AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	1406006
Client:	Victoria Gold	**Date:**	Sept. 21, 2017
Construction:	JDS Mining	**Inspection Number:**	FND01
BGC Personnel:	Tony Monasterio	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 1, and 2, Survey drawings attached.
Approval/Rejection Observations and Recommendations:
BGC requested additional excavation in select areas suspected to not be Type 3 bedrock in both Sections 1 and 2. Upon further excavation, parent rock fabric was observed and the area was approved. Some discontinuous areas of ice remain, and are impractical to remove. Sections 1 and 2 have been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	☐ Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	

PHOTOGRAPHS

Photo 1: North area of Section 1 approved under FND01

Photo 2: North half of Section 2 approved under FND01. The area uphill of approximately the red line was approved. Note that in areas of stronger rock, the slope cannot be cleaned as easily as soft rock and initially appears to not be excavated to bedrock. These areas were investigated and were found to be sufficient.

BGC Personnel:	Tony Monasterio	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 3, Survey drawings attached.
Approval/Rejection Observations and Recommendations:
BGC requested additional excavation in select areas suspected to not be Type 3 bedrock in both Sections 2 and 3. Excavation continued until parent rock fabric was observed and the area was approved. There is less ground ice in Section 3 than previously encountered, and mostly on the north side of the section. Section 3 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	☐ Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	

PHOTOGRAPHS

Summary and Observations

Pelly area(s) approved by this document: Section 4, Survey drawing attached.
Approval/Rejection Observations and Recommendations:
BGC requested additional excavation in select areas suspected to not be Type 3 bedrock. Excavation continued until parent rock fabric was observed and the area was approved. Again, ground ice was limited to the north third of the section. Ground temperatures in the north were -3 to 0°C; the south was much warmer, ranging from +2 to +5°C. Section 4 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	☐ Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible

Summary and Observations

Pelly area(s) approved by this document: Section 5, Survey drawing attached.
Approval/Rejection Observations and Recommendations:
BGC approved a portion of the west side of the ridge running down the center of Ann Gulch. Small areas which require additional cleaning or excavation near the bottom of the slope were excluded from this approval and will be attended to by Pelly and included in the next approval.
Ground ice was not encountered on the slope.
Section 4 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Summary and Observations

Pelly area(s) approved by this document: Section 8, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- Ground ice was encountered on the northern ¼ of the approved area. It was removed to hard, competent bedrock. Ground temperature measurements are included in Ground Temperature Measurement Log Sec08-01.
- As with all other approved sections, Section 8 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Section 8 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date:**	April 26, 2018
Construction:	JDS Mining	**Inspection Number:**	FND09
BGC Personnel:	Tony Monasterio	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 09, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- Areas was cleared in October 2017. However, BGC was demobilized before approval could be completed. BGC has inspected this area on April 26 and has approved it.
- Section 09 will require surface cleaning as ice removal activities in April 2018 has generated mud from pulverization of the upper portion (5 to 20 cm) of type 3 foundation. The area should be resurveyed once cleaning is complete and the final limits should be amended to this report, if needed.
- Section 09 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date:**	May 2, 2018
Construction:	JDS Mining	**Inspection Number:**	FND10
BGC Personnel:	Roy Morlan	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 10, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- Ground ice was encountered through most of the area. Foundation was over excavated in some areas between 30 to 50 cm as loose material at the surface was frozen to stronger material below and all material would be dislodged in one large frozen chunk. Type 3 foundation rock left had visible ice between joints in some sections. Ground temperature was measured between -1 C to 2C in Section 10.
- Frozen areas of type 3 will be inspected again after thaw to ensure that they did not lose strength. If frozen foundation has become loose after thaw it will have to be removed.
- As with all other approved sections, Section 10 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Section 10 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	
☐	☐

PHOTOGRAPHS

Photo 1: Foundation excavation spoils.

Photo 2: Example of type 3 foundation with ice between the joints. In place strength will need to be re-evaluated after ice has thawed. Area may need additional cleaning of loose material after ice has thawed.

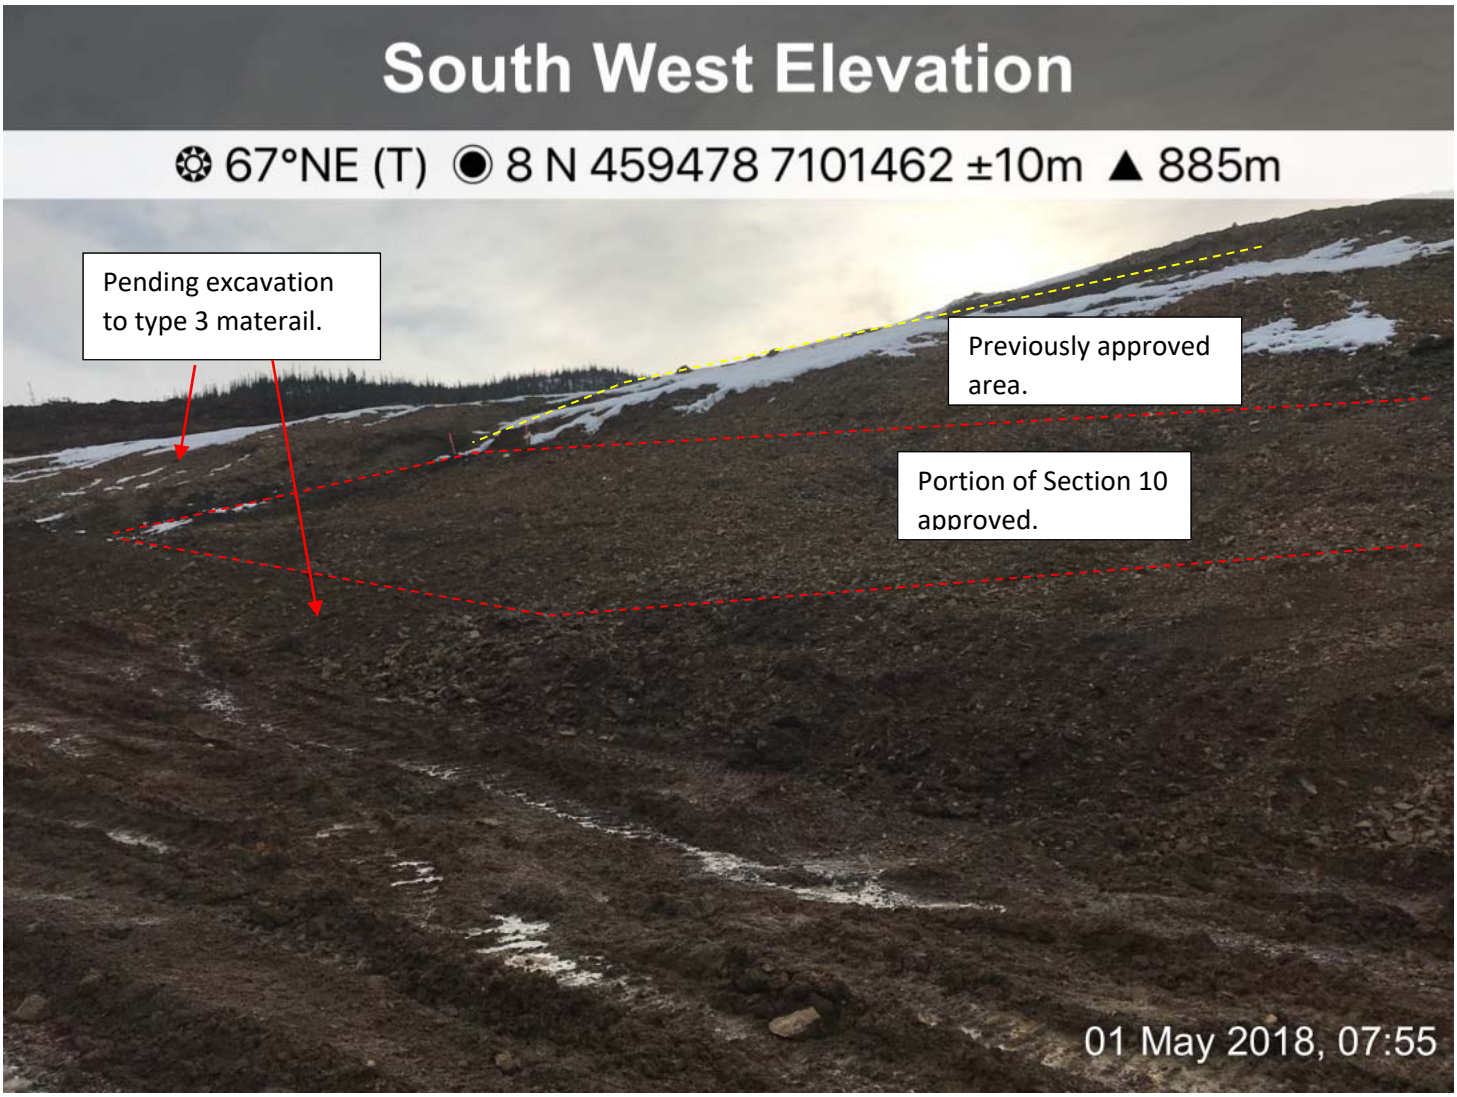

Photo 3: Portion of the area where type 3 foundation was approved in Section 10.

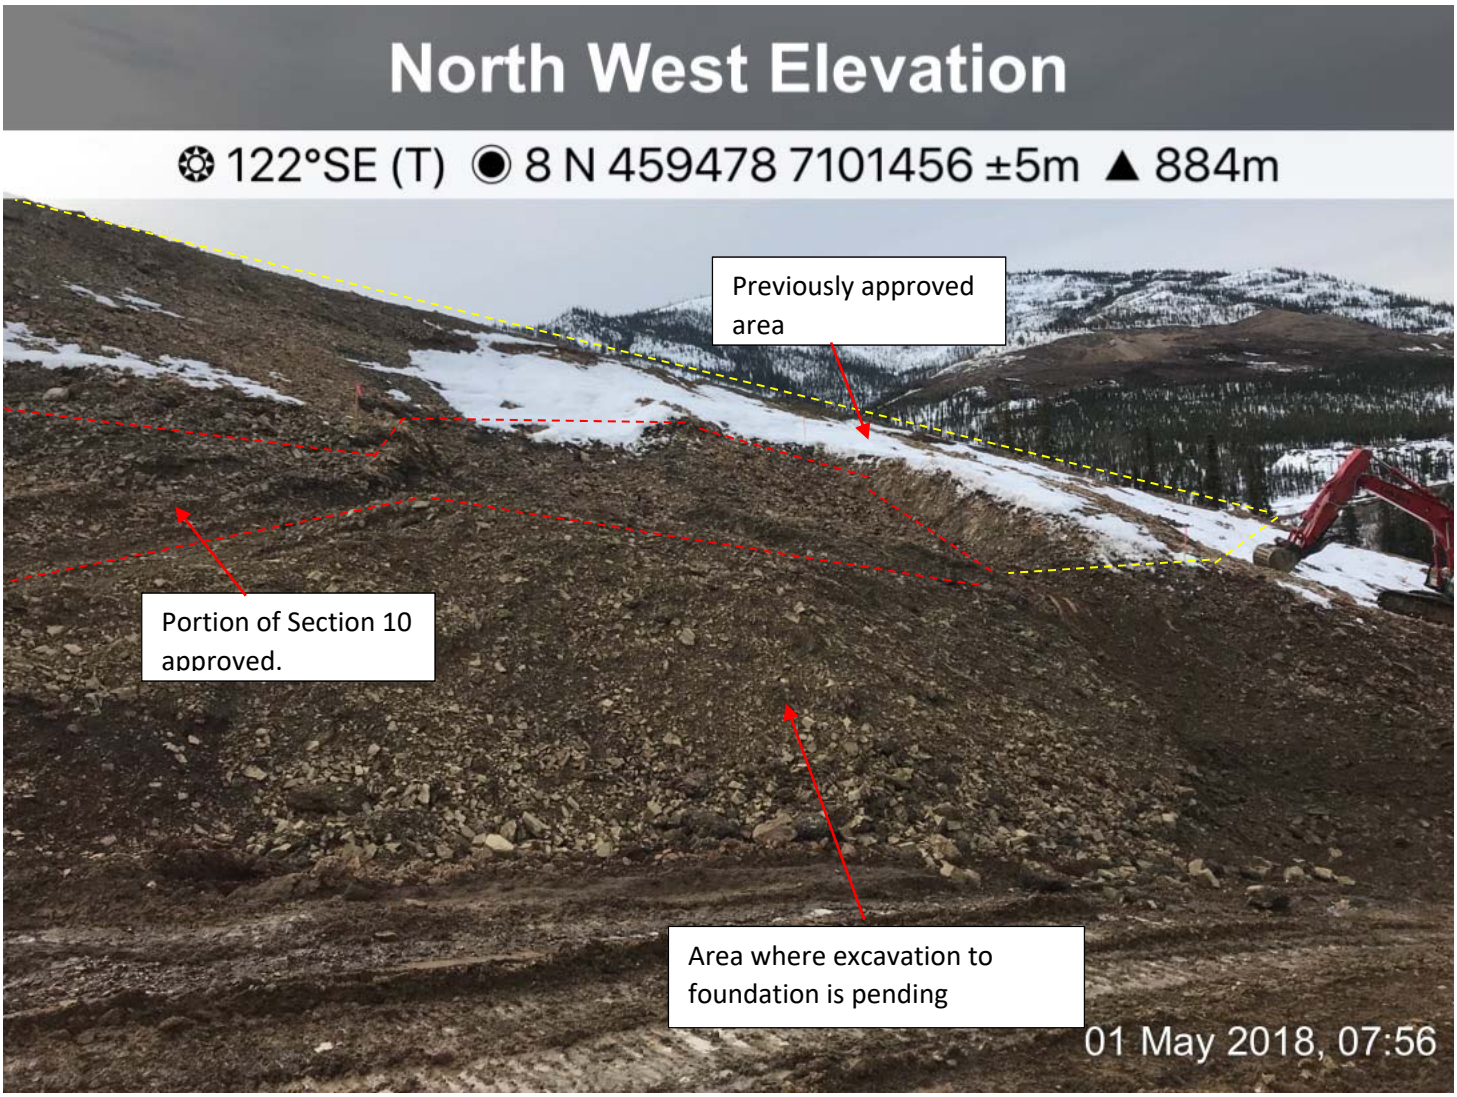

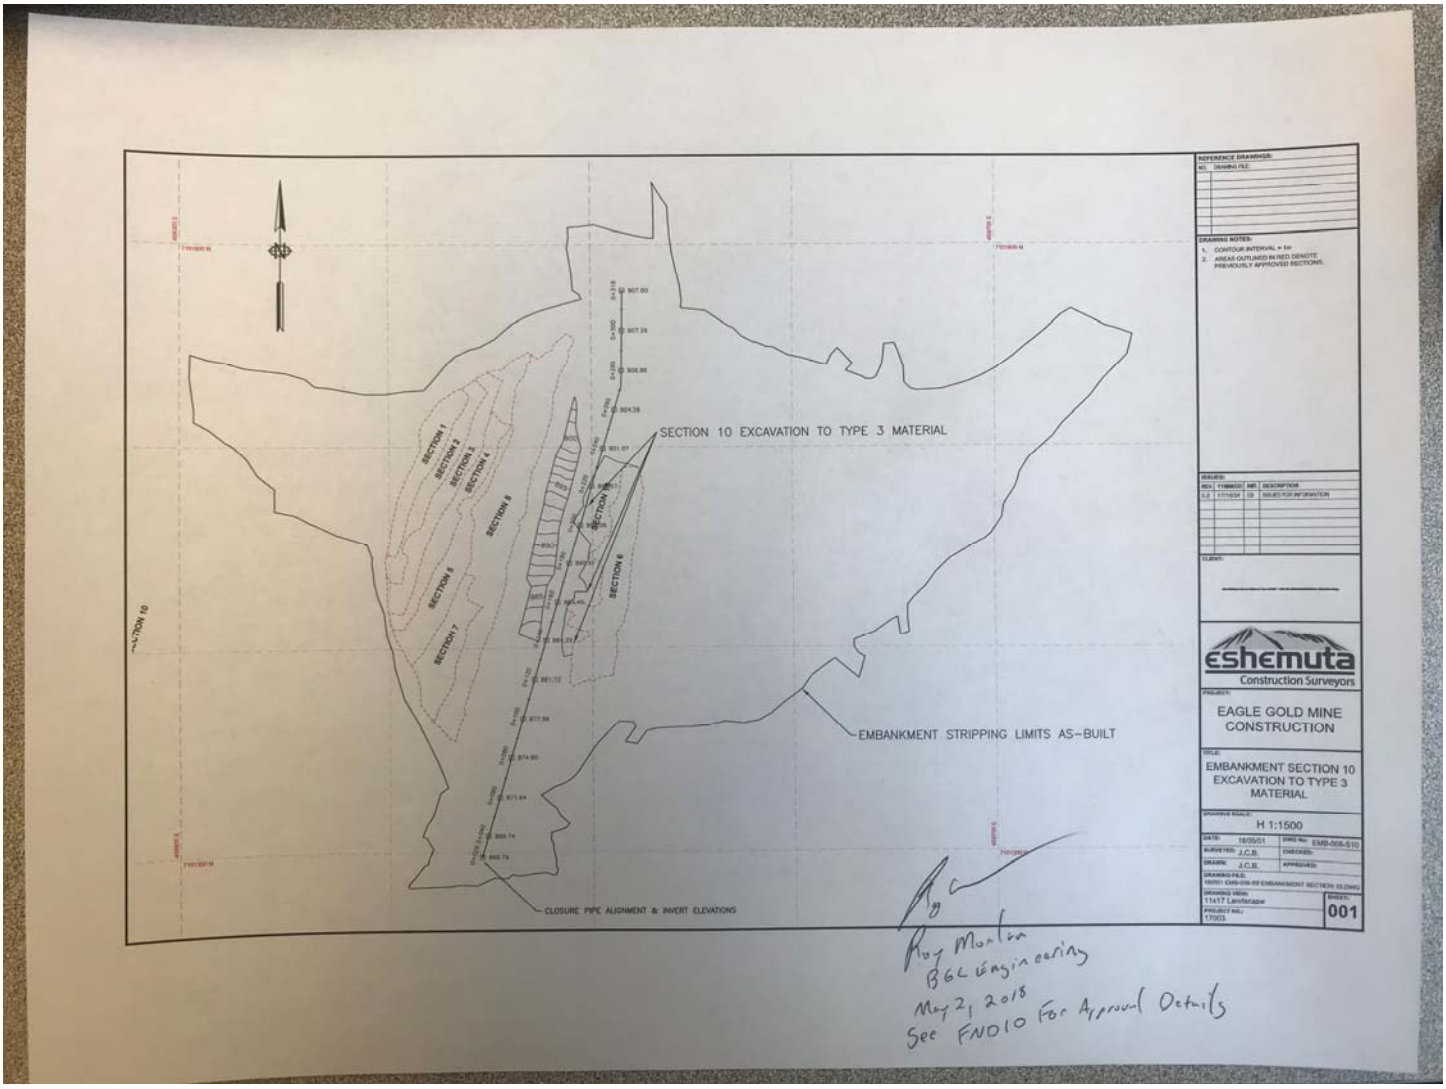

Photo 4: Remaining portion of Section 10 foundation approval.

AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date:**	May 15, 2018
Construction:	JDS Mining	**Inspection Number:**	FND14
BGC Personnel:	Roy Morlan	**Approved:**	Y / N

Summary and Observations

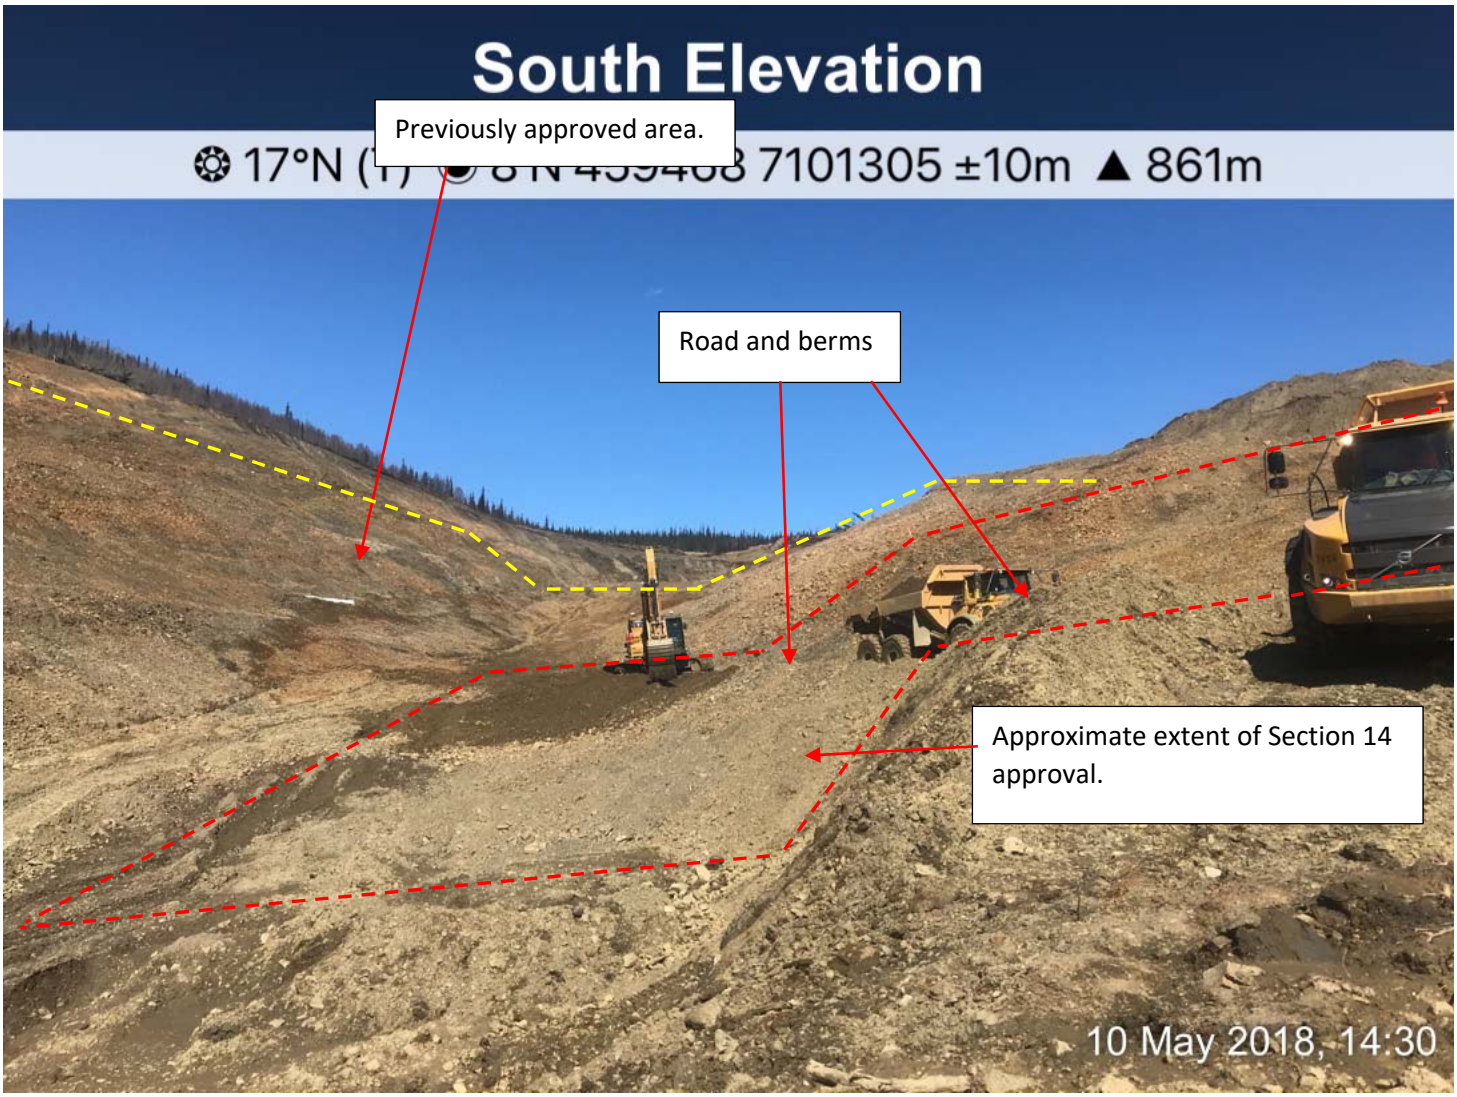
Pelly area(s) approved by this document: Section 14, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- As with all other approved sections, Section 14 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Portions of this section are approved on the condition that access roads and berms will be excavated prior to placement of embankment fill. Portions of the roads built directly into type 3 rock do not have to be removed. These structures were left in place by Pelly to allow access to the valley for transport of material.
- Section 14 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	
☐	☐

PHOTOGRAPHS



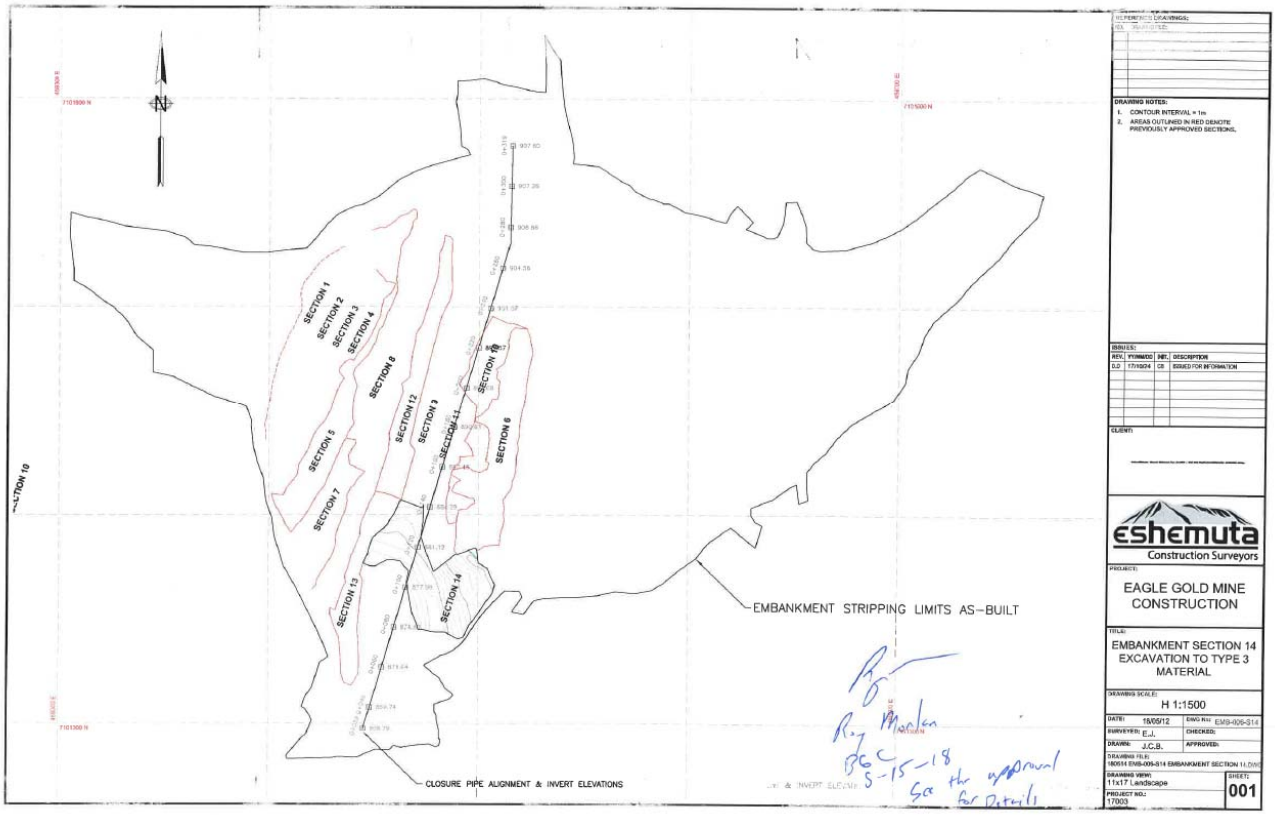


Photo 1: Photograph of Section 14 approved. Road and berms will have to be removed prior to placement of embankment fill.

Photo 2: Example of type 3 bedrock or better in Section 14.

Photo 3: Example of type 3 bedrock or better in Section 14.

Section 14 Foundation Approval Limits

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date:**	May 15, 2018
Construction:	JDS Mining	**Inspection Number:**	FND15
BGC Personnel:	Roy Morlan	**Approved:**	Y / N

Summary and Observations

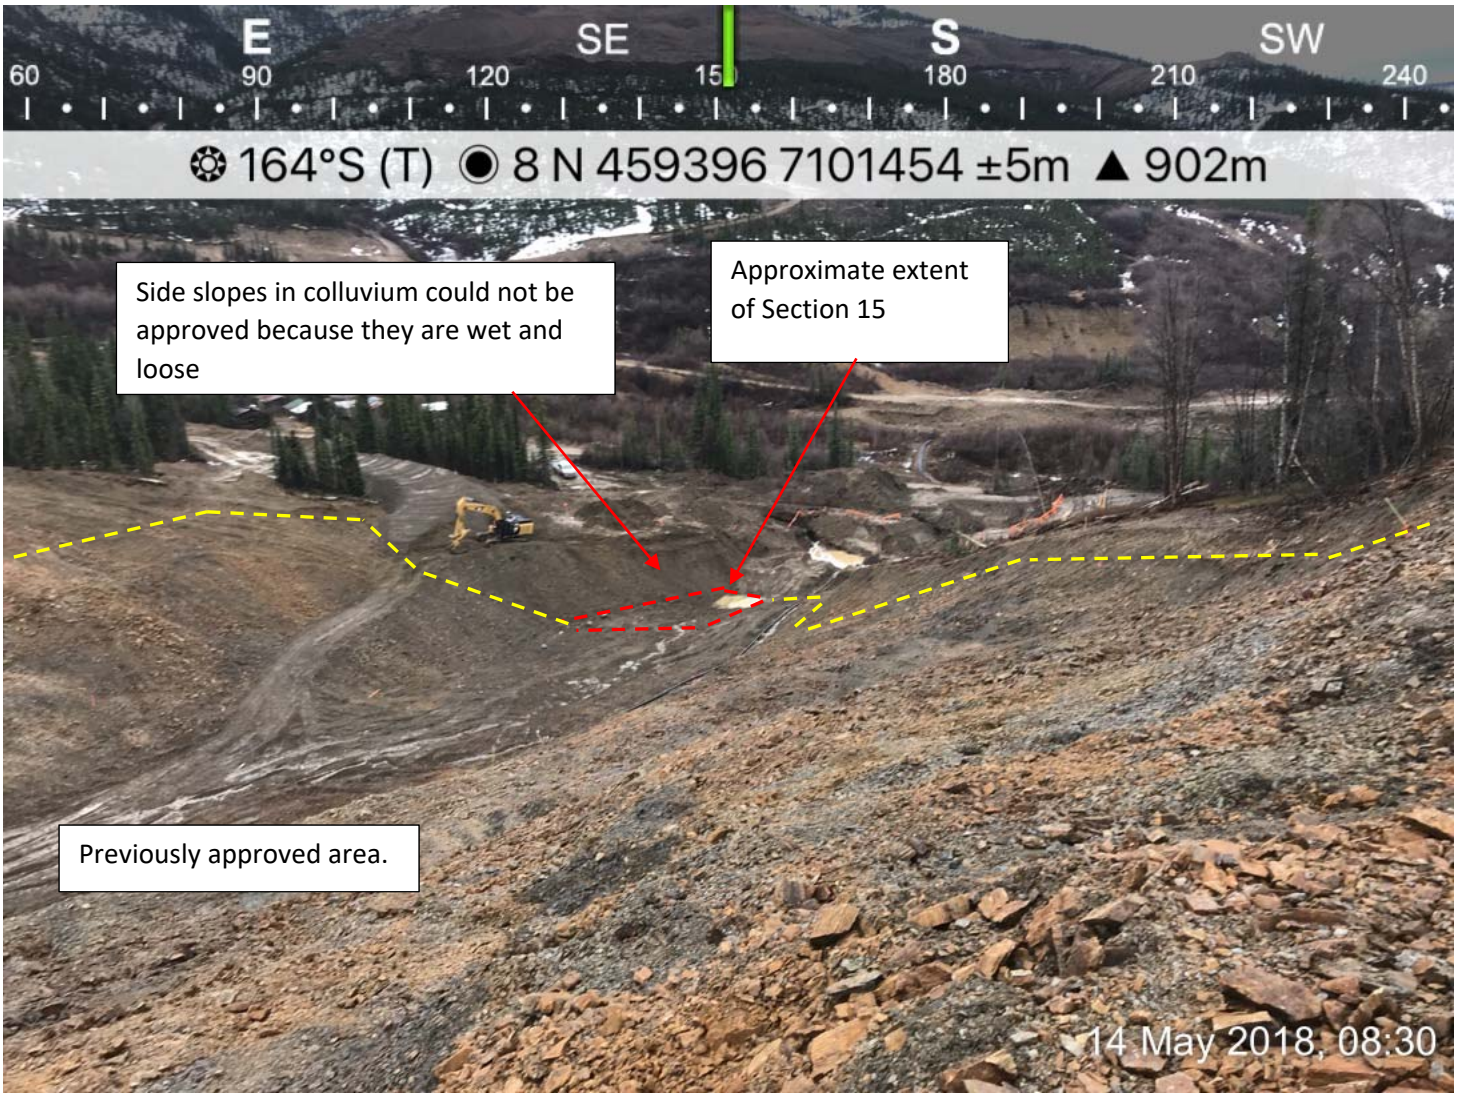
Pelly area(s) approved by this document: Section 15, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- As with all other approved sections, Section 15 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Slopes built in colluvium to key in the embankment toe were wet and loose and, therefore, could not be approved. Further excavation likely would not have resulted in drier, denser material because of the amount of water reporting to this area. Once water has been controlled in this areas the slopes can be re-inspected and determination of foundation treatment can be evaluated.
- Section 15 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	
☐	☐

PHOTOGRAPHS



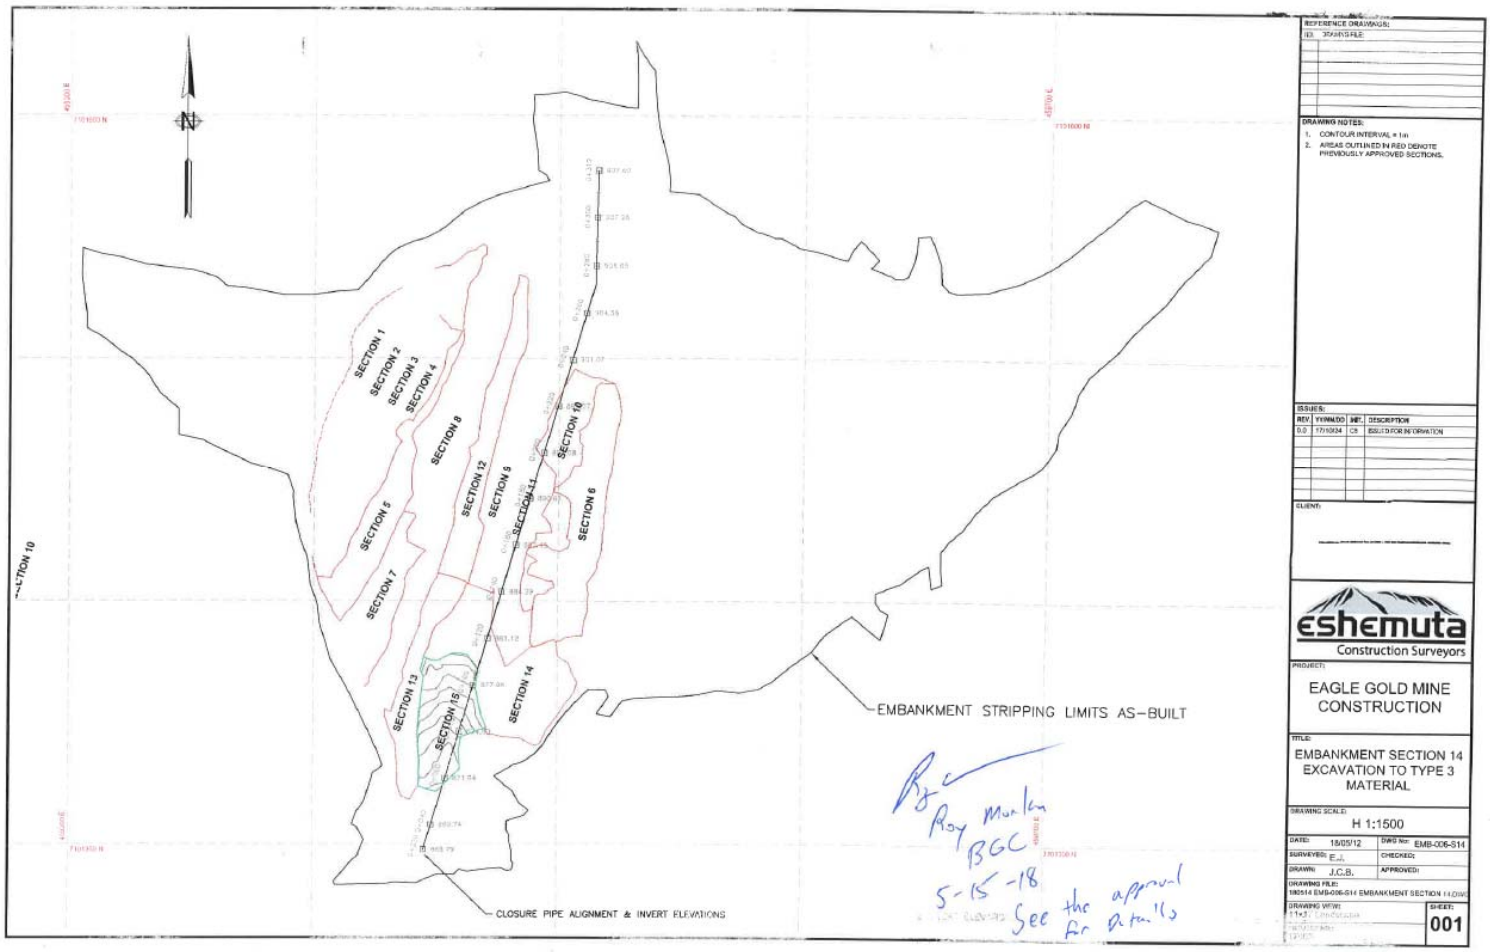


Photo 1: Photograph of Section 15 approved. Side slopes in colluvium were wet and loose. They could not be approved.

Photo 2: Example of type 3 bedrock being pulled apart by excavator at the bottom of Section 15.

Section 15 Foundation Approval Limits

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date:**	September 4, 2018
Construction:	JDS Mining	**Inspection Number:**	FND16 trough FND25
BGC Personnel:	Roy Morlan	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 16 through Section 25, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- As with all other approved sections, Sections 16 through 25 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Drains built in the foundation will be included in sperate approvals.
- Sections 16 through 25 have been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	

PHOTOGRAPHS

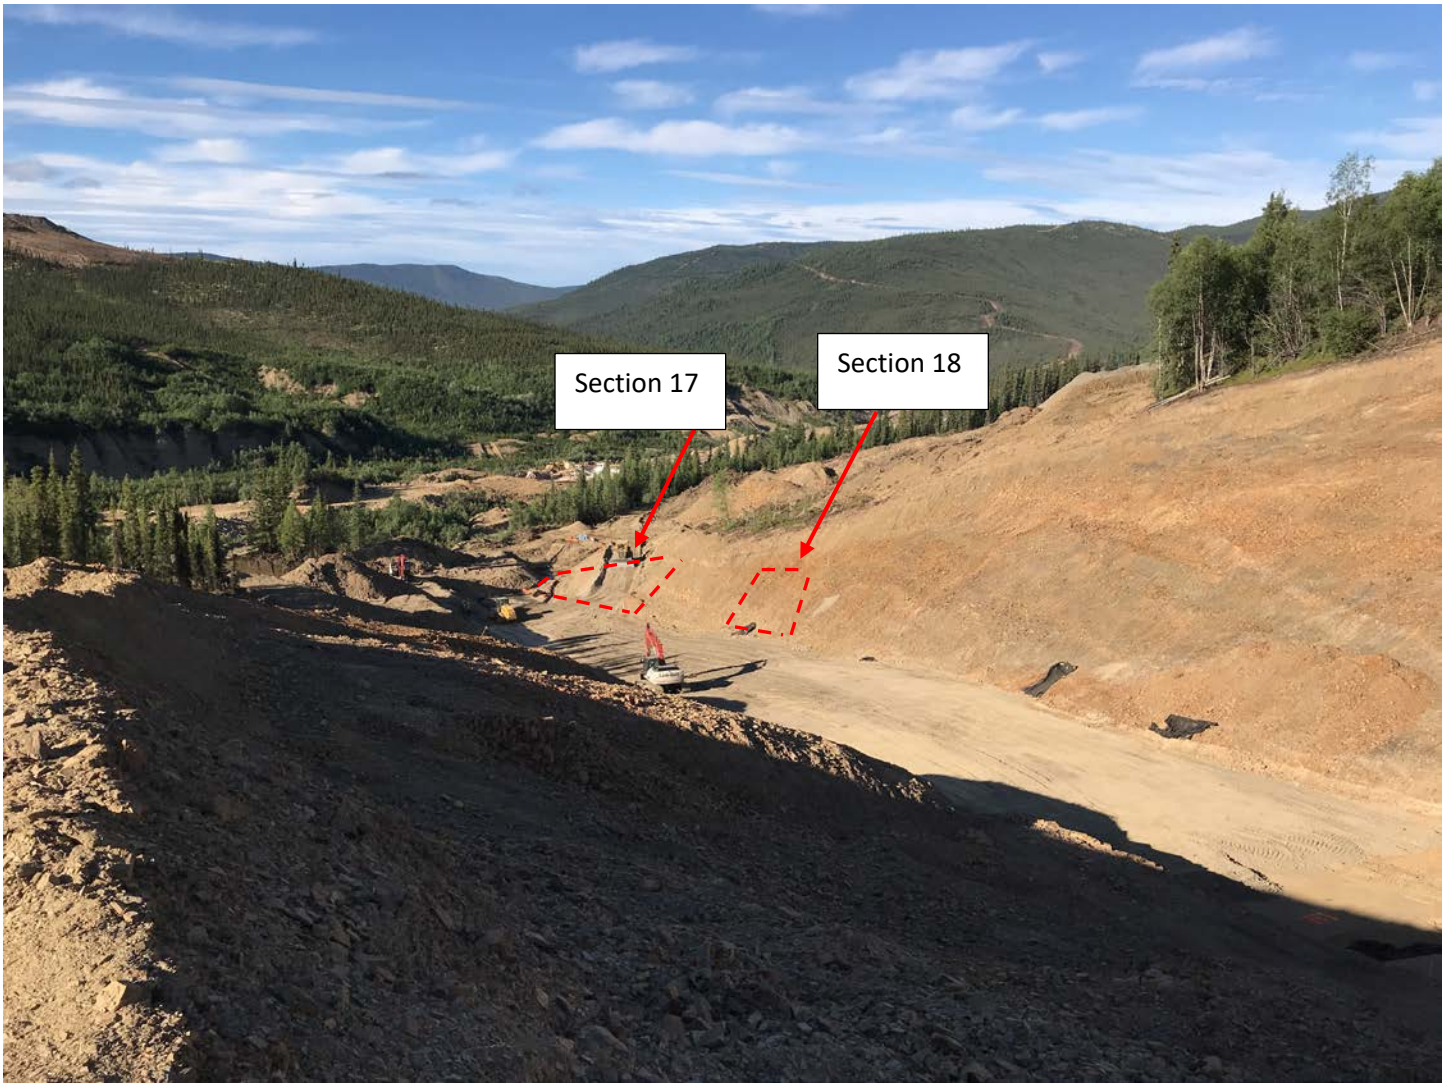

Photo 1: Photograph of Section 17 and 18 approved.

