (usually 1.0 in. or 25 mm)

Note 4: The assumed gage length is considered to be the unseamed sheet material on either side of the welded area. It generally

will be 1.0 in. (25 mm) from the edge of the seam to the grip face.

For HDPE seams (both smooth and textured), the strength of four out of five 1.0 in. (25 mm) wide strip specimens tested in peel should meet or exceed the values given in Tables 1(a) and 1(b). The fifth must meet or exceed 80% of the given values.

In addition, the peel separation (or incursion) should not exceed the values given in Tables 1(a) and 1(b). The value shall be based on the proportion of area of separated bond to the area of the original bonding as follows:

$$S = \frac{A}{A_o}(100) \qquad (2)$$

where

S = separation (%)
A = average area of separation, or incursion (in^2 or mm^2)
A_0 = original bonding area (in^2 or mm^2)

Note 5: The area of peel separation can occur in a number of nonuniform patterns across the seam width. The estimated dimensions of this separated area is visual and must be done with care and concern. The area must not include squeeze-out which is part of the welding process.

Regarding the locus-of-break patterns of the different seaming methods in shear and peel, the following are unacceptable break codes per their description in ASTM D6392 (in this regard, SIP is an acceptable break code);

Hot Wedge: AD and AD-Brk > 25%
Extrusion Fillet: AD1, AD2
Exception: AD-WLD (unless strength is achieved)

Note 6: Separation-in-plane (SIP) is a locus-of-break where the failure surface propagates within one of the seamed sheets during destructive testing (usually in the peel mode). It is not merely a surface skin effect producing a few ductile fibrils (sometimes called ductile drawdown). SIP is acceptable if the required strength, shear elongation and peel separation criteria are met.

6.2 LLDPE seams – For LLDPE seams (smooth, textured and scrim reinforced), the strength of four out of five 1.0 in. (25 mm) wide strip specimens in shear should meet or exceed the values given in Tables 2(a) through 2(d). The fifth must meet or exceed 80% of the given values. Note that the unreinforced specimens are 1.0 in. (25 mm) wide strips and the scrim reinforced specimens are 4.0 in. (100 mm) wide

grab tests. In addition, the shear percent elongation, calculated as follows, should exceed the values given in Tables 2(a) through 2(d).

$$E = \frac{L}{L_o}(100) \qquad (1)$$

where
E = elongation (%)
L = extension at end of test (in. or mm)
L_o = original average length (usually 1.0 in. or 25 mm)

Note 4: The assumed gage length is considered to be the unseamed sheet material on either side of the welded area. It generally will be 1.0 in. (25 mm) from the edge of the seam to the grip face.

Shear elongation is not relevant to scrim reinforced geomembranes and as such is listed as "not applicable" in Tables 2 (c) and (d).

For LLDPE seams (smooth, textured and scrim reinforced), the strength of four out of five 1.0 in. (25 mm) wide strip specimens tested in peel should meet or exceed the values given in Tables 2(a) through 2(d). The fifth must meet or exceed 80% of the given values.

In addition, the peel separation (or incursion) should not exceed the values given in Tables 2(a) through 2(d). The value shall be based on the proportion of area of separated bond to the area of the original bonding as follows:

$$S = \frac{A}{A_o}(100) \qquad (2)$$

where

S = separation (%)
A = average depth of separation, or incursion ($in.^2$ or mm^2)
A_0 = original bonding distance ($in.^2$ or mm^2)

Note 5: The area of peel separation can occur in a number of nonuniform patterns across the seam width. The estimated dimensions of this separated area is visual and must be done with care and concern. The area must not include squeeze-out which is part of the welding process.

Regarding the locus-of-break patterns of the different seaming methods in shear and peel, the following are unacceptable break codes per their description in ASTM D6392 (in this regard, SIP is an acceptable break code);

Hot Wedge: AD and AD-Brk > 25%
Extrusion Fillet: AD1, AD2
Exception: AD-WLD (unless strength is achieved)

Note 6: Separation-in-plane (SIP) is a locus-of-break where the failure surface propagates within one of the seamed sheets during destructive testing (usually in the peel mode). It is not merely a surface skin effect producing a few ductile fibrils (sometimes called ductile drawdown). SIP is acceptable if the required strength, shear elongation and peel separation criteria are met.

6.3 fPP Seams – For fPP seams (both nonreinforced and scrim reinforced), the strength of four out of five specimens in shear should meet or exceed the values given in Tables 3(a) and 3(b). The fifth must meet or exceed 80% of the given values. Note that the unreinforced specimens are 1.0 in. (25 mm) wide strips and the scrim reinforced specimens are 4.0 in. (100 mm) wide grab tests. In addition, the shear percent elongation on the unreinforced specimens, calculated as follows, should exceed the values given in Tables 3(a) and 3(b).

$$E = \frac{L}{L_o}(100) \qquad (1)$$

where
E = elongation (%)
L = extension at end of test (in. or mm)
L_o = original gauge length (usually 1.0 in. or 25 mm)

Note 4: The assumed gage length is considered to be the unseamed sheet material on either side of the welded area. It generally will be 1.0 in. (25 mm) from the edge of the seam to the grip face.

Shear elongation is not relevant to scrim reinforced geomembranes and as such is listed as "not applicable" in Tables 3(a) and 3(b).

For fPP seams (both nonreinforced and scrim reinforced), the strength of four out of five specimens in peel should meet or exceed the values given in Tables 3(a) and 3(b). The fifth must meet or exceed 80% of the given values. Note that the unreinforced specimens are 1.0 in. (25 mm) wide strips and the scrim reinforced specimens are grab tests. In addition, the peel percent separation (or incursion) should not exceed the values given in Tables 3(a) and 3(b). The values should be based on the proportion of area of separated bond to the area of the original bonding as follows.

$$S = \frac{A}{A_o}(100) \qquad (2)$$

where

S = separation in (%)
A = average depth of separation, or incursion (in.^{2} or mm^2)
A_o = original bonding distance (in.^{2} or mm^2)

Note 5: The area of peel separation can occur in a number of nonuniform patterns across the seam width. The estimated dimensions of this separated area is visual and must be done with care and concern. The area must not include squeeze-out which is part of the welding process.

Regarding the locus-of-break patterns of the different seaming methods in shear and peel, the following are unacceptable break codes per their description in ASTM D6392 (in this regard, SIP is an acceptable break code);

Hot Wedge: AD and AD-Brk > 25%
Extrusion Fillet: AD1, AD2
Exception: AD-WLD (unless strength is achieved)

Note 6: Separation-in-plane (SIP) is a locus-of-break where the failure surface propagates within one of the seamed sheets during destructive testing (usually in the peel mode). It is not merely a surface skin effect producing a few ductile fibrils (sometimes called ductile drawdown). SIP is acceptable if the required strength, shear elongation and peel separation criteria are met.

7. Retest and Rejection

7.1 If the results of the testing of a sample do not conform to the requirements of this specification, retesting to determine conformance or rejection should be done in accordance with the construction quality control or construction quality assurance plan for the particular site under construction.

8. Certification

8.1 Upon request of the construction quality assurance officer or certification engineer, an installer's certification that the geomembrane was installed and tested in accordance with this specification, together with a report of the test results, shall be furnished at the completion of the installation.

Adoption and Revision Schedule

for

Seam Specification per GRI-GM19

"Seam Strength and Related Properties of Thermally Bonded Polyolefin Geomembranes"

Adopted: February 18, 2002

Revision 1: May 15, 2003; Increased selected shear and peel test requirements, per the following:

Material	Test	Seam Type	Current GM19	Proposed GM19	Difference
HDPE	Shear	Hot Wedge	95% yield	95% yield	no change
		Extrusion	95% yield	95% yield	no change
	Peel	Hot Wedge	62% yield	72% yield	16% increase
		Extrusion	62% yield	62% yield	no change
LLDPE	Shear	Hot Wedge	1300 psi break	1500 psi break	15% increase
		Extrusion	1300 psi break	1500 psi break	15% increase
	Peel	Hot Wedge	1100 psi break	1250 psi break	14% increase
		Extrusion	1100 psi break	1100 psi break	no change

Revision 2: January 28, 2005; added Note 6 (in three locations) stating that incursion is measured on an area basis and not depth as in ASTM D6392.

Revision 3: June 4, 2010; Removed Note 6 on peel incursion since ASTM D6392 (2008) now uses area of incursion whereas previously they used linear length of incursion. Thus ASTM is now in agreement with GM19 in this regard.