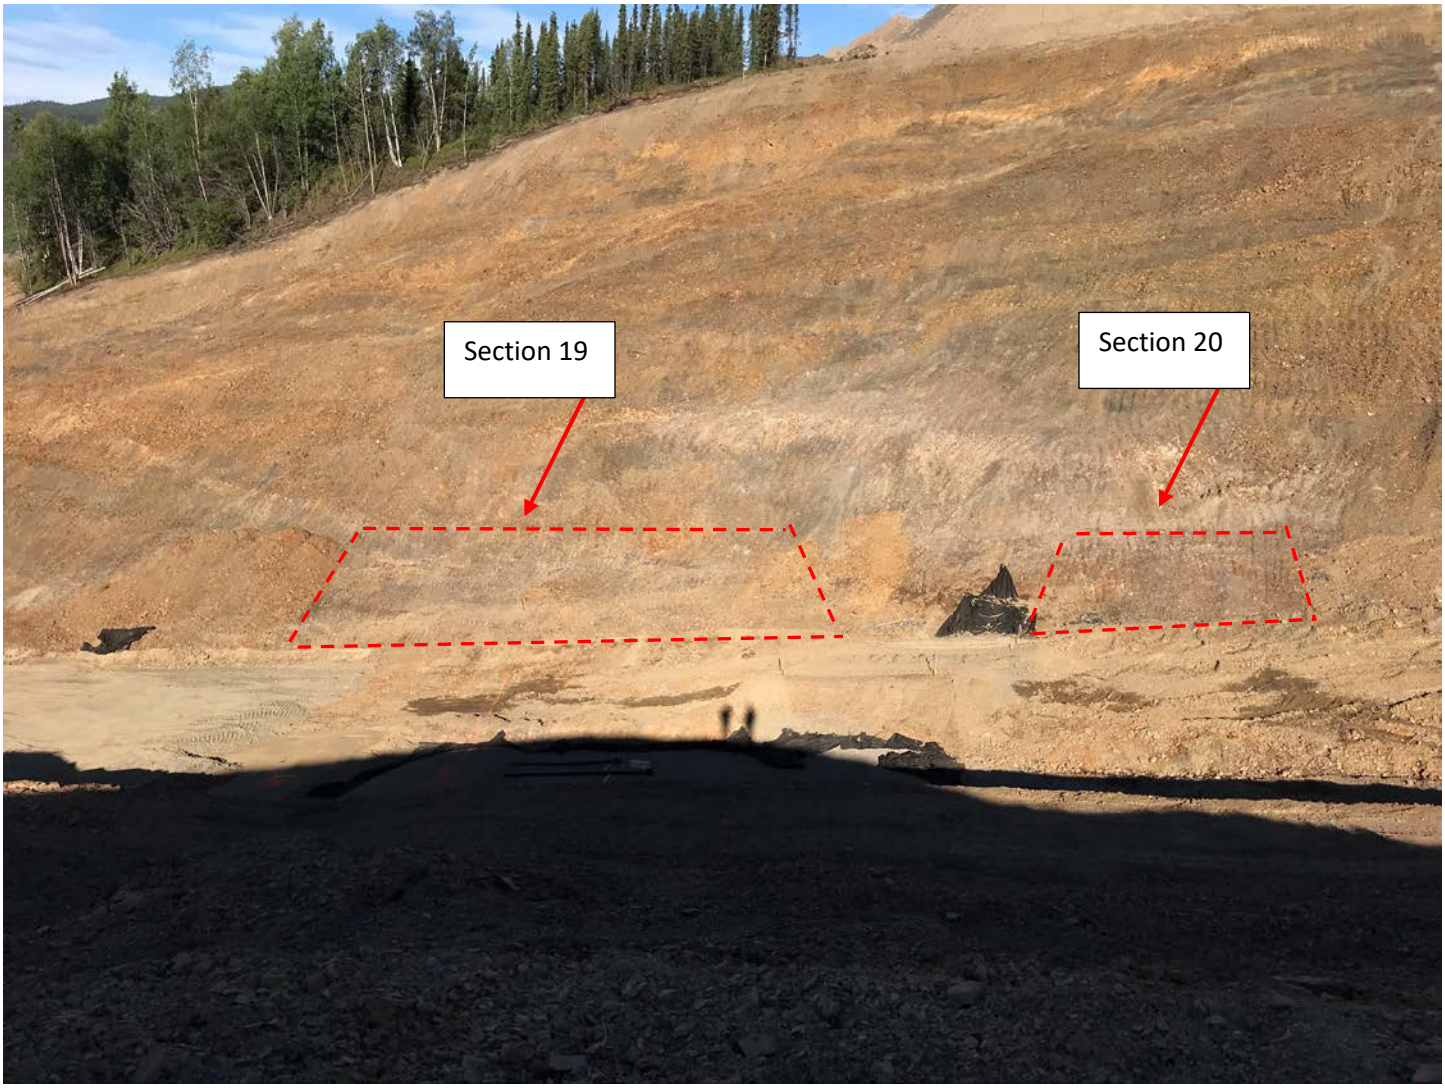

Photo 2: Photograph of Section 15 approved. Side slopes in colluvium were wet and loose. They could not be approved.

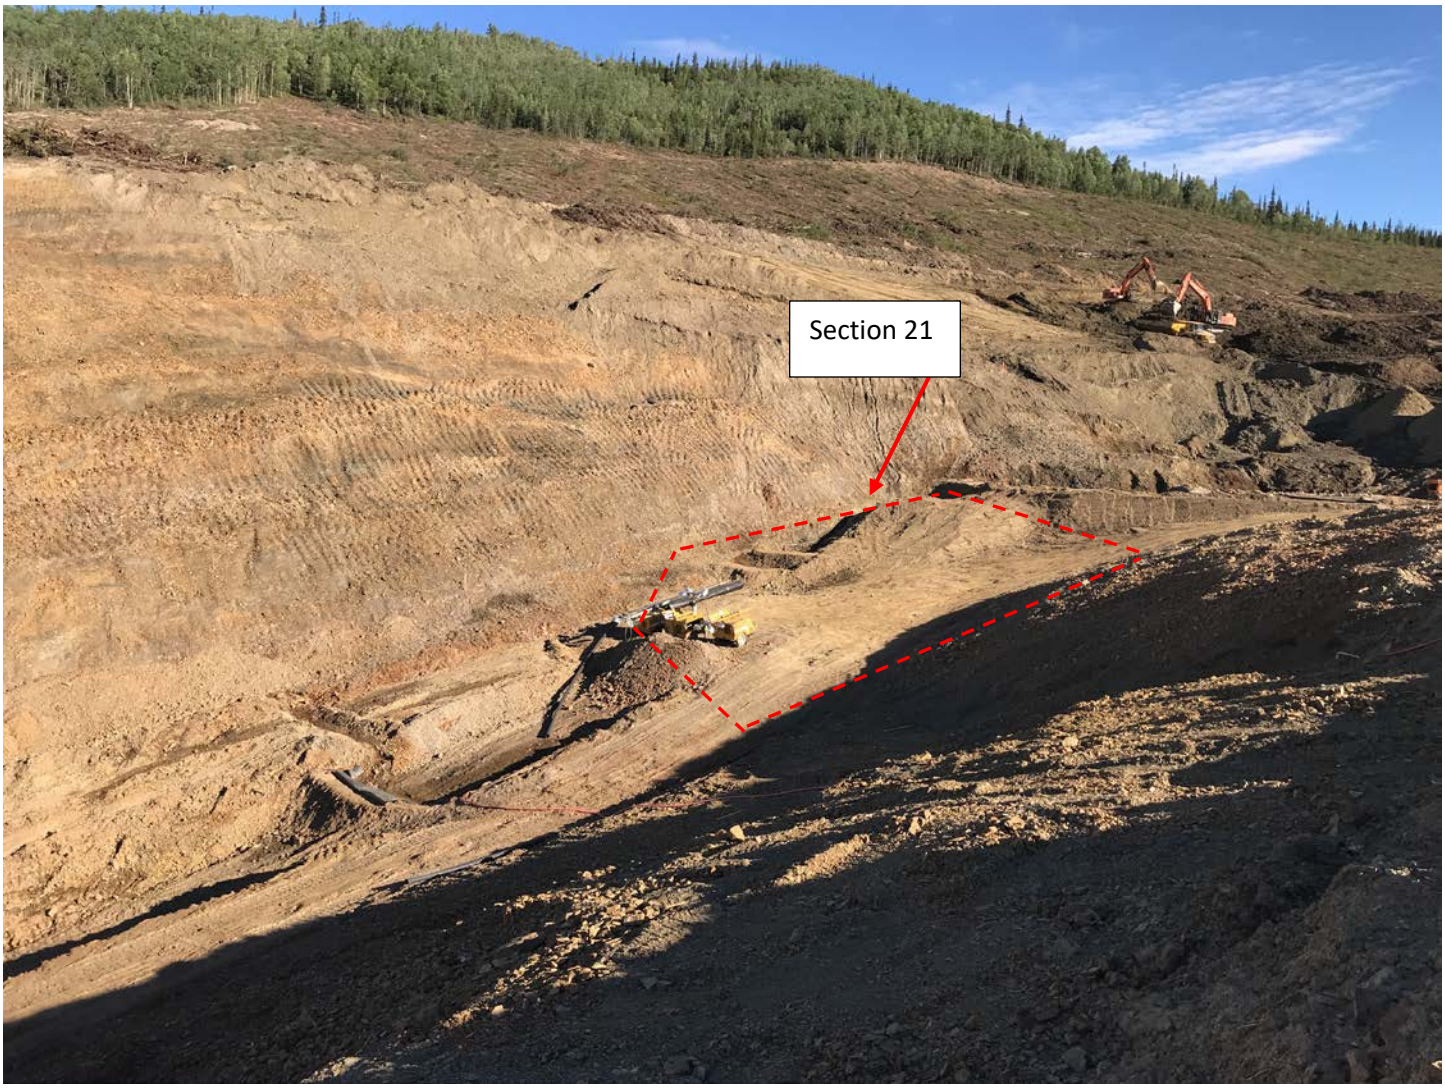

Photo 3: Photograph of Section 15 approved. Side slopes in colluvium were wet and loose. They could not be approved.

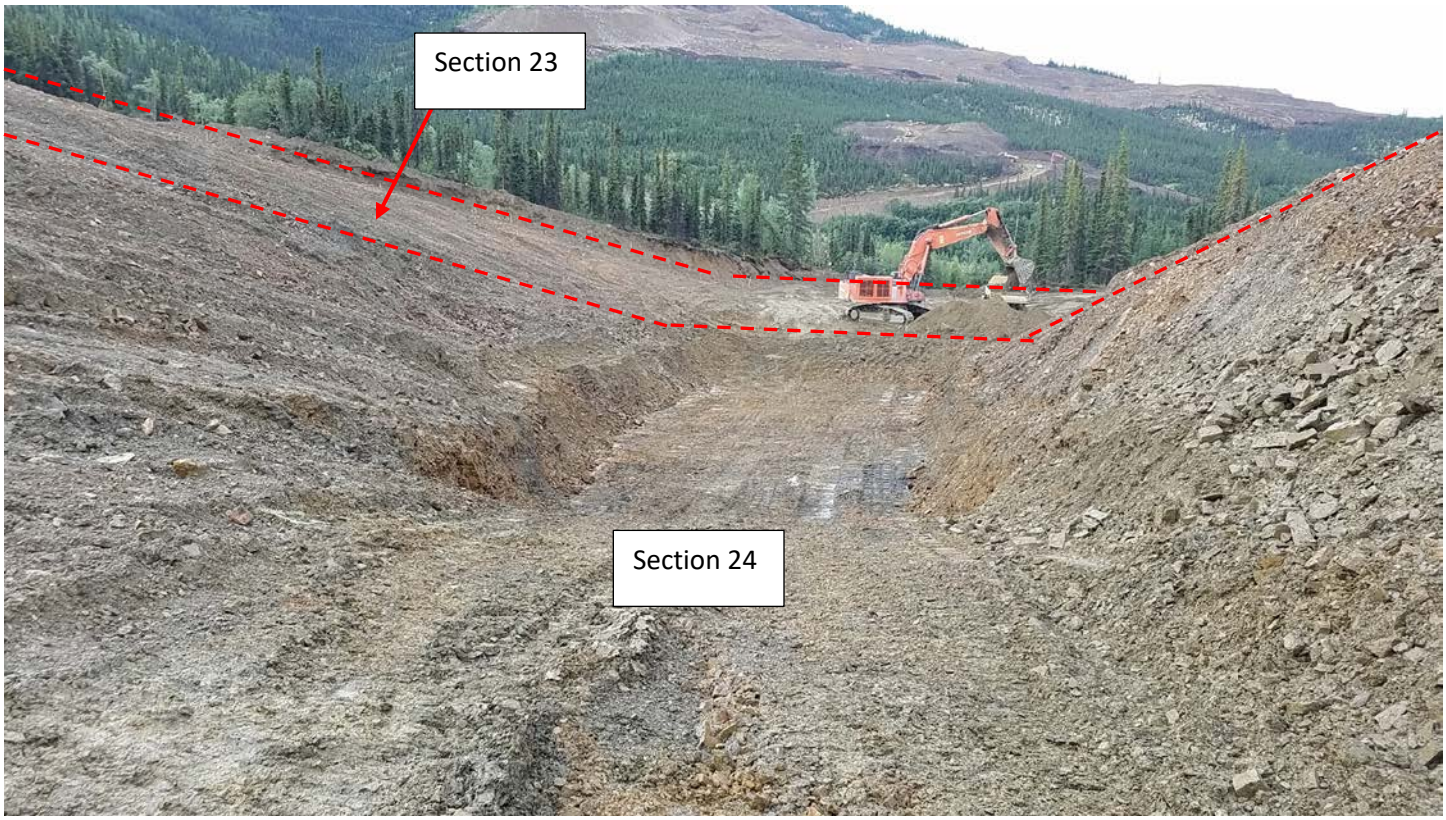

Photo 4: Section 23 and 24.

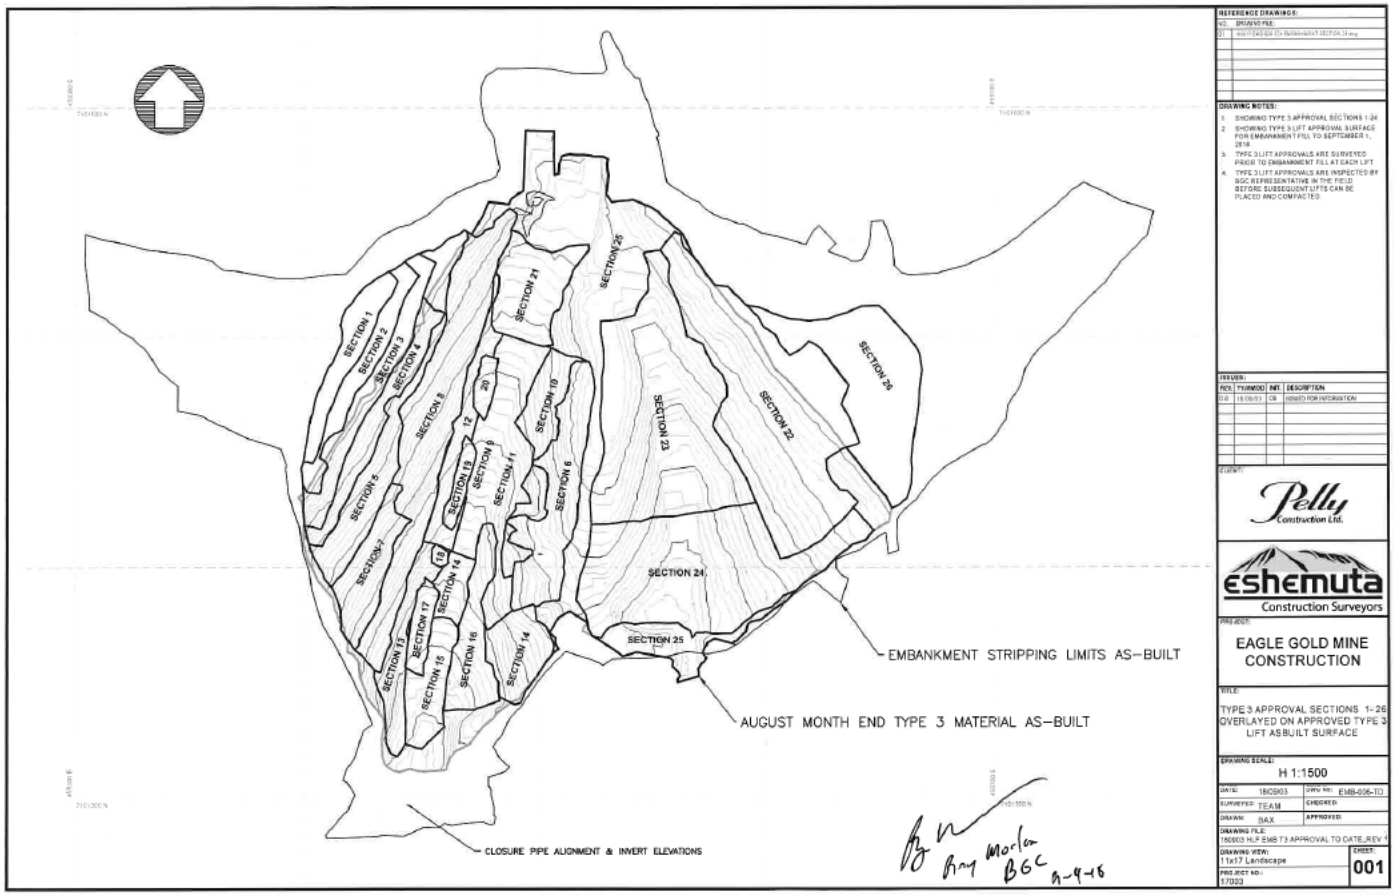

Figure 1: Approved Sections

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date:**	May 2, 2018
Construction:	JDS Mining	**Inspection Number:**	FND10
BGC Personnel:	Roy Morlan	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 10, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- Ground ice was encountered through most of the area. Foundation was over excavated in some areas between 30 to 50 cm as loose material at the surface was frozen to stronger material below and all material would be dislodged in one large frozen chunk. Type 3 foundation rock left had visible ice between joints in some sections. Ground temperature was measured between -1 C to 2C in Section 10.
- Frozen areas of type 3 will be inspected again after thaw to ensure that they did not lose strength. If frozen foundation has become loose after thaw it will have to be removed.
- As with all other approved sections, Section 10 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Section 10 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	
☐	☐

PHOTOGRAPHS

Photo 1: Foundation excavation spoils.

Photo 2: Example of type 3 foundation with ice between the joints. In place strength will need to be re-evaluated after ice has thawed. Area may need additional cleaning of loose material after ice has thawed.

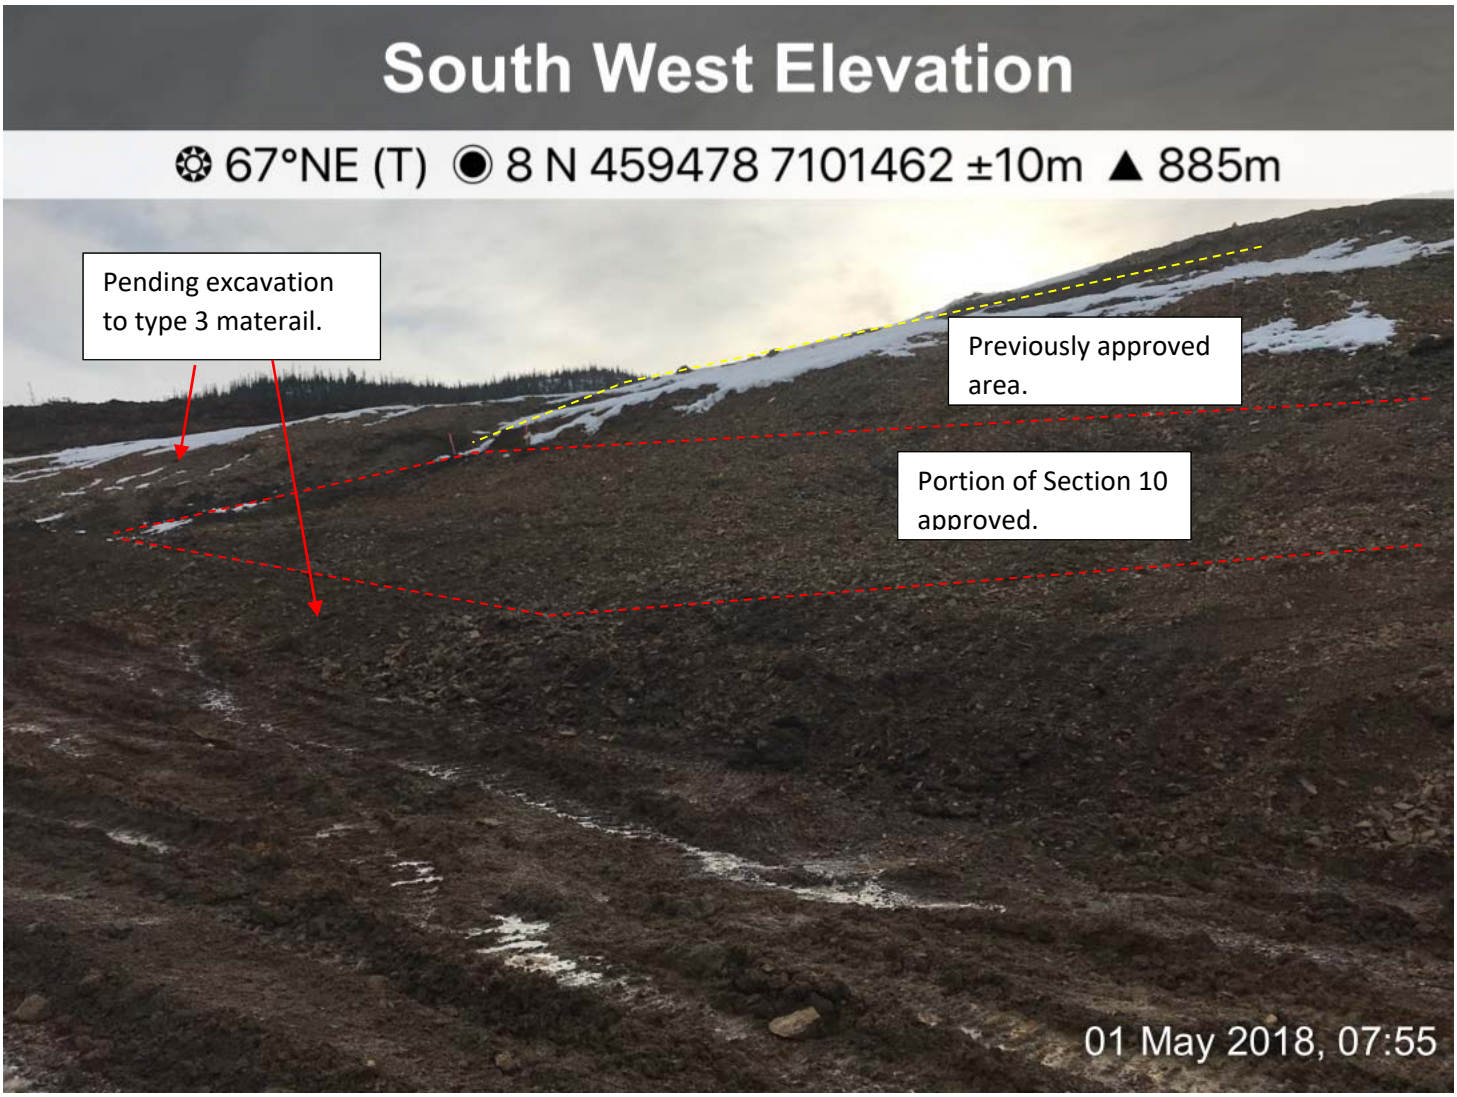

Photo 3: Portion of the area where type 3 foundation was approved in Section 10.

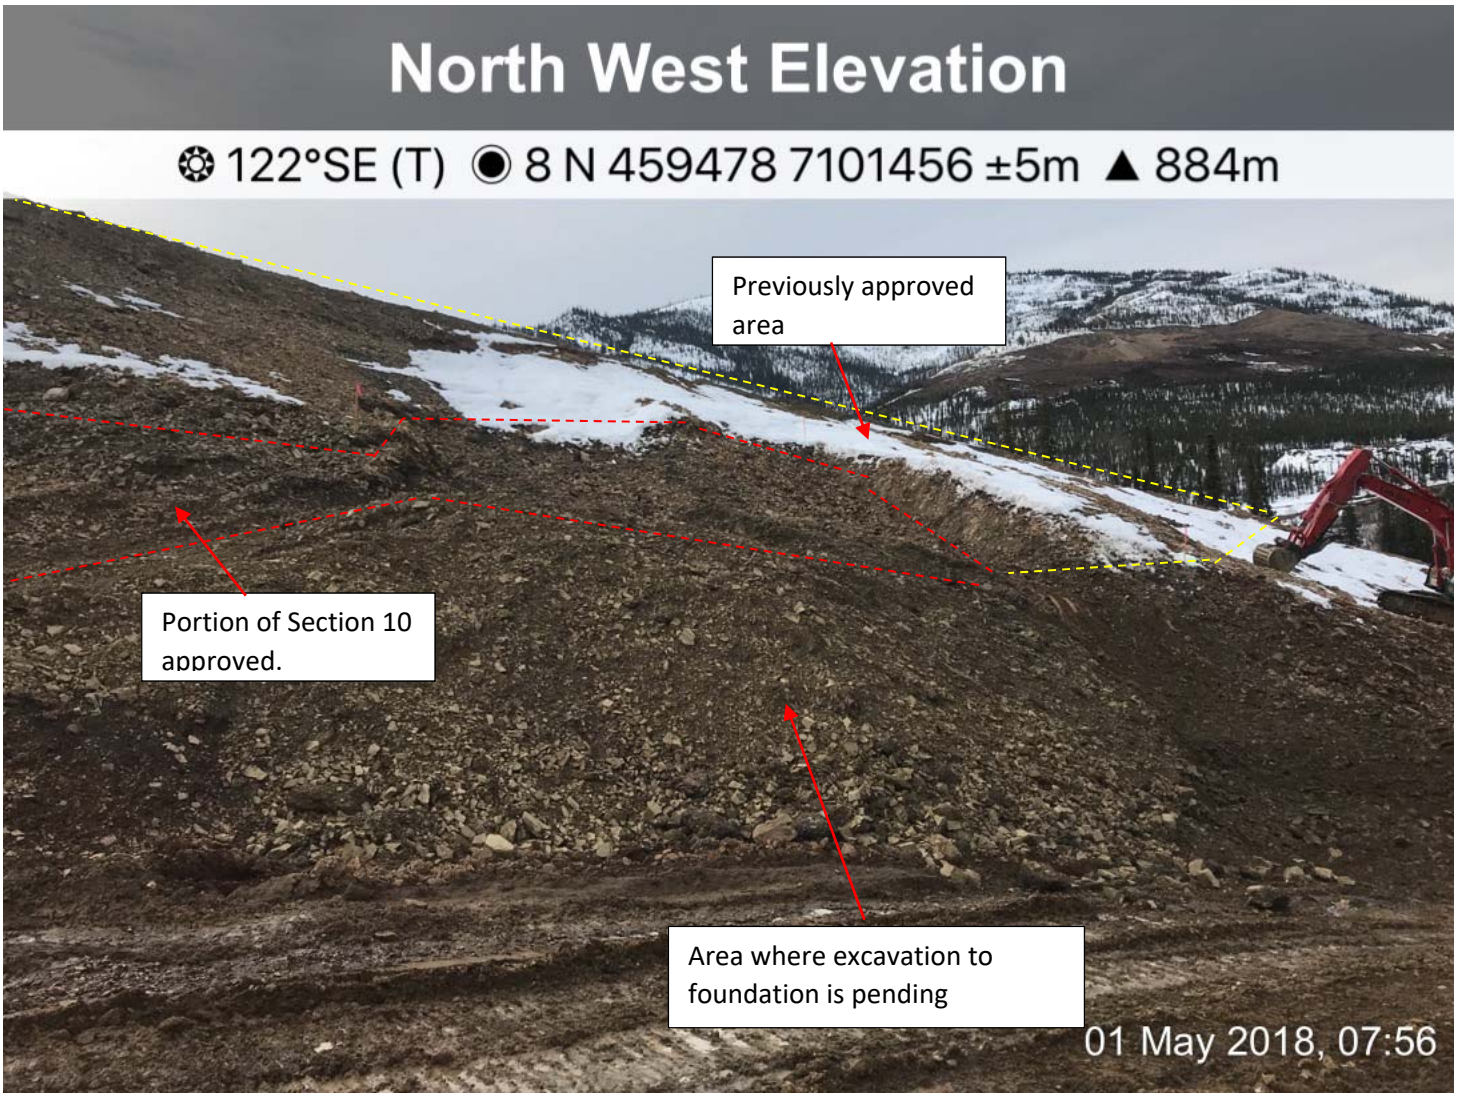

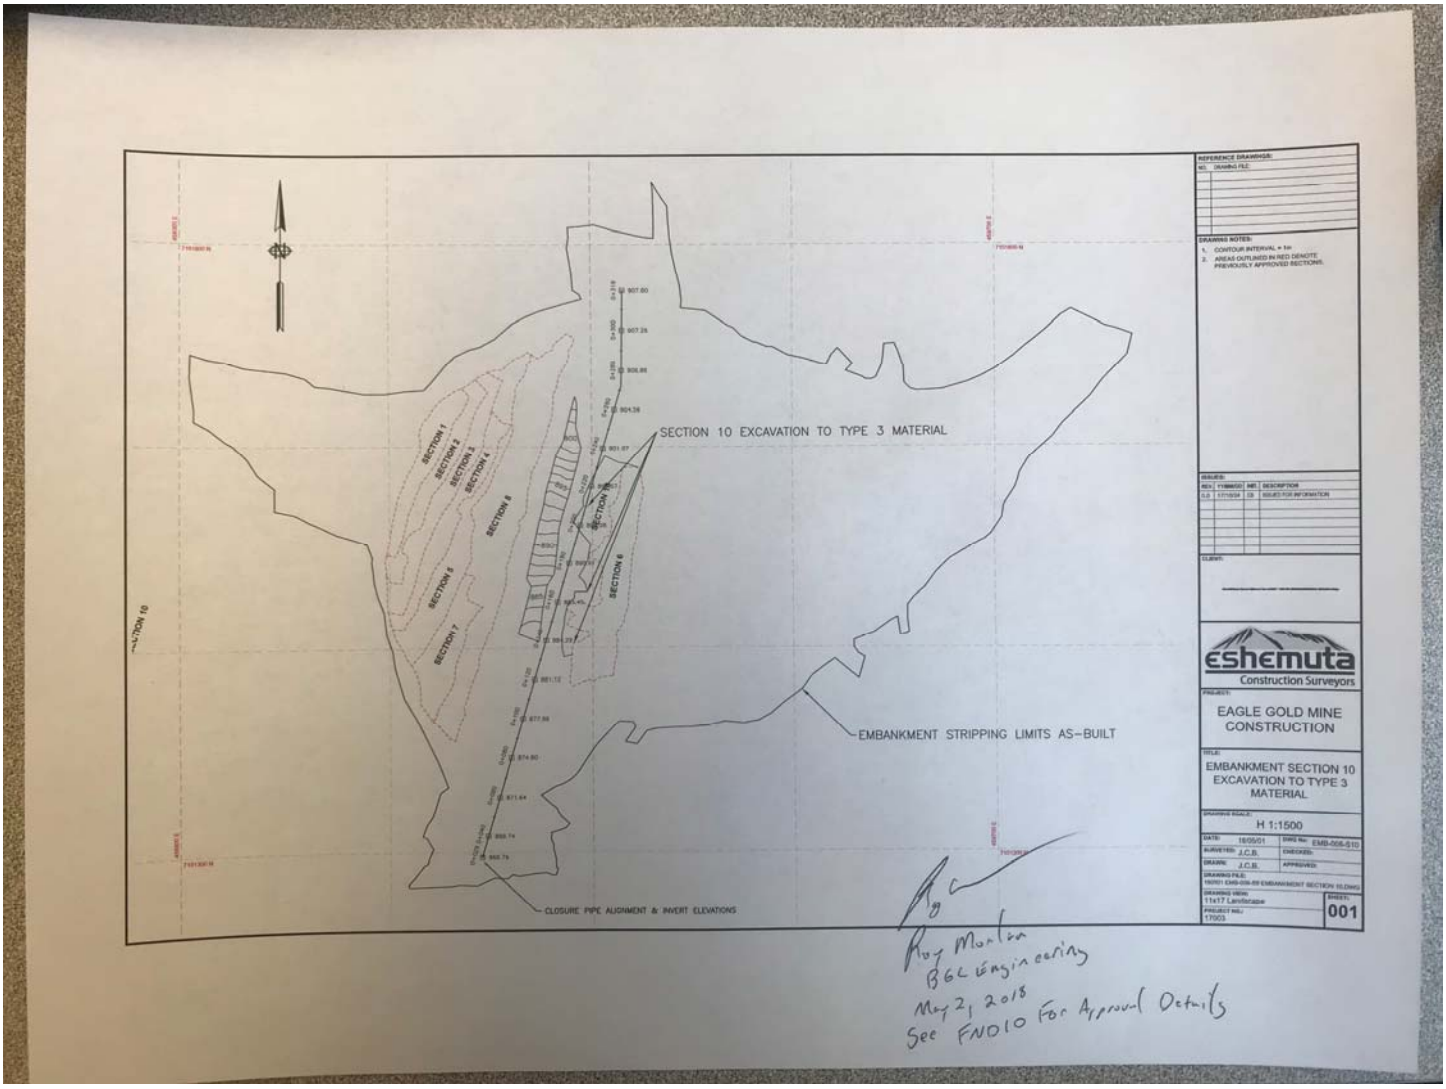

Photo 4: Remaining portion of Section 10 foundation approval.

Section 10 Foundation Approval Limits

* Field approval. Final approval dependant on as-built. ERM & Roy Morlan
* Field approval pending as-builts for finger drains
* Final approval requiring survey thickness of Drain rock.
* @ STN 1+10, a 50cm x 50cm piece of geotextile was cut-out, it will be heat-tac @ a later stage per BGC request
* BGC approved the use of mini-Hoe CAT304 working on the 0.5m of material 2 above the closed off geotextile.

DAILY REPORTS

BGC DAILY REPORTS

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	1406-006
Client:	Victoria Gold	**Date and Shift:**	September 10, 2017 Day Shift
Construction:	JDS Mining	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan		
Weather:	Cloudy and Rainy, 15°C to 8°C		

Summary and Observations

- Summary and Observations:
  - Seeps from ice melting was observed along upstream portion of embankment right abutment. (***Photo 1 and 2***).
  - Heavy rains have delayed the foundation excavation to Type 3 bedrock. A revised schedule is in the works, however, excavation is expected to begin within the next two to three days, weather permitting.
- Recommendations:
  - None

1) QA/QC Results:

- BGC Recommendations:
  - None.

2) Communications (no follow up required):

No.	Personnel	Description
1	BGC to JDS	BGC-01030: IFC Drawings (September 8, 2017) • EGHLF-XD-03-03_Rev 0_PHASE 1 UNDERDRAIN PIPING PLAN • EGHLF-XD-03-04_Rev 0_PHASE 1 UNDERDRAIN PIPING DETAILS • EGHLF-XD-03-05_Rev 0_CLOSURE PIPING PLAN AND PROFILE • EGHLF-XD-05-06_Rev 0_MONITORING VAULT DETAILS • EGHLF-XD-06-01_Rev 0_PHASE 1 PLS RECOVERY PIPING PLAN VIEW • EGHLF-XD-06-02_Rev 0_PHASE 1 PLS RECOVERY PIPING DETAILS SHEET 1 OF 2 • EGHLF-XD-06-03_Rev 0_PHASE 1 PLS RECOVERY PIPING DETAILS SHEET 2 OF 2
2	JDS to BGC	September 8, 2017 - JDS requested comment on two potential changes to the design. The first is related to moving the union between SR9 and SR11 header pipe. The second is related to reconfiguration of the closure drain piping. BGC has begun looking into responses and provided initial guidance. JDS is developing RFIs to allow for a formal response.

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	1406-006
Client:	Victoria Gold	**Date and Shift:**	September 11, 2017 Day Shift
Construction:	JDS Mining	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan		
Weather:	Cloudy, 14°C to 8°C		

Summary and Observations

- Summary and Observations:
  - Seeps observed yesterday observed within the dam footprint have reduced in surficial flow. Lower volume subterranean flow was observed daylighting in the valley bottom within the same drainage channels. Localized slope failures and washout were observed in the areas where seepage flow was noted. (***Photo 1***).
  - BGC met with Jason from Pelly. Pelly informed me that excavation to Type 3 rock would begin September 12 (early September 13 at the latest). We discussed how to ensure that suitable Type 3 material is reached, what to do if frozen ground is encountered, and potential use of organics free soil generated from the foundation clearing. BGC will develop a memorandum to provide further explanation to Pelly. BGC and Pelly will also hold a meeting prior to the start of excavation to go over the memo.
- Recommendations:

Photo 1. Removal of topsoil pile from embankment footprint.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	1406006
Client:	Victoria Gold	**Date and Shift:**	September 14, 2017 Day Shift
Construction:	JDS Mining, Pelly, Cobalt	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Tony Monasterio	**Weather:**	Partly Cloudy, 14°C to 5°C

Summary and Observations

- Summary and Observations:
  - Pelly worked on removal of the topsoil piles from the center valley of the dam footprint.
  - Pelly has begun excavation to Type 3 bedrock.
  - A portion of the western abutment of the embankment has enough frost in the soil to cause melting. This area has become 'soupy' and the soil difficult to remove while wet. See photos.
- Recommendations:
  - None

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - None
- BGC Recommendations:
  - None

2) Communications (no follow up required):

No.	Personnel	Description
1	JDS to BGC	JDS has requested that all our future IFC packages have rev clouds on everything that has changed. JDS has requested BGC add the Pelly construction leads to the IFC drawing distribution list so nothing gets lost between cross-shifts. JDS has suggested looking at an alternative closure sump puncture system.
2	Pelly to BGC	Pelly has requested clarification on compaction requirements for the underdrain fills so they can order the correct equipment (urgent).

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
None		

Safety Issues: None.

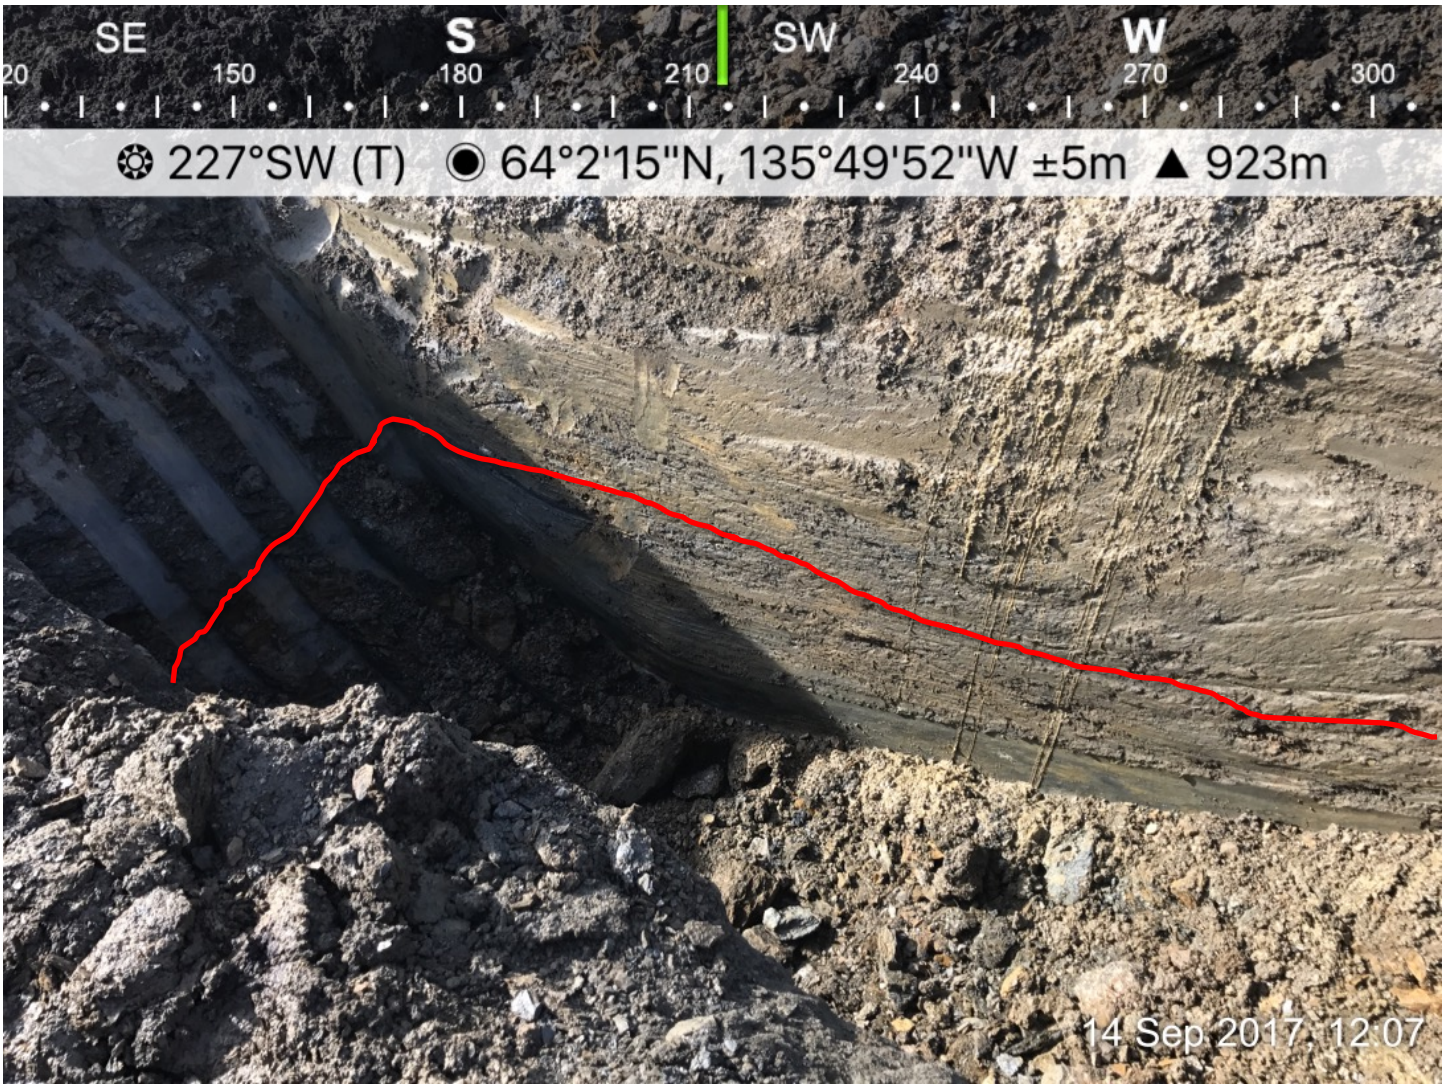

Photo 1: Test pit on west abutment of embankment, excavated the night previous. The red line approximately follows Type 3 bedrock; though the test pit doesn't show it well, this material was significantly more difficult to excavate. The Type 3 bedrock was approximately 1.5-2.5 meters below original ground surface in this area. Note the 'weeping' of the melting ice in the uppermost soil. No visible ice was identified. The infrared thermometer showed the material in the bottom of the pit was approx. -5°C while material on the surface (weeping) was +0.5°C.

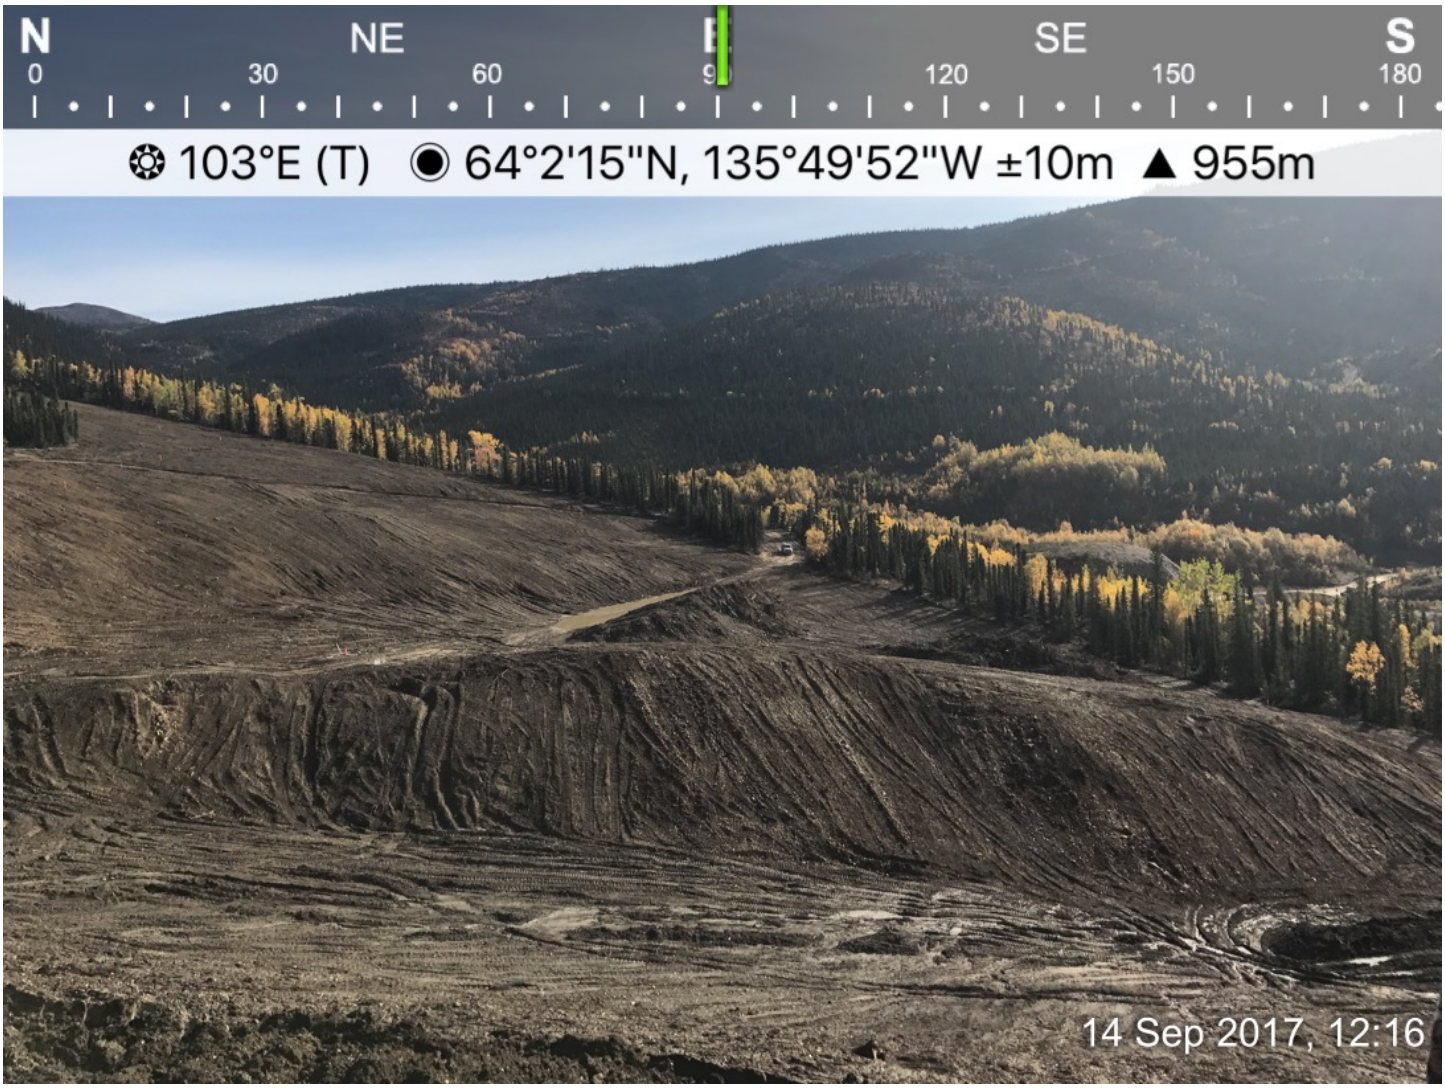

Photo 2: View East from the West abutment, all topsoil removed. Note that some areas appear drier than others. It was observed that the areas which appear wetter (likely because of melting permafrost) were also areas where JDS/Pelly personnel remembered black spruce thickets, and the drier areas appeared to be in areas which had poplar trees. This may be an rough method of delineating ground ice going forward.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	1406006
Client:	Victoria Gold	**Date and Shift:**	September 15, 2017 Day Shift
Construction:	JDS Mining, Pelly, Cobalt, NuWay	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Tony Monasterio	**Weather:**	Cloudy, light rain, 12°C to -2°C

Summary and Observations

- Summary and Observations:
  - Pelly worked on removal of the topsoil piles from the center valley of the dam footprint, and excavation to Type 3 bedrock.
  - NuWay has begun crushing, producing Select Drain Fill (along with two other products not used at the HLF). See photos.
  - Tetra Tech and BGC performed a rough measure of the Select Drain Fill transmissivity, approximately 4 cm/s.
- Recommendations:
  - BGC has recommended continuing crushing operations while the Select Drain Fill is evaluated for approval.

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - Preliminary gradation results for the Select Drain Fill show an excess of fines. The specification calls for less than 3% passing the #200 sieve, the test results show 6.8%. This is partially due to a misunderstanding of the specifications: the crushing operator's contract states they need to produce a material with less than 5% passing the #200, not 3% as the specifications are currently written. Washing the material, even briefly, was observed to effectively remove the fines content.
  - The hydraulic conductivity was attempted to be visually observed by passing water through the Select Drain Fill. It appeared to be 'free-draining', in line with the design intent.
- BGC Recommendations:
  - BGC is still evaluating whether the excess fines are acceptable. BGC has recommended sending a sample to a laboratory for loaded hydraulic conductivity testing.

2) Communications (no follow up required):

No.	Personnel	Description
1	BGC to JDS	BGC responded to RFI 004: Both Select Drain Fill (Material #5) and Pipe Trench Backfill (Material #5) shall be placed with no moisture conditioning in 0.3 m maximum loose lifts and compacted to a minimum 95 percent of the Standard Proctor maximum dry density (ASTM D698).
2	BGC to Pelly	BGC reviewed and approved Pelly's Inspection and Testing Plan for Excavation for Underdrain Trench Excavation
3	BGC to JDS	BGC clarified the original response to RFI 002: BGC understands the request is withdrawn, and the original design will be used. The intent of Troy's comment "the connection point shall be moved from Sta. 2+88 to Sta. 2+80" was to provide adequate flow at the merging point of the closure drain pipes. The merge point of the pipes should occur below the grade break from 2% to ~17%, which occurs near station 280.
4	BGC to JDS	BGC responded to RFI 003, item #2: BGC agrees and approves the continuation beyond the closure sump for off-season protection as described. The transition to 160mm DR9 pipe will occur at approximately Station 0+400. Please advise if this length beyond the closure sump is adequate for this year's construction.

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status

None		

Safety Issues: None.

Photo 1: Select Drain Fill stockpile at the NuWay crushing plant. The fines are primarily stuck to the gravel, and will likely be difficult to remove using only dry operations. BGC, JDS and NuWay discussed potentially using a more clean source, but it was observed that the placer tailings in the valley are generally not very clean to begin with, so a better source may not be found.

Photo 2: A different product of the crushing operations (coarse gravel for concrete aggregate) illustrates how the fines 'stick' to the gravels.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	1406006
Client:	Victoria Gold	**Date and Shift:**	September 16, 2017 Day Shift
Construction:	JDS Mining, Pelly, NuWay	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Tony Monasterio	**Weather:**	Partly cloudy, 14°C to 2°C

Summary and Observations

- Summary and Observations:
  - Pelly worked on removal of the topsoil piles from the center valley of the dam footprint, and excavation to Type 3 bedrock along the west abutment. See photo for progress.
  - Tetra Tech and BGC performed a rough measure of the Select Drain Fill permeability, results pending.
- Recommendations:
  - None

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - Two more gradations were completed on the Select Drain Fill, showing 4.6% and 5.1% fines content. The decrease from yesterday is the result of changes made to the screening process and borrow material selection.
- BGC Recommendations:
  - None.

2) Communications (no follow up required):

No.	Personnel	Description
1	Pelly to JDS/BGC	Pelly increased the clearing limits of the embankment to cover the continuation of underdrain pipes as approved in RFI 003.

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
None		

Safety Issues: None.

Photo 1: Excavator has removed more material from the west abutment. This material is being stored further up the embankment. Once Pelly finishes the stockpile locations across Dublin gulch, they will be focused on the embankment foundation preparation and the excavation to Type 3 bedrock will ramp up.

Photo 2: The extent of the excavation on the west embankment. Note the loosed bedrock (light brown) on the right; it appears the excavation has nearly reached Type 3 bedrock at this location.

Construction:	JDS Mining, Pelly, NuWay	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Tony Monasterio	**Weather:**	Partly cloudy, 14°C to 2°C

Summary and Observations

- Summary and Observations:
  - Pelly continued removal of the topsoil piles from the center valley of the dam footprint, and excavation to Type 3 bedrock along the west abutment. Today the material was dry enough to use a dozer in addition to the excavator. See photo for progress.
- Recommendations:
  - None

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - Two additional gradations were completed for the Select Drain Fill, showing much cleaner material, less than 2% fines in both. The crushing crew replaced the 10 mm screen with a 12.5 mm screen in hopes of producing higher percentage of gravels and it appears to be effective so far.
- BGC Recommendations:
  - None.

2) Communications (no follow up required):

No.	Personnel	Description
		None

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
None		

Safety Issues: None.

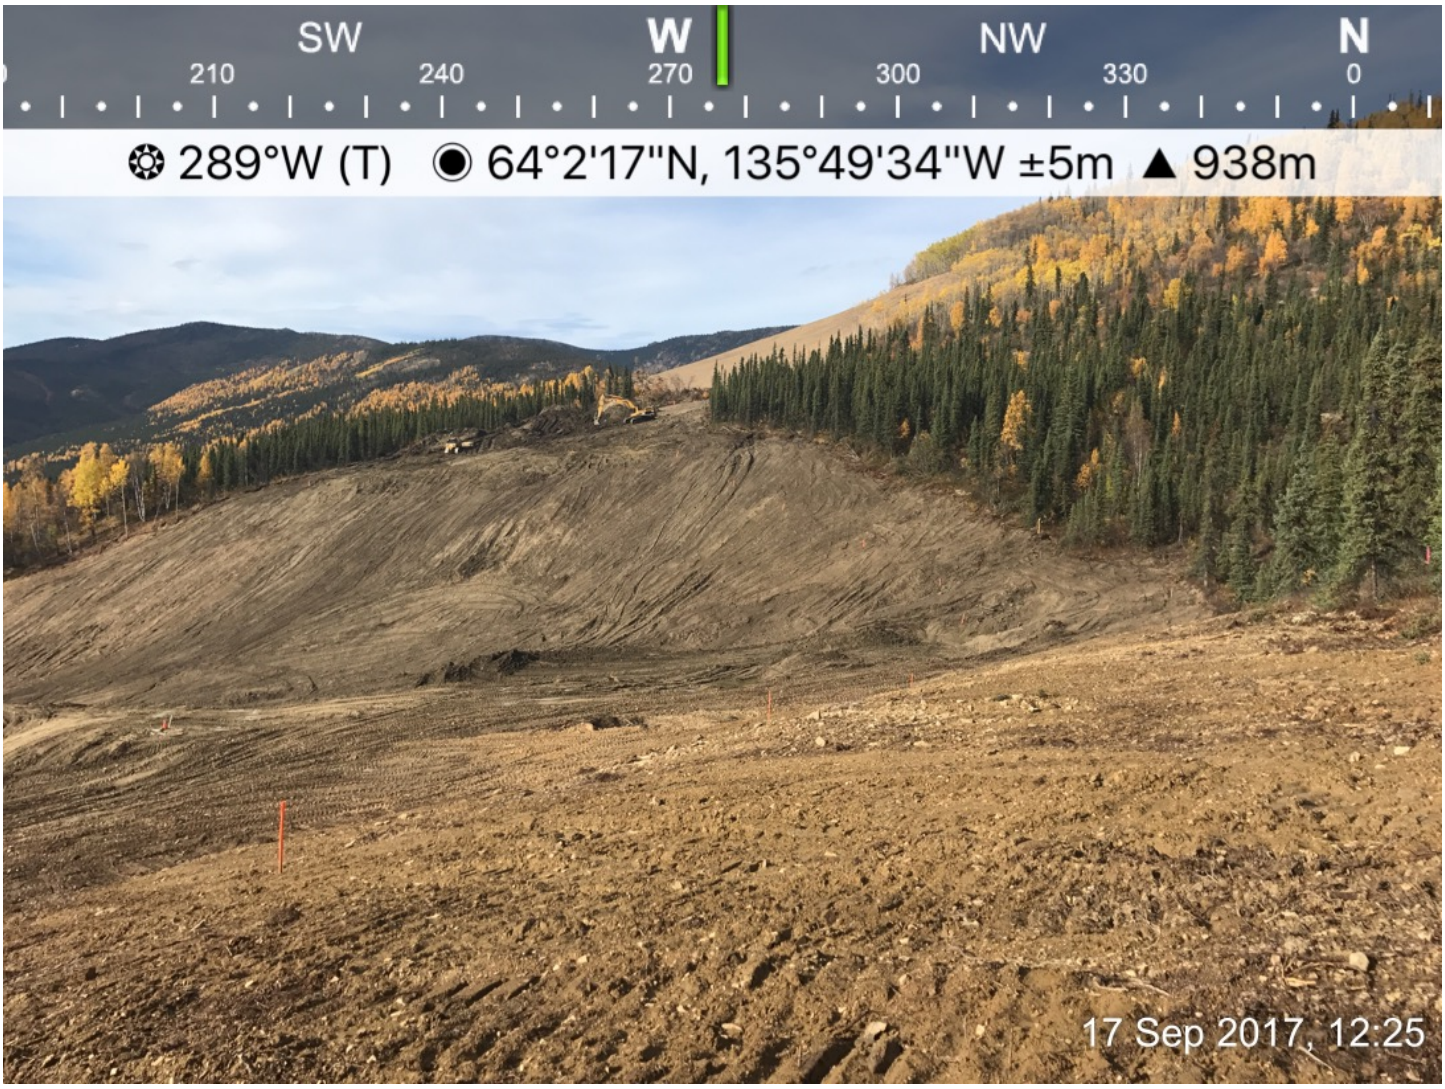

Photo 1: Embankment excavation progress is focused on the west abutment.

Photo 2: Some frozen materials have been exposed and are still quite cold. The IR thermometer read -10°C, which seems too low to be correct, but is clearly frozen. It is difficult to tell if this material is Type 3 bedrock on such a small excavation.

AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	1406006
Client:	Victoria Gold	**Date and Shift:**	September 18, 2017 Day Shift
Construction:	JDS Mining, Pelly, NuWay	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Tony Monasterio	**Weather:**	Partly cloudy, 14°C to 2°C

Summary and Observations

- Summary and Observations:
  - Pelly continued removal of the topsoil piles from the center valley of the dam footprint, and excavation to Type 3 bedrock along the west abutment. Excavation has reached the boundary between colluvium and bedrock where ice lenses are common. Lenses up to 5 cm thick were observed in the cut. The ice appears to melt quickly once exposed.
- Recommendations:
  - BGC recommended excavating down beyond the thick ice lenses, to a depth where the fractures are spaced further apart. BGC will monitor excavation progress tomorrow to evaluate how the materials change with depth.

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - None.

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
None		

Safety Issues: None.

Photo 1: This excavation is Pelly's first bench near the top of the west abutment. A cluster of visible ice lenses approximately 2.5 m below original ground surface is highlighted with the red line. The lenses are up to 5 cm thick and the clusters seem to be laterally discontinuous. They appear to be most common in the uppermost Type 3 bedrock. BGC will observe further excavation tomorrow.

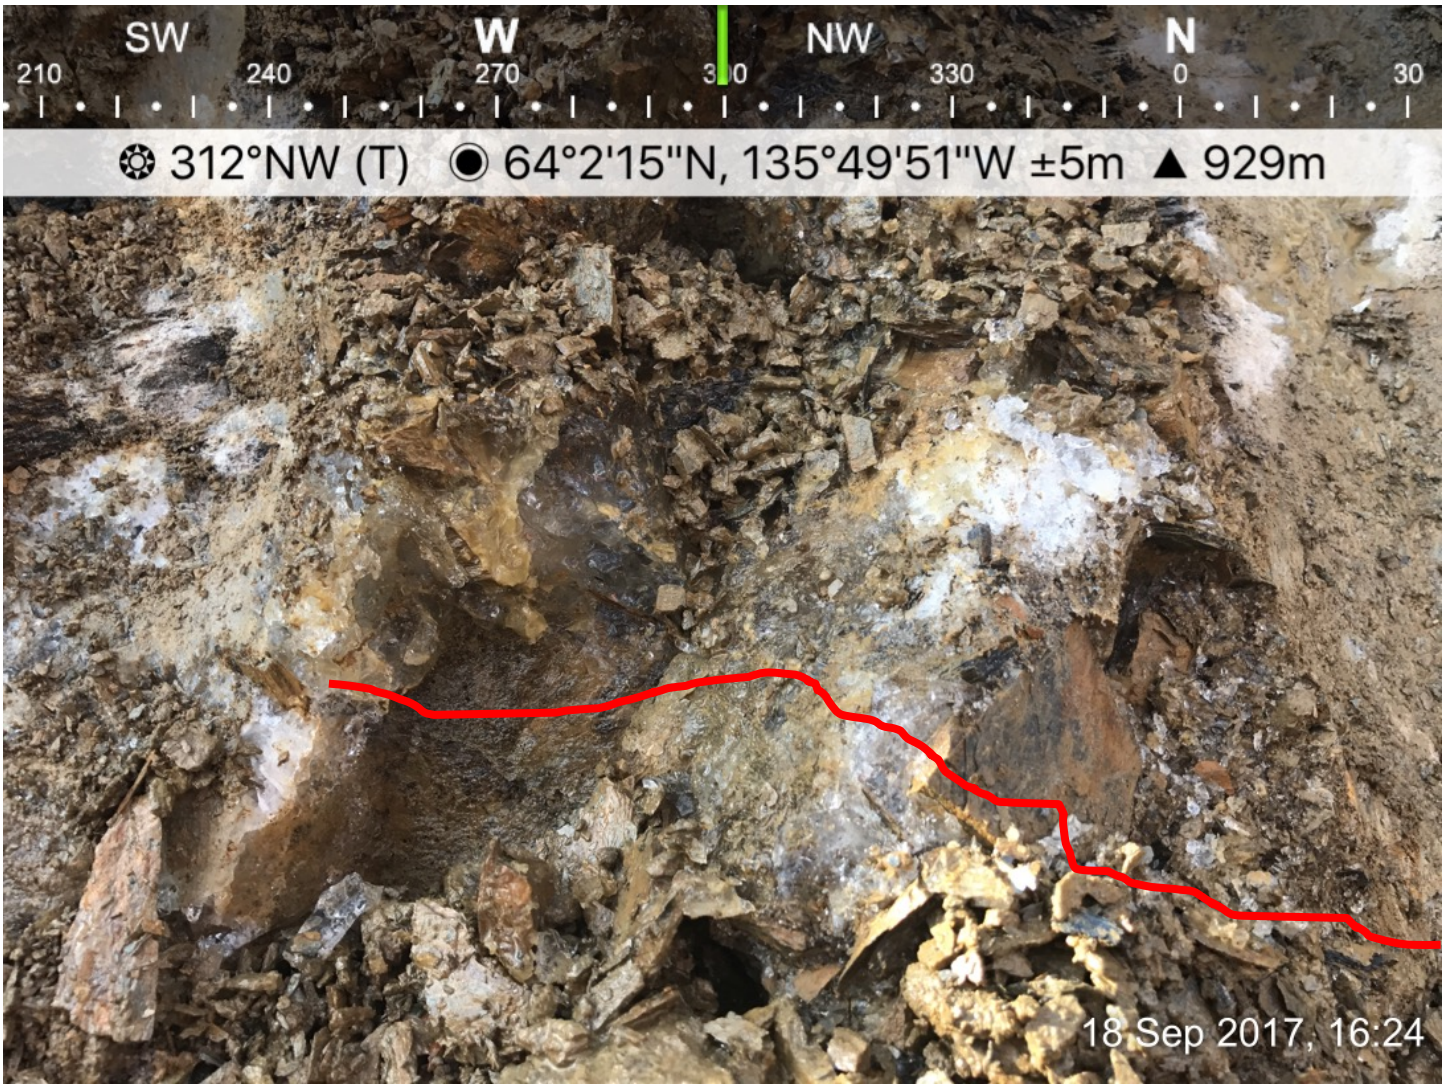

Photo 2: A close up of the ice lenses shown in Photo 1.

Photo 3: The same cut 30 m to the south. No visible ice present. The line is the estimated top of Type 3 bedrock, excavation will proceed at least 0.5 m into Type 3 bedrock in order to confirm the lack of visible ice and the continuation of bedrock. The top of Type 3 bedrock at this location is considered to be acceptable level of excavation and the overburden is considered 'suitable material' and can be used for fill products if it meets gradation and other specifications.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Tony Monasterio	**Weather:**	Cloudy, 14°C to 4°C

Summary and Observations

- Summary and Observations:
  - Pelly continued removal of the piles of unsuitable material (high fines content melted permafrost) in the valley bottom.
  - Excavation to Type 3 bedrock continued along the west abutment.
  - Discussed suitability of the material being excavated from the slope for use as embankment fill. Some of the particles are large, boulder size, and there are cobbles larger than 150 mm (10%?). Segregation during the excavation would be difficult and screening is not currently planned. Currently the drawings and specifications call for the embankment to be constructed entirely of material smaller than 150 mm. JDS to issue an RFI whether the material currently being encountered is suitable for use as embankment fill.
- Recommendations:
  - None.

1) QA/QC Results:

Safety Issues: None

Photo 1: Example of excavation into hard bedrock. The colluvium above this material is composed of cobbles and boulders of the nearby bedrock, so determination of whether an excavation is in colluvium or in-situ rock is difficult. Cleaning the slope of the larger particles is not practical. If these cobbles (and in some places, boulders) are considered unsuitable, they will need to be removed by hand immediately prior to placement of an embankment lift.

Photo 2: North slope after removal of most overburden. Excavation to Type 3 bedrock is not yet complete in most of the photo. Note that the bucket teeth marks are visible in areas with ground ice.

Photo 3: Example of frozen colluvium. This sample is representative of material 150 mm to 300 mm above Type 3 bedrock. This material is difficult to excavate until melted, so it is typically left exposed until melted.

Photo 4: Excavation progress on west abutment slope. In the next couple days, the excavated material will begin to be hauled to stockpile.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	1406006

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Tony Monasterio	**Weather:**	Morning Rain, 5°C to 8°C

Summary and Observations

- Summary and Observations:
  - Sampled and tested a potential Select Fill source in heap footprint on east embankment. Material meets the gradation specification and will be sampled in bulk for liner interface testing.
  - Little progress excavating to Type 3 bedrock along the west abutment due to other work and crew changeover. Pelly is working on removing the rest of the unsuitable material in the valley bottom.
  - Discussed rest of season plan with Pelly (Jason Abel) and JDS (Matt, Roman and Jamie). Plan is to:
    - Finish excavating to Type 3 bedrock in embankment footprint
    - Stockpile excavated suitable soils in embankment footprint, while attempting to separate materials containing cobbles from those without
    - Install underdrain piping, Select Drain Fill, geotextile, and cover with Structural Fill approximately up to grade
    - Continue placing Structural Fill in embankment until no longer practical due to temperature
    - In January/February, cut temporary diversion ditches above embankment construction area to prevent Ann Gulch flow from entering cleared area
    - Remove snow from cleared area, place above temporary ditches to melt in spring
- Recommendations:
  - None.

Project Name:	Eagle Gold Construction Support	**Project No.:**	1406006
Client:	Victoria Gold	**Date and Shift:**	October 1, 2017 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Tony Monasterio	**Weather:**	Overcast, -2°C to 6°C

Summary and Observations

- Summary and Observations:
  - Topsoil removal is complete. Pelly began stockpiling overburden on the east side of the ridge, and excavating to Type 3 bedrock on the west side of the ridge.
  - Type 3 bedrock is relatively shallow on the ridge, approx. 1 m in most places. Bedrock is dipping ~30° to the NW on the ridge, nearly parallel to the ground surface, which makes identification of Type 3 rock difficult for the excavator operator. Much of the bedrock is strong and coming up in large blocks, see photo. It is not practical for the excavator operator to remove all these cobbles/boulders without ripping more. These will need to be removed prior to placement of fill.
  - The material being excavated on the ridge and on the east abutment is not frozen. There is still frozen overburden in the north and northwest slope, however. There is permafrost melting in the area recently cleared to the north. The temperature of frozen ground is between -3° and -1°C.
  - There is are two areas where water is seeping up through the overburden. Both are in the valley bottom, see photos.
  - BGC took a large sample of overburden from the east abutment for laboratory testing as Select Fill (liner subgrade).
- Recommendations:
  - None

Photo 1: Example of the unsuitable material stockpile. Most material is frozen at the surface due to overnight temperatures, and has very little shear strength below. The stockpile area is nearly 'full' right now because the surface of the first lift is not trafficable. The stockpile is expected to dry with time, and freeze with winter, so more lifts may be possible in the future. The material was mostly thawed and had been allowed to weep in-situ prior to placement, and therefore did not slough or run after being placed. I believe this material may be dry enough to be used as fill next year.

Photo 2: CAT 365 with a cleanup bucket (flat edge) excavating the top off frozen colluvium on the north side of the heap embankment footprint. A thin layer of the frozen soil melts quickly once exposed and produces the reflective sheen.

Photo 3: Surface of the excavated frozen material shown above in Photo 2. This soil is -2°C.

Photo 4: Water seeping up through the saturated overburden. The arrow points to a plume of clear water flowing into the puddle. Pelly foreman mentioned that this was approximately the location of an old borehole, which could be causing the seep. Pelly's plan is to dig a trench around the east side of the ridge to direct this flow away from the underdrain work area.

Photo 5: On the left, two hoes are excavating to Type 3 bedrock on the east side of the ridge. Center shows the large excavator loading a haul truck with overburden removed from the west abutment. Pelly is stockpiling this material for use as Structural Fill on the east side of the ridge, see Photo 6. This photo is taken from the far north end of the heap embankment footprint, near the location of the PLS sump.

Photo 6: Stockpile of material to be used as fill on east side of ridge. Photo taken from the south end of the ridge.

Photo 7: Example of excavation to Type 3 bedrock on ridge. Arrows point to in-place rocks. The loose cobbles and boulders will need to be removed prior to placement of Structural Fill. This is difficult to do with the excavators.

BGC ENGINEERING INC.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy, -3°C to 1°C

Summary and Observations

- Summary and Observations:
  - Pelly continued stockpiling overburden on the east side of the ridge. No foundation excavation was performed today. (***Photo 1***)
  - JDS will deliver placer tailings from an area northeast of the control pond to Nuway tomorrow. Nuway, will be ready to switch from concrete aggregate to Overliner Drain Fill material tomorrow.
  - BGC is working with JDS to return to an area of the left abutment to perform a test pit along a fault that was identified.
  - BGC is discussing running gradation on site for the structural fill that will be used to cover the underdrain before construction starts. Most material visually appears to be 8" or under. Large chunks (>8") of clayey material near the surface of the stockpiles which were wet or became wet during the rains have now formed internal ice. (***Photo 2***) These frozen chunks will have to be removed prior to placement of the fill in the drain trenches. Its likely frozen material is located mostly near the exposed surface of the pile.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy, -6°C to 1°C

Summary and Observations

- Summary and Observations:
  - Pelly continued stockpiling overburden on the east side of the ridge. No foundation excavation was performed today.
  - Placer tailing (***Photo 1***) from an area northeast of the control pond and a small sample of Steiner material (***Photo 2***) was processed by Nuway into ODF. Grain size analysis run on the placer tailings material showed very little fines (<3% on average). Grain size analysis for the Steiner material is pending, however, visually the material appears to have generated scientifically more fine sand than the placer tailings. Samples of the placer tailings and Steiner material were collected for liner puncture and shear testing as well as permeability. Sample will be shipped with Smalls on October 17.
  - BGC is working with JDS to return to an area of the left abutment to perform a test pit along a fault that was identified.

Summary and Observations

- Summary and Observations:
  - Pelly continued stockpiling overburden on the east side of the ridge and resumed excavation to type 3 bedrock on the central nob near approval Area 6. (***Photo 1***)
  - A gradation sample of the Steiner material processed to ODF was prepared in the on-site Tetratech lab. The on-site lab does not have the ability to run the fines portion with a hydrometer, therefore, the fines fraction is an estimate. A full gradation will be completed with the samples sent to off-site labs.
  - A drainage test was performed on the Steiner material processed into ODF. The material is free draining.
  - Two samples of the Structural Fill was collected to be sent to Tetratech's lab in Whitehorse for proctor and full gradation analysis.
  - BGC is working with JDS to return to an area of the left abutment to perform a test pit along a fault that was identified.
  - Pelly has requested quality certifications for geotextile and HDPE pipe to be used in the underdrain construction.
  - Pelly has requested the maximum recommended bend radius for the HDPE pipe from the manufacturer in order to better understand field fitting limitations.

Photo 1: Stockpile management of material located on the north side of the HLF embankment footprint.

Photo 2: Potential material to be used in place of structural fill in backfilling the underdrain trench above the drain installation.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	1406006
Client:	Victoria Gold	**Date and Shift:**	October 18, 2017 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy, Snow, -9°C to 1°C

Summary and Observations

- Summary and Observations:
  - Pelly continued stockpiling overburden on the east side of the ridge. (***Photo 1***) A higher amount of oversize material (ie >8") is being deposited in the structural fill stockpile. BGC requested that trucks with high amounts of oversize material be stockpiled in a separate rockfill stockpile. Pelly identified and area and setup a rockfill stockpile today.
  - and digging to type 3 foundation. (***Photo 2***)
  - Samples were taken of the gravely placer tailings material for on-site gradation testing and to test at Tetratech's lab in Whitehourse. The gravely placer tailings material may be used instead of Material 2 or Material 3 when backfilling the underdrain trench to grade since it has become too cold to moisture condition those materials.
  - Field testing was performed on the gravely placer tailings material. The material is moderately weathered (W3); strong (R4); and hard (H3). The material is subangular and visually appears to have less than 5% fines. (***Photo 3***)
  - EPCM-RFI-007 was delivered to BGC and response was provided to JDS. The RFI and response discussed the method to plug and abandon monitoring hole BH-BGC16-091 as well as other borings within the HLF footprint.
- Recommendations:
  - Test fill be performed using the placer tailings gravel to determine compaction requirements and method to protect geotextile from puncture.
  - Care should be taken to stockpile material with oversize (>8") in the rockfill stockpile.
  - Larger chunks of consolidated soil material should be broken up before loading to determine if a significant amount of oversize material exists.
  - Material high in organics should be segregated and included in the structural fill or rockfill stockpiles.
  - Frozen materials should be segregated per the approved Foundation Improvement Plan.

Project Name:	Eagle Gold Construction Support	**Project No.:**	1406006
Client:	Victoria Gold	**Date and Shift:**	October 20, 2017 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy, Snow, -10°C to -1°C

Summary and Observations

- Summary and Observations:
  - Pelly continued stockpiling overburden on the east side of the ridge. (***Photo 1***)
  - Pelly continued to excavate to type 3 foundation within the HLF embankment footprint.
- Recommendations:
  - Test fill be performed using the placer tailings gravel to determine compaction requirements and method to protect geotextile from puncture. BGC is developing a work plan for the test fill estimated to be complete in draft form October 21. Once complete it will be provided to JDS and Pelly to begin planning execution.
  - Although mostly in conformance to date the constructor should take care to ensure that following criteria is consistently met:
    - Care should be taken to not place material with oversize (>8") in the structural fill stockpile.
    - Larger chunks of consolidated soil material should be broken up before being deposited in the structural fill stockpile to determine if a significant amount of oversize material exists, if its frozen, or if it contains a significant amount of clay.
    - Material high in organics should be segregated and not included in the structural fill or rockfill stockpiles.
    - Frozen materials should be segregated per the approved Foundation Improvement Plan.

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - Results from field gradation testing for the Steiner Material processed to ODF was completed. The results showed low fines (<4%). However, the material is high in sand and fine gravel with 47% of the material smaller than 12.5mm.
- BGC Recommendations:
  - None

2) Communications (no follow up required):

Personnel	Description
JDS	EPCM-RFI-007 was delivered to BGC.
BGC	Response to EPC-RFI-007.

Summary and Observations

- Summary and Observations:
  - Pelly continued stockpiling overburden on the east side of the ridge. (***Photo 1***)
  - Pelly continued to excavate to type 3 foundation within the HLF embankment footprint. (***Photo 2***)
- Recommendations:
  - Test fill be performed using the placer tailings gravel to determine compaction requirements and method to protect geotextile from puncture.
  - Although mostly in conformance to date the constructor should take care to ensure that following criteria is consistently met. BGC, Pelly, and JDS met to discuss this on October 21:
    - Care should be taken to not place material with oversize (>8") in the structural fill stockpile.
    - Larger chunks of consolidated soil material should be broken up before being deposited in the structural fill stockpile to determine if a significant amount of oversize material exists, if its frozen, or if it contains a significant amount of clay.
    - Material high in organics should be segregated and not included in the structural fill or rockfill stockpiles.
    - Frozen materials should be segregated per the approved Foundation Improvement Plan.

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - Material was delivered TetraTech's on-site QC personnel to take to their Whitehorse lab for testing when they leave on Sunday (October 22). The samples included:
    - BGC-GPT-01: Two buckets of the gravely placer tailings to be used as underdrain trench backfill. Grain size analysis will be performed on the sample.
    - BGC-SF-01: Two buckets of Material 3 (Structural Fill) taken from the stockpile on the east side of the HLF embankment footprint. A proctor and grain size analysis will be performed on this sample.
  - Results from field gradation testing for the Steiner Material processed to ODF was completed. The results showed low fines (<4%). However, the material is high in sand and fine gravel with 47% of the material smaller than 12.5mm.
- BGC Recommendations:
  - None

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
CC204-RFI-006	Pelly requested to use of rockfill from blasting in place of structural fill in the HLF embankment.	The use of a rockfill zone along the face of the embankment was approved in the 2017 EPCM-RFI-002. The current RFI was generated because Pelly believes that the less structural fill will be available than previously thought and that this upstream face may need to be reconfigured to a rockfill 'core'. BGC is providing Pelly with estimated volumes for use of rockfill as a zone along the face of the embankment and Pelly will be providing an estimated volume of structural fill and rockfill that is expected to be generated for construction. Once this information is available we can determine the best way to configure the rockfill within the embankment.

Safety Issues: None

Client:	Victoria Gold	**Date and Shift:**	May 4, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy 3°C to 13°C

Observations and Recommendations

- Observations and Recommendations:
  - Work excavating to type 3 embankment foundation resumed late in the day.
  - BGC, JDS, and Pelly discussed foundation requirements at the toe of the embankment near the monitoring vault. Trenching will be conducted downstream of the embankment toe near the monitoring vault to determine where type 3 bedrock is and so we can begin looking at potential solutions, if needed. BGC will oversee the excavation. Photographs showing the location of the current embankment toe footprint is included as ***Photos 1***.
  - Material recently excavated from the ADR plant foundation is courser than the structural fill previously excavated but mostly appears to meet the max size for structural fill. Although this material generally meets gradation requirements if the material produced becomes bonier (ie has gaps between cobble size material and sand size material or has structurally supported by material > 19mm) it can be blended with the Structural Fill already excavated to bring it into specification. This will help prevent gap grading in the final product. Care will need to be taken to not mix too much bonier material creating a product that is no longer structurally supported by a well graded mix of material. (***Photos 2 through 4***)
  - Some oversize (>8") pieces are present (<5%) that do not meet the criteria for Structural Fill. This material should be segregated out prior to placement at the embankment (***Photo 5***).

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy 2°C to 12°C

Observations and Recommendations

- Observations and Recommendations:
  - Pelly cleared an area to type 3 foundation along the rock nob. This area will be surveyed and approved tomorrow. (***Photo 1***).
  - Pelly will excavate the remaining area at the toe of the right abutment that still requires approval. Over the winter ice developed in the valley and appears to have loosened this zone and portions of the foundation above that have already been approved (***Photo 2***). Additionally, portions of the unapproved area are still frozen (***Photo 3***). Additional excavation will be required in both the unapproved and approved zones to remove loose type 3 material and to remove ice.
  - Material continues to be excavated at the ADR Plant foundation and stockpiled for use as Structural Fill. The material being excavated is blocker but still usable as Structural Fill. Blockier material is pushed over the side of the pile allowing segregation of oversize pieces. (***Photo 4***).