Revision 4: November 15, 2010; Added Note 6 (in three locations) stating what separation-in-plane (SIP) is, and is not, and that it is acceptable if the required strength, shear elongation and peel separation criteria are met.

Revision 5: July 12, 2011; AD1 and AD2 breaks are now unacceptable even if strength is achieved.

Revision 6: October 3, 2011; Added LLDPE-R to the various geomembrane types, in particular, Tables 2(c) and 2(d) and made editorial changes.

ASTM Designation: D 6392 -08

"Standard Test Method for Determining the Integrity of Nonreinforced Geomembrane Seams Produced Using Thermo-Fusion Methods"

EBA Engineering Consultants Ltd. operating as EBA, A Tetra Tech Company
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

Designation: D 6392 – 08

Standard Test Method for Determining the Integrity of Nonreinforced Geomembrane Seams Produced Using Thermo-Fusion Methods[1]

This standard is issued under the fixed designation D 6392; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This test method describes destructive quality control and quality assurance tests used to determine the integrity of geomembrane seams produced by thermo-fusion methods. This test method presents the procedures used for determining the quality of nonbituminous bonded seams subjected to both peel and shear tests. These test procedures are intended for nonreinforced geomembranes only.

1.2 The types of thermal field seaming techniques used to construct geomembrane seams include the following.

1.2.1 *Hot Air*—This technique introduces high-temperature air or gas between two geomembrane surfaces to facilitate melting. Pressure is applied to the top or bottom geomembrane, forcing together the two surfaces to form a continuous bond.

1.2.2 *Hot Wedge (or Knife)*—This technique melts the two geomembrane surfaces to be seamed by running a hot metal wedge between them. Pressure is applied to the top or bottom geomembrane, or both, to form a continuous bond. Some seams of this kind are made with dual bond tracks separated by a nonbonded gap. These seams are sometimes referred to as dual hot wedge seams or double-track seams.

1.2.3 *Extrusion*—This technique encompasses extruding molten resin between two geomembranes or at the edge of two overlapped geomembranes to effect a continuous bond.

1.3 The types of materials covered by this test method include the following.

1.3.1 *Very Low Density Polyethylene (VLDPE).*
1.3.2 *Linear Low Density Polyethylene (LLDPE).*
1.3.3 *Very Flexible Polyethylene (VFPE).*
1.3.4 *Linear Medium Density Polyethylene (LMDPE).*
1.3.5 *High Density Polyethylene (HDPE).*
1.3.6 *Polyvinyl Chloride (PVC).*
1.3.7 *Flexible Polypropylene (fPP).*

NOTE 1—The polyethylene identifiers presented in 1.3.1-1.3.5 describe the types of materials typically tested using this test method. These are industry accepted trade descriptions and are not technical material classifications based upon material density.

1.4 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Documents

2.1 *ASTM Standards:* [2]
D 638 Test Method for Tensile Properties of Plastics
D 4439 Terminology for Geosynthetics
D 5199 Test Method for Measuring the Nominal Thickness of Geosynthetics
D 5994 Test Method for Measuring Core Thickness of Textured Geomembrane

2.2 *EPA Standards:*
EPA/600/2-88/052 Lining of Waste Containment and Other Containment Facilities; Appendix N, Locus of break codes for various types of FML seams[3]

3. Terminology

3.1 *Definitions of Terms Specific to This Standard:*

3.1.1 *geomembrane, n*—essentially impermeable geosynthetic composed of one or more synthetic sheets.

3.1.2 *quality assurance, n*—all planned and systematic actions necessary to provide adequate confidence that an item or a facility will perform satisfactorily in service.

3.1.3 *quality control, n*—the operational techniques and the activities, which sustain a quality of material, product, system, or service that will satisfy given needs; also the use of such techniques and activities.

4. Significance and Use

4.1 The use of geomembranes as barrier materials to restrict liquid migration from one location to another in soil and rock has created a need for a standard test method to evaluate the quality of geomembrane seams produced by thermo-fusion methods. In the case of geomembranes, it has become evident

[1] This test method is under the jurisdiction of ASTM Committee D35 on Geosynthetics and is the direct responsibility of Subcommittee D35.10 on Geomembranes.

Current edition approved July 1, 2008. Published July 2008. Originally approved in 1999. Last previous edition approved in 2006 as D 6392–99(2006).

that geomembrane seams can exhibit separation in the field under certain conditions. Although this is an index type test method used for quality assurance and quality control purposes, it is also intended to provide the quality assurance engineer with sufficient seam peel and shear data to evaluate seam quality. Recording and reporting data, such as separation that occurs during the peel test and elongation during the shear test, will allow the quality assurance engineer to take measures necessary to ensure the repair of inferior seams during facility construction, and therefore, minimize the potential for seam separation in service.

5. Apparatus

5.1 Tensile instrumentation shall meet the requirements outlined in Test Method D 638.

5.2 *Grip Faces*—Grip faces shall be 25 mm (1 in.) wide and a minimum of 25 mm (1 in.) in length. Smooth rubber, fine serrated or coarse serrated grip faces have all been found to be suitable for testing geomembrane seams.

6. Sample and Specimen Preparation

6.1 *Seam Samples*—Cut a portion of the fabricated seam sample from the installed liner in accordance with the project specifications. It is recommended that the cutout sample be 0.3 m (1 ft) wide and 0.45 m (1.5 ft) in length with the seam centered in the middle.

6.2 *Specimen Preparation*—Ten specimens shall be cut from the sample submittal. The specimens shall be die cut using a 25 mm (nominal 1 in.) wide by a minimum of 150 mm (nominal 6 in.) long die. Specimens that will be subjected to peel and shear tests shall be selected alternately from the sample and labeled as shown in Fig. 1. Specimens shall be cut such that the seam is perpendicular to the longer dimension of the strip specimen.

6.3 *Conditioning*—Samples should be conditioned for 40 h in a standard laboratory environment that conforms to the requirements for testing geosynthetics as stated in Terminology D 4439. Long sample conditioning times typically are not possible for most applications that require seam testing. Prior to testing, samples should be conditioned for a minimum of 1 h at 23 ± 2°C and a relative humidity between 50 and 70 %.

7. Destructive Test Methods

7.1 *Peel Testing*—Subject five specimens to the 90° "T-Peel" test (see Fig. 2). If the tested sample is a dual hot wedge seam, five specimens must be examined for each external track of the seam. Maintaining the specimen in a horizontal position throughout the test is not required. Fully grip the test specimen across the width of the specimen. Grip the peel specimen by securing grips 25 mm (1 in.) on each side of the start of the seam bond, a constant machine cross head speed of 50 mm (2 in.)/min for HDPE, LMDPE, and PVC, 500 mm (20 in.)/min for LLDPE, VLDPE, VFPE, and fPP. The test is complete when the specimen ruptures.

7.2 *Shear Testing*—Subject five specimens to the shear test (see Fig. 2). Fully support the test specimen within the grips across the width of the specimen. Secure the grips 25 mm (1 in.) on each side of the start of the seam bond, a constant machine cross head speed of 50 mm (2 in.)/min for LMDPE and HDPE, 500 mm (20 in.)/min for fPP, LLDPE, VFPE, VLDPE, and PVC. The test is complete for HDPE and LMDPE once the specimen has elongated 50 %. PVC, fPP, LLDPE, VFPE and VLDPE geomembranes should be tested to rupture.

NOTE 2—Both peel and shear tests for fPP, LLDPE, VLDPE, and PVC geomembranes have been tested routinely at both 2 and 20 in./min. When conducting seam peel or shear testing for quality control, or quality assurance purposes, or both, it may be necessary to select the manufacturer's recommended testing speed. In the absence of explicit testing speed requirements, follow those recommended in 7.1 and 7.2.

8. Calculations and Observations

8.1 *Estimate of Seam Peel Separation*—Visually estimate the seam separation demonstrated prior to rupture for peel specimens. The estimate shall be based upon the proportion of the area of the separated bond, to the area of original bonding to the nearest 5%. However, if at any point across the width of

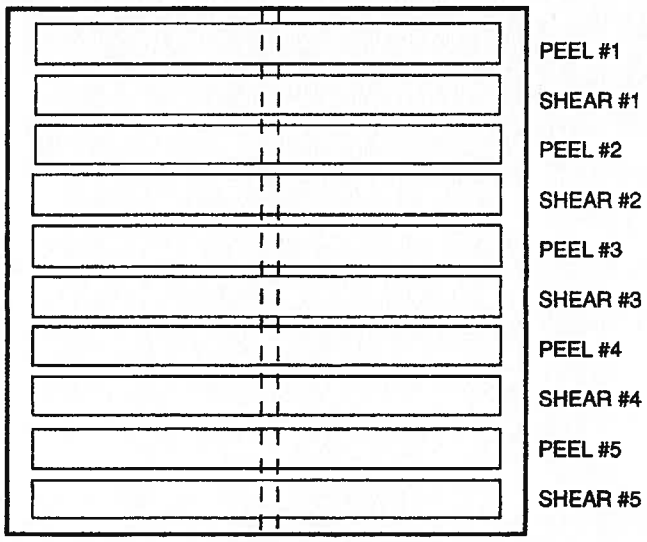

FIG. 1 Seam Sample

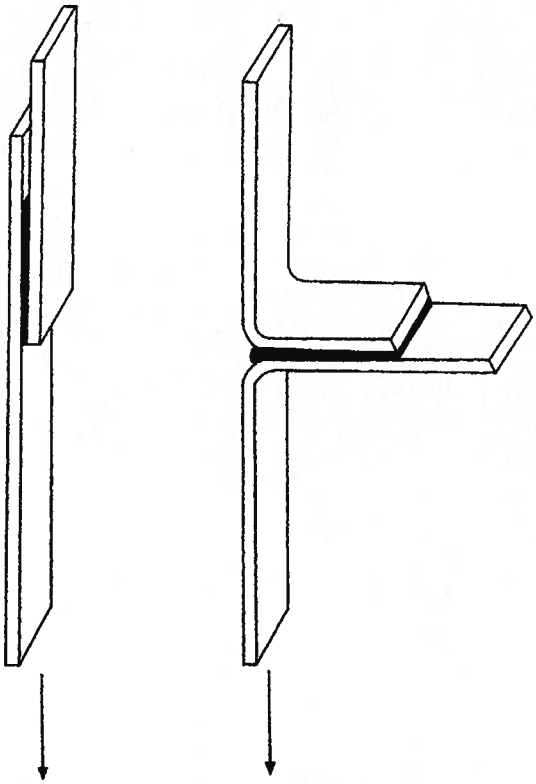

FIG. 2 Shear and T-Peel Specimens

the peel specimen, seam separation continues to the other side of the bonded area, the estimate of seam peel separation shall be 100 % regardless of the proportion of the area of the separated bond to the area of the original bonding.

NOTE 3—During the thermo-fusion welding process, some of the melted polymer may be shifted to the outside of the weld during the pressing of the geomembrane panels together. This melted polymer is sometimes called "squeeze-out" or "bleed out" and is not considered part of the bond. Care must be exercised during estimation of the seam peel separation to segregate the squeeze or bleed out area from the peeled bond area. The reported peel separation shall include the peeled bond area only.

8.2 *Rupture Mode Selection*—Determine the locus of break for both the peel and shear specimens as shown in Figs. 3 and 4. The locus of break for shear specimens that do not rupture prior to test end (50 % elongation) shall be interpreted as occurring in the membrane that exhibits yielding.

8.3 *Shear Percent Elongation*—Calculate the percent elongation on shear specimens according to Eq 1. Divide the extension at test end by the original gage length of 25 mm and multiply by 100.

$$\text{Elongation} = \text{E}\frac{L}{L_0} \times 100 \quad (1)$$

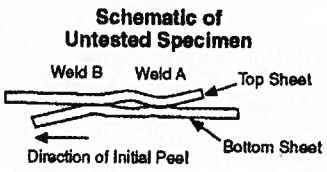
where:
L = extension at test end, and
L_0 = original gauge length.

NOTE 4—The intent of measuring elongation using this test method is to identify relatively large reductions in typical break elongation values of seam samples. Length is defined as the distance from one grip to the seam edge. Using this definition implies that all strain experienced by the specimen during the shear test occurs on one side of the seam. Of course this assumption is inaccurate, since some strain will occur on each side of the seam, and in the seam area itself; however, it is difficult to make an accurate measurement of the strain distribution which occurs in the specimen during testing. Further, it is not critical to know the exact location of all the strain which occurs during testing but rather to simply identify when significant reductions in elongation (when compared with the typical elongation of a new material) have occurred.

9. Report

9.1 The report shall include the following information.

9.1.1 Report the individual peel and shear specimen maximum unit tension values in N/mm of width (lb/in.).



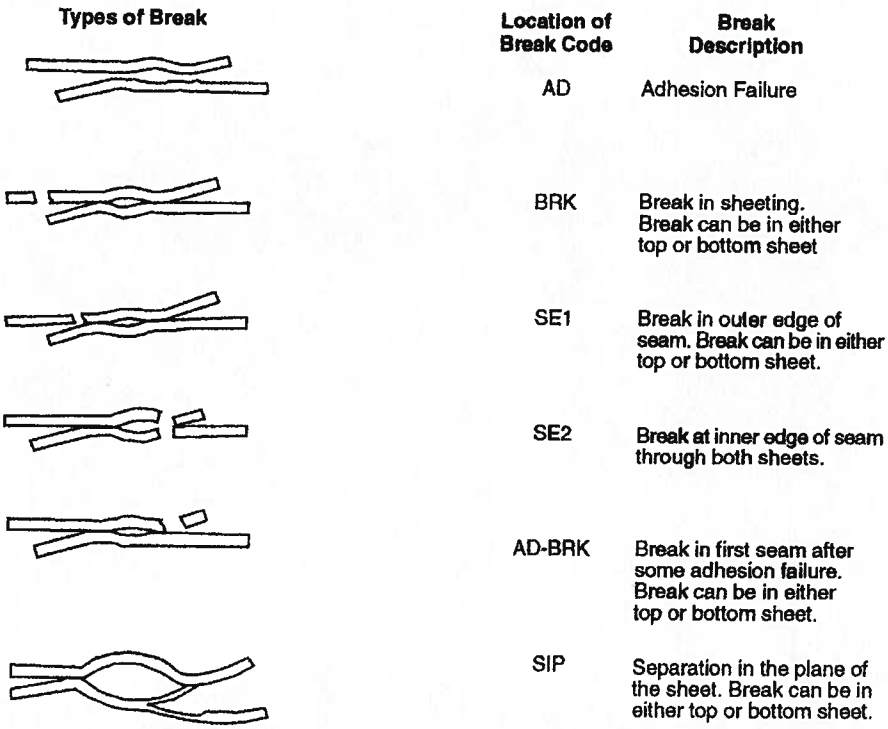
NOTE 5—If requested, report the maximum peel or shear stress. This calculation will require an accurate measurement of thickness for each specimen. These measurements should be made in accordance with Test Method D 5199 for smooth geomembranes and Test Method D 5994 for textured geomembranes.

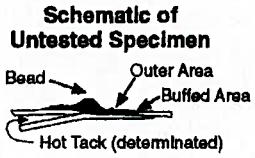
9.1.2 Report the cross head speed used during peel and shear testing.

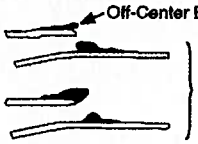
9.1.3 Report the average of the individual peel and shear sample values recorded.

9.1.4 If the peel or shear specimen does not rupture, report the elongation at the maximum cross-head travel limitation. If the gage length is reduced to less than 25 mm (1 in.), this must be noted in the report.

9.1.5 Report the mode of specimen rupture for peel and shear specimens according to Fig. 3 or Fig. 4.







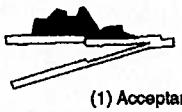


FIG. 3 Locus-of-Break Codes for Dual Hot Wedge Seams in Unreinforced Geomembranes Tested for Seam Strength in Shear and Peel Modes

NOTE 6—"Locus-of-Failure" (Figs. 3 and 4) include only some of the typically found seam configurations found in the industry. When this test method is applied to seams bonded in configurations other than those identified in Fig. 3 or Fig. 4, the users of this test method must agree on applicable descriptions for modes of specimen rupture.

10. Precision and Bias

10.1 No statement can be made at this time concerning precision or bias.

Types of Break	Location of Break Code	Break Description
	AD1	Failure in adhesion. Specimens may also delaminate under the bead and break through the thin extruded material in the outer area.
	AD2	Failure in adhesion.
	AD-WLD[1]	Break through the fillet.
	SE1	Break at seam edge in the bottom sheet (applicable to shear only).
	SE2	Break at seam edge in the top sheet (applicable to shear only).
	SE3	Break at seam edge in the bottom sheet (applicable to peel only).
	BRK1	Break in the bottom sheeting. A "B" in parebtheses following the code means the specimen broke in the buffed area.
	BRK2	Break in the top sheeting. A "B" in parebtheses following the code means the specimen broke in the buffed area.
	AD-BRK	Break in the bottom sheeting after some adhesion failure between the fillet and the bottom sheet.
	HT	Break at the edge of the hot tack for specimens which could not be delaminated in the hot tack.
	SIP	Separation in the plane of the sheet.