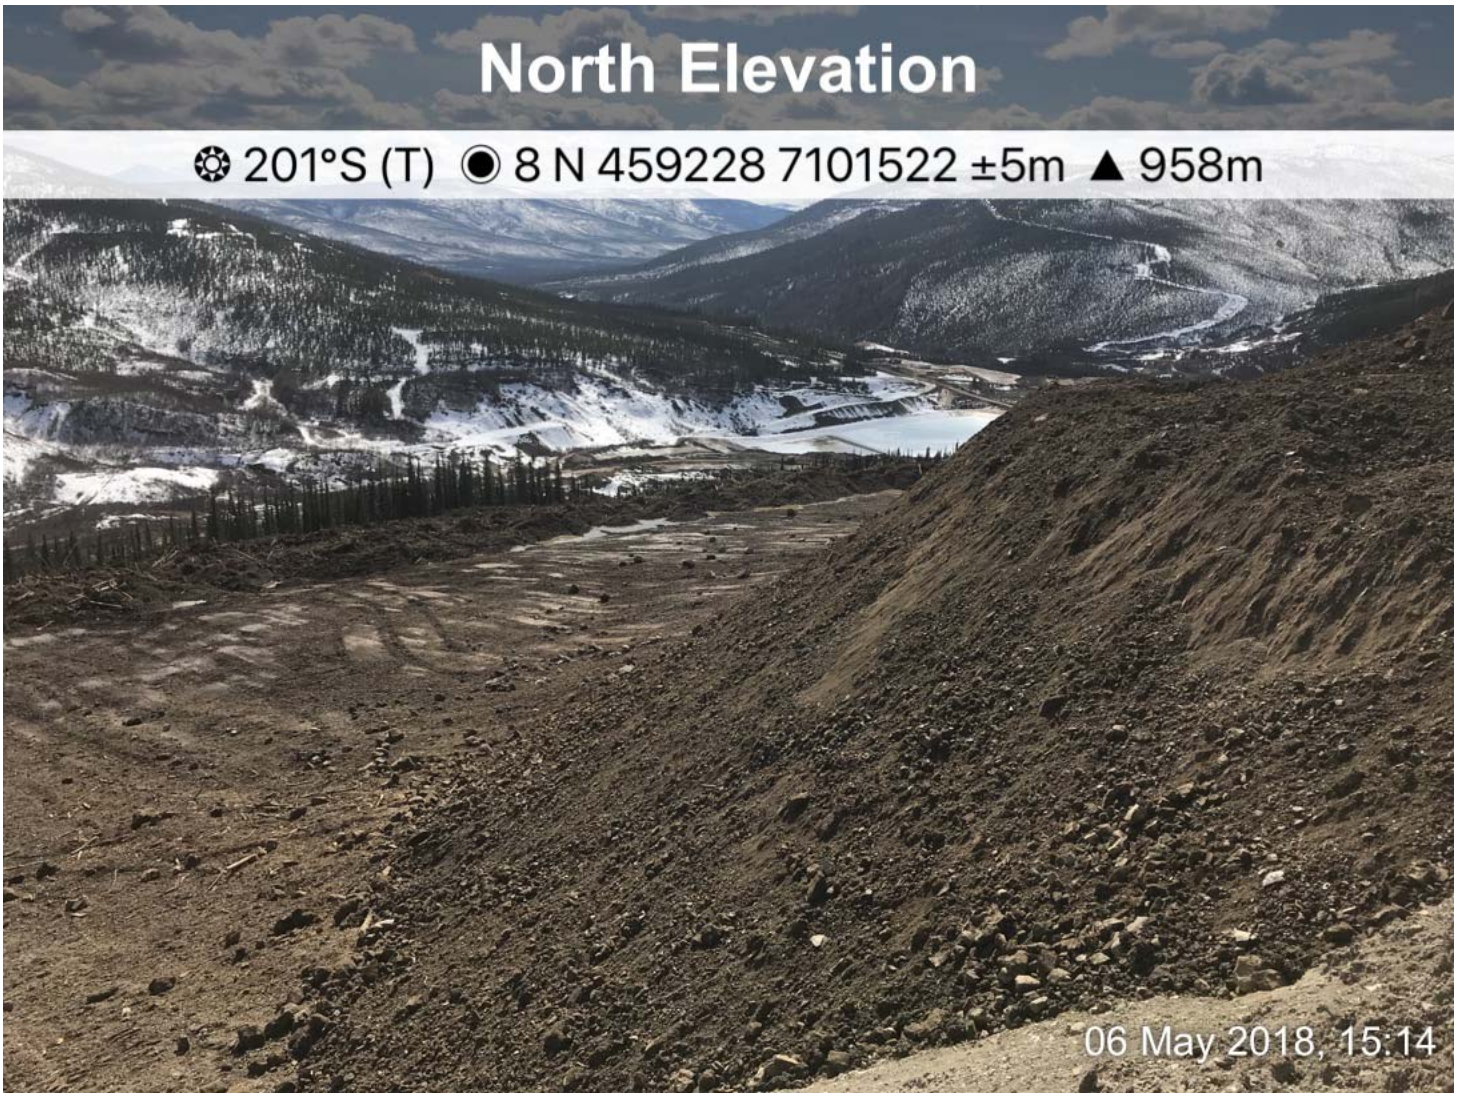

Photo 4: Structural fill stockpile at the ADR plant. Blockier material is being pushed over the edge of the pile allowing oversize pieces to be sorted out.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	May 7, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Snow/rain -2°C to 9°C

Observations and Recommendations

- Observations and Recommendations:
  - Pelly cleared an area to type 3 foundation along the right abutment. (***Photo 1***). This area was directly exposed to the sheet of ice that was excavated from the valley earlier this year and needed additional excavation to remove frost jacked near surface rock. A minimum amount of material was removed (between 0.3 and 0.5 m) in order to reach a zone that was confined enough to possibly not have been affected. These areas are still frozen and once they thaw they should be inspected again to ensure that the material is not too loose. If the surface material is loose it should be cleaned off before placing embankment fill. (***Photo 2 and 3***).
  - Section 11 along the rock nob was surveyed and approved today.
  - Pelly's surveyor collected the current elevations along the alignment of the underdrain and the current surface elevation along the center valley near the toe of the right abutment. This information will be used to evaluate the alignment of the underdrain now that the location of bedrock is known. It will also be used to interpret the location of bedrock at the toe of the embankment.
  - Material continues to be excavated at the ADR Plant foundation and stockpiled for use as Structural Fill.

The current RFI was generated because Pelly believes that the less structural fill will be available than previously thought and that this upstream face may need to be reconfigured to a rockfill 'core'. BGC provided Pelly with estimated volumes for use of rockfill as a zone along the face of the embankment. Pelly will be providing an estimated volume of the rockfill, where it will be placed, and a method to place it. BGC will review this and include it in the response to the RFI.

Safety Issues: None

Photo 1: Excavation to type 3 foundation along the base of the right abutment.

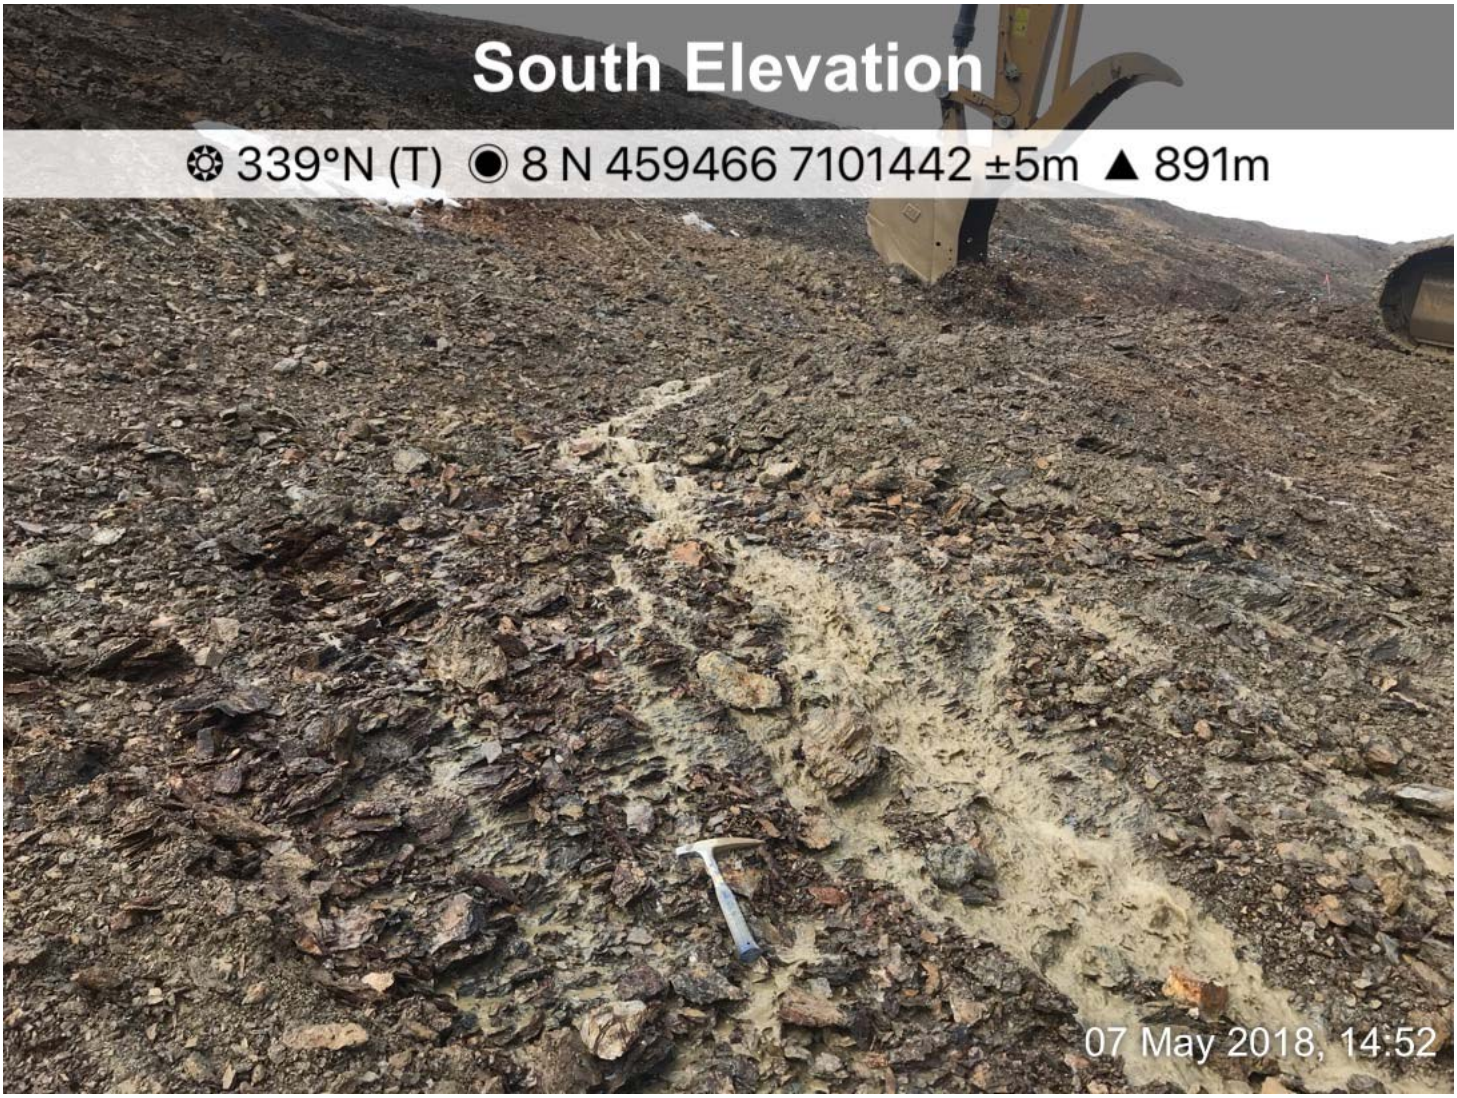

Photo 2: Embankment foundation cleared of frozen surface material.

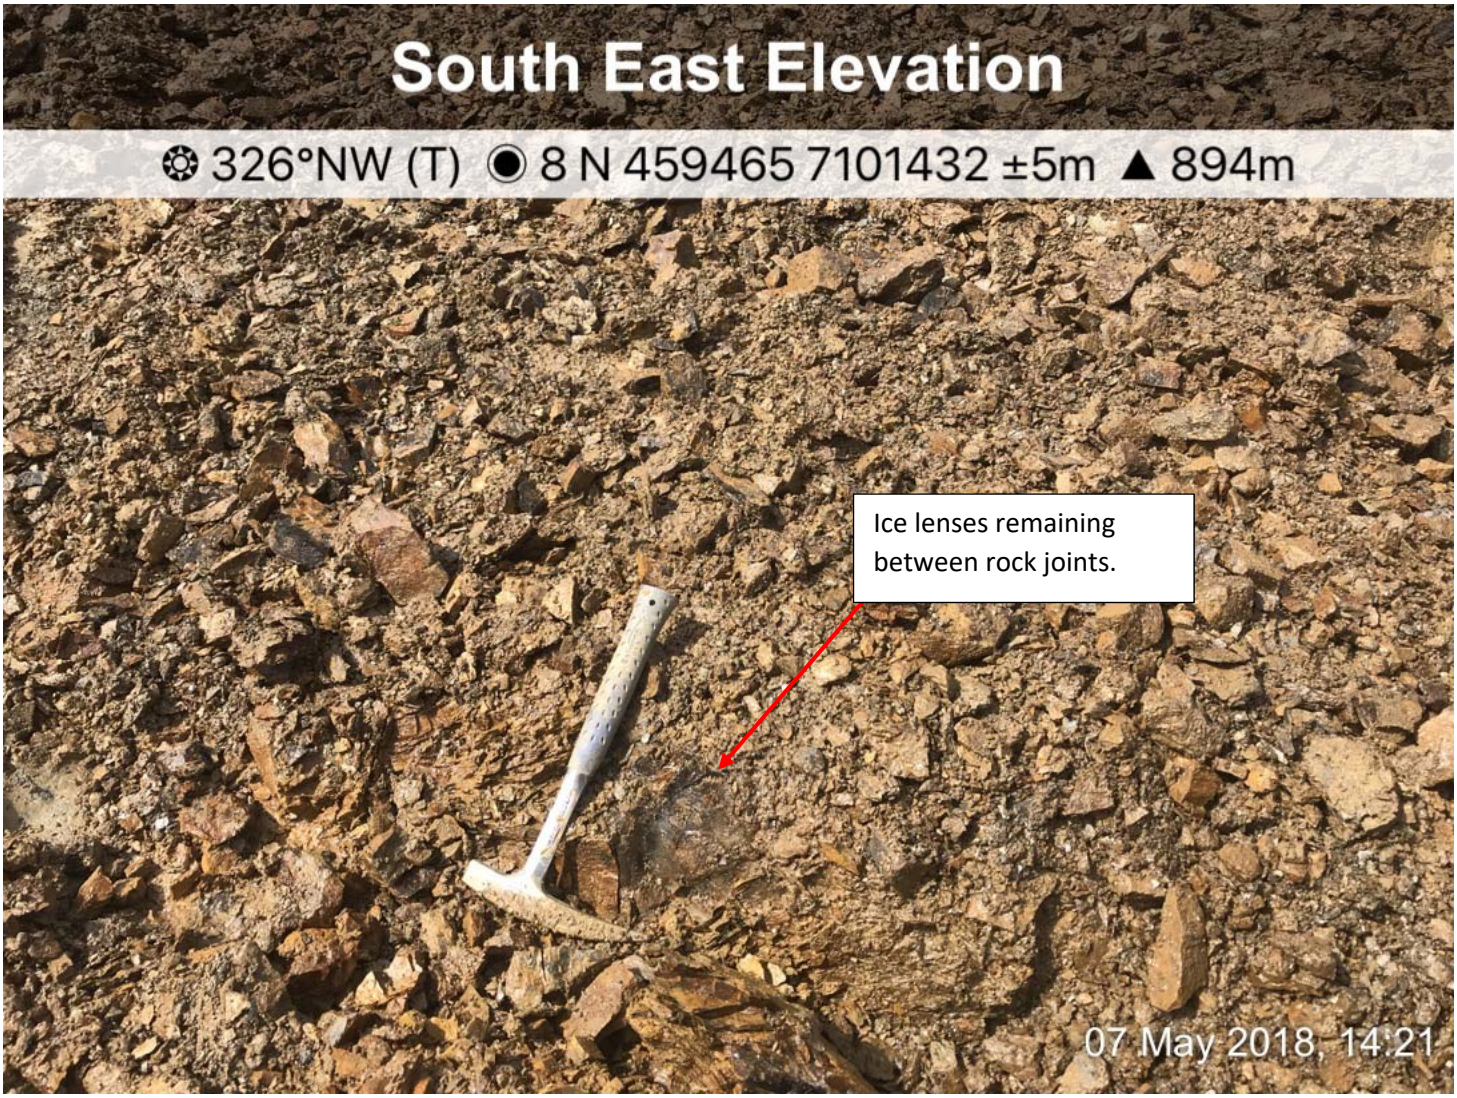

Photo 3: Example of frozen type 3 foundation material still contains ice filling in joints. The area should be inspected again once the ice has melted to ensure that the slope face is not loose.

Client:	Victoria Gold	**Date and Shift:**	May 8, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 1°C to 14°C

Observations and Recommendations

- Observations and Recommendations:
  - Pelly cleared an area to type 3 foundation along the right abutment up to the toe of the embankment. This area did not appear to have ice in the type 3 bedrock. (***Photo 1 and 2***).
  - Section 12 along the right abutment was approved and picked up by Pelly's surveyors. (***Photo 3***).
  - Pelly began excavation of the colluvium deposits near the left side of the embankment toe near the monitoring vault (***Photo 4***).
  - Material continues to be excavated at the ADR Plant foundation and stockpiled/regraded for use as Structural Fill. (***Photo* 5**)

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	May 9, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 3°C to 18°C

Observations and Recommendations

- Observations and Recommendations:
  - Section 13 along the right abutment was approved and picked up by Pelly's surveyors. (***Photo 1***).
  - Pelly moved stockpiled material previously excavated from the embankment foundation. (***Photo 2***).
  - Pelly had difficulty hauling material from the valley to the final stockpile, apparently exacerbated by the presence of melt water flowing from the ground later in the day (after 2pm) and a steep slope. Pelly repeatedly had to use a dozer to cut down areas of muddy pulverized type 3 material to create a dense surface for the haul trucks (***Photo 3***). This likely resulted in a lowering of the valley bottom. This issue was also observed in late 2017, reported in the daily reports, and discussed with JDS and Pelly. Pelly should take care not to lower the embankment foundation beyond the type 3 material surface as it could have implications on the pipe trench design, fill requirements, closure pipe design, in-heap pond design, and water control requirements if groundwater is encountered. Once the valley bottom has been cleared of stockpiled material and excavated to type 3 foundation it should be surveyed to determine how its current elevation will affect the current design.
  - Material continues to be excavated at the ADR Plant foundation and stockpiled/regraded for use as Structural Fill.

Client:	Victoria Gold	**Date and Shift:**	May 10, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 1°C to 13°C

Observations and Recommendations

- Observations and Recommendations:
  - The remaining area of Section 14 was cleared to type 3 foundation. (***Photo 1***).
  - Pelly completed moving stockpiled material previously excavated from the embankment foundation. (***Photo 2***).
  - The areas at the toe of the embankment near the monitoring vault remains saturated. This area cannot be cleared to type 3 foundation material until water has been controlled and the area is allowed to drain. Excavation of this area while the ground is saturated may result in over-excavation.
  - Material continues to be excavated at the ADR Plant foundation and stockpiled/regraded for use as Structural Fill.
  - Responses to CC204-RFI-006 and CC204-RFI-007 were provided to Pelly and JDS. A verbal response to EPCM-RFI-012 was provided to Pelly and JDS. A written response is pending completion of drawing revisions.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Rain 4°C to 17°C

Observations and Recommendations

- Observations and Recommendations:
  - Pelly's surveyor picked up the area for Section 14 foundation approval. (***Photo 1***).
  - Pelly worked on managing water in the area where the pipe trench will be installed under the embankment and the quality of discharge to Dublin Gulch. This included:
    - Installing a pipe to direct water from the in-heap pond area across the right abutment. (***Photo 2***).
    - Digging a sump to allow faster water exfiltration and to also serve as a settling pond to reduce discharge of silt into Dublin Gulch. Sump is located approximately 8m from the embankment toe and was reported as approximately 5m deep. (***Photo 3***)
  - JDS, Pelly, and BGC will discuss backfilling this sump as part of the HLF construction. A portion of this area will likely serve as the pipe trench foundation. Backfill in this area should conform with the structural fill or site grading fill requirements, depending on the material that will be used. The portion of the pipe trench that crosses this section may also need to be protected from loss of water into the fill.
  - Pelly excavated the wet area at the toe of the embankment. Much of the area has reached type 3 bedrock or better. (***Photo 4***) The final excavation depth appears approximately 2m deeper than the design elevation.
  - Material continues to be excavated at the ADR Plant foundation and stockpiled/regraded for use as Structural Fill.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	May 12, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 1°C to 14°C

Observations and Recommendations

- Observations and Recommendations:
  - Pelly's surveyor developed a 1m contour topographic map to help determine the new alignment of the pipe trench underneath the embankment. The pipe trench will be field fitted to lowest point in the valley. (***Photo 1***).
  - Section 15 was approved by BGC and picked up by Pelly's surveyor. (***Photo 2***). Although type 3 bedrock was located in this area significant cleaning of material excavated from the exfiltration sump and shaping of the contact between the toe and colluvium remains. (***Photo 3***). Pelly will remove this material tomorrow.
  - Pelly planned to dig to type 3 bedrock at the embankment toe. BGC requested that a trench be dug near the toe of the embankment to determine the depth to bedrock. Bedrock was encountered at the bottom of the trench. However, determining type 3 bedrock depth in this area was difficult because the ground was saturated. (**Photo 4**).
  - Material continues to be excavated at the ADR Plant foundation and stockpiled/regraded for use as Structural Fill.
  - Response to EPCM-RFI-012 was delivered to JDS.
  - CC204-RFI-008 was delivered to BGC by Pelly.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy 4°C to 14°C

Observations and Recommendations

- Observations and Recommendations:
  - Pelly's excavated the remaining portion of the embankment near the monitoring vault and shaped the colluvium around the toe. The colluvium areas were wet and soft. However, further excavation was not going lead to drier, dense material. These sloped areas were left to dry and will be inspected again prior to the embankment fill to determine if further treatment will be needed. (***Photo 1 and 2***).
  - Pelly's surveyor picked up the last portion of the embankment approvals to type 3 bedrock.
  - Pelly staged excavated material. This material appears to meet the requirements for structural fill. However, the material is saturated and should be allowed to drain prior to placement. (***Photo 3***)
  - Pelly and BGC worked on development of a cut plan for the portion of the drain trench now that type 3 material has been exposed and grades are known. Grades in this portion of the pipe trench are close to the original design grades with grade breaks shifting some. (***Figure 1***) The intent of the plan is to reduce the amount of cut required while digging the trench and to ensure the trench and drain fill are installed in the near surface bedrock.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy 5ºC to 11ºC

Observations and Recommendations

- Observations and Recommendations:
  - Pelly's stepped back an area near the embankment toe to lessen the slope and make it more stable. (***Photo 1***)
  - Pelly began digging the pipe trench under the embankment. Survey was present through most of it in order to get measure depth, grade, and levelness. Once complete Pelly plans on developing an as-built and providing it to BGC for review and approval of the pipe trench foundation. (***Photo 2***)
  - Material excavated from the pipe trench is too course and jagged to be used as Material 3 - structural fill or Material 2 - select fill. (***Photo 3***). Rock fragments are too large to be used in 30 cm lifts. The material may be stockipiled as Material 8 – Rockfill for future use. A test fill for rockfill material is pending.
  - The right abutment area cleared to type 3 foundation was inspected to determine the level of effort needed for cleanup prior to placement of embankment fill. Areas with exposed phyllite appear to have weathered significantly and will likely need to be excavated during embankment fill. (***Photo 4 and 5***)
  - Excavation continues at the ADR plant. Material being stockpiles appears to be suitable for the structural fill if larger diameter pieces are segregated. (***Photo 6***)
-

CC204-RFI-008	Related to the use of electrofusion of HDPE pipes within the pipe trench.	Pending.
CC204-RFI-009	Related to material take-off quantities.	Pending.

Safety Issues: None

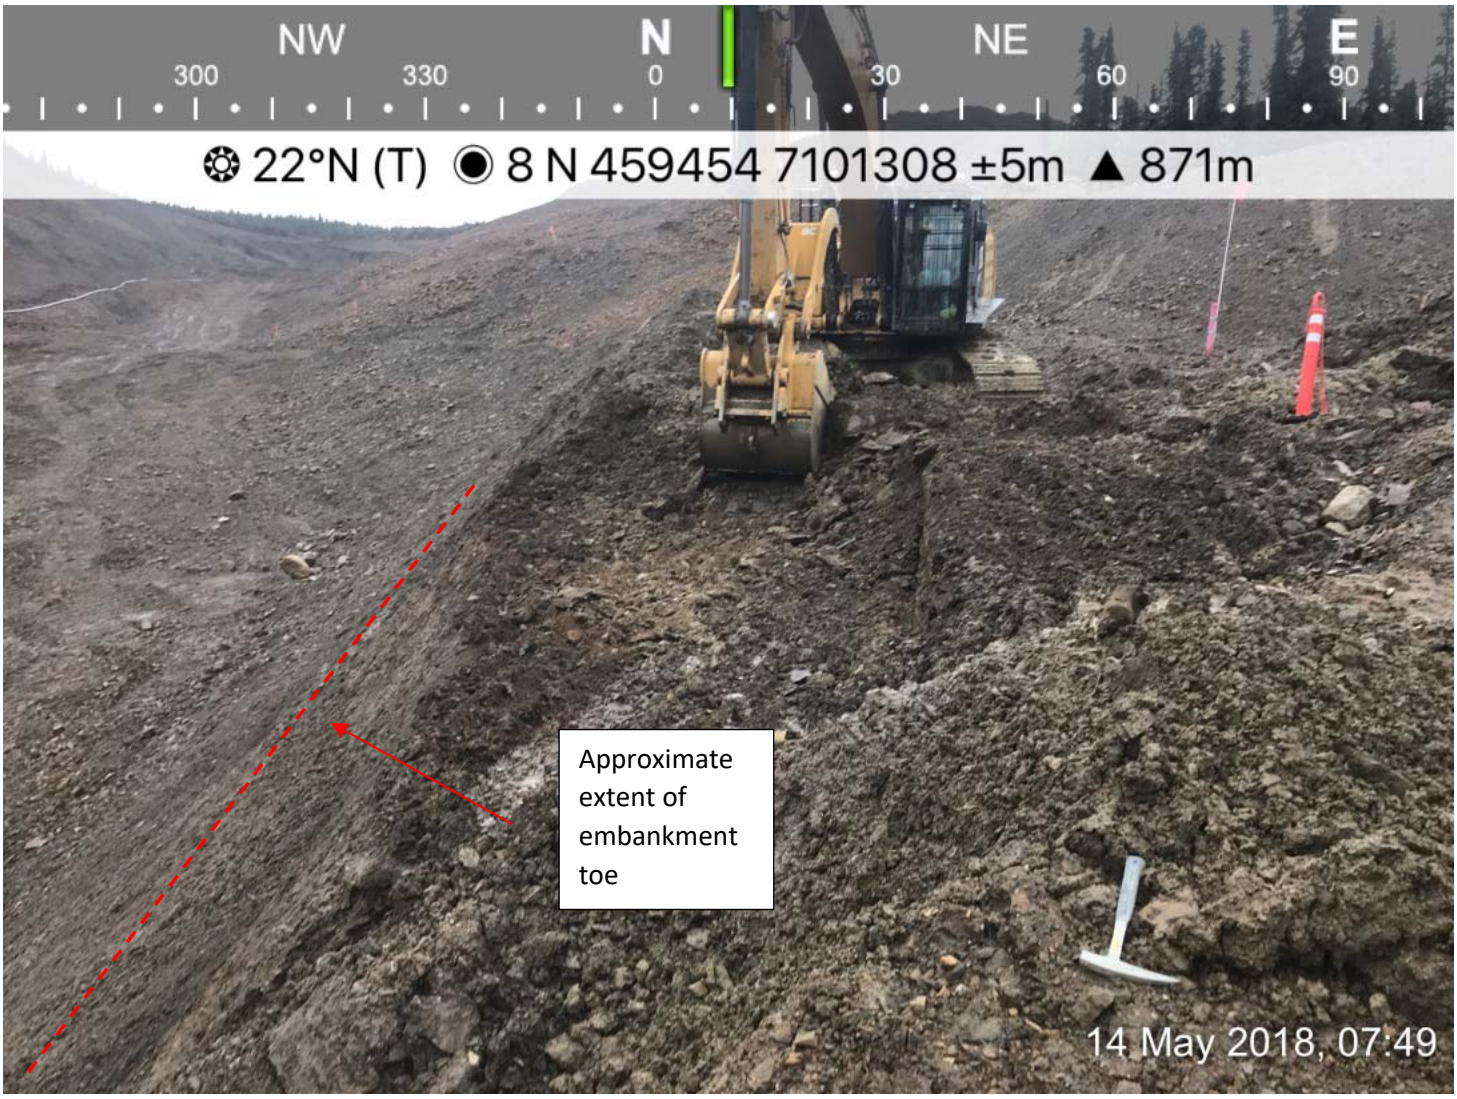

Photo 1: Pelly stepping back a steep slope near the embankment toe.

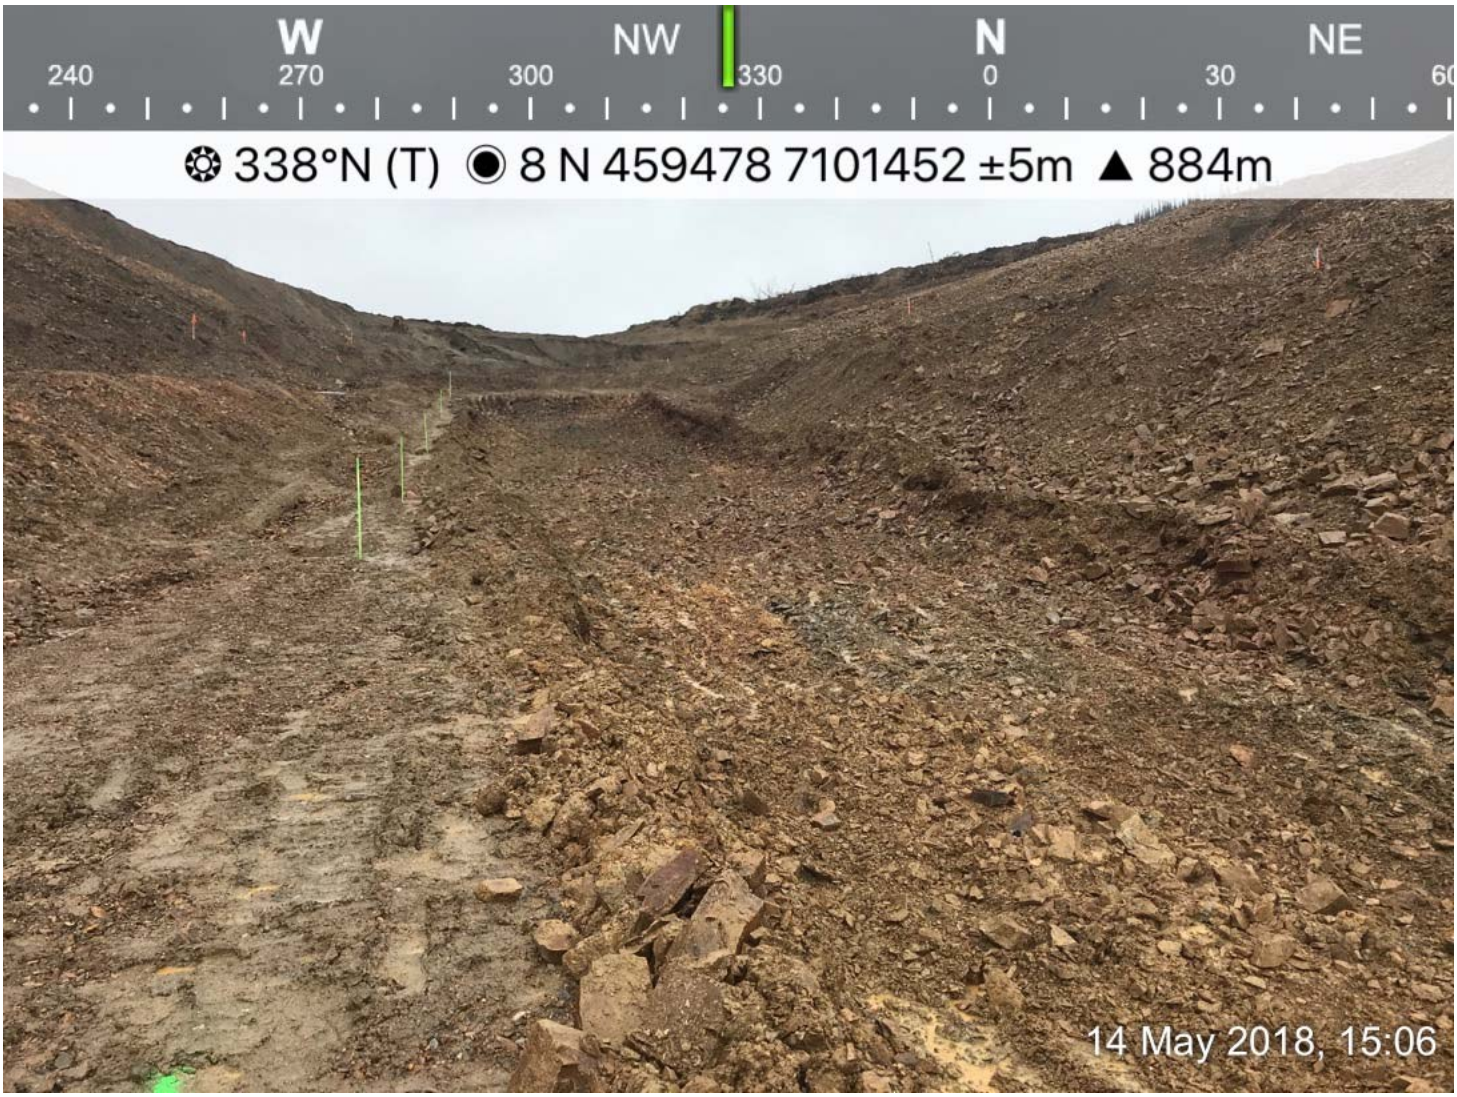

Photo 2: Pelly began digging the pipe trench through the embankment footprint. Excavation is leaving jagged rocks at the bottom. The pipe trench bottom will have to be smooth prior to placement of the geotextile to prevent punctures.

Photo 3: Excavated material consists of large jagged pieces that is not suitable to be used as select fill or structural fill.

Photo 4: Course outcrops appear somewhat lose.

Photo 5: Exposed phyllite layers in the abutment appear to have broken down and are now soft and weak.

Photo 6: Excavation at the ADR Plant.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	May 15, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Rainy 3°C to 15°C

Observations and Recommendations

- Observations and Recommendations:
  - Pelly continued digging the pipe trench under the embankment. Survey helped to ensure level, depth, and width. (***Photo 1***)
  - Areas within the first 30m of trench were surveyed for approval. (***Photo 2***). Some blocky jagged rocks will have to be removed by hand prior to placement of the geofabric to ensure that it won't be punctured.
  - Material excavated from the pipe trench is too course and jagged to be used as Material 3 - structural fill or Material 2 - select fill. (***Photo 3***). Rock fragments are too large to be used in 30 cm lifts. The material may be stockipiled as Material 8 – Rockfill for future use. A test fill for rockfill material is pending.
  - Prepared foundation that has been driven on by heavy equipment when wet tends to pulverize, as observed in previous daily reports from this season and 2017 and discussed on site. Ground surface layers that need to be removed because they were pulverized after approval were marked along the trench. The minimum trench depth discounts these loose areas as they will have to be removed prior to placement of embankment fill. (***Photos 4 and 5***)
  - Pelly excavated the area of embankment toe again to help water drain from this area. Previously approved areas driven on by heavy equipment have shown a tendency to pulverize when wet. Loose mud and rock at the toe may need to be excavated again prior to placement of embankment fill. (***Photo 6***)
  - During and before the recent rains areas of the trench received surface and near surface water flows. Approved areas should be protected from machinery when wet to prevent the need to further excavate after approval (***Photo 7***).
  - Excavation continues at the ADR plant.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 4ºC to 21ºC

Observations and Recommendations

- Observations and Recommendations:
  - Pelly continued digging the pipe trench under the embankment. Survey helped to ensure level, depth, and width. (***Photo 1***). Pelly is working on the approval documents. Some blocky jagged rocks will have to be removed by hand prior to placement of the geofabric to ensure that it won't be punctured. Loose and rocky materials from adjacent stockpiles has fallen into the excavation in some areas and should be cleaned out.
  - Pelly excavated the area at the toe of the embankment near the monitoring vault. Additional excavation is required. Pelly is working on water control to dry this area and to keep it from refilling with water before proceeding with further excavation. (***Photo 2***).
  - BGC is discussing the best method to build the toe of the embankment in this areas. Type 3 bedrock appears to drop significantly for the last 10m of embankment toe. BGC has recommended that the entire embankment toe be founded on type 3 bedrock (see ***Figure 1***). Pelly will continue excavation to type 3 bedrock once water control has been established.
  - Prepared foundation that has been driven on by heavy equipment when wet tends to pulverize, as observed in previous daily reports from this season and 2017 and discussed on site. Ground surface layers that need to be removed because they were pulverized after approval were marked along the trench. The minimum trench depth discounts these loose areas as they will have to be removed prior to placement of embankment fill.
  - Excavation/ pile grading continues at the ADR plant.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	May 19, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 9ºC to 21ºC

Observations and Recommendations

- Observations and Recommendations:
  - Pelly created a ditch and sump downstream of the embankment toe to allow water to drain prior to resuming excavation.
  - Pelly excavated the area of the in-heap pond. Material on the west side of the excavation was frozen. The excavation still requires a large amount of material removal before it is at final grade. (***Photo 1***).
  - BGC and Pelly discussed using a placer tailings deposit as backfill material for the toe of the HLF embankment. This material was inspected by BGC and found to be too poorly graded to be used as fill. (***Photo 2***)
  - A Rockfill Test Fill 01 was completed in the footprint of the HLF embankment. (***Photo 3***). It was determined that using the material excavated from the embankment drain trench as fill at the toe of the embankment is appropriate in 0.5m lifts. The number of passes needed to compact the material will be finalized once the settlement data is reviewed by BGC. However, preliminary estimates are 3 to 4 passes with 12 ton, smooth drum, vibratory roller. Details documenting the test fill and results will be presented in a brief memo developed by BGC.
  - BGC has recommended that the entire embankment toe be founded on type 3 bedrock. Pelly will continue excavation to type 3 bedrock once water control has been established.
  - Neway has resumed crushing material. (***Photo 4***) Their primary focus at this moment is to produce concrete aggregate. However, as a byproduct they are also producing Select Drain Fill. The piles they are generating of Select Drain Fill will undergo one more screening process to produce the correct gradation. This screening will happen at a later time. EBA's QC has tested the gradation of the partially screened Select Drain Fill Stockpile and reported that it has less than 6% fines.
  - Prepared foundation that has been driven on by heavy equipment when wet tends to pulverize, as observed in previous daily reports from this season and 2017 and discussed on site. Ground surface layers that need to be removed because they were pulverized after approval were marked along the trench. The minimum trench depth discounts these loose areas as they will have to be removed prior to placement of embankment fill.
  - Excavation/ pile grading continues at the ADR plant.

AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	May 20, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Rain 8°C to 20°C

Observations and Recommendations

- Observations and Recommendations:
  - Pelly excavated the toe area of the embankment. Type 3 bedrock was exposed in most of the excavation. Two meters of the toe remained in wet colluvium. This area could not be excavated due to water running into the excavation area. The area around the toe will have to be excavated and sloped to create more room to work in when fill is placed. (***Photo 1 and 2***)
  - Due to the geometry of the bedrock at the toe Pelly and JDS has asked for additional clarification on how to complete the doe and drain. JDS will provide an RFI to BGC tomorrow. Victoria Gold Environmental will be consulted in developing a solution in this area to ensure it complies with requirements for discharge and closure.
  - Neway continued crushing material. Their primary focus at this moment is to produce concrete aggregate. However, as a byproduct they are also producing Select Drain Fill. The piles they are generating of Select Drain Fill will undergo one more screening process to produce the correct gradation. This screening will happen at a later time. EBA's QC has tested the gradation of the partially screened Select Drain Fill Stockpile and has verbally reported that it has less than 6% fines. Select Drain Fill requires less than 5% fines. JDS has inquired if using <7% fines would be adequate under the HLF. BGC has asked EBA to collect a sample of the final SDF product if a batch is produced with >5 % fines (assuming up to 7% fines) to analyze at their Whitehorse lab for permeability.
  - Prepared foundation that has been driven on by heavy equipment when wet tends to pulverize, as observed in previous daily reports from this season and 2017 and discussed on site. Ground surface layers that need to be removed because they were pulverized after approval were marked along the trench. The minimum trench depth discounts these loose areas as they will have to be removed prior to placement of embankment fill.
  - Pelly's on-site compactors are less than 6,000 kg effective weight at the drum. This is less then minimum requirement of 9,000 kg for compaction of the embankment fill materials. Pelly is reviewing options to have a larger compactor available for construction.
  - Excavation/ pile grading continues at the ADR plant. Some material is being used for road construction. Most of the material produced to date from this area meets the requirements for Material 3 – Structural Fill. As reported in previous daily reports, there are some larger boulders being produced that will need to be picked out before use. Material has been segregated by regrading the piles and pushing larger boulders off slopes. However, this will result in larger rockfill zones at the bottom of the piles. BGC will have to be present during fill loadout to determine when and how much of these bottom areas need to be segregated so rockfill is not placed in structural fill zones of the embankment. (***Photo 3 and 4***)

ID	Description	Status
CC204-RFI-008	Related to the use of electrofusion of HDPE pipes within the pipe trench.	Open: Pending BGC response.
CC204-RFI-012	Related to drain pipe wrapping.	Closed: Received May 17. BGC responded May 19.
CC204-RFI-015	Related to event pond underdrain.	Open: Received May 17. Pending response.