(1) Acceptance of AD-WLD breaks may depend on whether test values meet a minimum specification value.

FIG. 4 Locus-of-Break Codes for Fillet Extrusion Weld Seams in Unreinforced Geomembranes Tested for Seam Strength in Shear and Peel Modes

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

APPENDIX D

TETRA TECH'S LIMITATIONS ON USE OF THIS DOCUMENT

LIMITATIONS ON USE OF THIS DOCUMENT

GEOTECHNICAL

1.1 USE OF DOCUMENT AND OWNERSHIP

This document pertains to a specific site, a specific development, and a specific scope of work. The document may include plans, drawings, profiles and other supporting documents that collectively constitute the document (the "Professional Document").

The Professional Document is intended for the sole use of TETRA TECH's Client (the "Client") as specifically identified in the TETRA TECH Services Agreement or other Contractual Agreement entered into with the Client (either of which is termed the "Contract" herein). TETRA TECH does not accept any responsibility for the accuracy of any of the data, analyses, recommendations or other contents of the Professional Document when it is used or relied upon by any party other than the Client, unless authorized in writing by TETRA TECH.

Any unauthorized use of the Professional Document is at the sole risk of the user. TETRA TECH accepts no responsibility whatsoever for any loss or damage where such loss or damage is alleged to be or, is in fact, caused by the unauthorized use of the Professional Document.

Where TETRA TECH has expressly authorized the use of the Professional Document by a third party (an "Authorized Party"), consideration for such authorization is the Authorized Party's acceptance of these Limitations on Use of this Document as well as any limitations on liability contained in the Contract with the Client (all of which is collectively termed the "Limitations on Liability"). The Authorized Party should carefully review both these Limitations on Use of this Document and the Contract prior to making any use of the Professional Document. Any use made of the Professional Document by an Authorized Party constitutes the Authorized Party's express acceptance of, and agreement to, the Limitations on Liability.

The Professional Document and any other form or type of data or documents generated by TETRA TECH during the performance of the work are TETRA TECH's professional work product and shall remain the copyright property of TETRA TECH.

The Professional Document is subject to copyright and shall not be reproduced either wholly or in part without the prior, written permission of TETRA TECH. Additional copies of the Document, if required, may be obtained upon request.

1.2 ALTERNATIVE DOCUMENT FORMAT

Where TETRA TECH submits electronic file and/or hard copy versions of the Professional Document or any drawings or other project-related documents and deliverables (collectively termed TETRA TECH's "Instruments of Professional Service"), only the signed and/or sealed versions shall be considered final. The original signed and/or sealed electronic file and/or hard copy version archived by TETRA TECH shall be deemed to be the original. TETRA TECH will archive a protected digital copy of the original signed and/or sealed version for a period of 10 years.

Both electronic file and/or hard copy versions of TETRA TECH's Instruments of Professional Service shall not, under any circumstances, be altered by any party except TETRA TECH. TETRA TECH's Instruments of Professional Service will be used only and exactly as submitted by TETRA TECH.

Electronic files submitted by TETRA TECH have been prepared and submitted using specific software and hardware systems. TETRA TECH makes no representation about the compatibility of these files with the Client's current or future software and hardware systems.

1.3 STANDARD OF CARE

Services performed by TETRA TECH for the Professional Document have been conducted in accordance with the Contract, in a manner consistent with the level of skill ordinarily exercised by members of the profession currently practicing under similar conditions in the jurisdiction in which the services are provided. Professional judgment has been applied in developing the conclusions and/or recommendations provided in this Professional Document. No warranty or guarantee, express or implied, is made concerning the test results, comments, recommendations, or any other portion of the Professional Document.

If any error or omission is detected by the Client or an Authorized Party, the error or omission must be immediately brought to the attention of TETRA TECH.

1.4 DISCLOSURE OF INFORMATION BY CLIENT

The Client acknowledges that it has fully cooperated with TETRA TECH with respect to the provision of all available information on the past, present, and proposed conditions on the site, including historical information respecting the use of the site. The Client further acknowledges that in order for TETRA TECH to properly provide the services contracted for in the Contract, TETRA TECH has relied upon the Client with respect to both the full disclosure and accuracy of any such information.

1.5 INFORMATION PROVIDED TO TETRA TECH BY OTHERS

During the performance of the work and the preparation of this Professional Document, TETRA TECH may have relied on information provided by third parties other than the Client.

While TETRA TECH endeavours to verify the accuracy of such information, TETRA TECH accepts no responsibility for the accuracy or the reliability of such information even where inaccurate or unreliable information impacts any recommendations, design or other deliverables and causes the Client or an Authorized Party loss or damage.

1.6 GENERAL LIMITATIONS OF DOCUMENT

This Professional Document is based solely on the conditions presented and the data available to TETRA TECH at the time the data were collected in the field or gathered from available databases.

The Client, and any Authorized Party, acknowledges that the Professional Document is based on limited data and that the conclusions, opinions, and recommendations contained in the Professional Document are the result of the application of professional judgment to such limited data.

The Professional Document is not applicable to any other sites, nor should it be relied upon for types of development other than those to which it refers. Any variation from the site conditions present, or variation in assumed conditions which might form the basis of design or recommendations as outlined in this document, at or on the development proposed as of the date of the Professional Document requires a supplementary exploration, investigation, and assessment.

TETRA TECH is neither qualified to, nor is it making, any recommendations with respect to the purchase, sale, investment or development of the property, the decisions on which are the sole responsibility of the Client.

1.7 ENVIRONMENTAL AND REGULATORY ISSUES

Unless stipulated in the report, TETRA TECH has not been retained to explore, address or consider and has not explored, addressed or considered any environmental or regulatory issues associated with development on the subject site.

1.8 NATURE AND EXACTNESS OF SOIL AND ROCK DESCRIPTIONS

Classification and identification of soils and rocks are based upon commonly accepted systems, methods and standards employed in professional geotechnical practice. This report contains descriptions of the systems and methods used. Where deviations from the system or method prevail, they are specifically mentioned.

Classification and identification of geological units are judgmental in nature as to both type and condition. TETRA TECH does not warrant conditions represented herein as exact, but infers accuracy only to the extent that is common in practice.

Where subsurface conditions encountered during development are different from those described in this report, qualified geotechnical personnel should revisit the site and review recommendations in light of the actual conditions encountered.

1.9 LOGS OF TESTHOLES

The testhole logs are a compilation of conditions and classification of soils and rocks as obtained from field observations and laboratory testing of selected samples. Soil and rock zones have been interpreted. Change from one geological zone to the other, indicated on the logs as a distinct line, can be, in fact, transitional. The extent of transition is interpretive. Any circumstance which requires precise definition of soil or rock zone transition elevations may require further investigation and review.

1.10 STRATIGRAPHIC AND GEOLOGICAL INFORMATION

The stratigraphic and geological information indicated on drawings contained in this report are inferred from logs of test holes and/or soil/rock exposures. Stratigraphy is known only at the locations of the test hole or exposure. Actual geology and stratigraphy between test holes and/or exposures may vary from that shown on these drawings. Natural variations in geological conditions are inherent and are a function of the historical environment. TETRA TECH does not represent the conditions illustrated as exact but recognizes that variations will exist. Where knowledge of more precise locations of geological units is necessary, additional exploration and review may be necessary.

1.11 PROTECTION OF EXPOSED GROUND

Excavation and construction operations expose geological materials to climatic elements (freeze/thaw, wet/dry) and/or mechanical disturbance which can cause severe deterioration. Unless otherwise specifically indicated in this report, the walls and floors of excavations must be protected from the elements, particularly moisture, desiccation, frost action and construction traffic.

1.12 SUPPORT OF ADJACENT GROUND AND STRUCTURES

Unless otherwise specifically advised, support of ground and structures adjacent to the anticipated construction and preservation of adjacent ground and structures from the adverse impact of construction activity is required.

1.13 INFLUENCE OF CONSTRUCTION ACTIVITY

Construction activity can impact structural performance of adjacent buildings and other installations. The influence of all anticipated construction activities should be considered by the contractor, owner, architect and prime engineer in consultation with a geotechnical engineer when the final design and construction techniques, and construction sequence are known.