Safety Issues: None

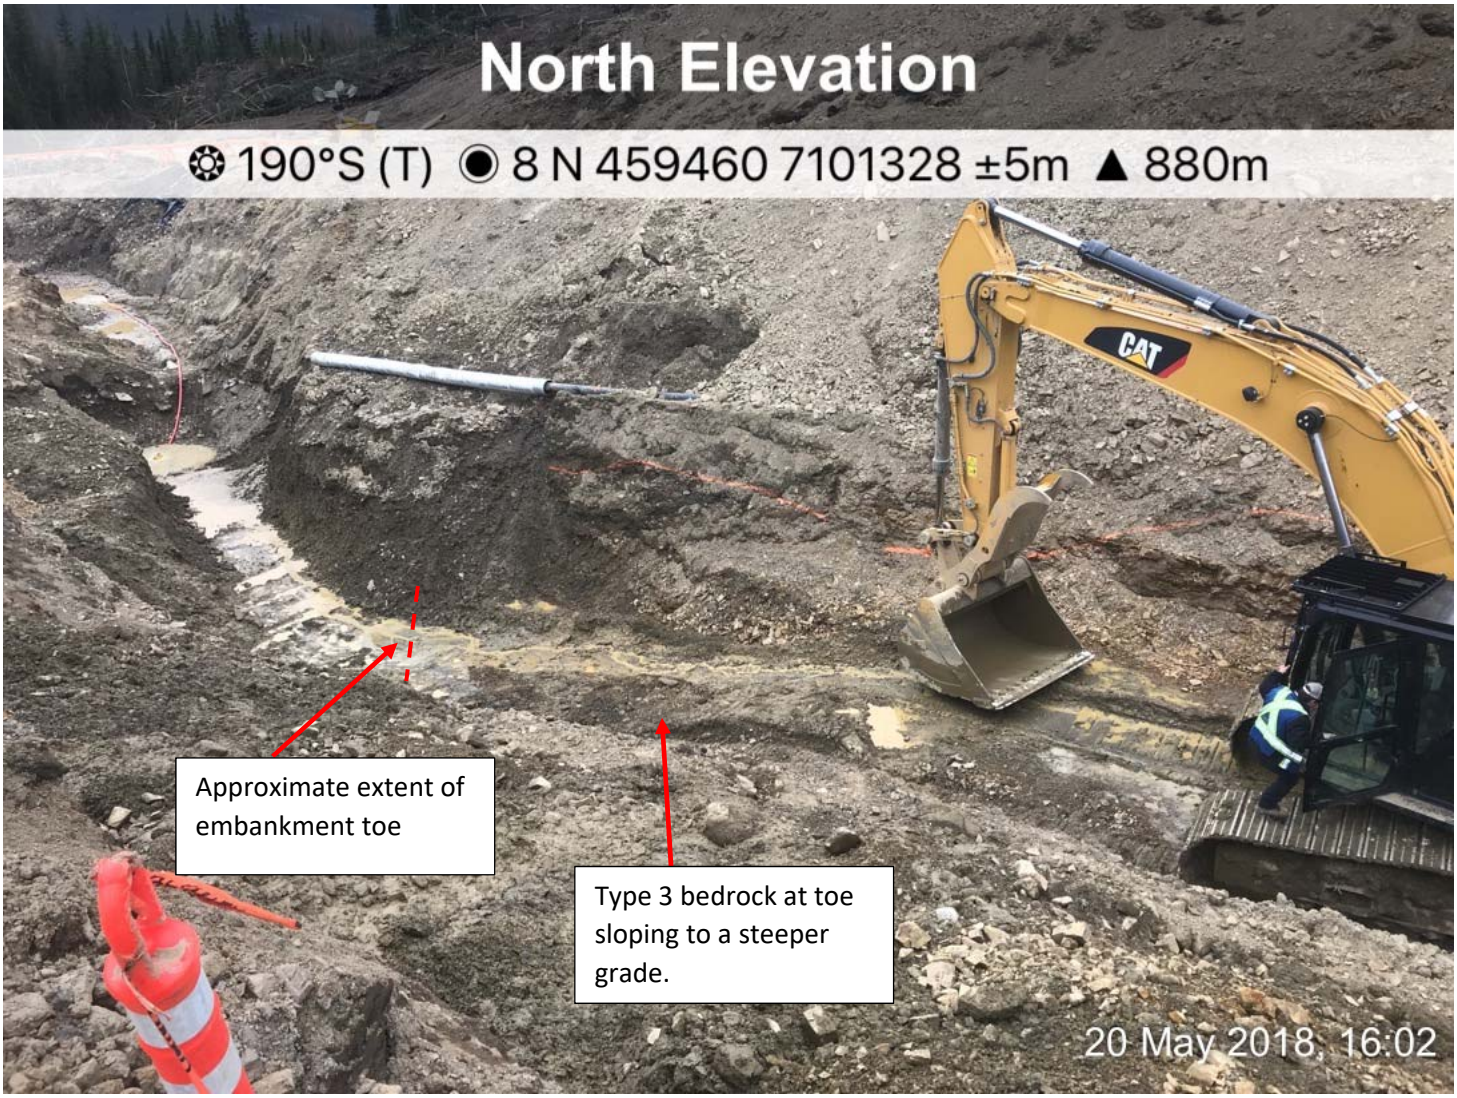

Photo 1: Pelly excavating the in-heap pond area.

Photo 2: Area at the toe is very wet and water continues to infiltrate into the excavation making identification of type 3 bedrock very difficult. Excavation is also narrow and will need to be widened and sloped for safety and working space.

Photo 3: ADR stockipile. Majority of material looks suitable for Structural Fill.

Photo 4: Larger material at the toe of the pile may not be suitable as Structural Fill. BGC should be present during haul out to determine when this material should be segregated as Material 7 – Compacted Rockfill.

BGC ENGINEERING INC.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Rain 4°C to 15°C

Observations and Recommendations

- Observations and Recommendations:
  - No work was performed at the HLF embankment area today.
  - Rainwater inundated the excavation at the toe of the embankment. (***Photo 1***). Rainwater has rutted the bottom of the washed some material, including jagged rocks into the trench. (***Photo 2***). The trench bottom should be cleaned of debris before placing geotextile.
  - Due to the geometry of the bedrock at the toe Pelly and JDS has asked for additional clarification on how to complete the doe and drain. JDS and Pelly have delivered an RFI to BGC regarding this issue. BGC has provided verbal direction and a conceptual sketch for the construction modifications (***Figure 1***). BGC is developing a new detail drawing to serve as guidance. Victoria Gold Environmental should review the final drawing to ensure it complies with requirements for discharge and closure. BGC expects a formal response to be complete this week.
  - Neway continued crushing material. Their primary focus at this moment is to produce concrete aggregate. However, as a byproduct they are also producing Select Drain Fill. The piles they are generating of Select Drain Fill will undergo one more screening process to produce the correct gradation. This screening will happen at a later time. BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	May 22, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Rain 3°C to 17°C

Observations and Recommendations

- Observations and Recommendations from Today:
  - No construction was performed at the HLF embankment area today. (***Photo 1***)
  - Pelly is in the process of redirecting and removing water from the area of the embankment toe. (***Photo 2***)
  - BGC sent a RFI to JDS to provide Pelly. The RFI requests water management details for all construction in the valley this season and protections over the winter. Recent rains have cause minor damage to the pipe trench excavation. Once fill/geosynthetics are placed and subgrade is prepared in areas like the embankment and the in-heap pond damage from surface water flow can result in significant rework. The storm water management plan should also cover protection of the stockpiles to avert erosion into streams, instability, and contamination. Victoria Gold should also review Pelly's water management plan to ensure that it complies with their intent and permitting requirements.
  - BGC verbally discussed Pelly developing a stockpile management plan. To date stockpile management has been adequate. However, a stockpile management plan should be developed to ensure that materials are mistakenly borrowed for the wrong use and that quantities are tracked.
- Open Observations and Recommendations:
  - Rainwater inundated the excavation at the toe of the embankment. Rainwater has rutted the bottom of the washed some material, including jagged rocks into the trench. The trench bottom should be cleaned of debris before placing geotextile.
  - Due to the geometry of the bedrock at the toe Pelly and JDS has asked for additional clarification on how to complete the toe and drain. Observations and Recommendations

- Observations and Recommendations from Today:
  - No construction was performed at the HLF embankment area today. (***Photo 1***)
  - Embankment toe was observed with no change. (***Photo 2***)
  - Pelly is actively evaluating on-site compactors on site meeting effective weight at the drum of 9,000 kg.
  - Vegetation and tree clearing was performed by excavators on the limits of the HLF area (***Photo 3***)
  - Select Drain Fill batch currently has 4.2% fines from EBA gradation tests.

- Open Observations and Recommendations:
  - Today's storm event inundated the excavation at the toe of the embankment. Rainwater has rutted the bottom of the washed some material, including jagged rocks into the trench. The trench bottom should be cleaned of debris before placing geotextile.
  - Neway continued crushing material. Their primary focus at this moment is to produce concrete aggregate. However, as a byproduct they are also producing Select Drain Fill. BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	May 26, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Daniel Granda	**Weather:**	Overcast/Sunny 10°C to 15°C

Observations and Recommendations

- Observations and Recommendations from Today:
  - Visited HLF project area with JDS Mining and Pelly representatives to discuss storm water management options. (***Photo 1***)
  - No construction was performed at the HLF embankment area today (***Photo 2***).
  - Pelly is actively evaluating on-site and off-site compactors to meet effective weight at the drum of 9,000 kg.
  - Vegetation and tree clearing was performed by excavators continued.
  - Select Drain Fill production suspended until tomorrow due equipment resources focused on concrete aggregate.

- Open Observations and Recommendations:
  - The trench bottom should be cleaned of debris before placing geotextile, jagged rocks should be cleared before geotextile placement.
  - Neway continued crushing material. Their primary focus at this moment is to produce concrete aggregate. However, as a byproduct they are also producing Select Drain Fill. The piles they are generating of Select Drain Fill will undergo one more screening process to produce the correct gradation. This screening will happen at a later time. EBA's QC has tested the gradation of the partially screened Select Drain Fill Stockpile and has verbally reported that it has less than 6% fines. Select Drain Fill requires less than 5% fines. JDS has inquired if using <7% fines would be adequate under the HLF. BGC has asked EBA to collect a sample of the final SDF product if a batch is produced with >5 % fines (assuming up to 7% fines) to analyze at their Whitehorse lab for permeability.
  - Prepared foundation that has been driven on by heavy equipment when wet tends to pulverize, as observed in previous daily reports from this season and 2017 and discussed on site. Ground surface layers that need to be removed because they were pulverized after approval were marked along the trench. The minimum trench depth discounts these loose areas as they will have to be removed prior to placement of embankment fill.
  - Pelly's on-site compactors are less than 6,000 kg effective weight at the drum. This is less then minimum requirement of 9,000 kg for compaction of the embankment fill materials. Pelly is reviewing options to have a larger compactor available for construction.
  - Excavation/ pile grading continues at the ADR plant. Some material is being used for road construction. Most of the material produced to date from this area meets the requirements for Material 3 – Structural Fill. As reported in previous daily reports, there are some larger boulders being produced that will need to be picked out before use. Material has been segregated by regarding the piles and pushing larger boulders off slopes. However, this will result in larger rockfill zones at the bottom of the piles. BGC will have to be present during fill loadout to determine when and how much of these bottom areas need to be segregated so rockfill is not placed in structural fill zones of the embankment.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Daniel Granda	**Weather:**	Sunny/Overcast/Rain 5°C to 15°C

Observations and Recommendations

- Observations and Recommendations from Today:
  - Runoff bypass installed by Pelly continues to work. (***Photo 1***)
  - During inspection with Pelly, Pelly wanted to use their pump to see how fast they could drain the downstream pump. (***Photos 2, 3 and 4***), estimated approximately 20 minutes to drain sump.
  - No construction was performed at the HLF embankment area today (***Photo 5***).
  - Continued to observe seeps, Pelly was made aware of locations during inspection (***Photo 6)***
  - Inspected runoff interception ditch at elevation 940 m, part of the Phase 1 Water Management Plan. (***Photo 7)***
  - Inspected runoff interception ditch at elevation 1010 m, to provide additional run off control during construction (***Photo 8***).
  - The results of the sampled locations for Select Fill – Material 2 for HLF Embankment Foundation Toe did not pass fines content requirements, other locations will be assessed tomorrow that can meet the requirement.
  - Pelly is actively evaluating on-site and off-site compactors to meet effective weight at the drum of 9,000 kg. BGC participated on meeting Friday June 1st, 2018 at 9 AM to discuss equipment, equipment that meets specification is available and supplier will contact Pelly.
  - Select Drain Fill production continues.

- Open Observations and Recommendations:
  - The trench bottom should be cleaned of debris before placing geotextile, jagged rocks should be cleared before geotextile placement.
  - Neway continued crushing material. Their primary focus at this moment is to produce concrete aggregate. However, as a byproduct they are also producing Select Drain Fill. The piles they are generating of Select Drain Fill will undergo one more screening process to produce the correct gradation. This screening will happen at a later time. EBA's QC has tested the gradation of the partially screened Select Drain Fill Stockpile and has verbally reported that it has less than 6% fines. Select Drain Fill requires less than 5% fines. JDS has inquired if using <7% fines would be adequate under the HLF. BGC has asked EBA to collect a sample of the final SDF product if a batch is produced with >5 % fines (assuming up to 7% fines) to analyze at their Whitehorse lab for permeability.
  - Prepared foundation that has been driven on by heavy equipment when wet tends to pulverize, as observed in previous daily reports from this season and 2017 and discussed on site. Ground surface layers that need to be removed because they were pulverized after approval were marked along the trench. The minimum trench depth discounts these loose areas as they will have to be removed prior to placement of embankment fill.
  - Pelly's on-site compactors are less than 6,000 kg effective weight at the drum. This is less then minimum requirement of 9,000 kg for compaction of the embankment fill materials. Pelly is reviewing options to have a larger compactor available for construction.
  - Excavation/ pile grading continues at the ADR plant. Some material is being used for road construction. Most of the material produced to date from this area meets the requirements for Material 3 – Structural Fill. As reported in previous daily reports, there are some larger boulders being produced that will need to be picked out before use. Material has been segregated by regarding the piles and pushing larger boulders off slopes. However, this will result in larger rockfill zones at the bottom of the piles. BGC will have to be present during fill loadout to determine when and how much of these bottom areas need to be segregated so rockfill is not placed in structural fill zones of the embankment.

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
BGC-RFI-001 EPCM-RFI-013	Related to protection of construction from surface water runoff.	Closed. Plan received June 1.
CC204-RFI-021	HLF In-Heap Sump	Open: Received May 27.
CC204-RFI-022	HLF Embankment Fill	Open: Received May 27.
CC204-RFI-031	Split Coupling	Open: Received May 30.
CC204-RFI-032	Monitoring Well Decommissioning	Closed. Response sent June 1.
BGC-RFI-002	Embankment Underdrain Construction Plan	Open: Send to JDS June 1.

Safety Issues: None

Photo 1: Runoff bypass systems placed with Pelly working.

Photo 2: Pelly turned on the pump to test how fast it could drain a sump.

Photo 3: Pump test started at 3:16 pm.

Photo 4: Pump end started at 3:36 pm.

Photo 5: Downstream view of HLF, small pockets of wet zones were observed.

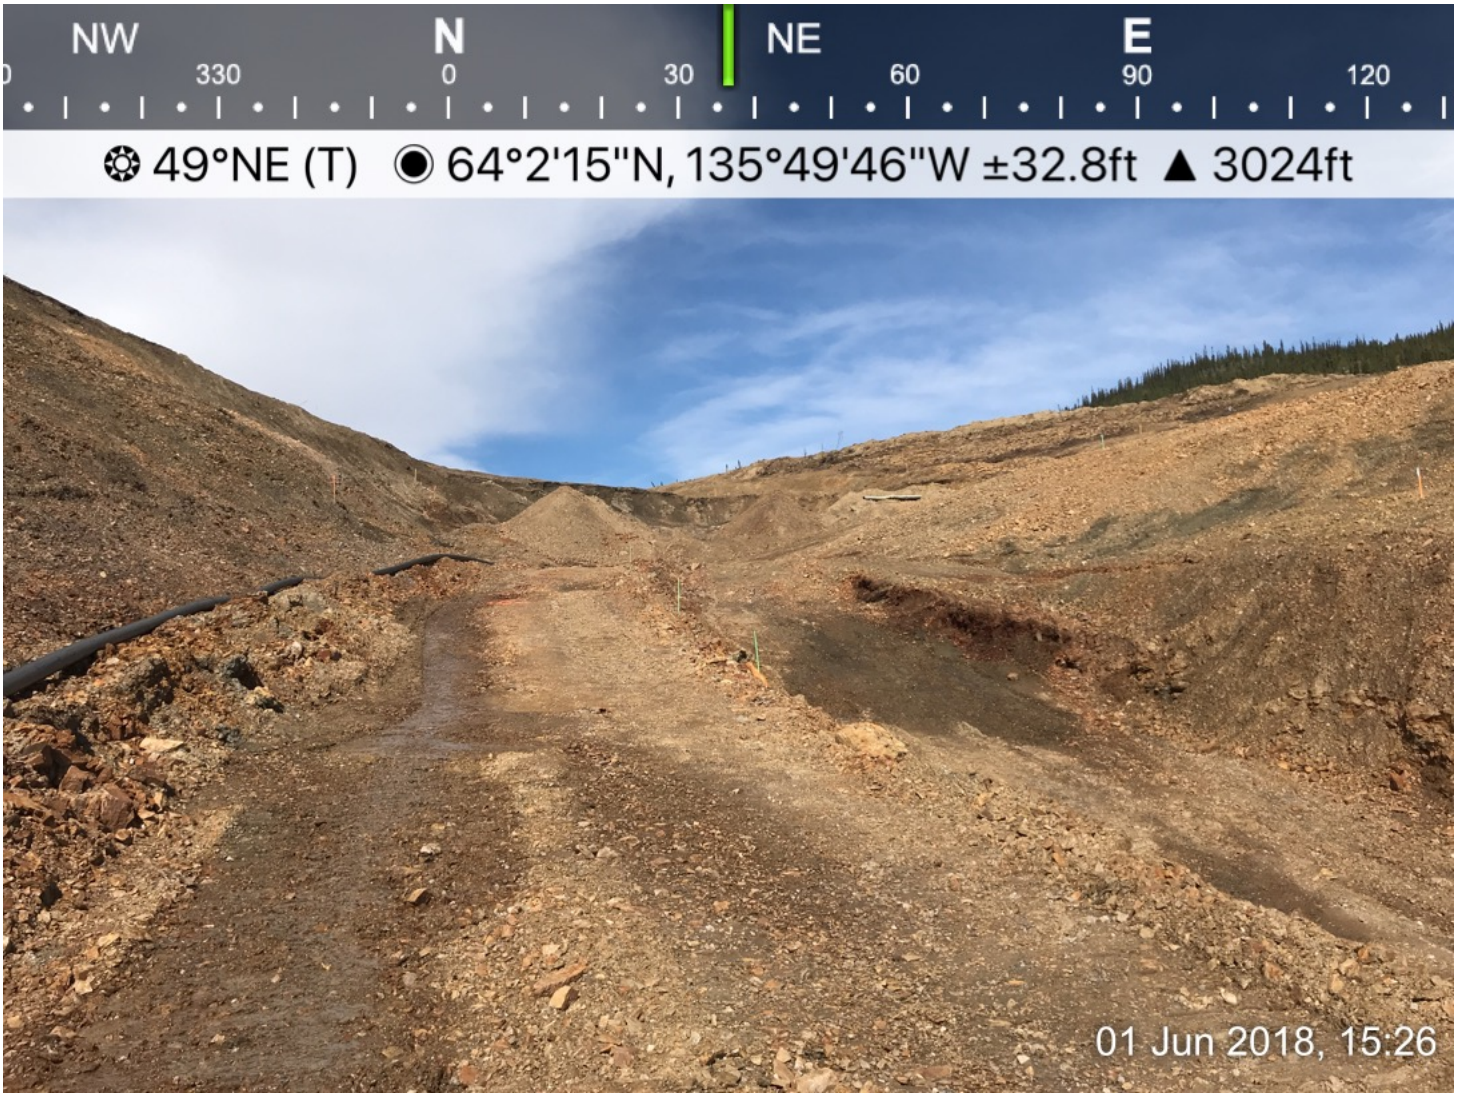

Photo 6: Upstream view of HLF, right side wet side continues to be observed and is suspected to be connected to artesian well upstream towards the East.

Photo 7: Inspected runoff interception ditch at elevation 940 m with Pelly.

Photo 8: Inspected runoff interception ditch at elevation 1010 m (per Pelly's staff).

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	June 2, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Daniel Granda	**Weather:**	Sunny/Overcast/Rain 5°C to 15°C

Observations and Recommendations

- Observations and Recommendations from Today:
  - In preparation for construction, BGC visited Neways production area with EBA (Tetra Tech) QC to visually inspect the Select Drain Fill (Material 5) (***Photos 1 and 2***).
  - Pelly (Surveyor and Engineering Rep.) and BGC located piezometers in the embankment footprint, only 3 out of 8 were found intact with casings, the remaining 5 have likely been buried or destroyed during earthworks. An excavator was used to gently move material on recorded locations and digging up to 2 metres to attempt discovery of casing or pvc material and confirm locations (***Photo 3***)
  - BGC used the opportunity of having an excavator to conduct in-situ test pits to help determine depths to competent material. Between elevation 920 to 1010 m, no suitable foundation material was found at a depth of 2 meters. Between elevation 905 to 920 m, frozen material and ice were found at depths of 1.5 to 2 metres, with no suitable foundation material. (**Photos 4, 5 and 6**)
  - No construction was performed at the HLF embankment area today (***Photo 7 and 8***).

- Open Observations and Recommendations:
  - Located sources for Select Fill – Material 2 after further testing. Attaching gradation results as an attachment, this material can be used for RFI -017, toe embankment construction. Pelly aware of location, within excavator reach from toe of embankment construction.
  - Discussed with Pelly that toe embankment construction will commence tomorrow, BGC will be present during operation.
  - Will discuss with Pelly the plan with Midnight Sun Drilling as they arrive to site June 4th.
  - BGC recommends labeling Stockpiles produced by Neway and construction efforts commence.

Client:	Victoria Gold	**Date and Shift:**	June 5, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Daniel Granda	**Weather:**	Overcast/Rain/Hail 5°C to 12°C

Observations and Recommendations

- Observations and Recommendations from Today:
  - Construction continued at the HLF embankment area today, with RFI-017 Embankment Toe (***Photo 1-7***).
  - Midnight Sun drilled in the area of the artesian well but was unable to locate or seal.
  - Worked with Pelly surveyor for as-build info gathering and final grading of RFI-017, confirmed areas in underdrain trench that meet width requirements.

- Open Observations and Recommendations:
  - Stockpile areas for Type 2 material may be needed as the project needs for this material grow.
  - Potential Type 2 material sources have been identified and will require gradation tests to confirm.
  - Pelley will implement water management plan before underdrain installation begins.

-

CC204-RFI-022	HLF Embankment Fill	Open: Received May 27.
BGC-RFI-002	Embankment Underdrain Construction Plan	Closed: Pelley discussed and BGC reviewed.

Safety Issues: None

Photo 1: Continued RFI-017, excavator re-mixed layers with coarser material to achieve better compaction.

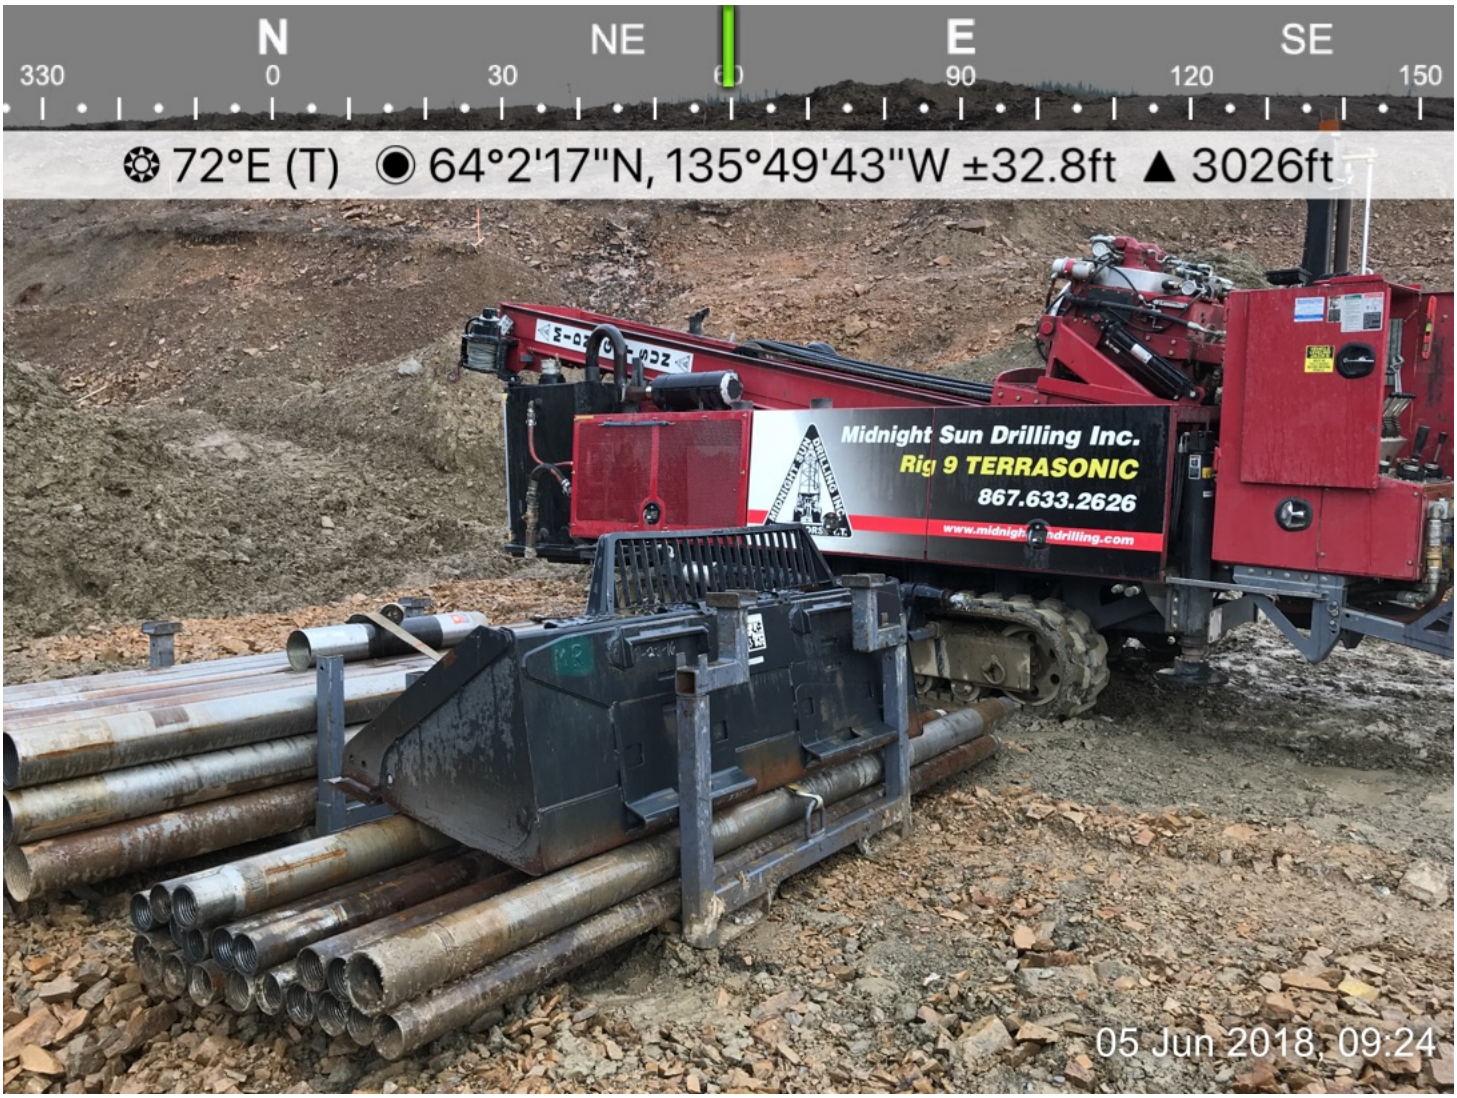

Photo 2: Midnight Sun Drilling arrived at site, positioned itself on the artesian well area under direction from Pelly.

Photo 3: Pelly placed material to raise up the current downstream sump collect runoff from upstream.

Photo 4: Phase 2 of RFI-017 was accepted and surveyed.

Photo 5: Geotextile was place before placing type 2 material to finalize RFI -017. BGC communicated via radio with both source excavator for type 2 and excavator placing, an articulated rock truck hauled material between excavators.

Photo 6: Field plan was placed for excavator to spread type 2 material and compact with shovel.

Photo 7: Due to very intense rainfall, work stopped due to moisture effects on type 2 material, expected to finalize final grading for surface to be ready for underdrain design placement.

Client:	Victoria Gold	**Date and Shift:**	June 6, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Daniel Granda	**Weather:**	Continuous Rain 5ºC to 10ºC

Observations and Recommendations

- Observations and Recommendations from Today:
  - Construction continued at the HLF embankment area today, with RFI-017 Embankment Toe (***Photo 1-4***).
  - RFI-017 was halted due to excess moisture and continuous rain affecting compaction and behavior of Type 2 material.
  - Located and made plans for access to close down wells (***Photo 5***).
  - Midnight Sun drilled and sealed the unnamed well next to MW10-AG5 (***Photo 6***).
  - Pelly build a sump/embankment to start implementing Phase 1 Water Management Plan (***Photo 7***).

- Open Observations and Recommendations:
  - New sources of Type 2 material have been identified and geotechnical tests by EBA/Tetra Tech will be conducted.
  - A small test pit is recommended on the artesian well area to help identify possible source or direction of source.
  - BGC will continue to monitor driller (Midnight Sun's activities) as they continue to decommission wells in HLF.

-

1) QA/QC Results:

QA/QC Results

None	

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
CC204-RFI-022	HLF Embankment Fill	Open: Received May 27.

Safety Issues: None

Photo 1: Continued RFI-017.

Photo 2: Continuous rainfall was observed to have over saturated Type 2 Material.

Photo 3: Materials were mixed, Type 2 material from south facing slopes and free drainage were used but the compaction was not adequate. The left grayish side was the compacted Type 2 from June 5 and the right side wetter surface is the compacted Type 2 of June 6.

Photo 4: A different source for Type 2 was selected and blended with some type 3 but the compaction was not adequate and the placement of this material on the toe of the embankment was canceled due to saturation and inability to compact with shovel bucket.

Photo 5: Pelly and BGC identified DG10-399C and made plans for Pelly equipment to make access for Midnight Sun Drillers

Photo 6: Midnight Sun sealed borehole Unnamed well by MW10-AG5.

Photo 7: Pelley started with the Phase 1 Management Plan to control runoff on underdrain trench.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	June 7, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Daniel Granda / Elliot Matthews	**Weather:**	Continuous Rain 5ºC to 10ºC

Observations and Recommendations

- Observations and Recommendations from Today:
  - RFI-017 was halted due to excess moisture and continuous rain affecting compaction and behavior of Type 2 material (***Photo 1***).
  - Midnight Sun drilled and sealed MW10-AG5 (***Photo 2***).
  - BGC and QC (EBA) took samples of new possibly source for Material Type 2 (***Photo 3***).
  - QC (EBA) conducted nuclear density gauge tests on new possible (***Photo 4***).
  - Over saturations observed throughout HLF site (***Photo 5***).

- Open Observations and Recommendations:
  - New sources of Type 2 material have been identified and geotechnical tests by EBA/Tetra Tech are being conducted.
  - A small test pit is recommended on the artesian well area to help identify possible source or direction of source.
  - BGC will continue to monitor driller (Midnight Sun's activities) as they continue to decommission wells in HLF.
  - Nuclear Density tests showed the following; Material by berm and slope had a dry density of 17.39 kN/m^3 and moisture of 14%, material that was oversaturated and soft had a dry density of 18.88 kN/ m^3 and moisture of 16%, material that was compacted by tracks of excavator or bulldozer has a dry density of 21.9 kN/ m^3 and moisture of 9%. No recommendations are provided at this time as geotechnical tests in the lab continue.
  - Escorted Elliot Matthews (BGC QA) from Mayo to Site.

-

1) QA/QC Results:

QA/QC Results

CC204-RFI-022	HLF Embankment Fill	Open: Received May 27.

Safety Issues: None

Photo 1: Due to continuous rain and moisture, no work was done on RFI-17 Toe Embankment.

Photo 2: Midnight Sun Drilling continuing on MW10-AG5 well decommissioning.

Photo 3: BGC took samples of new possible locations for Type 2 – Select Fill, three samples were taken.

Photo 4: QC (EBA) used nuclear density gauge to measure dry density and moisture content in-situ to understand how variable the material can behave.

Photo 5: View from upstream after the rainstorms, presenting saturation throughout site.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	June 8, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Daniel Granda / Elliot Matthews	**Weather:**	Overcast/Rain 5ºC to 10ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Midnight Sun drilled DG10-399C to 182 m (***Photo 1***).
  - Rainfall continued to affect the HLF site; natural saturation prevented placement and compaction of Type 2 material (***Photo 2)***.
  - A potential new source for Type 2 material (proposed by Pelly) was sampled from the Process Plant area and submitted for lab testing (***Photo 3***).
  - HDPE pipe fusing and current fused pipes were inspected (***Photo 4 and 5***).

- Observations and Recommendations (OPEN):
  - New sources of Type 2 material have been identified and geotechnical tests by EBA/Tetra Tech are being conducted.
  - A small test pit is recommended for the artesian well area to characterize localized groundwater flow.
  - BGC should continue to monitor drilling (conducted by Midnight Sun) as they continue to decommission wells in the HLF.
  - BGC should evaluate mix options for Type 2 material (Type 2 mixed with granular material sources), lab tests pending.

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - None

CC204-RFI-022	HLF Embankment Fill	Open: Received May 27.
CC204-RFI-030	Steel Pipe Works	Open: Received June 8.
CC204-RFI-034	Closure Drill Casing	Open: Received June 8.

Safety Issues: None

Photo 1: Midnight Sun drilled DG10-399C.

Photo 2: Rainfall and moisture continue to oversaturate surfaces and stockpiles of Type 2 material.

Photo 3: BGC took samples from new locations for potential sources of Type 2 material – Potential new Select Fill, from the Process Plant area, was suggested by Pelly.

Photo 4: BGC visited Pelly's work area for fusing HDPE pipe.

Photo 5: HDPE pipes continue to be fused in preparations for the drain construction.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	June 9, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Daniel Granda / Elliot Matthews	**Weather:**	Sunny 5ºC to 12ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Midnight Sun grouted DG10-399C (***Photo 1***).
  - BGC/Pelly used a window of fair weather (clear skies and sun) to attempt placing Type 2 material on the embankment toe (***Photo 2)***.
  - Type 2 material on all sources were still oversaturated and the first load was rejected upon arrival at the embankment toe (***Photo 3, 4 and 5***).
  - JDS suggested testing of new potential replacement material for the oversaturated Type 2 material (***Photo 6***), it was not accepted due to failing technical specifications criteria (not enough fines).
  - Pelly continued work on the underdrain trench by putting vampire drains to help with water management (***Photo 7).***
  - Type 2 material was excavated and spread out in an open area to encourage soil drying in anticipation of future placement attempts (***Photo 8***).

- Observations and Recommendations (OPEN):
  - Potential new sources of Type 2 material have been identified and geotechnical tests by EBA/Tetra Tech are being conducted.
  - A small test pit is recommended for the artesian well area to characterize localized groundwater flow.
  - BGC should evaluate mix options for Type 2 material (Type 2 mixed with granular material sources), lab tests pending for other potential new sources of Type 2 material.

CC204-RFI-030	Steel Pipe Works	Open: Received June 8.
CC204-RFI-034	Closure Drill Casing	Open: Received June 8.

Safety Issues: None

Photo 1: Midnight Sun grouted DG10-399C.

Photo 2: Today was a sunny day and BGC/Pelly prepared the surface of the toe embankment in anticipation of placing Type 2 material.

Photo 3: Type 2 material excavation was supervised by BGC.

Photo 4: BGC observed a small excavation from the Pelly excavator (immediately after excavation).

Photo 5: BGC noticed the previous small excavation filled with water (26 minutes after initial excavation). Water was not from run off or rain but derived from the saturated material around the excavation.

Photo 6: A representative from JDS suggested testing the waste material from the Neway crusher as an alternative for Type 2 material. Grain size analysis indicated the proposed alternative soil had less than 8% fines and was thereby below technical specification criteria. BGC rejected the proposed alternative soil based on the failing technical specification criteria.

Photo 7: Pelly continued working on the vampire drains to help guide runoff in underdrain trench.

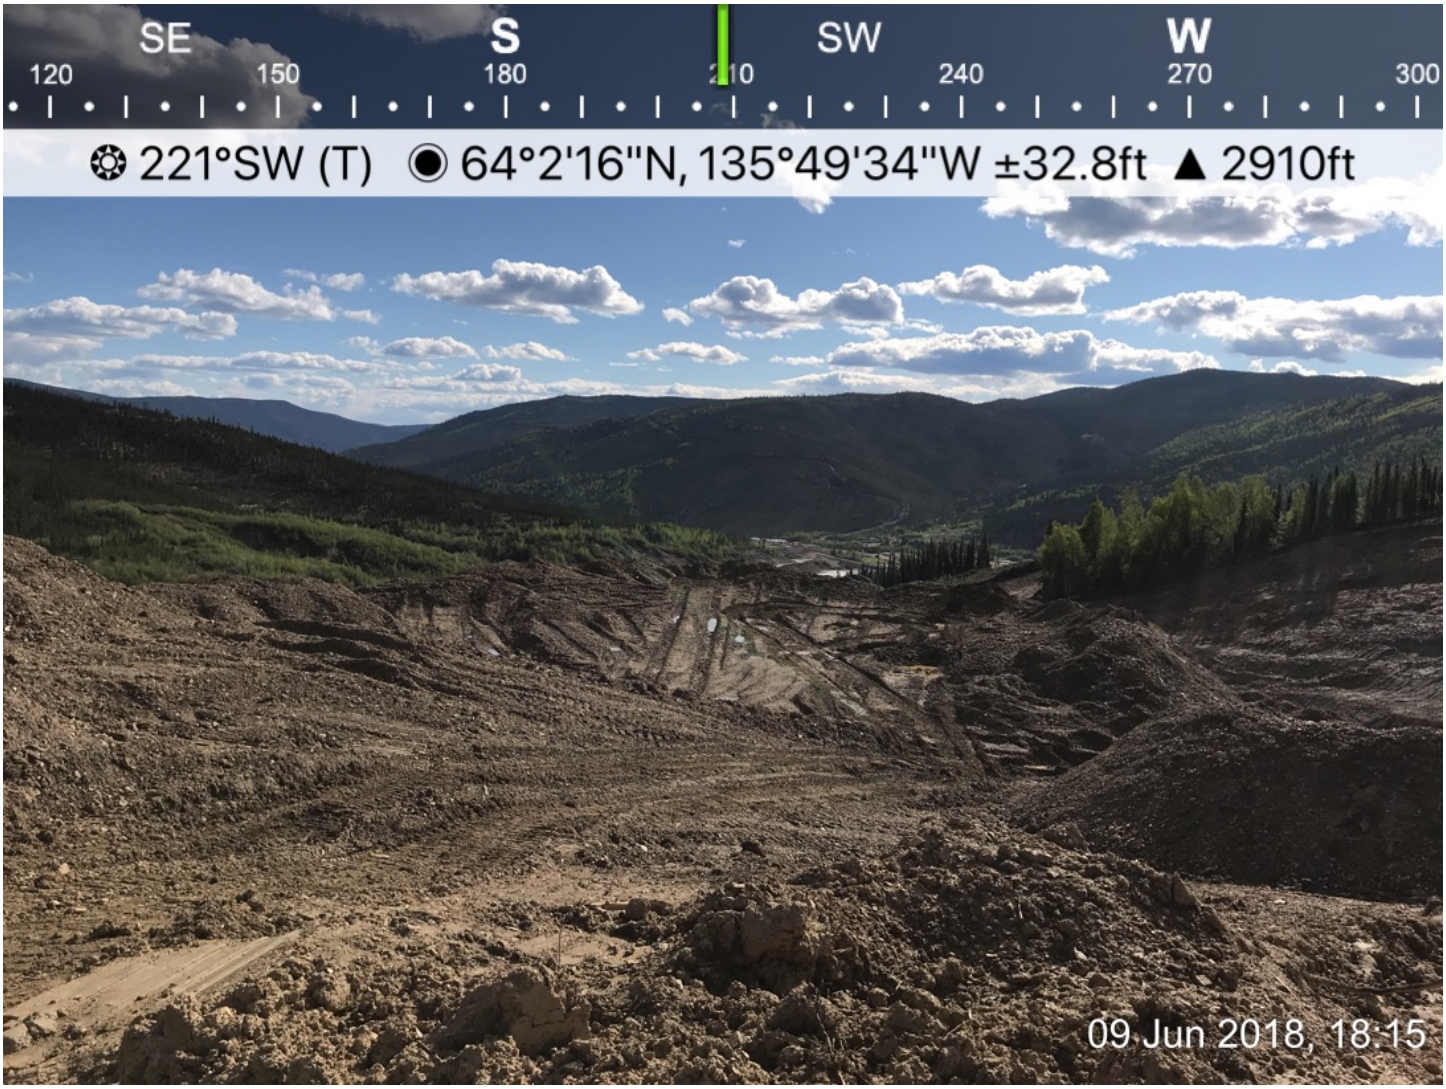

Photo 7: Type 2 material was spread out in an open area to encourage drying in anticipation of future placement attempts.

BGC ENGINEERING INC.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	June 10, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Daniel Granda / Elliot Matthews	**Weather:**	Sunny/overcast 5ºC to 15ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - BGC contacted Pelly to initiate Type 2 material placement due to favorable weather at approximately 07:00 HRS (2 days without rainfall).
  - Construction (placement and compaction) of the toe embankment took place between 11:00 HRS and 19:00 HRS (***Photo 1 to 5***).

- Observations and Recommendations (OPEN):
  - A small test pit is recommended for the artesian well area to characterize localized groundwater flow.
  - BGC recommends JDS/Pelly develop a Type 2 material stockpile plan to improve material properties and optimize placement opportunities during construction.

Safety Issues: None

Photo 1: Storm event saturated site, vampire drains working to bring runoff to pump.

Photo 2: Entire site had ponded water.

Photo 3: Material Type 2 area from yesterday was found to be saturated with ponds.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	June 12, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Matthews	**Weather:**	Sunny 7°C to 20°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - BGC rotation. Dan Granda left site and Roy Morlan returned to site.
  - No construction was performed in the HLF today. BGC met with Pelly and JDS to plan a path forward for construction.
  - Water control appears adequate for construction of the drain. Pelly will begin drain construction the morning of June 13. The path forward will include:
    - Pelly will extend the 'Vampire Drains' past the toe of the embankment.
    - Pelly will work from the bottom of the valley up completing the proper depth and width for the drain trench as they go. A survey crew will be present as they dig. Pelly will move stockpiles of Material 7 – Rockfill located along the trench sides as they go. (***Photo 1***).
    - Geotextile will be placed in the drain trench as they work their way up. Pelly will attempt to use large rocks (small boulder size rocks) as ballast hand placed on the geotextile. These rocks will be hand removed prior to placement of drainfill. If these rocks appear to damage the geotextile Pelly will have to cease the use of them and replace damaged geotextile. BGC has recommended the use of drainfill rock as ballast.
    - Finger drains will be constructed connecting to the pipe trench. A preliminary design of 3 finger drains leading from the right abutment between pipe trench stations 0+300 and 0+150 is being developed. (***Photos 2 and 3***).
    - BGC observed waste piles (material high in organics and silt) stored at the toe of the HLF embankment (***Photo 4***). Some material that was determined suitable for Material 7 – Rockfill is being stored on either side of the drain trench (***Photo 5***). At the ADR excavation Material 7 – Rockfill is being stored on top of a leveled platform of Material 3 – Structural Fill (***Photo 6***). Areas of the Material 3 – Structural fill stockpile have been borrowed for use in construction of the embankment drain toe. Total volumes and materials and stockpile delineation is unclear and a Materials Management Plan should be completed.