1.14 OBSERVATIONS DURING CONSTRUCTION

Because of the nature of geological deposits, the judgmental nature of geotechnical engineering, and the potential of adverse circumstances arising from construction activity, observations during site preparation, excavation and construction should be carried out by a geotechnical engineer. These observations may then serve as the basis for confirmation and/or alteration of geotechnical recommendations or design guidelines presented herein.

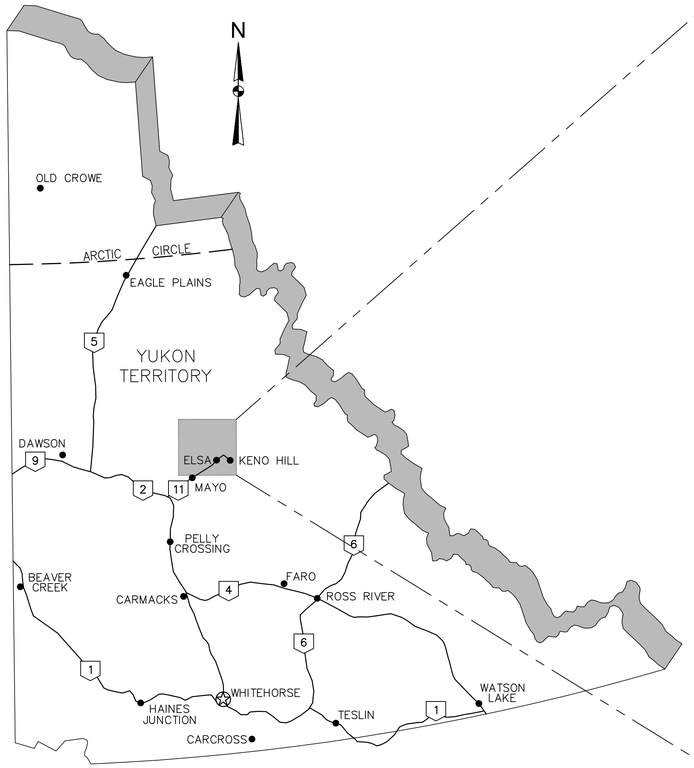
1.15 DRAINAGE SYSTEMS

Unless otherwise specified, it is a condition of this report that effective temporary and permanent drainage systems are required and that they must be considered in relation to project purpose and function. Where temporary or permanent drainage systems are installed within or around a structure, these systems must protect the structure from loss of ground due to mechanisms such as internal erosion and must be designed so as to assure continued satisfactory performance of the drains. Specific design details regarding the geotechnical aspects of such systems (e.g. bedding material, surrounding soil, soil cover, geotextile type) should be reviewed by the geotechnical engineer to confirm the performance of the system is consistent with the conditions used in the geotechnical design.

1.16 DESIGN PARAMETERS

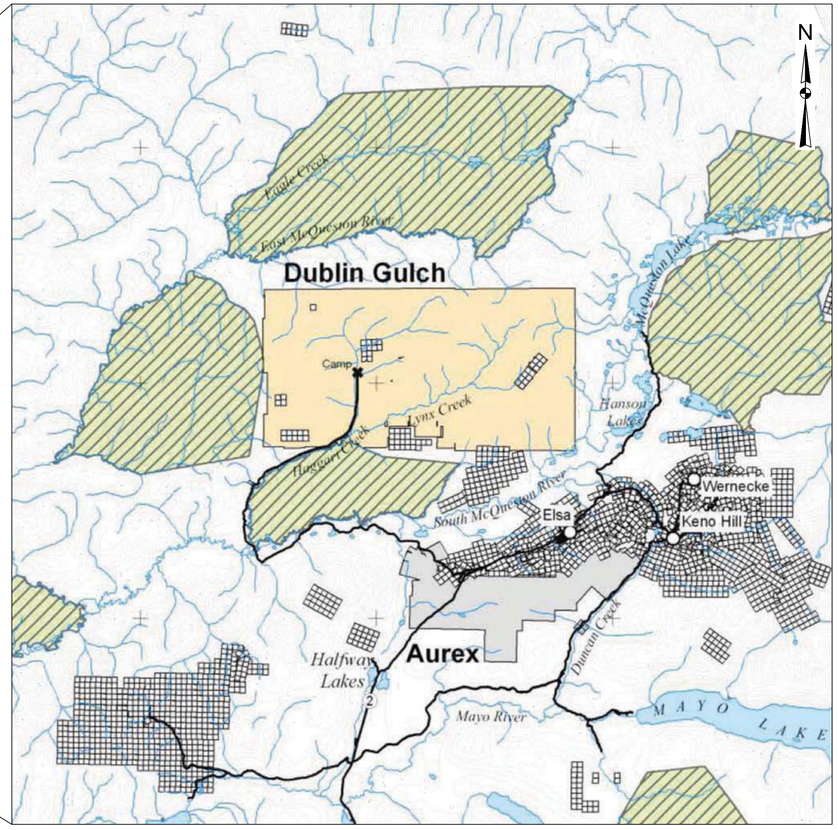
Bearing capacities for Limit States or Allowable Stress Design, strength/stiffness properties and similar geotechnical design parameters quoted in this report relate to a specific soil or rock type and condition. Construction activity and environmental circumstances can materially change the condition of soil or rock. The elevation at which a soil or rock type occurs is variable. It is a requirement of this report that structural elements be founded in and/or upon geological materials of the type and in the condition used in this report. Sufficient observations should be made by qualified geotechnical personnel during construction to assure that the soil and/or rock conditions considered in this report in fact exist at the site.

1.17 SAMPLES



TETRA TECH will retain all soil and rock samples for 30 days after this report is issued. Further storage or transfer of samples can be made at the Client's expense upon written request, otherwise samples will be discarded.

1.18 APPLICABLE CODES, STANDARDS, GUIDELINES & BEST PRACTICE



This document has been prepared based on the applicable codes, standards, guidelines or best practice as identified in the report. Some mandated codes, standards and guidelines (such as ASTM, AASHTO Bridge Design/Construction Codes, Canadian Highway Bridge Design Code, National/Provincial Building Codes) are routinely updated and corrections made. TETRA TECH cannot predict nor be held liable for any such future changes, amendments, errors or omissions in these documents that may have a bearing on the assessment, design or analyses included in this report.

GENERAL NOTES:

UNLESS OTHERWISE INDICATED ON THE DRAWINGS, THE FOLLOWING GENERAL NOTES SHALL APPLY:

1. ALL COORDINATES AND ELEVATIONS ARE SHOWN IN METRES, UNLESS NOTED OTHERWISE. COORDINATES AND TOPOGRAPHY ARE IN NAD83 (CSRS) UTM ZONE 8N COORDINATE SYSTEM. SURVEY PROVIDED BY UNDERHILL GEOMATICS LTD.
2. THESE DRAWINGS ARE TO BE READ IN CONJUNCTION WITH ACCOMPANYING DRAWINGS, SPECIFICATIONS, AND THE REPORT TITLED: "EAGLE GOLD PROJECT - HEAP LEACH FACILITY DETAILED DESIGN - DRAFT" ISSUED AUGUST 11, 2017. THE CONTRACTOR SHALL IMMEDIATELY NOTIFY THE ENGINEER SHOULD UNCERTAINTIES ARISE WITH THE DRAWINGS, SCOPE, AND/OR TECHNICAL SPECIFICATIONS.
3. UNLESS BGC AGREES OTHERWISE IN WRITING, THIS DRAWING SHALL NOT BE MODIFIED OR USED FOR ANY PURPOSE OTHER THAN THE PURPOSE FOR WHICH BGC GENERATED IT. BGC SHALL HAVE NO LIABILITY FOR ANY DAMAGES OR LOSS ARISING IN ANY WAY FROM ANY USE OR MODIFICATION OF THIS DOCUMENT NOT AUTHORIZED BY BGC. ANY USE OF OR RELIANCE UPON THIS DOCUMENT OR ITS CONTENT BY THIRD PARTIES SHALL BE AT SUCH THIRD PARTIES' SOLE RISK
4. SURFICIAL GEOLOGY PROVIDED BY BGC.
5. ALL DIMENSIONS, STATIONING, AND SCALES ARE SI METRIC SYSTEM.
6. SITE INVESTIGATION BOREHOLES, TEST PITS, AND SEISMIC LINE LOCATIONS SHOWN ON THESE DRAWINGS ARE THE BASIS FOR INTERPRETATION OF SUBSURFACE CONDITIONS FOR DESIGN. SEE APPENDIX A - SUPPORTING INFORMATION OF THE REPORT TITLED: "EAGLE GOLD PROJECT - HEAP LEACH FACILITY DETAILED DESIGN - DRAFT" ISSUED AUGUST 11, 2017. SUBSURFACE CONDITIONS MAY VARY BETWEEN THE SITE INVESTIGATION LOCATIONS DURING CONSTRUCTION. THE CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFICATION OF ACTUAL SUBSURFACE CONDITIONS FOR CONSTRUCTION, AS WELL AS ANY CHANGES IN DESIGN GROUND LINES VERSUS EXISTING GROUND LINES BASED ON 2 METRE CONTOUR INTERVAL TOPOGRAPHY.
7. TOPOGRAPHY AND MINE FACILITY LAYOUTS PROVIDED BY HATCH.
8. ROAD SURFACES TO BE SLOPED AND GRADED TO DRAIN. CULVERTS TO BE INSTALLED AS REQUIRED TO PREVENT PONDING.
9. FINAL DESIGN OF SITE-WIDE ACCESS ROADS BY OTHERS, OTHER THAN THAT SHOWN HEREIN.
10. FINAL DESIGN OF THE PROCESS PLANT, CONVEYORS AND RELATED FACILITIES BY OTHERS. ELECTRICAL UTILITIES DESIGNED BY OTHERS.
11. FINAL DESIGN OF THE BARREN AND PREGNANT DELIVERY PIPELINES AND ASSOCIATED PUMPING AND DISTRIBUTION SYSTEMS, FRESH WATER SUPPLY PUMPS AND PIPELINES BY OTHERS.
12. ALL FOUNDATIONS AND OTHER EXCAVATIONS SHALL BE INSPECTED BY THE OWNER'S ENGINEER PRIOR TO FILL PLACEMENT.
13. ALL DRILL HOLES SHALL BE PLUGGED WITH CEMENT OR BENTONITE (WITHIN LIMITS OF AFFECTED AREA).