- Observations and Recommendations (OPEN):
  - A small test pit is recommended for the artesian well area to characterize localized groundwater flow. A drain that would capture this flow as well some upstream flow on this side of the rock knob is in development.
  - Type 2 material stockpile plan to improve material properties and optimize placement opportunities during construction.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Matthews	**Weather:**	Cloudy 4°C to 18°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly worked with BGC to identify the top of bedrock and to determine how much more excavation is required to complete the trench to the proper size along its entire alignment. (***Photo 1***).
  - Pelly graded the area at the toe of the embankment and used the blade of a small excavator to seal the surface. (***Photo 2***).
  - Pelly began preparations to test the closure pipe for leaks.
  - Pelly continues work at the ADR plant and is generating rockfill for use in the embankment construction in this area.

- Observations and Recommendations (OPEN):
  - A small test pit is recommended for the artesian well area to characterize localized groundwater flow. A drain that would capture this flow as well some upstream flow on this side of the rock knob is in development.
  - Total volumes and materials and stockpile delineation is unclear for Materials 7, 3, and 2. Material used at the toe of the embankment (Material 2) has a low optimum moisture for construction, is very wet, and in an area that receives runoff during rain. A materials management plan should be developed. It should also include planning to improve material properties and optimize placement opportunities during construction for Material 2. The overall plan should also include anticipated and current volumes updated periodically of all materials generated or procured. This will help plan and identify material needs before an issue arises and allow better tracking of QA/QC testing.

Photo 2: Embankment toe area.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	June 14, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Matthews	**Weather:**	Cloudy 4°C to 21°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly performed a shift change today, limiting the amount of work that was completed at the HLF.
  - Pelly continued preparations to test the closure pipe for leaks.
  - Pelly surveyed the toe area of the embankment. The portion where the fill area meets the type 3 bedrock is less than 2% slope (1.8%). BGC approved the remaining area which was over 2% slope. BGC discussed using Material 2 to regrade the area that was too horizontal and tie it into the type 3 bedrock. (***Photo 1***)
  - Pelly continues work at the ADR plant and is generating rockfill for use in the embankment construction in this area. Pelly has built a road from the ADR plant foundation area to the location where the event pond will be excavated. They are stockpiling Material 7 – Rockfill in this area.
  - Pelly's operator worked on water control near the Material 3 – Structural Fill stockpile late in the day.
  - Pelly did not perform excavation at the pipe trench today.
  - BGC and EBA collected a sample from the Material 7 – Rockfill to perform a rough gradation estimate. This rough gradation estimate will be used to determine if there will be piping issues if the embankment construction is reconfigured by Pelly to place Material 3 – Structural Fill over Material 7 – Rockfill. If the results of the sample show piping will be a concern or if the results are border-line transition, zoning will have to be designed or a true gradation for both materials will have to be completed for further analysis. (***Photos 2 and 3***)

- Observations and Recommendations (OPEN):
  - The test pit and drain at the artesian hole on the east side of the embankment will be completed after the Material 3 – Structural Fill stockpile is cleared from this area or reconfigured in a way that it is not in the footprint of this drain.
  - JDS/Pelly are developing a materials management and tracking plan.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	June 16, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Matthews/ Tory Meyer	**Weather:**	Cloudy 11ºC to 24ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly performed the leak test on the closure pipe. The pipe passed the test. Pelly will develop a brief report explaining the testing procedure and execution. BGB will develop a short report discussing the results. The pipe tested should be marked for use as the closure pipe. (***Photo 1 and 2***)
  - Material was identified for use at the toe of the embankment. The material was transported to the toe and Pelly began installing it to improve the grade at the toe and build the trench side walls. (***Photo 3 and 4***).
  - While looking for material for use at the toe at the Material 3 stockpile BGC observed that an area along the north side of the stockpile consisted of material with high fines, max sizes approximately 6 inches, and a moderate amount of organics. I estimate that there is about 10,000 cubic meters of this material at this location. This material did not come from the embankment footprint excavation in 2017 and Pelly was not sure where the material originated from. However, the most likely source is road construction from this area. This material is not suitable as Material 3 – Structural Fill and should not be used in the embankment lifts. It should be moved or clearly marked so it is not mistakenly used in the embankment construction (***Photo 5***).
  - Pelly dug a test trench in the Material 3 stockpile on the east side of the embankment footprint. The Material is saturated at about 0.5m bgs. Water drained from the trench after excavation. This material will not be suitable for construction of the embankment in this state. A method to drain and dry this material should be devised before embankment placement begins. (***Photo 6***).
  - BGC recommends that Pelly delineate how much of the Material 3 stockpile is saturated prior to use at the embankment. Pelly should develop a model of usable vs currently saturated material in order to properly plan for construction.
  - Pelly continues work at the ADR plant and is generating rockfill for use in the embankment construction in this area. Pelly has built a road from the ADR plant foundation area to the location where the event pond will be excavated. They are stockpiling Material 7 – Rockfill in this area.

- Observations and Recommendations (OPEN):
  - JDS/Pelly are developing a materials management and tracking plan.

BGC Personnel:	Roy Morlan / Elliot Matthews/ Tory Meyer	**Weather:**	Cloudy 7ºC to 22ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly constructed the side walls of the pipe trench (***Photo 1***).
  - Pelly began excavation of the first finger drain on the west side of the pipe trench (***Photo 2***).
  - BGC, Pelly, and JDS discussed land farming the Material 3 stockpile in preparation for its use in the embankment. Pelly will focus on construction of the drains before they are able to perform this work.
  - Pelly continues work at the ADR plant and is generating rockfill for use in the embankment construction in this area. Pelly has built a road from the ADR plant foundation area to the location where the event pond will be excavated. They are stockpiling Material 7 – Rockfill in this area.
  - BGC discussed the use of crusher reject material as Material 2 underneath the liner on the upstream face of the dam. BGC will further investigate this tomorrow.

- Observations and Recommendations (OPEN):
  - JDS/Pelly are developing a materials management and tracking plan.
  - An area of material high in organics on the northern portion of the Material 3 stockpile should be delineated and segregated from the pile.
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state.

Client:	Victoria Gold	**Date and Shift:**	June 18, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Matthews	**Weather:**	Clear 11°C to 26°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly compacted one 15 cm lift on the pipe trench toe walls (***Photo 1***).
  - Pelly completed excavation of the first finger drain on the west side of the pipe trench – Finger Drain 2 (***Photo 2***).
  - Pelly prepared the drain surface, placed geotextile, and some drain rock (***Photos 3 and 4***).
  - Pelly continues work at the ADR plant and is generating rockfill for use in the embankment construction in this area. Pelly has built a road from the ADR plant foundation area to the location where the event pond will be excavated. They are stockpiling Material 7 – Rockfill in this area.
  - Crusher reject material was inspected and BGC received gradation results from EBA. The material is mostly well graded sand from 0.8mm to 2mm. Due to the materials lack of cohesion a small test placement will be needed to ensure that the material can be placed at a 2.5:1 slope and compacted using hand tampers. BGC will also verify the filter compatibility between the reject material and Material 3.

- Observations and Recommendations (OPEN):
  - JDS/Pelly are developing a materials management and tracking plan.
  - An area of material high in organics on the northern portion of the Material 3 stockpile in the embankment footprint should be delineated and segregated from the pile.
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	June 19, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Matthews	**Weather:**	Clear 11°C to 26°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly compacted one additional 15 cm lift on the pipe trench toe walls (***Photo 1***). The pipe trench toe wall is now up to grade. However, the width of the trench still requires shaping.
  - Pelly completed the first finger drain (FD2). Pelly backfilled the temporary rockfill haul road to road grade using compacted structural fill (***Photo 2***). Loose, jagged material in the trench bottom will need to be cleared out before Pelly places material over the geotextile. Pelly reported constructing the drain using the wrong drain fill material. They delivered and installed 38" minus drain rock originally intended for an electrical substation construction. EBA provided BGC gradation results for this material. The material is compatible with the Material 5 drain fill which will be used in the pipe trench. BGC allowed the material to stay in FD2. However, future drains should be constructed with drain material required in the design.
  - Pelly continues work at the ADR plant and is generating rockfill for use in the embankment construction in this area. Pelly has built a road from the ADR plant foundation area to the location where the event pond will be excavated. They are stockpiling Material 7 – Rockfill in this area.
  - BGC has scheduled a proctor test with EBA on the crusher reject material. Filter compatibility compatibility calculations show no issues with use the material against Material 3. BGC estimates approximately 20,000 cubic meters of material will be needed.
  - BGC performed mapping of the western portion of the ADR plant rockwall (***Photo 3***).
  - Material 3 at the ADR borrow has thick zones of finer material being generated and stockpiled. This finer material should be blended with courser Material 3 before use. (***Photo 4***)

- Observations and Recommendations (OPEN):
  - JDS/Pelly are developing a materials management and tracking plan.
  - An area of material high in organics on the northern portion of the Material 3 stockpile in the embankment footprint should be delineated and segregated from the pile.
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material.
  - The artesian well should be investigated using a trench in order to complete the design for finger drain FD1.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Matthews	**Weather:**	Clear 12°C to 27°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly completed the second finger drain. Pelly backfilled the temporary rockfill haul road to road grade using compacted structural fill (***Photo 1 and 2***). Loose, jagged material in in the pipe trench will need to be cleared out before Pelly places material over the geotextile.
  - Pelly continues work at the ADR plant and is generating rockfill for use in the embankment construction in this area. Pelly has built a road from the ADR plant foundation area to the location where the event pond will be excavated. They are stockpiling Material 7 – Rockfill in this area.
  - Pelly excavated a test pit around the artesian well to design the drain for this feature. BGC determined the seepage point and will provide Pelly with a design for the drain. (***Photo 3***)
  - BGC received CC204-RFI-037.
  - Pelly, JDS, and BGC discussed planning a rockfill test fill. Pelly has an idea for a location. BGC will follow up to finalize the location. A water replacement test will be performed in the test fill for determine density. BGC will follow up with Pelly to determine if all the equipment and materials needed to perform the test are on site (large capacity scale, thin walled geomembrane or thick plastic, flow meter or graduated container to measure volume).

- Observations and Recommendations (OPEN):
  - JDS/Pelly are developing a materials management and tracking plan.
  - An area of material high in organics on the northern portion of the Material 3 stockpile in the embankment footprint should be delineated and segregated from the pile.
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material.
  - Proctor test on the reject sand for use as Material 2 is still pending.
  - Material 3 at the ADR borrow has thick zones of finer material being generated and stockpiled. This finer material should be blended with courser Material 3 before use.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Matthews	**Weather:**	Cloudy 8ºC to 21ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly had a shift change so no work was performed between 10am and 3pm.
  - Pelly partially constructed vampire drain through the toe of the embankment to aid in water control. (***Photo 1***)
  - As part of the water control Pelly removed the berm at the toe of the embankment and replaced it with 2 smaller berms (***Photo 1***).
  - Pelly added more fill above the completed drain to bring it up to road grade (***Photo 2***).
  - JDS delivered EPCM-RFI-020 related to ballast spacing and configuration.
  - Pelly developed a preliminary stockpile map for the ADR area. Pelly and BGC visited the ADR and revised the map to reflect actual conditions at the ADR stockpiles.
  - Underhill tested the use of their drone and image processing software to measure volumes. The surface created was detailed and visually appeared to be comparable to using plastic liner and water replacement. Underhill is still determining the best method to calculate volumes from the surface using the software they have one site. BGC recommends that the first density test pit in the rockfill test fill be excavated and shot with the drone. Then a water replacement test should be done so both methods can be compared.

- Observations and Recommendations (OPEN):
  - JDS/Pelly are developing a materials management and tracking plan.
  - An area of material high in organics on the northern portion of the Material 3 stockpile in the embankment footprint should be delineated and segregated from the pile.
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material.
  - Proctor test on the reject sand for use as Material 2 is still pending.
  - Material 3 at the ADR borrow has thick zones of finer material being generated and stockpiled. This finer material should be blended with courser Material 3 before use.
  - BGC will follow up to finalize the rockfill test fill location. BGC will follow up with Pelly to determine if all the equipment and materials needed to perform the test are on site (large capacity scale, thin walled geomembrane or thick plastic, flow meter or graduated container to measure volume). Pelly and BGC will schedule a time to do the test.

Safety Issues: None

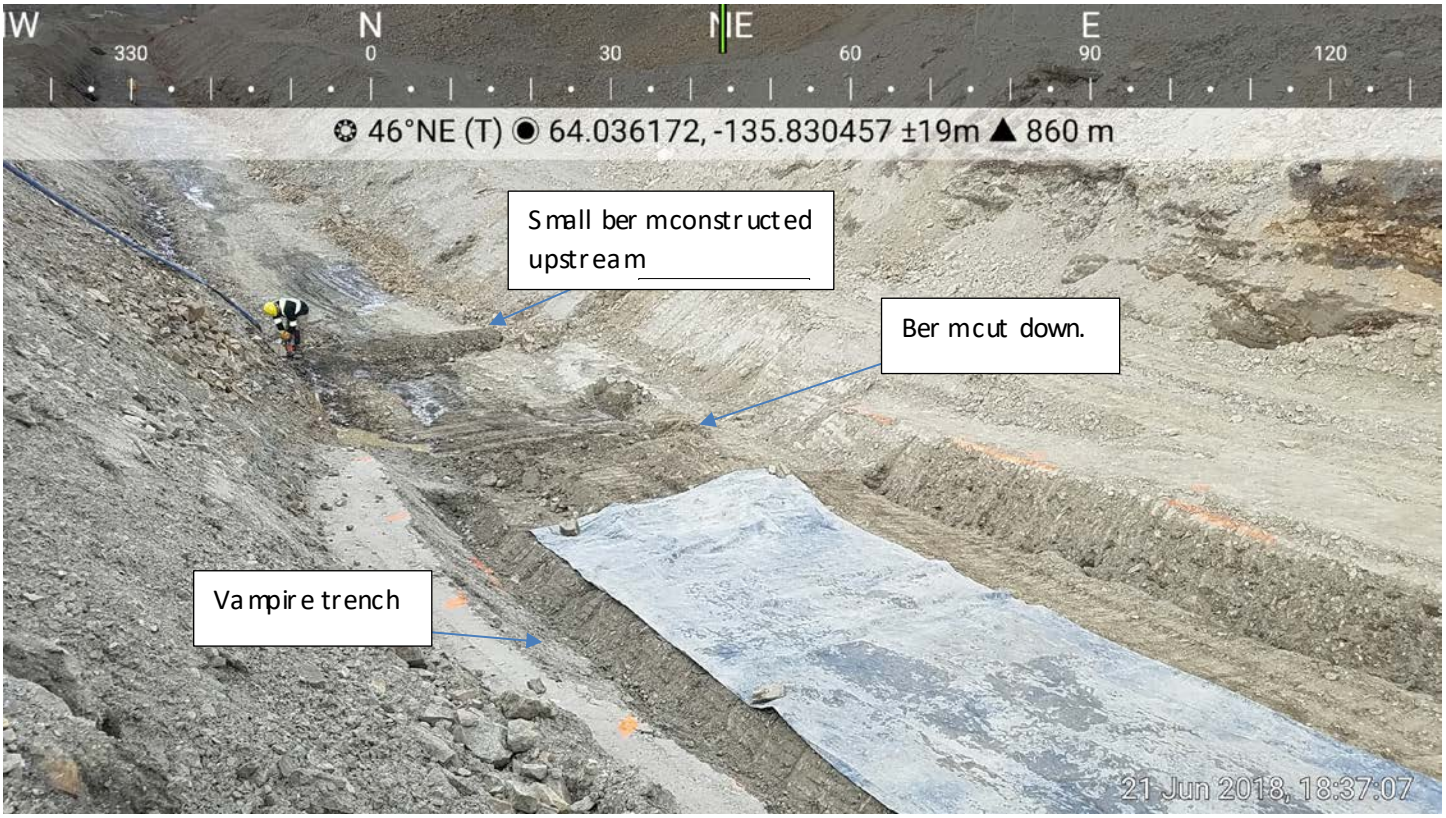

Photo 1: Vampire drain at the toe of the embankment. Berm at the toe was removed and two smaller berms built.

Photo 2: Completed drain.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	June 22, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Matthews	**Weather:**	Cloudy 8ºC to 22ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly completed detail work shaping the toe area of the embankment drain and tying it into upstream bedrock. (***Photo 1***)
  - In extending the vampire trenches through the completed toe construction Pelly damaged geotextile in 3 locations (***Photo 2***). The damage was minor and BGC allowed Pelly to cover the areas with low permeability fill (Material 2) and hand tamp the areas to a dense state.
  - Pelly cleaned the bottom of most of the pipe trench length. Vampire drains were not cleaned and will need jagged rocks removed or to be filled with drain rock before laying geotextile. There are also areas of the pipe trench near the toe that will need to be dug deeper. Pelly survey has marked the cuts needed in these areas in the field. (***Photo 3***)
  - BGC performed preliminary mapping of the area grubbed within the HLF footprint. Mapping focused on surficial slumping, cracking, or deformation that may be obvious from exposure of the ground to direct sunlight. No obvious deformation was observed. Wet areas at the surface were observed on the west side of the cleared area. (***Photo 4***)
  - BGC provided Pelly with pipe length, type, and diameter for the drain to be constructed from the artesian hole to the under drain pipe trench. This response was provided as an estimate via email to allow Pelly to order materials. BGC is completing a design memorandum for this drain, which will have the final construction details.
  - BGC send JDS BGC-RFI-008 via email which asks for a QC Plan from Pelly.

- Observations and Recommendations (OPEN):
  - JDS/Pelly are developing a materials management and tracking plan.
  - An area of material high in organics on the northern portion of the Material 3 stockpile in the embankment footprint should be delineated and segregated from the pile.
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material.
  - Proctor test on the reject sand for use as Material 2 is still pending.
  - Material 3 at the ADR borrow has thick zones of finer material being generated and stockpiled. This finer material should be blended with courser Material 3 before use.
  - BGC will follow up to finalize the rockfill test fill location. BGC will follow up with Pelly to determine if all the equipment and materials needed to perform the test are on site (large capacity scale, thin walled geomembrane or thick plastic, flow meter or graduated container to measure volume). Pelly and BGC will schedule a time to do the test.

Client:	Victoria Gold	**Date and Shift:**	June 23, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Matthews	**Weather:**	Cloudy 8ºC to 22ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - The area at approximately 0+090 of the pipe trench, located north of finger drain FD3, did not dewater as much as anticipated (***Photo 1***). Moisture is present in the road fill above the type 3 bedrock in this area presenting concerns that seepage in this area may result in wetting of the rockfill embankment lifts in this area and piping of fine material from the rockfill. The moisture in this area has two potential sources; seepage from the adjacent abutment at 0+090 and/or or a seep located upstream at approximately station 0+200 (***Photo 2***). Water from the seep at 0+200 is running along the surface of the road and seeping into the road fill. BGC proposed an additional drain at the 0+200 seepage point. Installing this drain first would allow us to control this seep and determine if a drain further downstream is required. Pelly did not want to excavate the drain at 0+200 until they filled the trench drain to this location. Because the finger drain construction ties into the trench drain and because BGC could not determine the source of the wetness at 0+090 until flow from the 0+200 seep was captured, BGC required that a drain also be installed at station 0+090 to capture potential flow from the abutment.
  - Pelly excavated and constructed the additional finger drain at approximately station 0+090. As with all the other finger drains constructed so far Pelly chose to construct the drain completely and fill over the drain to road grade. As with all the other finger drains constructed this way, Pelly will have to take care when removing the road before embankment lift placement to ensure that the drain is not damaged. Damage to the finger drain may result in excavation replacement of the drain. (***Photos 3 and 4***)
  - Pelly completed laying the geotextile in the drain trench a placing approximately 10 cm of drain fill in the trench up to station 0+070. BGC approved the foundation for placement from Station 0+010 to 0+070. Pelly placed geotextile and drain rock between stations 0+000 and 0+010. They stated that this was done to make placing the trench pipe easier. The construction between 0+000 and 0+010 is not complete. Pelly says they will remove the material at a later time to complete this construction. (***Photo 5***)

- Observations and Recommendations (OPEN):
  - JDS/Pelly are developing a materials management and tracking plan.
  - An area of material high in organics on the northern portion of the Material 3 stockpile in the embankment footprint should be delineated and segregated from the pile.
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material.
  - Material 3 at the ADR borrow has thick zones of finer material being generated and stockpiled. This finer material should be blended with courser Material 3 before use.
  - BGC will follow up to finalize the rockfill test fill location. BGC will follow up with Pelly to determine if all the equipment and materials needed to perform the test are on site (large capacity scale, thin walled geomembrane or thick plastic, flow meter or graduated container to measure volume). Pelly and BGC will schedule a time to do the test.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Matthews	**Weather:**	Rain 8ºC to 22ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Geotextile and drain rock were placed to station 0+170 in the pipe trench. (***Photo 1***).
  - Pelly tied the three constructed finger drains into the drain trench. Because the drains were fully constructed this process was very laborious and the results of geotextile overlap sloppier than a typical drain installation, which was one of BGC concerns with fully constructing the finger drains in advance of the pipe trench. Because BGC does not believe Pelly has a valid method to properly tie constructed drains into the pipe trench BGC will require that geotextile be shown to properly overlap when a higher order drain enters a lower order drain before any drain fill is placed at that junction. (***Photo 2***).
  - BGC delivered memorandum BGC-FM-003 to JDS related to observations made during the pressure testing of the closure pipe.
  - BGC completed mapping at the ADR rockwall cut.

- Observations and Recommendations (OPEN):
  - JDS/Pelly are developing a materials management and tracking plan.
  - An area of material high in organics on the northern portion of the Material 3 stockpile in the embankment footprint should be delineated and segregated from the pile.
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material.
  - Material 3 at the ADR borrow has thick zones of finer material being generated and stockpiled. This finer material should be blended with courser Material 3 before use.
  - BGC will follow up to finalize the rockfill test fill location. BGC will follow up with Pelly to determine if all the equipment and materials needed to perform the test are on site (large capacity scale, thin walled geomembrane or thick plastic, flow meter or graduated container to measure volume). Pelly and BGC will schedule a time to do the test.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Matthews	**Weather:**	Rain 8ºC to 19ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly moved the first 180m of piping into the pipe trench. (***Photo 1***)
  - BGC performed a final inspection of all pipe. One joint in the closure pipe was dented. BGC requested it be cut and re-fused. Pelly provided a joint report for this fusing. (***Photo 2 and 3***). All other sections of pipe were approved by BGC.
  - Pelly spaced and covered drain pipe to station 0+090. (***Photo 4***)
  - BGC delivered the response the CC204-RFI-037
  - Pelly identified a rockfill test fill location. BGC watched the foundation proof rolled with a loaded haul truck. The foundation is dense enough and large enough for a test fill. Test fill is planned for tomorrow. (***Photo 5***)

- Observations and Recommendations (OPEN):
  - JDS/Pelly are developing a materials management and tracking plan.
  - An area of material high in organics on the northern portion of the Material 3 stockpile in the embankment footprint should be delineated and segregated from the pile.
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material. Pelly is planning a to blend dryer ADR material with wetter embankment material on June 26.
  - Material 3 at the ADR borrow has thick zones of finer material being generated and stockpiled. This finer material should be blended with courser Material 3 before use.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Matthews	**Weather:**	Rain 8ºC to 23ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued burying trench pipe with Material 5 to station 0+175. (***Photo 1***)
  - BGC and Pelly delineated contaminated material to be segregated out of the Material 3 stockpile.
  - Pelly began covering the pipe trench drain with geotextile. (***Photo 2***)
  - BGC and Pelly mixed saturated Material 3 from the embankment footprint with dry Material 3 from the ADR cut. A ratio of 2 ADR to 1 embankment load appears sufficient. Due to the high fines in most of the saturated material mixing was difficult and had inconsistent results. Due to inconsistent moisture in both stockpiles this mix ratio may change. (***Photo 3***)
  - BGC performed a 30 cm and 15 cm test fill of the reject sand Material 2. Both were compacted to 95% of the proctor with 3 passes from a 6 ton compactor without vibration. Moisture measured in the Material 2 was 3% lower than optimal. BGC has approved the use of Material 2 in 30 cm lifts to backfill the pipe trench to grade. However, additional moisture should be added at the borrow pile or in the haul truck before dumping. (***Photo 4***)
  - Pelly delivered the Phase 2 Water Management Plan.

- Observations and Recommendations (OPEN):
  - JDS/Pelly are developing a materials management and tracking plan.
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material. Pelly is planning a to blend dryer ADR material with wetter embankment material on June 26.
  - Material 3 at the ADR borrow has thick zones of finer material being generated and stockpiled. This finer material should be blended with courser Material 3 before use.

AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	June 27, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber	**Weather:**	Rain 10ºC to 14ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly covered the pipe trench with geotextile up to station 0+175. (***Photo 1***) Geotextile was either overlapped by a minimum 0.5m or tack welded if the overlap was between 0.15m and 0.5m. A portion of the geotextile with less than 0.5m overlap was missed by the tack welding. BGC requested this area be completed before approval. However, Pelly buried this section with Material 2 backfill before completing the weld. BGC will require that this area be excavated by hand and the weld completed. (***Photo 2***)
  - Began placement and compaction of Material 2 in 30 cm loose lifts over the pipe trench drain material. Compaction was performed with a 6 ton compactor with no vibration. (***Photo 3***). Lift construction was uneven in some areas leading to low density sections in the fill. BGC has asked that Pelly place leveling lifts to bring the low spots up to the lift grade and to compact these areas. (***Photo 4***)
  - Pelly moisture conditioned the Material 2 at the borrow site prior to placement in the embankment pipe trench. (***Photo 5***).

- Observations and Recommendations (OPEN):
  - JDS/Pelly are developing a materials management and tracking plan.
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material. A blend test was performed on wet and dry materials. However, Pelly has not yet decided if blending with be the preferred method.
  - Material 3 at the ADR borrow has thick zones of finer material being generated and stockpiled. This finer material should be blended with courser Material 3 before use.

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - EBA (Tetra Tech) collected a sample of the Material 2 to be shipped for laboratory analysis of permeability.
  - EBA (Tetra Tech) performed moisture content analysis on the Material 2.
  - EBA (Tetra Tech) performed in-situ testing of compacted Material 2.
  - EBA (Tetra Tech) delivered analytical reports for in-situ density and moisture tests performed for the Material 2 Test Fills.
- BGC Recommendations:
  - None

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
EPCM-RFI-020	JDS requests clarification on ballast placement and spacing.	Open. Sent June 21. Pending response from BGC.
BGC-RFI-003	Materials/Stockpile management plan	Open: Sent June 7. Pending response from Pelly/JDS

BGC-RFI-007	Material Type 2 Production/Stockpile Reserve Plan	Open. Sent: June 11. Pending response from Pelly/JDS
BGC-RFI-008	QC Management Plan	Open: Sent June 23. Pending response from Pelly/JDS.

Safety Issues: None

Photo 1: Pipe trench covered with geotextile.

Photo 2: General area marked by BGC to be hand excavated so geotextile can be welded.

Photo 3: Material 2 compaction over the pipe trench.

Photo 4: Material 2 compaction over the pipe trench.

Photo 5: Moisture conditioning Material 2 stockpile at the source.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	June 28, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber	**Weather:**	Rain 8ºC to 22ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly hand dug the geotextile at station 0+140 and welded it properly.
  - Completed placement and compaction of under drain trench Material 2, lift 1 up to approximately station 0+145 (***Photo 1***)
  - Scarified surface and placed second lift of Material 2 up to approximately station 0+090. (***Photo 2***) The second lift will bring the Material 2 compacted surface to or above 30cm over the pipe trench drain fill.
  - Pelly continued to moisture condition the Material 2 at the borrow site prior to placement in the embankment pipe trench. (***Photo 3***).
  - Pelly had a shift change today.
  - BGC and Pelly are planning a Material 7 test fill and to dig test pits in the heap pad phase 1 area tomorrow.

- Observations and Recommendations (OPEN):
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material. A blend test was performed on wet and dry materials. However, Pelly has not yet decided if blending with be the preferred method.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	June 29, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber	**Weather:**	Rain 8°C to 19°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly completed a second lift over the pipe trench using Material 2. (***Photo 1***).
  - Localized pockets showed less density than what was achieved by most of the lift. It appears these areas are over wet. This was likely caused by leaving the lift spread but uncompacted over the rainy night. Rain falling directly on the fill and runoff coming from the right abutment and rock knob did not penetrate the first compacted lift readily and collected in the uncompact fill. Additionally some of the saturated pockets appeared to be higher in silt, which would have made them more susceptible to over loading with moisture. Since these areas were small and localized, confined within the lifts, and have rockfill placed directly on them in horizontal lifts, they were left in place without mitigation (***Photo 2***). However, future lifts of Material 2 should not be placed unless they are to be compacted the same day.
  - Pelly and BGC completed a Material 7 (Rockfill) Test Fill 01 with a loose lift thickness of 0.9m. (***Photo 3***). Density and moisture results were taken as a reference with the nuclear density gauge. Density results varied significantly (between 2050 and 2200 kg/m3), which is expected from gauge readings given the material. Moisture results collected from using the nuclear density gauge were approximately 4% and moisture results performed on a sample of the soily matrix in the field lab were reported at 3.5%. A water replacement test was performed on the rockfill to determine final density (***Photo 4***). Pelly will weigh the material excavated for the test on June 30. A test trench dug through the fill showed a densely packed matrix with little void space and little rock breakdown. (***Photo 5***)
  - Pelly sent a progress update on the QC plan. They are also requesting more information to complete the plan.

- Observations and Recommendations (OPEN):
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material. A blend test was performed on wet and dry materials. However, Pelly has not yet decided if blending with be the preferred method.

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - EBA (Tetra Tech) collected a moisture sample from the Material 7 Test Fill.
  - EBA (Tetra Tech) collected in-situ density and moisture readings from the Material 7 Test Fill using the nuclear density gage.
- BGC Recommendations:
  - None

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber	**Weather:**	Rain 11°C to 19°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly began excavating the rockfill placed east and west of the underdrain pipe trench. (***Photo 1***)
  - Pelly excavated 10 test pits in the footprint of the in-heap pond and the phase 1 heap leach pad. (***Photo 2***) Additional test pits are scheduled for tomorrow in the footprint of the phase 1 heap pad. BGC logged the test pits and will provide a memo discussing our observations once all the test pits are complete.
  - Pelly weighed the material excavated for the water replacement test at Material 7 – Test Fill 01 using its crane. The results were provided to BGC.

- Observations and Recommendations (OPEN):
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material. A blend test was performed on wet and dry materials. However, Pelly has not yet decided if blending with be the preferred method.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber	**Weather:**	Cloudy 11°C to 22°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued excavating the rockfill placed east and west of the underdrain pipe trench. (***Photo 1***) It was reported to BGC by Pelly that this material is not being stockpiled for use at the embankment. It is being used in other parts of the mine site.
  - Only minor erosion damage was observed from the last several days of rains. Water control measures implemented by Pelly diverted most water from the construction zone. BGC does not recommend any repairs to the current construction with the exception of reconstituting the area of the drain beyond the toe when this part of the construction resumes. (***Photos 2, 3, 4***)
  - Pelly completed excavation of the test pits in the footprint of the in-heap pond and the phase 1 heap leach pad. (***Photo 5***). BGC logged the test pits and will provide a memo discussing our observations once all the test pits are complete.

- Observations and Recommendations (OPEN):
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material. A blend test was performed on wet and dry materials. However, Pelly has not yet decided if blending with be the preferred method.

1) QA/QC Results:

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber	**Weather:**	Rain 8ºC to 23ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly complete most of the excavation of the rockfill placed east and west of the underdrain pipe trench. (***Photo 1***)
  - Pelly excavated the colluvium around the toe of the embankment in preparation for embankment fill (***Photo 2***). The colluvium appeared dry, relatively dense, and free of ice.
  - Pelly excavated the area of the in-heap pond. (***Photo 3***). Spoils are being hauled to for disposal as waste.
  - BGC conducted point load testing of samples collected from the right abutment.

- Observations and Recommendations (OPEN):
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material. A blend test was performed on wet and dry materials. However, Pelly has not yet decided if blending with be the preferred method.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Ethan Faber	**Weather:**	Sunny/Overcast 12°C to 18°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Seep identified and notified via email for drain installation approval (No approval was given July 4th). (***Photo 1***)
  - Through communication via email, construction of embankment was suspended at 7 AM, later accepted by 9 AM and construction began at 12 PM. (***Photo 2***)
  - Seep was re-confirmed as construction began, with flows observed between 5 L/min to 10L/min, the drain was dug and left for completion as embankment lifts started (***Photos 3-5***)
  - Pelly continued foundation preparations for final approval of first lift zone. (***Photo 6***).
  - Upon approval, Pelly began the first loose lift placement at 2:30 PM and continued until approximately 7:00 PM, the first loose lift was not finalized, planning to finish tomorrow for first compaction (***Photos 7-8***).

- Observations and Recommendations (OPEN):
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material. A blend test was performed on wet and dry materials. However, Pelly has not yet decided if blending with be the preferred method.
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.

BGC-RFI-008	QC Management Plan	Open: Sent June 23. In process. Pending response from Pelly/JDS.

Safety Issues: None

Photo 1: Seep identified and communicated to JDS/Pelly, July 4 AM

Photo 2: JDS suspended construction of embankment as the finger drain was not warranted, finger drain was later accepted at 9 AM, construction started at 12 PM.

Photo 3: The seep was confirmed as water began pooling at the start of the drain construction.

Photo 4: Finger drain was completed, inspected and accepted pending final stage of drain construction. Flow ranging from 5 L/min to 10L/min was observed.

Photo 5: Finger drain was completed by hand digging to the border, very small tear was repaired with torch welding of geotextile, water began moving towards underdrain.

Photo 6: Excavator cleaning abutments foundation for approval.

Photo 7: After foundation for first lift was approved, the first haul trucks arrived for placements at 2:30 PM.

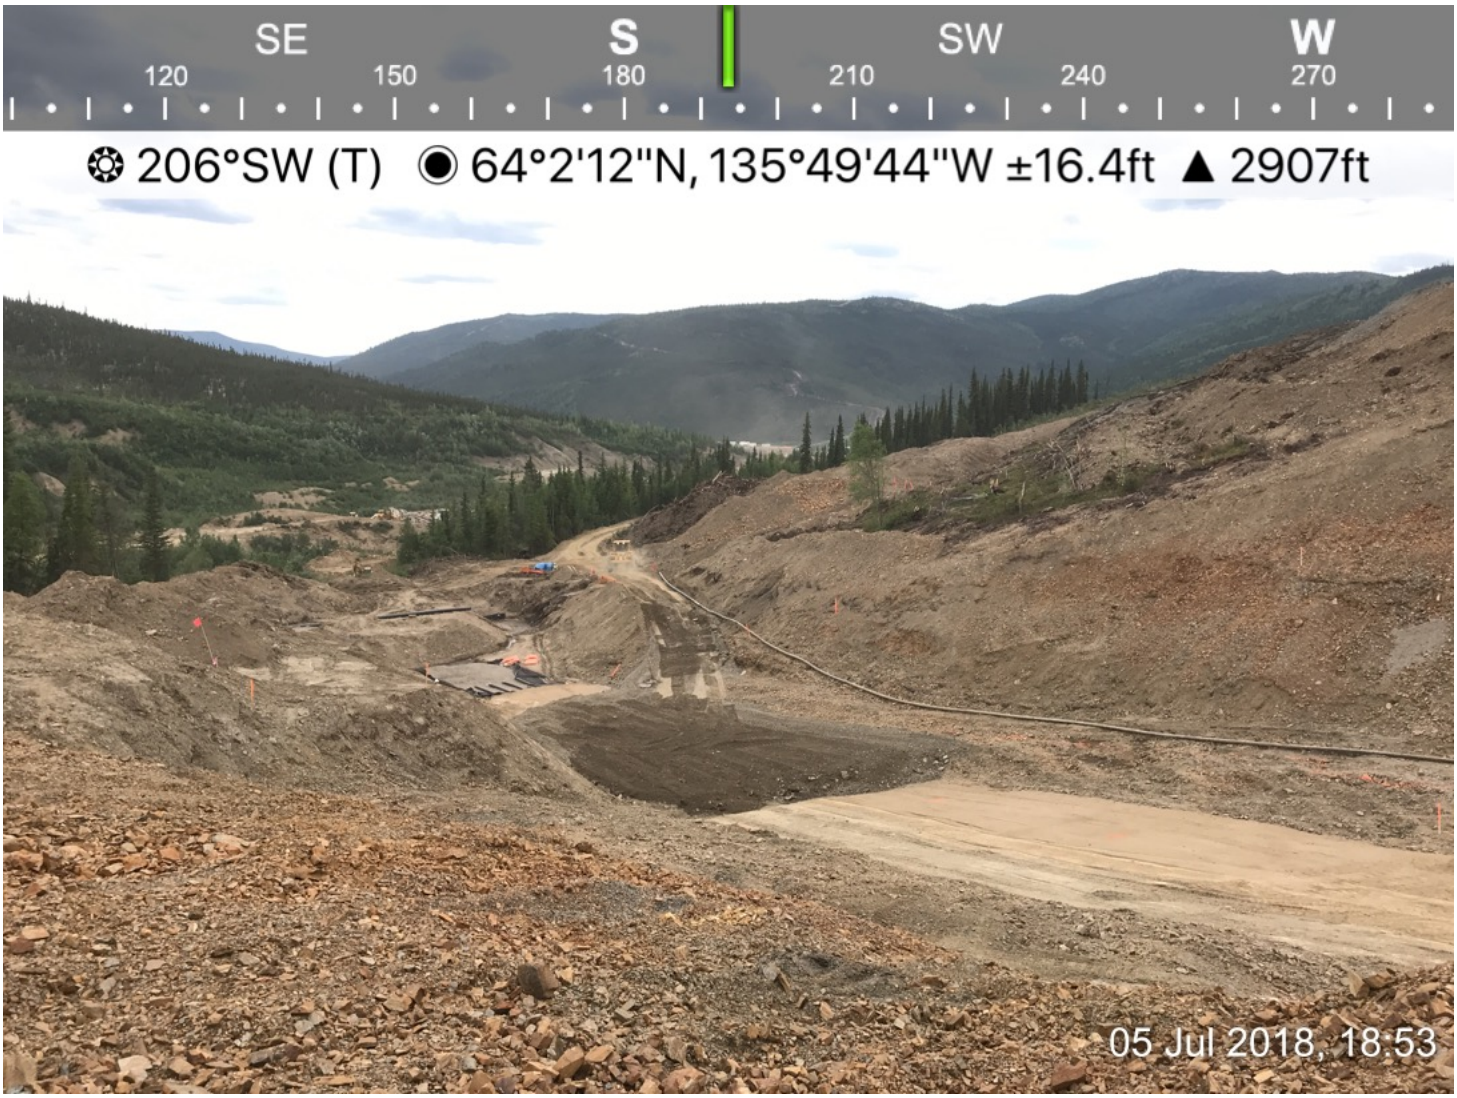

Photo 8: First loose lift was not completed, Pelly/JDS were informed of need for QC Plan for Embankment Construction, needing survey controls for each lift.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 6, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Ethan Faber	**Weather:**	Sunny/Overcast 12°C to 20°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Drain for seep identified on July 4 finished construction while first lift was being constructed. By the end of the shift, the right abutment side drainage pipe had hidden another potential path and this was identified and controlled to be fixed tomorrow by a small extension up the abutment (***Photos 1-6***)
  - A wet spot (circled yellow) that was initially observed on July 4 (**Photo 1**) was further observed during and after the first lift compaction. By the end of the shift, the wet spot re-appeared and was given 12 hrs to dissipate and will be further accessed tomorrow (**Photo 6**).
  - Pelly continued to place first lift during drain construction activities, compaction was also conducted. (***Photo 7-8***).
  - Water was displaced over the right abutment area, saturating the surface but this was controlled quickly due a breach of the pipe intake zone that bypasses construction surface (**Photo 9**).
  - Minor erosion/construction damage was observed to underdrain trench type 2 material layer, it was recommended to fix and cover the underdrain further to protect during embankment construction (***Photo 10***).

- Observations and Recommendations (OPEN):
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material. A blend test was performed on wet and dry materials. However, Pelly has not yet decided if blending with be the preferred method.
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.
  - BGC recommended Pelly to remove right abutment pipe that diverts runoff from the upstream side to the downstream sump due to potential leaks and obstructions during lift placement, drain constructions, seep identification and compaction of embankment.
  - BGC recommended Pelly to repair small zones erode of type 2 material on the exposed toe area of underdrain trench and further cover underdrain trench to protect area from construction activities of embankment construction.