FILL TYPES FOR CONSTRUCTION

MATERIAL No.	FILL MATERIAL NAME	FILL DESCRIPTION	MOISTURE CONDITIONING	LOOSE LIFT THICKNESS	COMPACTION EFFORT
①	SITE GRADING FILL	SITE GRADING SOILS FROM REQUIRED EXCAVATIONS AND CUT/FILL ACTIVITIES	2% +/- OF OPTIMUM	300 mm MAX.	95% OF ASTM D698 COMPACTION
②	SELECT FILL	FINE GRAINED MATERIALS FOR LINER BEDDING	-2% + 1% OF OPTIMUM	150 mm MAX.	95% OF ASTM D698 COMPACTION
③	STRUCTURAL FILL	WELL GRADED SOILS AND WEATHERED BEDROCK FROM REQUIRED EXCAVATIONS FOR EMBANKMENT FILL	2% +/- OF OPTIMUM	300 mm MAX.	95% OF ASTM D698 COMPACTION
④	OVERLINER DRAIN FILL (ODF)	CLEAN GRAVEL MATERIALS FOR HLF LINER COVER, PLS AND LDRS SUMPS	NONE	FILL NOTE 1	NONE REQUIRED
⑤	SELECT DRAIN FILL	CLEAN GRAVEL MATERIAL FOR UNDERDRAIN PIPES	NONE	AS REQUIRED	NONE REQUIRED
⑥	PIPE TRENCH BACKFILL	COARSE AGGREGATE STONE	NONE	AS REQUIRED	NONE REQUIRED
⑦	COMPACTED ROCKFILL	HIGH STRENGTH ROCK MATERIALS	AS REQUIRED	FILL NOTE 2	LARGE SCALE TEST FILL REQUIRED (FILL NOTE 2)
⑧	ANCHOR TRENCH BACKFILL	SITE GRADING FILL MATERIAL FOR USE IN LINER ANCHOR TRENCHES	AS REQUIRED	150 mm	85% OF ASTM D698 COMPACTION
⑨	ROAD WEARING COARSE	WELL GRADED SANDY GRAVEL	AS REQUIRED	150 mm	95% OF ASTM D698 COMPACTION
⑩	RIPRAP	COMPETENT ROCK FROM EXCAVATIONS	NONE	NONE REQUIRED	NONE REQUIRED
⑪	ORE	CRUSHED ORE MATERIAL FOR HEAP LEACHING	N/A	N/A	N/A

FILL NOTES:
1) OVERLINER DRAIN FILL TO BE PLACED IN A SINGLE LOOSE LIFT OF 0.6 m (MINIMUM) ON THE UPPER PAD AREAS AND 1.0 m (MINIMUM) IN THE IN-HEAP POND AREAS.
2) COMPACTED ROCKFILL THICKNESS AND COMPACTION DEPENDING ON AVAILABLE MATERIALS AND RESULTS OF LARGE SCALE TEST FILLS CONDUCTED BY THE ENGINEER DURING CONSTRUCTION, AS REQUIRED BY THE SPECIFICATIONS.

NOTES:
1. SEE DRAWING EGHLF-XD-00-02 FOR GENERAL NOTES, ABBREVIATIONS, LEGEND AND FILL TYPES.
2. THE REGRADED CONTOURS REPRESENT THE TOP OF THE LEACH PAD LINER WITHIN THE PAD, TOP OF ROAD SURFACES, AND BOTTOM OF EROSION PROTECTION WITHIN ALL CHANNELS. BELOW ELEVATION 940m, CLEAR & GRUB THEN REMOVE 1.8m NATIVE MATERIAL TO PREPARED SUBGRADE. ABOVE ELEVATION 940, CLEAR & GRUB THEN REMOVE 0.3m NATIVE MATERIAL TO PREPARED SUBGRADE.
3. ALL UNSUITABLE MATERIALS ENCOUNTERED DURING CONSTRUCTION MUST BE REMOVED AND EITHER REPLACED WITH COMPACTED RANDOM FILL, SITE GRADING FILL, OR HAVE THE EXCAVATED SURFACE PREPARED AS THE ROUGH GRADE SURFACE.
4. SLOPES OF THE REGRADED PAD GROUND SURFACE CONTOURS SHALL NOT EXCEED 2.5H:1V UNLESS NOTED OTHERWISE.
5. MINE PLANT, CRUSHER, CONVEYORS, AGGLOMERATOR, CAMP, MONITORING VAULT, SEDIMENT PONDS, ACCESS ROADS AND OTHER INFRASTRUCTURE BY OTHERS.

THIS DRAWING MAY HAVE BEEN REDUCED OR ENLARGED. ALL FRACTIONAL SCALE NOTATIONS INDICATED ARE BASED ON ORIGINAL FORMAT DRAWINGS.

TYPICAL IN-HEAP POND SUMP SECTION (K, 04-03)

TYPICAL IN-HEAP POND SUMP SECTION (L, --)

TYPICAL IN-HEAP POND SUMP SECTION (M, --)

THIS DRAWING MAY HAVE BEEN REDUCED OR ENLARGED. ALL FRACTIONAL SCALE NOTATIONS INDICATED ARE BASED ON ORIGINAL FORMAT DRAWINGS.

NOTES:
1. SEE DRAWING EGHLF-XD-00-02 FOR GENERAL NOTES, ABBREVIATIONS, LEGEND AND FILL TYPES.
2. RUB SHEET SHALL BE INSTALLED UNDER EACH STEEL CASING WITH DIRECT CONTACT TO THE LINER. RUB SHEET SHALL CONSIST OF A 16 OZ. NON-WOVEN GEOTEXTILE AND AN ADDITIONAL LAYER OF 2 mm (80-mil) DOUBLE-SIDE TEXTURED LLDPE GEOMEMBRANE PLACED BENEATH EACH PUMP CASING FOR LINER PROTECTION. TEMPORARILY SECURE RUB SHEET WITH SAND BAGS AS NEEDED.
3. 2 m LONG CONCRETE FILLED STEEL PIPE ANCHOR POSTS (EACH SIDE OF PUMP CASING) EMBEDDED 0.9 m INTO CONCRETE ANCHOR TO INHIBIT LATERAL MOVEMENT AND VERTICAL SETTLEMENT OF RISER.
4. ALL SOLID PIPE FITTINGS AND CONNECTIONS TO CONFORM TO AWWA C-906 STANDARDS.
5. INSTALL 12.5 mm (0.5") THICK STEEL PLATES ON TOP OF LINER TO PROTECT DURING CLOSURE DRILLING. STEEL PLATES ARE TO BE UNDERLAIN WITH CONVEYOR BELT MATERIAL OR 16 OZ. NON-WOVEN GEOTEXTILE AND THE EDGES BEVELLED TO PREVENT PUNCTURING OF LINER. STEEL PLATE INSTALLED IN CLOSURE SUMP IS TO INCLUDE AN ANGLE AT THE BOTTOM TO IDENTIFY TERMINATION POINT FOR DRILLING. STEEL PLATES ARE TO BE SPACED 0.2 m APART TO ALLOW ROOM FOR LINER SYSTEM BETWEEN THEM.
6. FREE-FLOATING (LOW FRICTION) PIPE SUPPORT TO BE INSTALLED AT TOP OF RISER TO ALLOW FOR THERMAL EXPANSION/CONTRACTION WHILE INHIBITING LATERAL MOVEMENT AND VERTICAL SETTLEMENT.
7. ALL CONNECTIONS BETWEEN PE AND STEEL PIPE (AND OTHER CONNECTIONS AS IDENTIFIED BY THE FIELD ENGINEER) SHALL BE COMPLETELY AND SECURELY WRAPPED WITH GEOCOMPOSITE TO AT LEAST 500 mm ON BOTH SIDES OF THE CONNECTIONS.