EPCM-RFI-020	JDS requests clarification on ballast placement and spacing.	Open. Sent June 21. Pending response from BGC.
BGC-RFI-008	QC Management Plan	Open: Sent June 23. In process. Pending response from Pelly/JDS.
BGC-RFI-009	Embankment Zoning Plan	Open: Sent July 6. Pending response from Pelly/JDS.
EPCM_RFI-022	LDS Liner Requirements	Open: Sent July 6. Pending response from BGC

Safety Issues: None

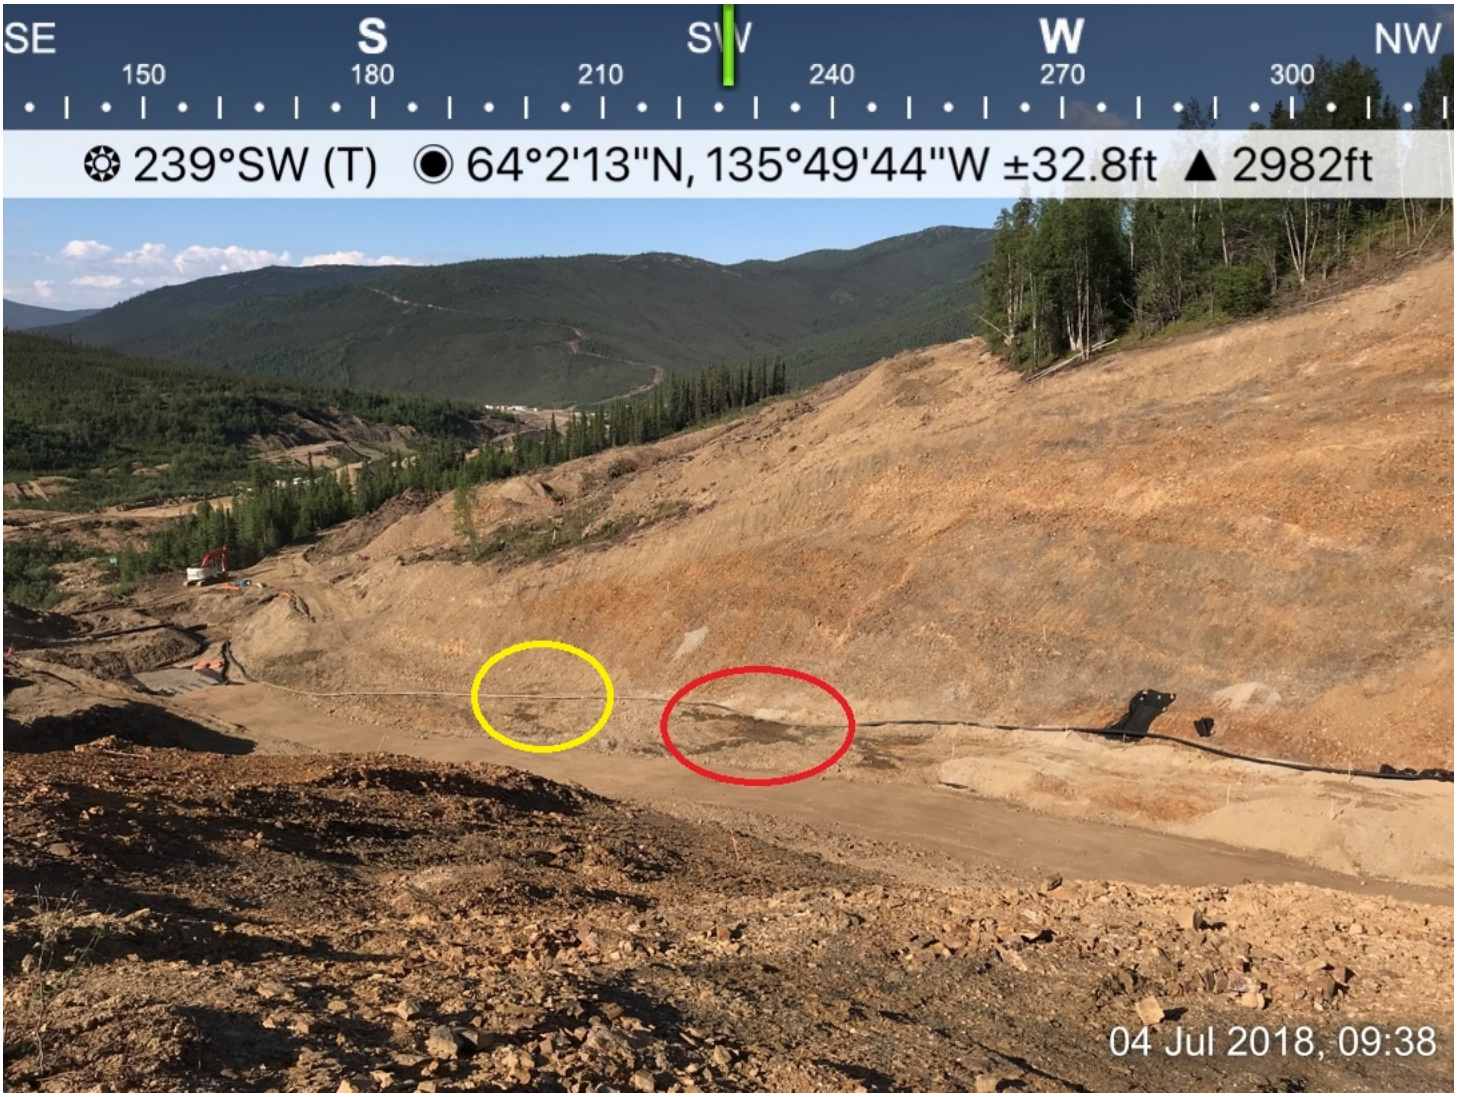

Photo 1: Seep in red was identified July 4th, with drain construction starting July 5th. Wet spot in yellow was observed.

Photo 2: Drain (seep circled in red) was cleaned further before construction.

Photo 3: Drain (seep circled in red) had geotextile installed and excavator began placing Select Drain Fill.

Photo 4: Drain (seep circled in red) had geotextile cover the drain and began placing Material 2. Compaction of lift 1 continued uninterrupted by drain construction.

Photo 5: Drain (seep circled in red) was covered with material 2, saturation by the abutment and drain pipe on right abutment was observed, a small ditch was hand dug and the drain will be slightly extended further upstream to capture it.

Photo 6: Seep in red will be covered with a slight increase of the drain upstream. Seep in yellow was initially observed on July 4 as a wet spot, it is now considered a potential seep and will be given 12 hrs to disperse in case of leak from pipe.

Photo 7: Placement of first lift continued approved foundation during drain construction upstream of toe.

Photo 8: Compaction of first lift also continued.

Photo 9: During early hours of the morning, the pipe intake area (water management Phase 1) of the pipe that brings runoff bypassing the construction zone breached, causing runoff to run down and saturated zones but was controlled quickly.

Photo 10: BGC recommended Pelly to further cover the downstream side of the underdrain trench to protect it from construction and debris as lifts continue to be placed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 6, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Ethan Faber	**Weather:**	Sunny/Overcast 12°C to 20°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - The drain (red circle) (***Photos 1 and 2***) was extended. The seep (yellow circle) was confirmed after 12 hours and manual digging to expose it, (***Photos 1 and 2***). Construction of drain for new identified seep commenced and will be finalized tomorrow, drain (red circle) was completed today but material type 2 needs compaction to be completed tomorrow. (***Photos 3-7***)
  - During constructions operations, the runoff bypass pipe located on the right abutment was moved up the slope to allow access for excavator, during operations the pipe became disconnected but not runoff damage was done to the rockfill lift, Pelly commenced a plan to remove this pipe as recommended (**Photos 7-8**).
  - Pelly continued to place first lift during drain construction activities, compaction was also conducted. (***Photos 10-11***.
  - Pelly began preparations to disconnect and remove the bypass pipe by constructing a series of diversion embankments with sumps that will be lined with geomembrane and drained through pumping on the left abutment drainage channel away from the current construction zone (**Photos 12-13**).
  - BGC was informed that Cobalt will be taking over the removal of organic and unsuitable material on the HLP area as of today.
  - BGC (Dan Granda, Ethan Faber), Pelly (Jason Abel) and JDS (Mike Blusson) walked the right abutment and noted seeps being exposed by the clearing of the temporary construction roads.

- Observations and Recommendations (OPEN):
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material. A blend test was performed on wet and dry materials. However, Pelly has not yet decided if blending with be the preferred method.
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.
  - BGC recommended Pelly to remove right abutment pipe that diverts runoff from the upstream side to the downstream sump due to potential leaks and obstructions during lift placement, drain constructions, seep identification and compaction of embankment.
  - BGC recommended Pelly to repair small zones erode of type 2 material on the exposed toe area of underdrain trench and further cover underdrain trench to protect area from construction activities of embankment construction.

Safety Issues: None

Photo 1: Seep in red will be covered with a slight increase of the drain upstream. Seep in yellow was initially observed on July 4 as a wet spot, it is now considered a potential seep and will be given 12 hrs to disperse in case of leak from pipe.

Photo 2: After 12 hours seep in red remained the same (will be extended). Seep in yellow initially observed on July 4 as a wet spot, it is now considered a seep after 12 hours, JDS was notified and Mike Blusson (JDS) approved drain, work began right away.

Photo 3: New finger drain was marked for clearing.

Photo 4: New drain was exposed by hand to help with field design and construction, flow and water ponding was observed and confirmed

Photo 5: New drain commenced excavation.

.

Photo 6: New drain was excavated by hand carefully to avoid damage to underdrain geotextile.

Photo 7: Once surveyed, the new drain was covered with geotextile to be completed tomorrow. The upstream drain was extended but needs compaction of type 2 material. By the end of the shift, lift placement and compaction was done on left abutment as well.

Photo 8: Pelly tried moving the pipe that bypasses runoff from upstream to downstream sump but it disconnected, this was repaired and no water damage was observed on current compacted rockfill lift.

Photo 9: Pelly moved the pipe up the right abutment, BGC suggested removing it as it will be on the way of future construction, Pelly began plans to remove it.

Photo 10: First lift continued to be placed and spread by bulldozer during finger drain construction.

Photo 11:.The first lift was extended to approved type 3 bedrock on the left abutment but it stopped at the toe of the temporary road that will require to be removed. This lift was compacted.

Photo 12: Pelly constructed the first of two diversion embankments that will divert the runoff and sediments through a pump system.

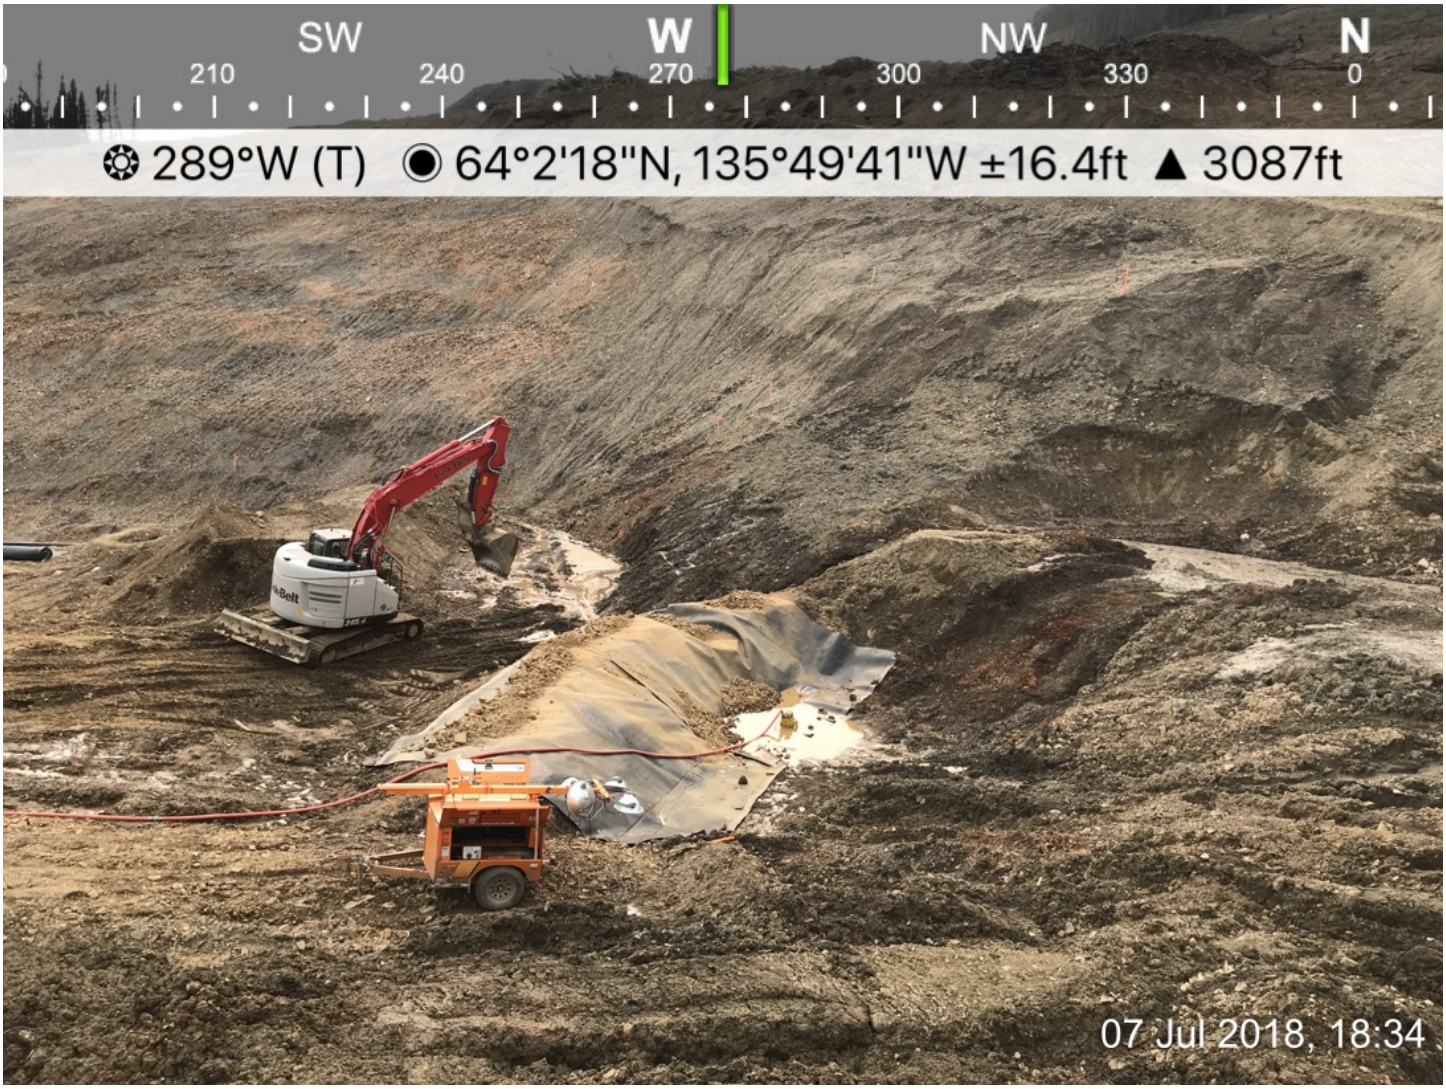

Photo 13: Pelly constructed the first of two diversion embankments that will divert the runoff and sediments through a pump system.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 8, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Ethan Faber	**Weather:**	Sunny/Overcast 12°C to 20°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - The drain (red circle) (***Photos 1 and 2***) was extended. The seep (yellow circle) was confirmed after 12 hours and manual digging to expose it, (***Photos 1 and 2***). Drains were completed. (***Photos 3, 6, 9***)
  - QC tests was done on the lift 1 loose lift to help control moisture content, Tetratech reported 7.1%, BGC asked Pelly to lower the moisture content to 6% as a max, 3 % as a min. This result was accepted and spread out (**Photo 4**).
  - BGC observed a potential artesian seep on the right abutment, it was noted and will be observed for a few days. (***Photo 5)***.
  - Pelly continued the lift placement, removal of waste materials and compacting while finishing the drains (**Photos 6,9**).
  - Pelly's sediment settling pond and retention pond was completed and started operations, allow for the removal of the runoff pipe tomorrow, the pipe was cut today (**Photo 7**).
  - Cobalt continues to remove organic layer of HLP (**Photo 8**).
  - Pelly stockpiled material 2 material by the toe to spread and tamper compact if needed to extend toe for lift 1 construction, Pelly was advised to be careful on putting weight on toe underdrains to due proximity. To be completed tomorrow (**Photo 10**).

- Observations and Recommendations (OPEN):
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material. A blend test was performed on wet and dry materials. However, Pelly has not yet decided if blending with be the preferred method.
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.
  - BGC recommended Pelly to remove right abutment pipe that diverts runoff from the upstream side to the downstream sump due to potential leaks and obstructions during lift placement, drain constructions, seep identification and compaction of embankment.
  - BGC recommended Pelly to repair small zones erode of type 2 material on the exposed toe area of underdrain trench and further cover underdrain trench to protect area from construction activities of embankment construction.

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - QC on loose lift 1, moisture content 7.1%.

- BGC Recommendations:
  - None

2) Communications (no follow up required):

Personnel	Description
None	

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
EPCM-RFI-020	JDS requests clarification on ballast placement and spacing.	Open. Sent June 21. Pending response from BGC.
BGC-RFI-008	QC Management Plan	Open: Sent June 23. In process. Pending response from Pelly/JDS.
BGC-RFI-009	Embankment Zoning Plan	Open: Sent July 6. Pending response from Pelly/JDS.
EPCM_RFI-022	LDS Liner Requirements	Open: Sent July 6. Pending response from BGC

Safety Issues: None

Photo 1: Seep in red will be covered with a slight increase of the drain upstream. Seep in yellow was initially observed on July 4 as a wet spot, it is now considered a potential seep and will be given 12 hrs to disperse in case of leak from pipe.

Photo 2: After 12 hours seep in red remained the same (will be extended). Seep in yellow initially observed on July 4 as a wet spot, it is now considered a seep after 12 hours, JDS was notified and Mike Blusson (JDS) approved drain, work began right away.

Photo 3: New drain was covered with approved Select Drain Fill.

Photo 4: QC by Tetratech was done on a loose lift spread to measure moisture conditioning for record keeping, the results was 7.1% moisture content.

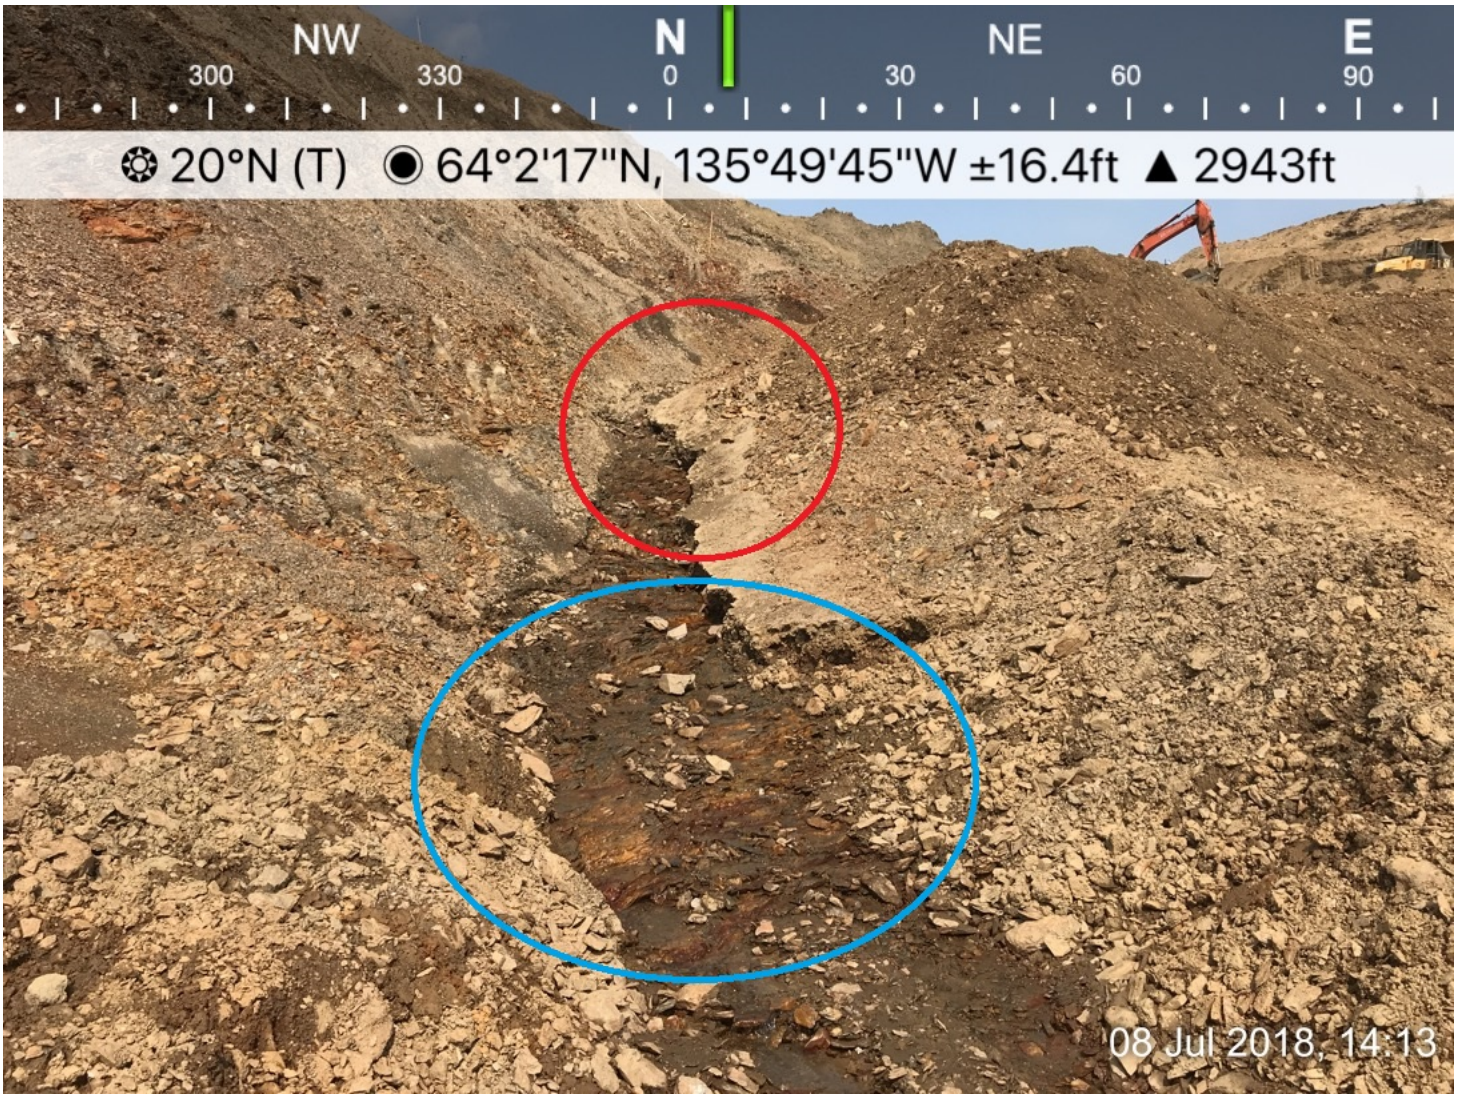

Photo 5: BGC identified a potential seep on the upper sections of the right abutment, the red circle was dry with no flow due to Pelly closing runoff access and the blue circle is an observed artesian seep coming out from at a 5-15 L/min rate, it will continue to be monitored for a few days.

.

Photo 6: Pelly continued removing temporary road constructions to finalize lift 1 area and hauled all waste material out of embankment for lift 1 to be cleared and approved on the right abutment.

Photo 7: Pelly's sedimentation pond and water diversion embankment was completed and lined, water from the HLP is being pumped out through this system bypassing the right abutment pipe (to be removed).

Photo 8: Cobalt continues to remove organic layer material on the HLP area right abutment.

Photo 9: Drains were completed and lift 1 continued to be spread on approved foundation surface.

Photo 10: Pelly stockpiled Material 2 to cover the underdrain pipes as they prepare for small tamper compaction if needed, to be done tomorrow.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 9, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Ethan Faber	**Weather:**	Sunny/Overcast 12°C to 20°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Underdrain toe area was noted to be compacted with the 9000 kg compactor vibrating, JDS and Pelly were notified of potential damage to drain pipes. BGC Engineer of Record Troy Meyer will assess situation of pipes on his time to site tomorrow. Pelly was asked to document this for their records as well. (***Photos 1 and 4***)
  - Pelly continued cleaning all waste material and placing lift to complete lift 1, loose lift 1 was finalized to loose lift thickness at 6:51 PM (**Photos 2,3,5,8 and 9**).
  - Pelly's sedimentation ponds were working and Pelly removed the right abutment runoff pipe, freeing the surface for foundation inspections and preparations for future lifts. (***Photo 6)***.
  - BGC conducted a QA test by collecting an insitu sample of compacted material 7 (results pending) (**Photo 7**).

- Observations and Recommendations (OPEN):
  - Pelly should plan for construction considering the Material 3 stockpile may be at least partially saturated and unusable in its current state. Moisture conditioning may be necessary, either adding or removing water from the material. A blend test was performed on wet and dry materials. However, Pelly has not yet decided if blending with be the preferred method.
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.
  - BGC recommended Pelly to remove right abutment pipe that diverts runoff from the upstream side to the downstream sump due to potential leaks and obstructions during lift placement, drain constructions, seep identification and compaction of embankment.
  - BGC recommended Pelly to repair small zones erode of type 2 material on the exposed toe area of underdrain trench and further cover underdrain trench to protect area from construction activities of embankment construction.
  - BGC notified Engineer of Record Troy Meyer of incident with the pipes and 9 ton compactor, waiting assessment of potential damage.

EPCM-RFI-020	JDS requests clarification on ballast placement and spacing.	Open. Sent June 21. Pending response from BGC.
BGC-RFI-008	QC Management Plan	Open: Sent June 23. In process. Pending response from Pelly/JDS.
BGC-RFI-009	Embankment Zoning Plan	Open: Sent July 6. Pending response from Pelly/JDS.
EPCM_RFI-022	LDS Liner Requirements	Open: Sent July 6. Pending response from BGC

Safety Issues: None

Photo 1: BGC observed that the 9 000 kg compactor was used to compact material 2 on the underdrain downstream end using vibration. BGC noted and notified both Pelly and JDS representatives of potential damage to pipes, Pelly (Dan Russell) was asked to document this for construction records as this order came from JDS and not Pelly.

Photo 2: Drains were finalized yesterday and all waste material was planned to be removed.

Photo 3: Pelly continued placing lift 1 material by hauling in material 7 rockfill and hauling out waste material.

Photo 4: JDS representative Roman Bilobrowka was notified of the potential damage to pipes by both BGC (Ethan Faber and Daniel Granda), this was dismissed and under JDS representative's direction material 2 placement continued. BGC notified BGC Engineer of Record, Troy Meyer, of incident via email.

Photo 5: As Pelly cleared waste and BGC approved foundations, Pelly continued spreading Material 7 rockfill.

Photo 6: Pelly's runoff diversion system was inspected and noted as working during day shift.

Photo 7: BGC made a small excavation with Pelly to observe compacted walls and collect samples for moisture testing, excavated area was sealed and recompacted.

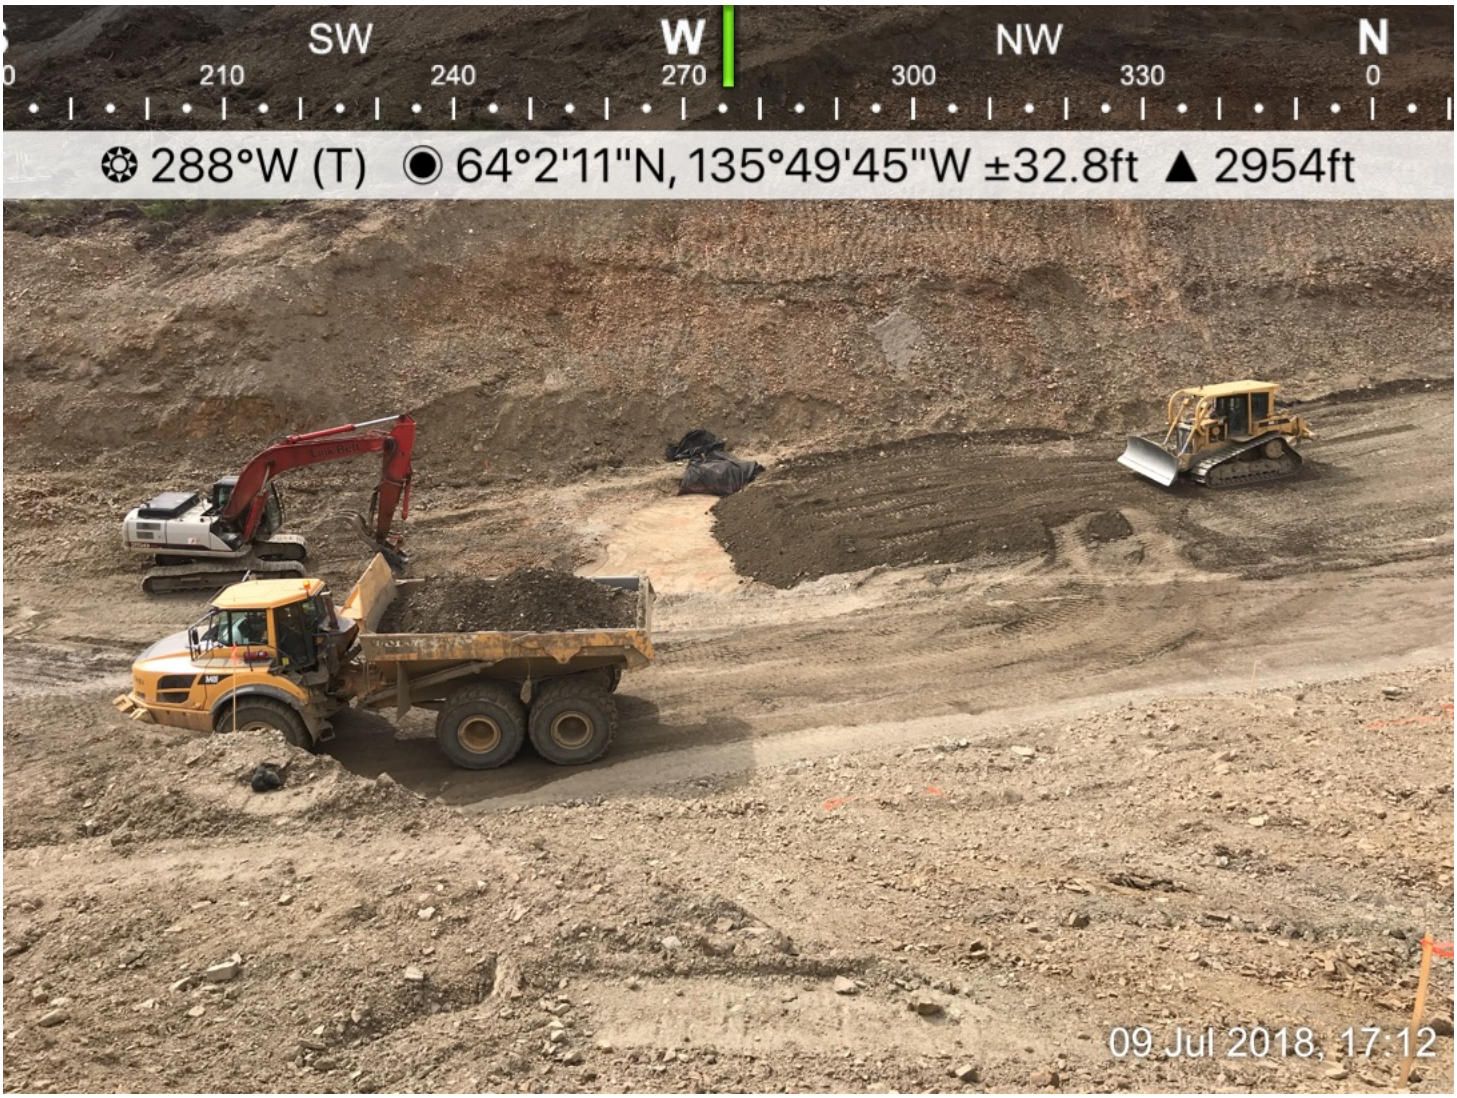

Photo 8: Pelly continued the cycle of hauling material 7, spreading, compacting and hauling waste and BGC continued to approve foundation for completion of lift 1.

Photo 9: Lift 1 was officially spread out at 6:51 PM, compaction to be resumed tomorrow morning to final inspection by BGC.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 10, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer/ Dan Granda / Ethan Faber	**Weather:**	Sunny/Overcast 12°C to 20°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Troy Meyer (BGC) arrived to site in the afternoon.
  - Pelly started the shift by finishing compacting the first loose lift placed on the embankment. (***Photos 1 and 2***)
  - BGC went to the material 7 Rockfill source to observe the current stockpile. BGC representative (Daniel Granda) gave Pelly representative "Greg" directions on handling phyllitic material and quartzite material in upcoming haulages (**Photo 3**).
  - Pelly started clearing temporary road fill upstream of left abutment. (***Photo 4)***.
  - Pelly finished the shift by finishing lift 3 and QC conducting a density test to check densities (**Photo 5**).

- Observations and Recommendations (OPEN):
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.
  - BGC notified Engineer of Record Troy Meyer of incident with the pipes and 9 ton compactor, waiting assessment of potential damage.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer/ Dan Granda / Ethan Faber	**Weather:**	Sunny/Overcast 12°C to 20°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Troy Meyer (BGC) visited construction site and AR plant (Material 7 – Rockfill Source Area).
  - Pelly continued work on lift placements and clearing upstream areas for construction. (***Photos 1 and 2***)
  - BGC and Pelly took weight measurement of material excavated for water replacement density test, the test passed. (**Photo 3**).
  - Pelly exposed both the closure pipe and pipe closest to left abutment of the underdrain trench (***Photo 4)***. No major damage was observed, a small gouge was noted on the left abutment pipe exposed, any deeper and it would have likely required repairs. Evidence of pipe being dragged by rocky material was also observed, more care should be noted in future pipe transport for the underdrain construction upstream.
  - Pelly continued placing lifts and compacting, lift #5 was placed by the late afternoon, pending compaction (**Photo 5**).

- Observations and Recommendations (OPEN):
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.

- Embankment Placement Tracking:

Material 7 – Rockfill Lifts ID	Loose lift elev. (m)	Approved	Comments
1	*0.9 m from toe to Sta 0+120	Toe to Sta 0+120	Requires attention upstream
2	870.7	Yes	N/A
3	871.05	Yes	N/A
4	871.6	Yes	N/A
5	872.35	Pending Compaction	To be finished tomorrow

*The loose maximum thickness per lift is 0.9 m, per Test fill memorandum submitted to JDS/Pelly.

BGC Personnel:	Troy Meyer/ Dan Granda / Ethan Faber	**Weather:**	Rain/Overcast 5°C to 12°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued work on lift placements. (***Photos 1,2,3,5 and 6***)
  - Pelly started clearing new identified finger drain foundation. (**Photo 4**).
  - BGC observed need to clean and re-route water and saturated silty/organic mixtures from crest of right abutment that may come down to work area (***Photo 6)***.
  - BGC identified a possible test fill pad area (circled yellow) for material 2 stockpile (circled in orange) (***Photo 7***)
  - BGC found a potential phyllite zone for sampling and testing shear strength on the right abutment (sampling pending) (***Photo 8***).
  - Pelly continued constructing the new drain and finished covering it and taking as built survey points (**Photos 9, 10 and 12**).
  - Pelly continued construction, leaving loose lift 7 to be completed tomorrow morning (**Photos 11 and 13**).

- Observations and Recommendations (OPEN):
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.
  - BGC Troy Meyer updated CC204-RFI-022 considering zones and construction considerations after meeting with Victoria Gold and JDS. Submitted to JDS and Pelly as it refers to BGC RFI 009.

- Embankment Placement Tracking:

Photo 5: Pelly started placing loose lift 11.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 15, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Ethan Faber	**Weather:**	Rain/Overcast 5°C to 12°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - BGC new schedule: BGC Dan Granda 6 am to 6 pm (6 am to noon Embankment QA; noon to 6 pm Resident Engineer duties); BGC Ethan Faber (Noon to Midnight Embankment QA).
  - Pelly continued work on lift placements. (***Photos 1, 2, 3, 4 and 6***)
  - QC was done on lift 13, water replacement test (results pending) (***Photo 5)***

- Observations and Recommendations (OPEN):
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.

- Embankment Placement Tracking:

Material 7 – Rockfill Lifts ID	Loose lift elev. (m)	Approved	Comments
1	*0.9 m from toe to Sta 0+120	Toe to Sta 0+120	Requires attention upstream
2	870.7	Yes	N/A
3	871.05	Yes	N/A
4	871.6	Yes	N/A
5	872.35	Yes	N/A
6	872.9	Yes	N/A
7	873.7	Yes	N/A
8	874.3	Yes	N/A
9	875.07	Yes	N/A
10	875.6	Yes	N/A
11	876.25	Yes	N/A
12	877.00	Yes	N/A
13	877.75	Yes	Accepted at night shift
14	878.5	N/A	To be completed tomorrow

*The loose maximum thickness per lift is 0.9 m, per Test fill memorandum submitted to JDS/Pelly.

1) QA/QC Results:

QA/QC Results

Safety Issues: None

Photo 1: Night shift placing loose Lift 16 before cross shift with dayshift.

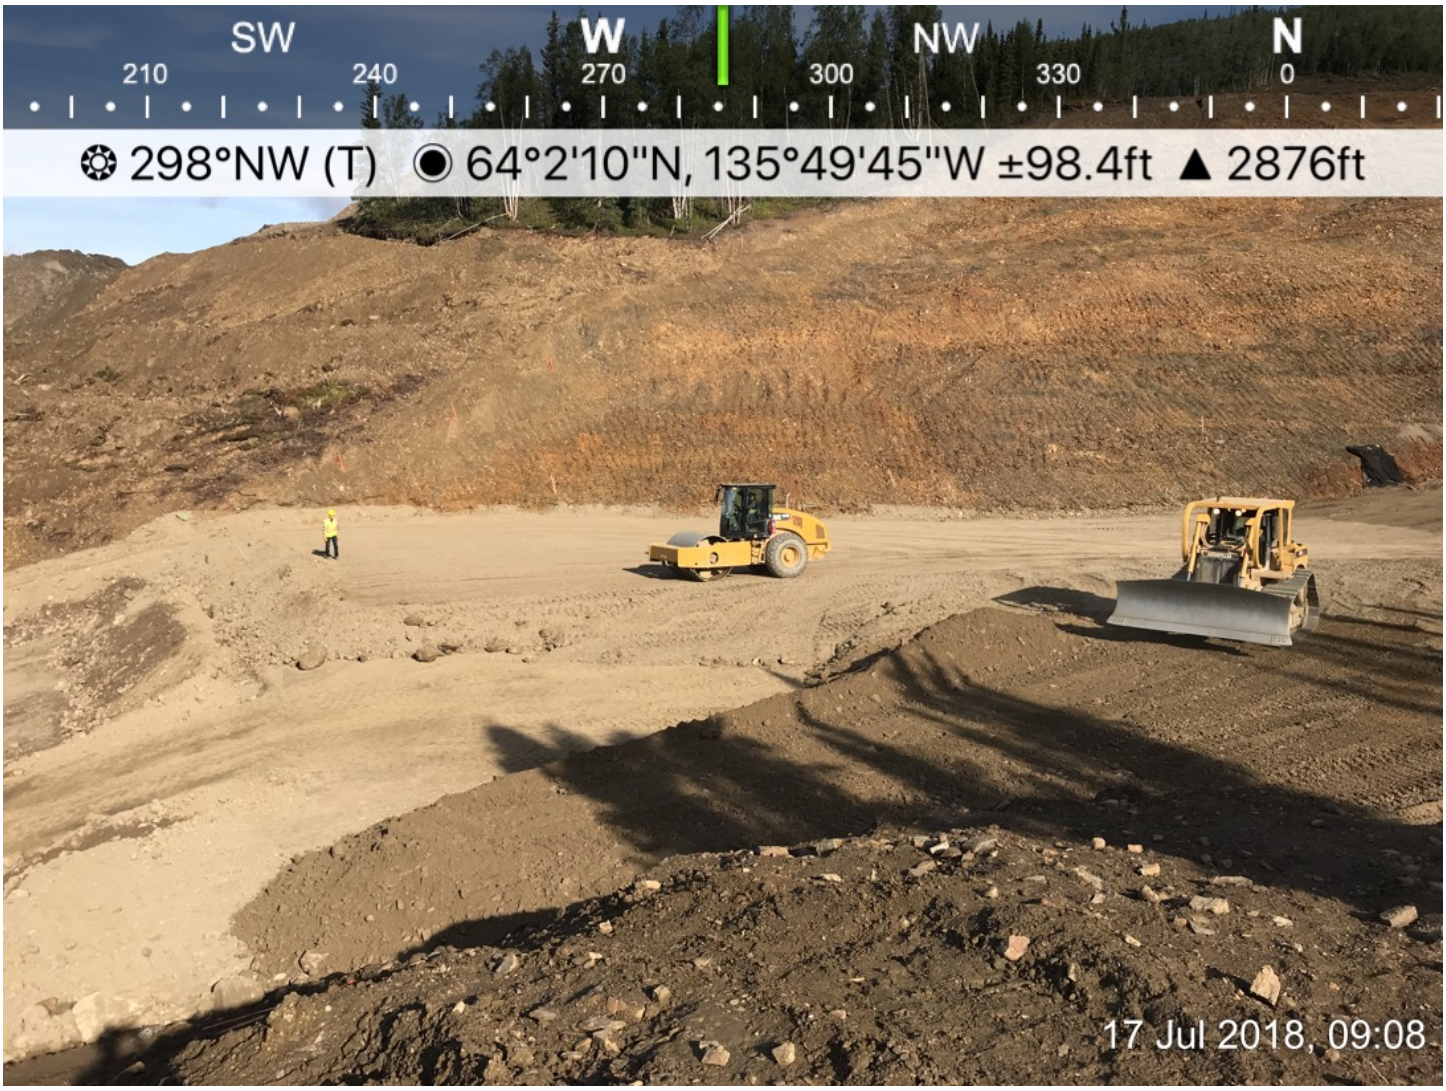

Photo 2: Day shift continued and started compaction on right abutment, lift 16.

Photo 3: Lift 16 was surveyed and accepted after compaction.

Photo 4: Lift 16 was moisture conditioned before placement of lift 17 started.

Photo 5: Pelly continued preparing foundation of underdrain for BGC inspection and acceptance, Cobalt continued clearing organics and overburden on upper right abutment areas.

Photo 6: Pelly continued to place lift 17, to be finished at night shift.

Photo 7: Underdrain foundation upstream was approved and Pelly began placing geotextile, during acceptance heavy rain started (reason why geotextile in picture is wet).

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 18, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Harra Vardeleon	**Weather:**	Sunny/Overcast 10°C to 20°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued work on lift placements, dayshift finished lift 19 and moisture conditioned for night shift to continue (***Photos 1, 5, and 10***)
  - BGC and Vitoria Gold geologist went to ARD plant stock piles areas to look at current stockpiles. BGC informed Pelly and JDS of concerns of running out of material 7 rockfill in 3-5 days. (***Photos 2 and 3***)
  - Pelly continued to work on the underdrain construction upstream, select drain fill was placed per design and approved by BGC (***Photos 4 and 8***). Pelly continued to bring HDPE pipes for fusing tomorrow.
  - Pelly continued work on new access road from ARD plant to cut hauling times (***Photo 6***).
  - QC testing was done on lift 18 (compacted) with nuclear density test (***Photo 7).***
  - Embankment toe inspected, vampire drains transporting finger drain captured flow at an estimated rate of 20 to 30 L/min (storm event occurred yesterday) (***Photo 9)***

- Observations and Recommendations (OPEN):
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.