TEMPORARILY SECURE RUB SHEET WITH SAND BAGS AS NEEDED.
3. LDRS RISER PIPE ASSEMBLIES SHALL BE 600mm O.D. FABRICATED USING ASTM 139 HIGH STRENGTH LOW ALLOY STEEL (A606 TYPE 4.) MINIMUM PIPE WALL THICKNESS SHALL BE 17.5mm (SCH 40).
4. 2 m LONG CONCRETE FILLED STEEL PIPE ANCHOR POSTS (EACH SIDE OF PUMP CASING) EMBEDDED 0.9 m INTO CONCRETE ANCHOR TO INHIBIT LATERAL MOVEMENT AND VERTICAL SETTLEMENT OF RISER.
5. ALL SOLID PIPE FITTINGS AND CONNECTIONS TO CONFORM TO AWWA C-906 STANDARDS.
6. INSTALL 12.5 mm (0.5") THICK STEEL PLATES ON TOP OF LINER TO PROTECT DURING CLOSURE DRILLING. STEEL PLATES ARE TO BE UNDERLAIN WITH CONVEYOR BELT MATERIAL OR TWO LAYERS OF 12 OZ. NON-WOVEN GEOTEXTILE AND THE EDGES BEVELLED TO PREVENT PUNCTURING OF LINER. STEEL PLATE INSTALLED IN CLOSURE SUMP IS TO INCLUDE AN ANGLE AT THE BOTTOM TO IDENTIFY TERMINATION POINT FOR DRILLING. STEEL PLATES ARE TO BE SPACED 0.2 m APART TO ALLOW ROOM FOR LINER SYSTEM BETWEEN THEM.
7. FREE-FLOATING (LOW FRICTION) PIPE SUPPORT TO BE INSTALLED AT TOP OF RISER TO ALLOW FOR THERMAL EXPANSION/CONTRACTION WHILE INHIBITING LATERAL MOVEMENT AND VERTICAL SETTLEMENT.
8. ALL CONNECTIONS BETWEEN PE AND STEEL PIPE (AND OTHER CONNECTIONS AS IDENTIFIED BY THE FIELD ENGINEER) SHALL BE COMPLETELY AND SECURELY WRAPPED WITH TWO LAYERS OF 12 OZ. GEOTEXTILE TO AT LEAST 500 mm ON BOTH SIDES OF THE CONNECTIONS.
9. THE BOTTOM 2m OF LDRS INSTRUMENTATION CASING SHALL BE SLOTTED. SLOTTING IN THE STEEL PIPE SHALL BE 2mm WIDE BY 75mm LONG (MEASURED PERPENDICULAR TO PIPE FLOW) SPACED 150mm ON CENTER AROUND THE PIPE IN ROWS SPACED 150mm ON CENTER.

P:\Apex Shared\Civil Projects\X-DRIVE-BGC\Projects\0792 Victoria Gold\CAD\Production\As-Built\EAGLE GOLD HLF - END OF 2019 SEASON\EGHLF-XD-00-01.dwg Layout: EGHLF-00-01 Plot Date: Nov 5 19 Time: 2:07 PM

GENERAL NOTES:

UNLESS OTHERWISE INDICATED ON THE DRAWINGS, THE FOLLOWING GENERAL NOTES SHALL APPLY:

1. ALL COORDINATES AND ELEVATIONS ARE SHOWN IN METRES, UNLESS NOTED OTHERWISE. COORDINATES AND TOPOGRAPHY ARE IN NAD83 (CSRS) UTM ZONE 8N COORDINATE SYSTEM. SURVEY PROVIDED BY UNDERHILL GEOMATICS LTD.
2. THESE DRAWINGS ARE TO BE READ IN CONJUNCTION WITH ACCOMPANYING DRAWINGS, SPECIFICATIONS, AND THE REPORT TITLED: “EAGLE GOLD PROJECT - HEAP LEACH FACILITY DETAILED DESIGN” ISSUED JANUARY, 2018.
3. UNLESS BGC AGREES OTHERWISE IN WRITING, THIS DRAWING SHALL NOT BE MODIFIED OR USED FOR ANY PURPOSE OTHER THAN THE PURPOSE FOR WHICH BGC GENERATED IT. BGC SHALL HAVE NO LIABILITY FOR ANY DAMAGES OR LOSS ARISING IN ANY WAY FROM ANY USE OR MODIFICATION OF THIS DOCUMENT NOT AUTHORIZED BY BGC. ANY USE OF OR RELIANCE UPON THIS DOCUMENT OR ITS CONTENT BY THIRD PARTIES SHALL BE AT SUCH THIRD PARTIES' SOLE RISK
4. SURFICIAL GEOLOGY PROVIDED BY BGC.
5. ALL DIMENSIONS, STATIONING, AND SCALES ARE SI METRIC SYSTEM.
6. SITE INVESTIGATION BOREHOLES, TEST PITS, AND SEISMIC LINE LOCATIONS SHOWN ON THESE DRAWINGS ARE THE BASIS FOR INTERPRETATION OF SUBSURFACE CONDITIONS FOR DESIGN. SEE APPENDIX A - SUPPORTING INFORMATION OF THE REPORT TITLED: "EAGLE GOLD PROJECT - HEAP LEACH FACILITY DETAILED DESIGN - DRAFT" ISSUED AUGUST 11, 2017. SUBSURFACE CONDITIONS MAY VARY BETWEEN THE SITE INVESTIGATION LOCATIONS DURING CONSTRUCTION. THE CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFICATION OF ACTUAL SUBSURFACE CONDITIONS FOR CONSTRUCTION, AS WELL AS ANY CHANGES IN DESIGN GROUND LINES VERSUS EXISTING GROUND LINES BASED ON 2 METRE CONTOUR INTERVAL TOPOGRAPHY.
7. PREVIOUSLY EXISTING TOPOGRAPHY AND MINE FACILITY LAYOUTS PROVIDED BY HATCH. AS-BUILT TOPOGRAPHY AND SURFACES PROVIDED BY PELLY AND UNDERHILL.
8. ROAD SURFACES TO BE SLOPED AND GRADED TO DRAIN. CULVERTS TO BE INSTALLED AS REQUIRED TO PREVENT PONDING.
9. FINAL DESIGN OF SITE-WIDE ACCESS ROADS BY OTHERS, OTHER THAN THAT SHOWN HEREIN.
10. FINAL DESIGN OF THE PROCESS PLANT, CONVEYORS AND RELATED FACILITIES BY OTHERS. ELECTRICAL UTILITIES DESIGNED BY OTHERS.
11. FINAL DESIGN OF THE BARREN AND PREGNANT DELIVERY PIPELINES AND ASSOCIATED PUMPING AND DISTRIBUTION SYSTEMS, FRESH WATER SUPPLY PUMPS AND PIPELINES BY OTHERS.
12. ALL FOUNDATIONS AND OTHER EXCAVATIONS SHALL BE INSPECTED BY THE OWNER'S ENGINEER PRIOR TO FILL PLACEMENT.
13. ALL DRILL HOLES SHALL BE PLUGGED WITH CEMENT OR BENTONITE (WITHIN LIMITS OF AFFECTED AREA).
14. BGC DID NOT INDEPENDENTLY VERIFY THE ACCURACY OF AS-BUILT SURVEY INFORMATION PROVIDED BY THE CONTRACTOR, WHICH FORMS A PART OF THE RECORD DRAWINGS.

PROPOSED FACILITIES

DETAIL CALL-OUT

CROSS-SECTION LOCATION

FILL TYPES FOR CONSTRUCTION

MATERIAL No.	FILL MATERIAL NAME	FILL DESCRIPTION
1	SITE GRADING FILL	SITE GRADING SOILS FROM REQUIRED EXCAVATIONS AND CUT/FILL ACTIVITIES
2	SELECT FILL	FINE GRAINED MATERIALS FOR LINER BEDDING
3	STRUCTURAL FILL	WELL GRADED SOILS AND WEATHERED BEDROCK FROM REQUIRED EXCAVATIONS FOR EMBANKMENT FILL
4	OVERLINER DRAIN FILL (ODF)	CLEAN GRAVEL MATERIALS FOR HLF LINER COVER, PLS AND LDRS SUMPS
5	SELECT DRAIN FILL	CLEAN GRAVEL MATERIAL FOR UNDERDRAIN PIPES
6	PIPE TRENCH BACKFILL	COARSE AGGREGATE STONE
7	COMPACTED ROCKFILL	HIGH STRENGTH ROCK MATERIALS
8	ANCHOR TRENCH BACKFILL	SITE GRADING FILL MATERIAL FOR USE IN LINER ANCHOR TRENCHES
9	ROAD WEARING COARSE	WELL GRADED SANDY GRAVEL
10	RIPRAP	COMPETENT ROCK FROM EXCAVATIONS
11	ORE	CRUSHED ORE MATERIAL FOR HEAP LEACHING

FILL NOTES:
1) OVERLINER DRAIN FILL TO BE PLACED IN A SINGLE LOOSE LIFT OF 0.6 m (MINIMUM) ON THE UPPER PAD AREAS AND 1.0 m (MINIMUM) IN THE IN-HEAP POND AREAS.
2) COMPACTED ROCKFILL THICKNESS AND COMPACTION DEPENDING ON AVAILABLE MATERIALS AND RESULTS OF LARGE SCALE TEST FILLS CONDUCTED BY THE ENGINEER DURING CONSTRUCTION, AS REQUIRED BY THE SPECIFICATIONS.
3) SEE CONSTRUCTION COMPLETION REPORT FOR FINAL CRITERIA.

TYPICAL IN-HEAP POND SUMP SECTION (L, --)

TYPICAL IN-HEAP POND SUMP SECTION (M, --)

CONFIGURATION AND ELEVATIONS SHOWN ARE FROM IFC AND ARE FOR REFERENCE ONLY, REFER TO 05-04 FOR AS-BUILT CONDITIONS

THIS DRAWING MAY HAVE BEEN REDUCED OR ENLARGED. ALL FRACTIONAL SCALE NOTATIONS INDICATED ARE BASED ON ORIGINAL FORMAT DRAWINGS.

NOTES:
1. SEE DRAWING EGHLF-XD-00-02 FOR GENERAL NOTES, ABBREVIATIONS, LEGEND AND FILL TYPES.
2. RUB SHEET SHALL BE INSTALLED UNDER EACH STEEL CASING WITH DIRECT CONTACT TO THE LINER. RUB SHEET SHALL CONSIST OF A 16 OZ. NON-WOVEN GEOTEXTILE AND AN ADDITIONAL LAYER OF 2 mm (80-mil) DOUBLE-SIDE TEXTURED LLDPE GEOMEMBRANE PLACED BENEATH EACH PUMP CASING FOR LINER PROTECTION. TEMPORARILY SECURE RUB SHEET WITH SAND BAGS AS NEEDED.
3. 2 m LONG CONCRETE FILLED STEEL PIPE ANCHOR POSTS (EACH SIDE OF PUMP CASING) EMBEDDED 0.9 m INTO CONCRETE ANCHOR TO INHIBIT LATERAL MOVEMENT AND VERTICAL SETTLEMENT OF RISER.
4. ALL SOLID PIPE FITTINGS AND CONNECTIONS TO CONFORM TO AWWA C-906 STANDARDS.
5. INSTALL 12.5 mm (0.5") THICK STEEL PLATES ON TOP OF LINER TO PROTECT DURING CLOSURE DRILLING. STEEL PLATES ARE TO BE UNDERLAIN WITH CONVEYOR BELT MATERIAL OR 16 OZ. NON-WOVEN GEOTEXTILE AND THE EDGES BEVELLED TO PREVENT PUNCTURING OF LINER. STEEL PLATE INSTALLED IN CLOSURE SUMP IS TO INCLUDE AN ANGLE AT THE BOTTOM TO IDENTIFY TERMINATION POINT FOR DRILLING. STEEL PLATES ARE TO BE SPACED 0.2 m APART TO ALLOW ROOM FOR LINER SYSTEM BETWEEN THEM.
6. FREE-FLOATING (LOW FRICTION) PIPE SUPPORT TO BE INSTALLED AT TOP OF RISER TO ALLOW FOR THERMAL EXPANSION/CONTRACTION WHILE INHIBITING LATERAL MOVEMENT AND VERTICAL SETTLEMENT.
7. ALL CONNECTIONS BETWEEN PE AND STEEL PIPE (AND OTHER CONNECTIONS AS IDENTIFIED BY THE FIELD ENGINEER) SHALL BE COMPLETELY AND SECURELY WRAPPED WITH GEOCOMPOSITE TO AT LEAST 500 mm ON BOTH SIDES OF THE CONNECTIONS.

PLS SUMP GEOMETRY DETAIL (26, 04-01)

PLS CASING AND MANIFOLD DETAIL (27, -)

TYPICAL CASING DETAIL (28, -)

NOTES:
1. SEE DRAWING EGHLF-XD-00-02 FOR GENERAL NOTES, ABBREVIATIONS, LEGEND AND FILL TYPES.
2. RUB SHEET SHALL BE INSTALLED UNDER EACH STEEL CASING WITH DIRECT CONTACT TO THE LINER. RUB SHEET SHALL CONSIST OF A 16 OZ. NON-WOVEN GEOTEXTILE AND AN ADDITIONAL LAYER OF 2 mm (80-mil) DOUBLE-SIDE TEXTURED LLDPE GEOMEMBRANE PLACED BENEATH EACH PUMP CASING FOR LINER PROTECTION. TEMPORARILY SECURE RUB SHEET WITH SAND BAGS AS NEEDED.
3. INSTALL 12.5 mm (0.5") THICK STEEL PLATES ON TOP OF LINER TO PROTECT DURING CLOSURE DRILLING. STEEL PLATES ARE TO BE UNDERLAIN WITH CONVEYOR BELT MATERIAL OR TWO LAYERS OF 12 OZ. NON-WOVEN GEOTEXTILE AND THE EDGES BEVELLED TO PREVENT PUNCTURING OF LINER. STEEL PLATE INSTALLED IN CLOSURE SUMP IS TO INCLUDE AN ANGLE AT THE BOTTOM TO IDENTIFY TERMINATION POINT FOR DRILLING. STEEL PLATES ARE TO BE SPACED 0.2 m APART TO ALLOW ROOM FOR LINER SYSTEM BETWEEN THEM.
4. FREE-FLOATING (LOW FRICTION) PIPE SUPPORT TO BE INSTALLED AT TOP OF RISER TO ALLOW FOR THERMAL EXPANSION/CONTRACTION WHILE INHIBITING LATERAL MOVEMENT AND VERTICAL SETTLEMENT.
5. ALL CONNECTIONS BETWEEN PE AND STEEL PIPE (AND OTHER CONNECTIONS AS IDENTIFIED BY THE FIELD ENGINEER) SHALL BE COMPLETELY AND SECURELY WRAPPED WITH TWO LAYERS OF 12 OZ. GEOTEXTILE TO AT LEAST 500 mm ON BOTH SIDES OF THE CONNECTIONS.

DRAWING NOTES:

1. This drawing represents the 1.0 meter cover of ODF required on top of the BBQ Grill. Targeted elevation on top of the 450mm ADS Perforated pipes (blue) was 916.1m.
2. The green lines represent the 450mm HDPE Solid pipes.
3. The blue lines represent the 450mm ADS Perforated pipes.
4. The orange lines represent the 250mm ADS Perforated pipes.
5. The red lines represent the 100mm ADS Perforated pipes.
6. The magenta line represent the pre-installed manifold.
7. The dashed lines represent the portion of the pipes that is buried.
8. The continuous lines represent the portion of the pipes that is still exposed.