BGC-RFI-008	QC Management Plan	Open: Sent June 23. In process. Pending response from Pelly/JDS.
BGC-RFI-009	Embankment Zoning Plan	Open: Sent July 6. Pending response from Pelly/JDS.

Safety Issues: None

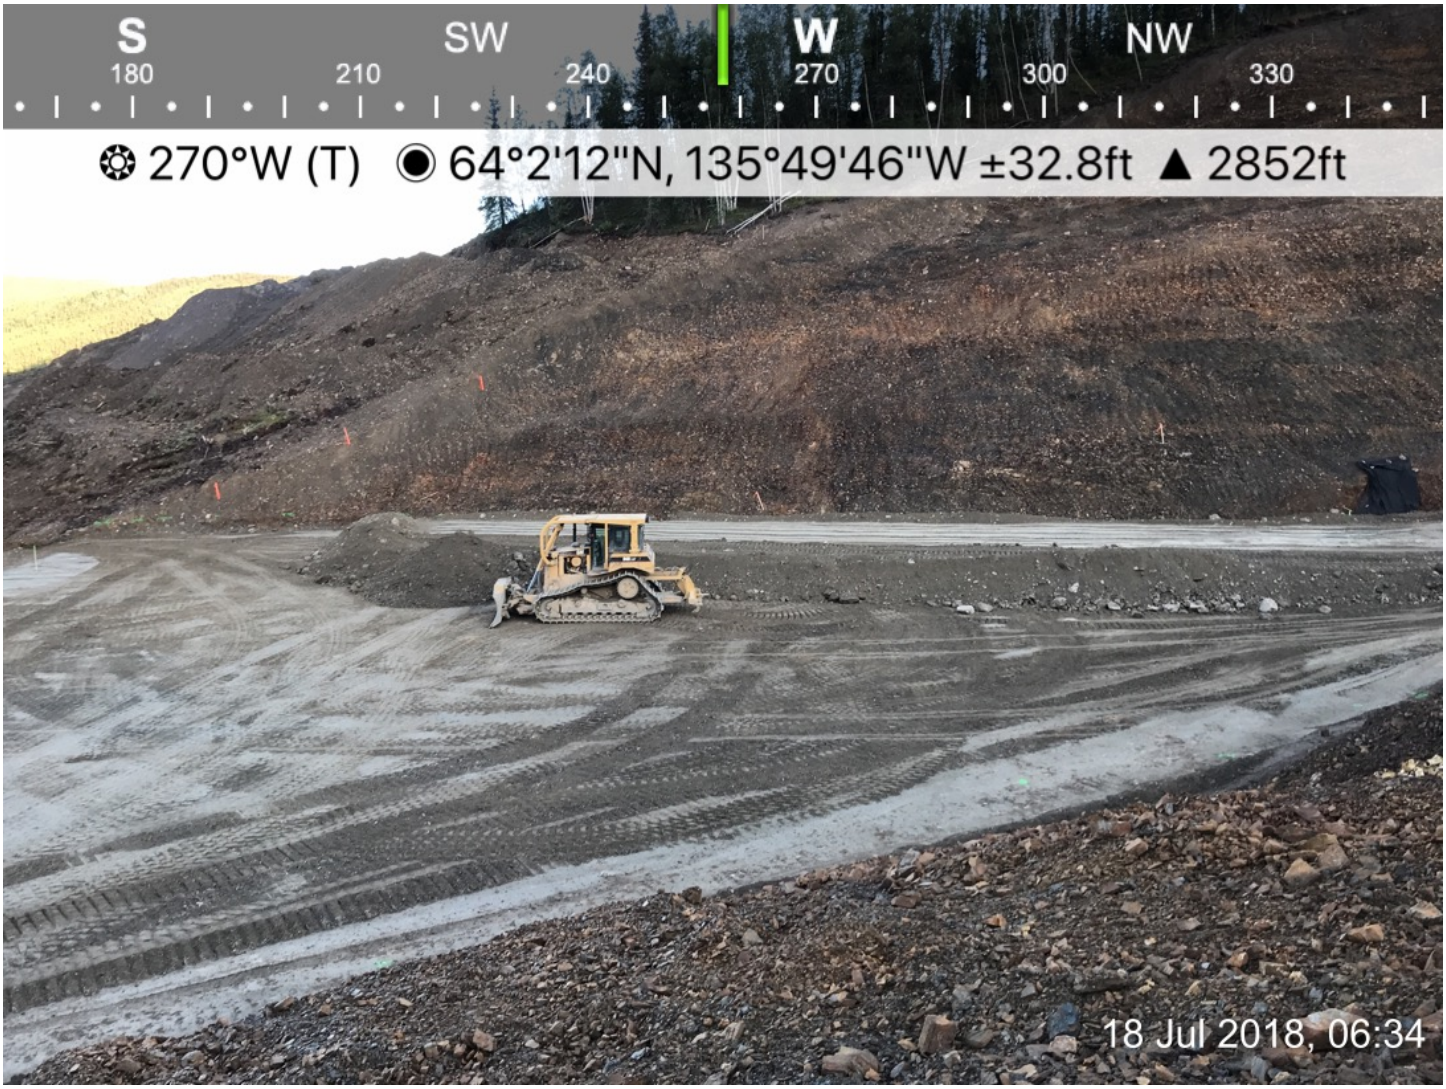

Photo 1: Night shift placing loose Lift 19 before cross shift with dayshift.

Photo 2: BGC representative Dan Granda went to ARD plant stockpile areas with Vitoria Gold Geologist Steve Wozniak to observe stockpile qualities and volumes.

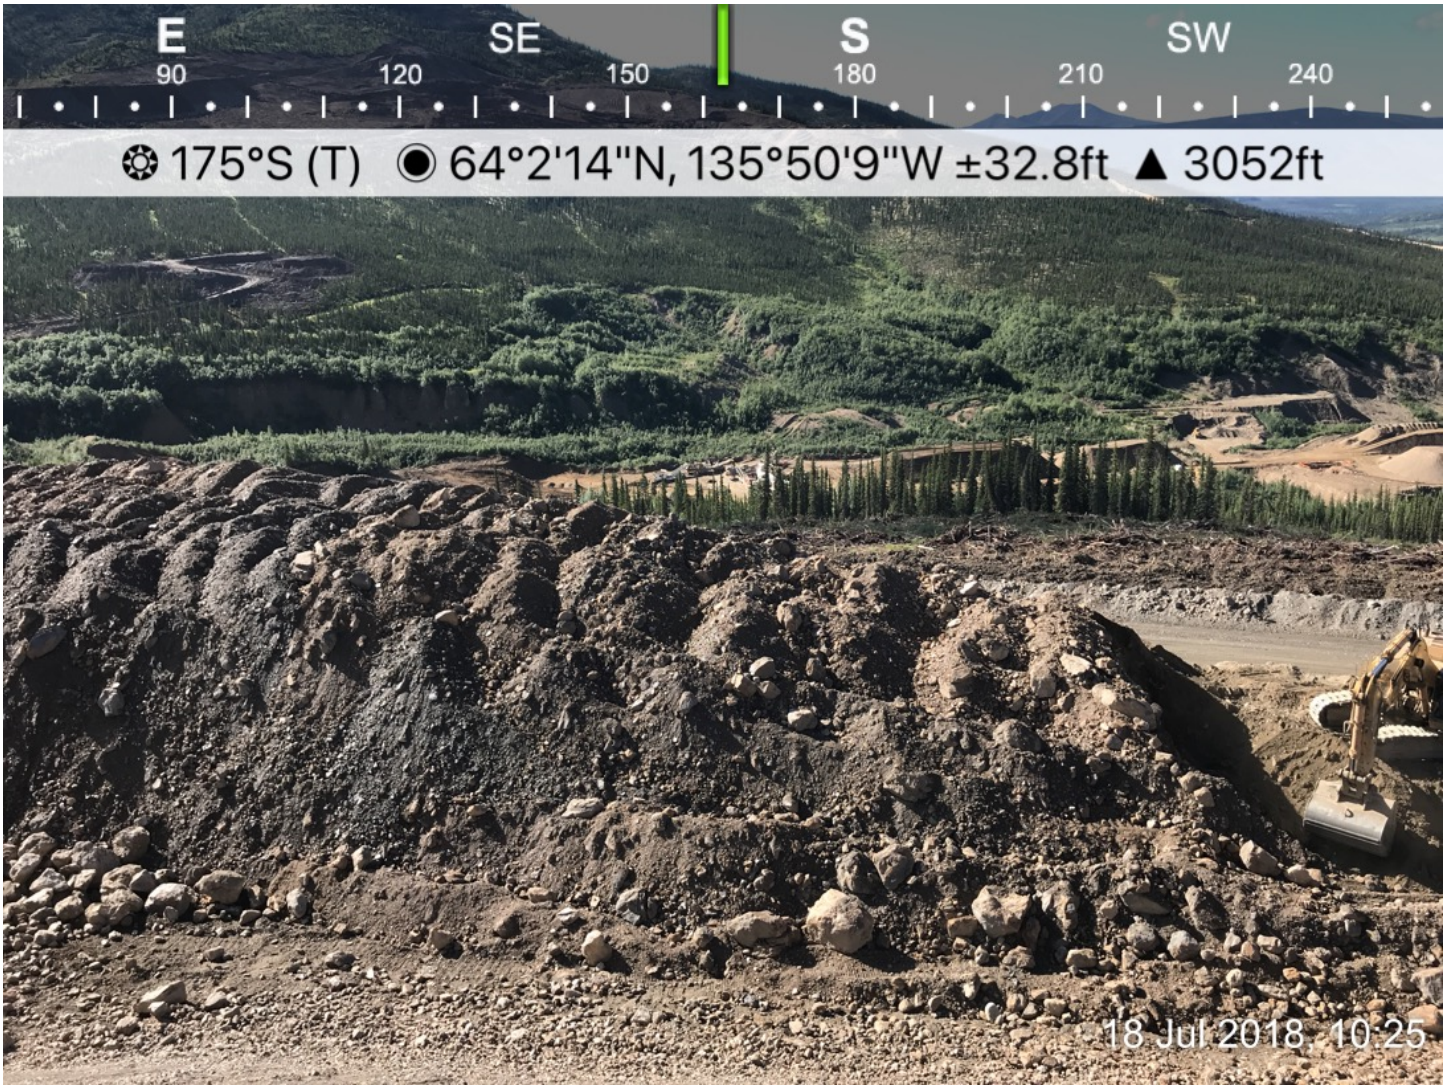

Photo 3: BGC representative Dan Granda went to ARD plant stockpile areas with Vitoria Gold Geologist Steve Wozniak to observe stockpile qualities and volumes. This is the material 7 rockfill remaining stockpile, estimated to last 3-5 days.

Photo 4: Pelly began placing bedding layer of select drain fill for underdrain extension upstream.

Photo 5: Pelly continued lift 19 in the dayshift.

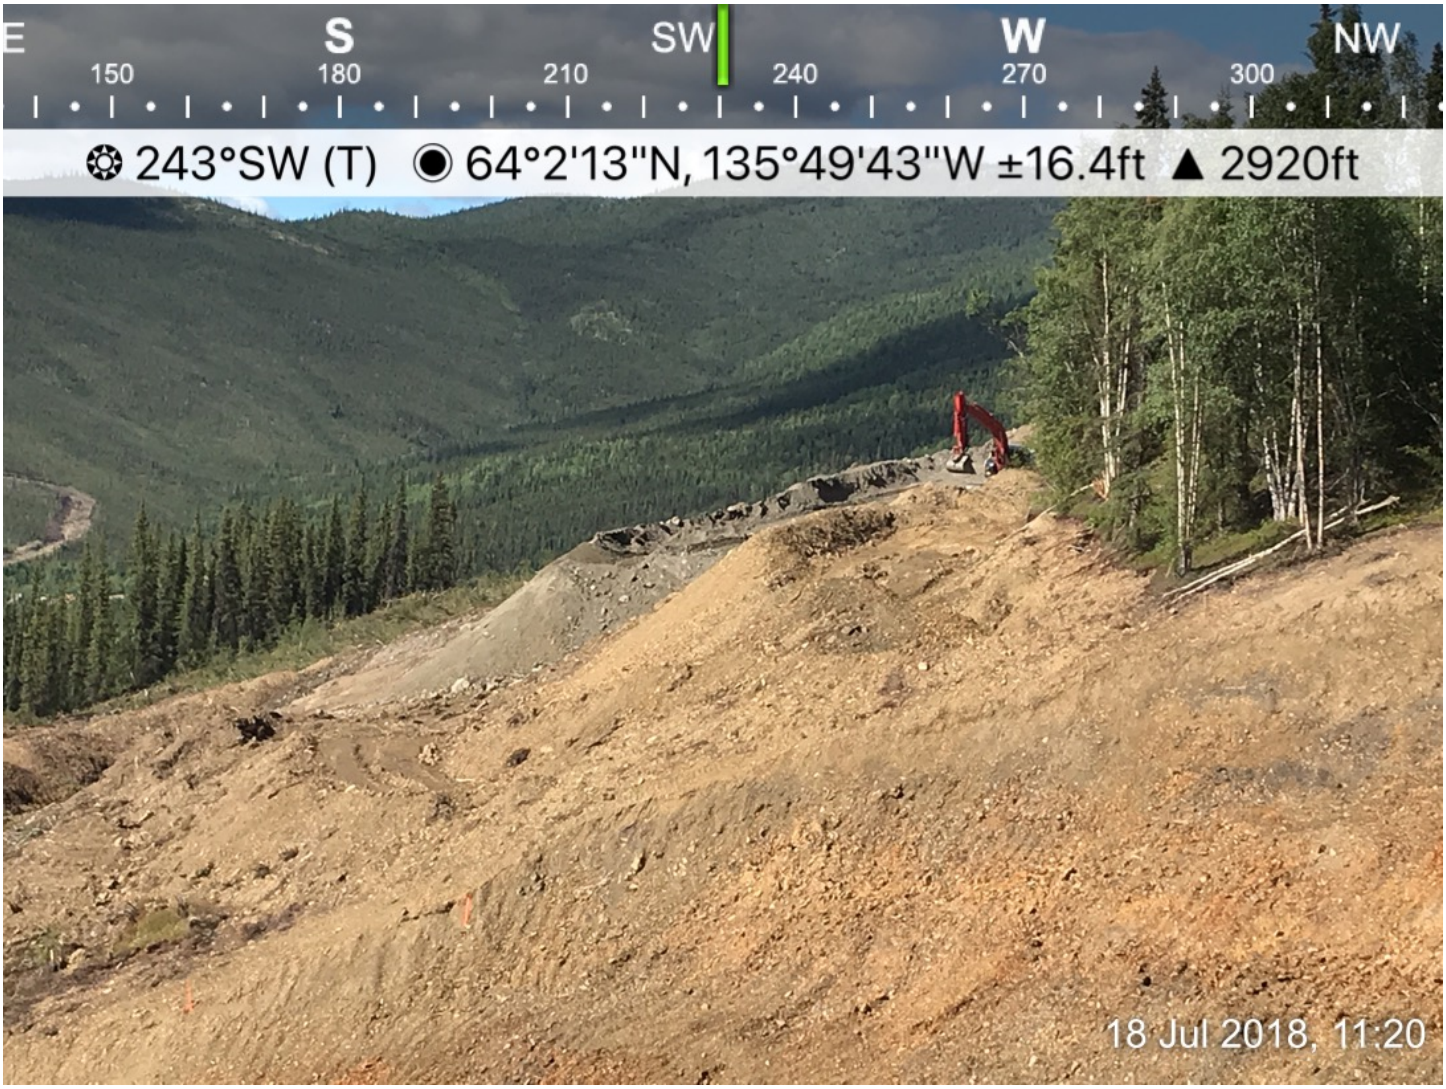

Photo 6: Pelly started and continued work on new access road from ADR plant to embankment to optimize haulage of material 7.

Photo 7: QC Tetratech did nuclear density tests on lift 18 (compacted) lift, results ranged from 2241 kg/m^3 to 2277 kg/m^3 dry density, moisture content range 4.5% to 6.1%.

Photo 8: BGC approved select drain fill bedding placement and Pelly continued by bringing in HDPE pipes for fusing.

Photo 9: Vampire drain on toe of embankment was observed to be transporting 20 to 30 L/min of seepage, likely from finger drains installed on the right abutment, water was observed clear. Select drain fill by toe was observed to be moist to wet indicating flow.

Photo 10: Water truck was brought in after lift 19 was finished to moisture condition for night shift lift placement.

Safety Issues: None

Photo 1: Night shift placing loose Lift 20 before cross shift with dayshift.

Photo 2: Caterpillar mechanic was called to fix compactor early morning.

Photo 3: Pelly made a sample of the fusing of the pipe transition through thickness.

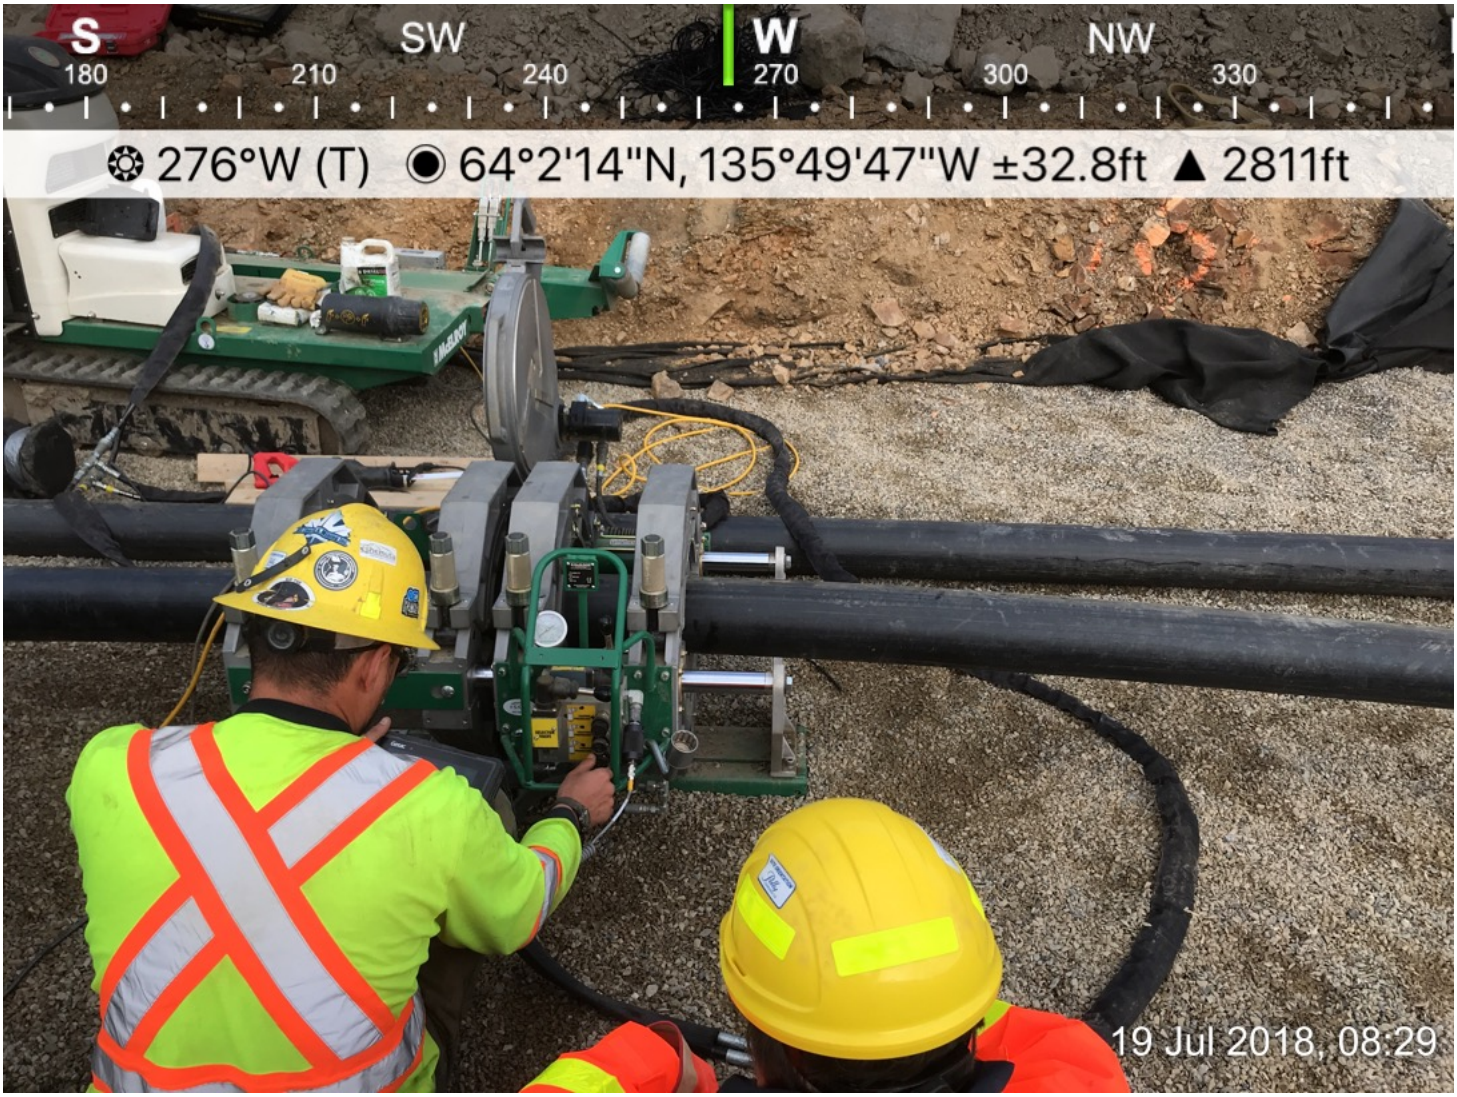

Photo 4: BGC was present during the fusing operations of the underdrain pipes.

Photo 5: Compactor was fixed and lift 20 was compacted for approval.

Photo 6: BGC accepted lift 20 with survey confirmation, survey placed marker for lift 21 and water truck moisture conditioned compacted lift for new lift placement.

Photo 7: Pelly continue placing loose lift 21.

Photo 8: BGC was informed of new compactor on site, CS78B, approximately 12 tons at drum per specifications, to be used on embankment.

Photo 9: BGC accepted the underdrain pipes and Pelly proceeded placing select drain fill layer cover.

Photo 10: BGC observed the placement of select drain fill cover on underdrain pipes.

Photo 11: View from top of right abutment on site.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 20, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Harra Vardeleon	**Weather:**	Rain/Overcast 10°C to 20°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued work on lift placements, nightshift finished compacting lift 21 and dayshift started lift 22 for night shift to continue (***Photos 1, 4, and 9***)
  - Lift 21 was tested with a nuclear density method on two points, middle of lift and toe. Dry density at middle of lift was measured to be 2243 kg/m^3 and moisture content at 4.8%, dry density at the toe was measured to be 2221 kg/m^3 and moisture content at 5.0%. (***Photos 2 and 3***)
  - Pelly continued work on the underdrain. After BGC accepting the select drain fill cover and having survey pick up the as built information, Pelly placed geotextile and designed overlap. BGC inspected and accepted geotextile placement. Pelly proceeded to place Material 2 from crusher area with moisture conditioning, compacting and having BGC accept the compacted lift after doing nuclear density test to confirm density (***Photos 5, 6 and 10***).
  - Pelly informed BGC that they were instructed to take material from stockpile on ARD plant area, BGC and Victoria Gold representative Briar Gonie inspected area exposed by excavator and classified as 75% phyllite and rejected any load from this area due to material not conforming to rockfill material 7 definition, further analysis recommended. Pelly's excavator and haul trucks returned to approved rockfill #2 stockpile of material 7. EOR Troy Meyer notified. (***Photo 7***).
  - BGC and Vitoria Gold Geology observed current stockpile used for material 7, estimating 3-4 days left until depleted (***Photo 8***). BGC advised of this depletion previously on daily from July 18, 2018 with observations from Vitoria Gold Geologist Steve Wozniak.

- Observations and Recommendations (OPEN):
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.

- Embankment Placement Tracking:

EPCM-RFI-020	JDS requests clarification on ballast placement and spacing.	Open. Sent June 21. Pending response from BGC.
BGC-RFI-008	QC Management Plan	Open: Sent June 23. In process. Pending response from Pelly/JDS.
BGC-RFI-009	Embankment Zoning Plan	Open: Sent July 6. Pending response from Pelly/JDS.

Safety Issues: None

Photo 1: Night shift finished compacting of lift 21, dayshift started loose lift 22.

Photo 2: QC test, nuclear density, was done on 2 points. This picture shows it being done in the middle of the lift.

Photo 3: QC density test was also done by the toe of embankment.

Photo 4: Pelly continued placing loose lift 22. Due to recent rain, no moisture conditioning was needed before placement.

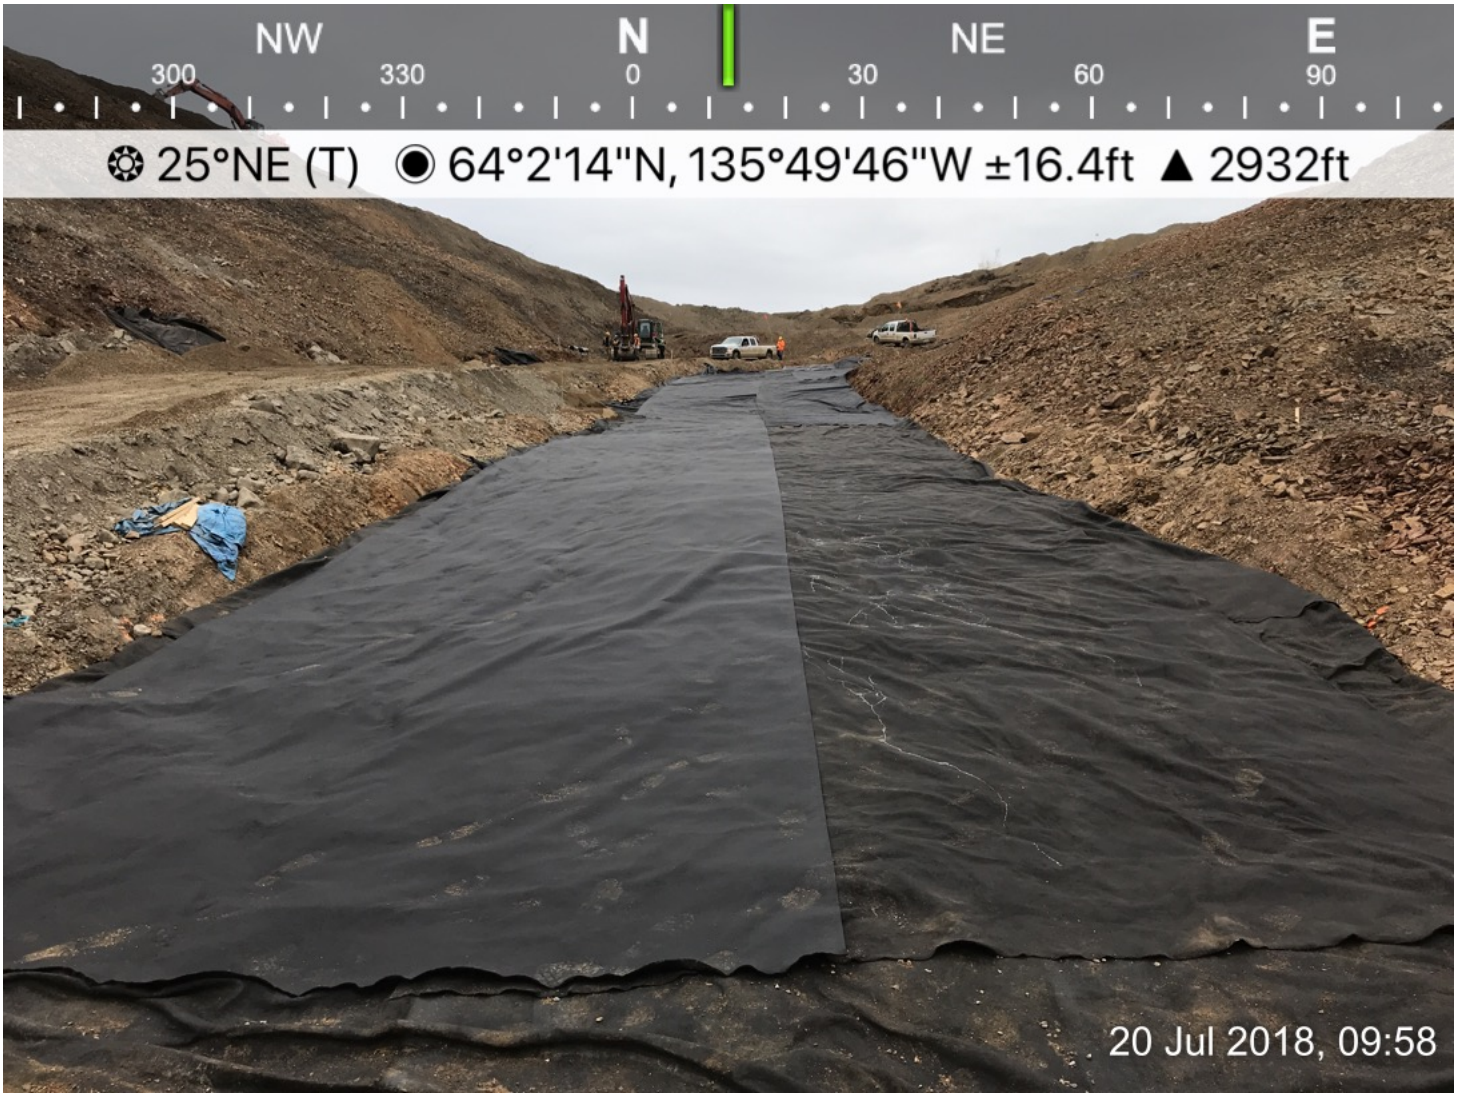

Photo 5: Pelly placed geotextile over the select drain fill cover on top of the underdrain pipes, BGC accepted the placement.

Photo 6: Pelly continued to finish underdrain trench by placing material 2 from crusher area, BGC advised to moisture condition before placement and Pelly placed a water truck to do so.

Photo 7: Pelly informed BGC that they were instructed to get material from an ARD stockpile, BGC representative Dan Granda and Victoria Gold Geologist Briar Gonie inspected the excavation and identified it as 75% phyllite and any load from this area was rejected for placement. Pelly moved back to the rockfill #2 stockpile that is near depletion. BGC representative informed EOR and Pelly of this.

Photo 8: Current rockfill #2 stockpile status (estimated 3-4 days left).

Photo 9: Pelly continued to place loose lift 22, placement and compaction to be finished by night shift.

Photo 10: Pelly completed first lift, compaction was tested with nuclear density and accepted by BGC, pelly placed a second lift for additional protection of pipes.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 21, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Harra Vardeleon	**Weather:**	Sunny 12°C to 20°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued work on lift placements, nightshift finished placing lift 23 and dayshift started compacting lift 23 (***Photo 1)***
  - Lift 23 was tested with a nuclear density method on two points, middle of lift and toe. Dry density at middle of lift was measured to be 2267 kg/m^3 and moisture content at 4.4%, dry density at the toe was measured to be 2216 kg/m^3 and moisture content at 4.1%. (***Photo 2***)
  - After accepting lift 23, BGC observed areas that required cleaning of phyllite layers on the right abutment. Pelly used bulldozer and excavator to remove loose material and phyllite until compatible bedrock was reached, BGC inspected and accepted surface for next lift (***Photos 3 and 4***).
  - Pelly cleaned up the upper right abutment finger drain, water flow was observed. (***Photos 5 and 6***). Drain was compacted and an additional small seep was observed and incorporated into the finger drain (***Photo 12***).
  - Pelly continued with the next placement of loose lift after foundation surface of the right abutment was confirmed and accepted (***Photo 7***).
  - BGC and Victoria Gold Geology used the excavation from yesterday on the ARD stockpile of phyllite to make an assessment. (***Photo 8***). BGC representative Dan Granda and Victoria Gold Geologist Briar Gonie inspected phyllite rich zones and fragments (***Photos 9 and 10***). Pelly representatives and JDS representatives showed up (not planned meeting with BGC and Victoria Gold), and the opportunity was used to show JDS that massive amounts of phyllite and a potential source of quartzite that would need a bit of blending for it to be a potential source of rockfill material 7 (***Photo 11***).
  - BGC and Victoria Gold Geology started a testfill to provide information on a new potential source for rockfill material 7, as the remaining stockpile is running out. (***Photos 13 to 20***).
  - BGC recommends taking material from the orange area material runs out before tests are completed (***Photo 21***), oversight from a geologist or geotechnical engineer will be required to make sure the right outcrop and material is excavated until all unsuitable phyllite is cleaned or clearly marked to be avoided.

- BGC "Quartzite Blend Test Fill ARD":
  - Testfill was 9.25 m by 6.25 m, the loose lift was 0.9 m (confirmed with survey controls).
  - Steel plates were placed in 3 spots, each spot elevation was recorded with survey before compaction.
  - The compactor used was a CAT CS78B (12 to 13.5 tons at the drum), vibrating.
  - Each pass includes vibration going forward and backwards, a total of 4 passes was done. After each pass, vertical deflection from compression was recorded by survey (summarized on table below).

Plate ID	Pre-compaction elevation (m)	After Pass 1 elevation (m)	After Pass 2 elevation (m)	After Pass 3 elevation (m)	After Pass 4 elevation (m)	Total compaction
1	948.43	948.39	948.38	948.38	948.37	0.06 m
2	948.46	948.42	948.42	948.42	948.41	0.05 m
3	948.53	948.50	948.49	948.49	948.48	0.05 m

  - It was observed that this material has hard quartzite, showing angularity, resistance to splitting and is interbedded with phyllite that provides cohesion and moisture retention.
  - The expected compaction is 0.05 m, for every 0.9 m lift, the compacted lift would have an estimated thickness of 0.85 m.
  - The water replacement test showed a water volume of 184.4 US Gallons or 0.698 m^3.
  - BGC, Pelly and Tetra Tech were not able to weight the soil due to JDS not having the weight scale requested by Tetra Tech James Buyck last week. Super sacs remain in the field until weight, the weight will help determine in-situ density of this testfill material as different method to the nuclear density test.
  - Nuclear density tests showed a dry density range of 2212 to 2263 kg/m^3 and moisture content % of 4.9 to 4.2.

- BGC recommends taking material from the orange area material runs out before tests are completed (Photo 21), oversight from a geologist or geotechnical engineer.

- Observations and Recommendations (OPEN):
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.

- Embankment Placement Tracking:

*The loose maximum thickness per lift is 0.9 m, per Test fill memorandum submitted to JDS/Pelly.

1) QA/QC Results:

QA/QC Results
• QA/QC: o • BGC Recommendations: o None

2) Communications (no follow up required):

Personnel	**Description**
None	

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
EPCM-RFI-020	JDS requests clarification on ballast placement and spacing.	Open. Sent June 21. Pending response from BGC.
BGC-RFI-008	QC Management Plan	Open: Sent June 23. In process. Pending response from Pelly/JDS.
BGC-RFI-009	Embankment Zoning Plan	Open: Sent July 6. Pending response from Pelly/JDS.

Safety Issues: None

Photo 1: Day shift finished compacting of lift 23, dayshift started loose lift 24.

Photo 2: QC nuclear density test on toe, dry density 2216 kg/m^3, moisture content is 4.1%. Lift Accepted.

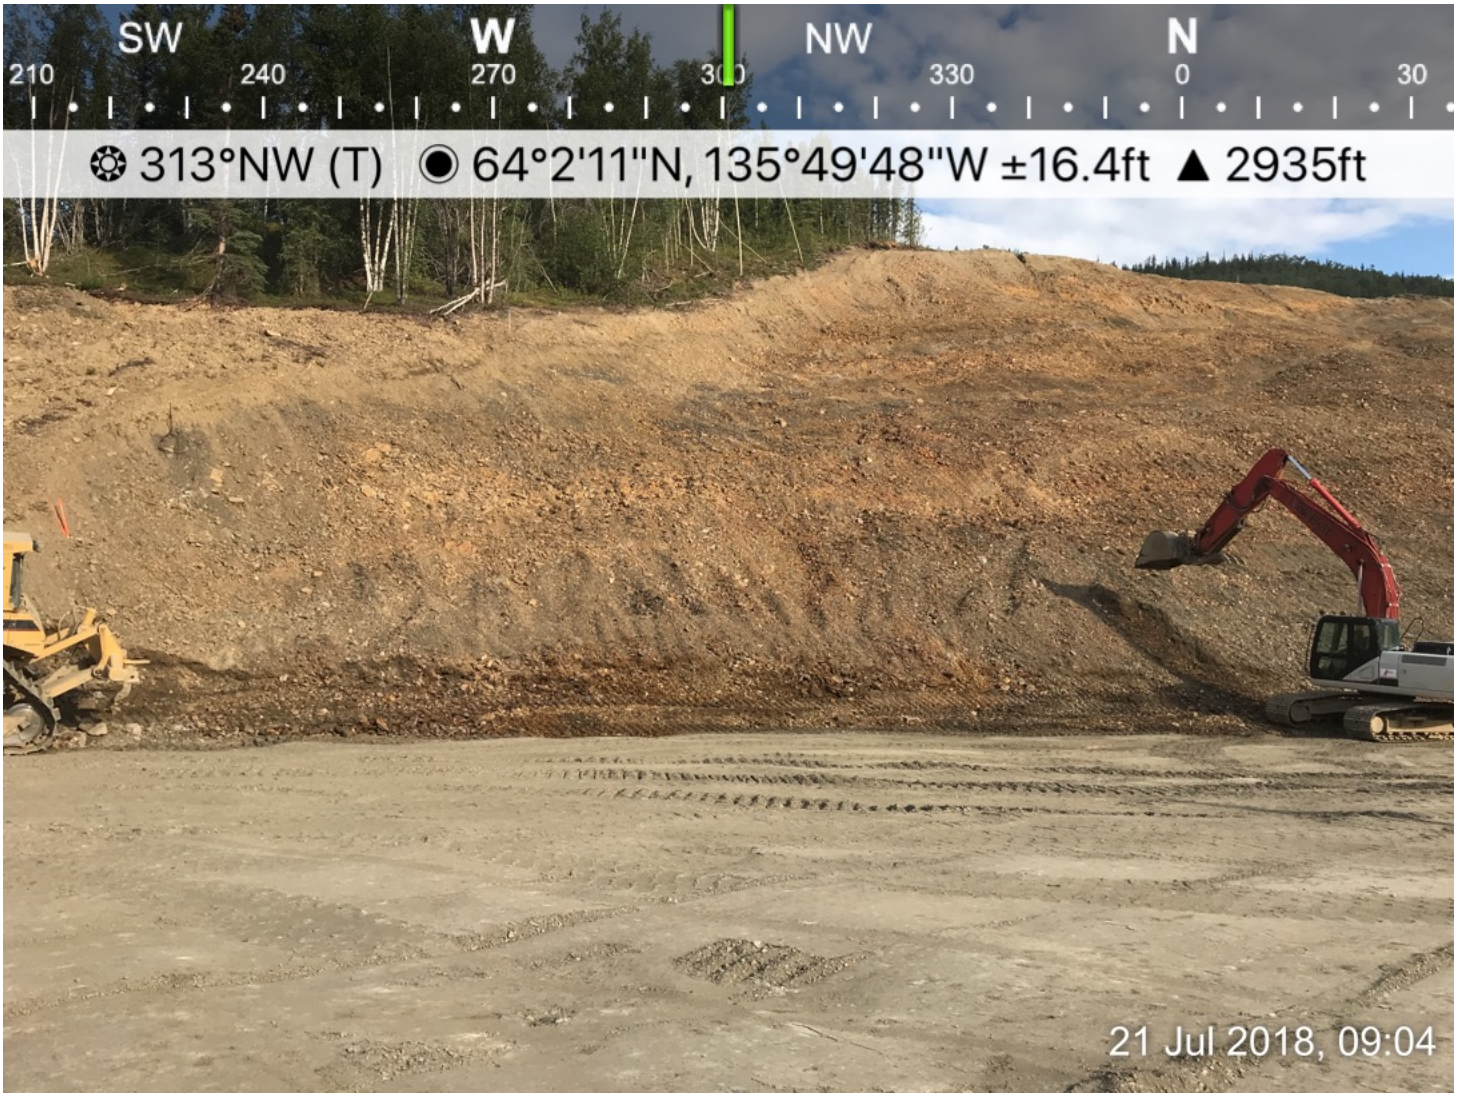

Photo 3: BGC instructed Pelly on cleaning right abutment as a layer of phyllite was observed, both dozer and excavator were able to clean surface.

Photo 4: Cleaning was inspected and accepted for next loose lift placement.

Photo 5: Pelly cleaned the upper right abutment finger drain, water was clearly observed to flow at a 5L to 10L/min rate.

Photo 6: Pelly cleaned the upper right abutment finger drain, water was clearly observed to flow at a 5L to 10L/min rate.

Photo 7: Pelly continued with loose lift placement.

Photo 8: Victoria Gold Geologist Briar Gonie inspecting phyllite stockpile that was excavated by Pelly yesterday, areas showed ranges from 100% phyllite to 75% phyllite and other particles (quartzite fragments).

Photo 9: Multiple areas were assessed for phyllite.

Photo 10: Victoria Gold Geologist Briar Gonie showing how phyllite fragments (easily friable) can be mistaken for quartzite by doing the scratch test, these particles were found throughout the stockpile, the color could be confused with quartzite. The main difference is quartzite is more resistant to normal stress than a friable phyllite fragment which will generate more fines during compaction.

Photo 11: During the BGC/Victoria Gold assessment of stockpile that was excavated yesterday, JDS representatives arrived with Pelly. BGC and Victoria Gold used the opportunity to show them the amount of phyllite in the area and the little volume of competent quartzite available.

Photo 12: During material 2 compaction of upper right abutment finger drain, a seep was observed directly from the right abutment, this was addressed by letting the water coming into the drain.

Photo 13: Pelly excavator exposed more phyllite rich zones for BGC and Victoria Gold Geologist to observe material composition.

Photo 14: Pelly mobilized to area where outcrop of quartzite was identified by BGC and Victoria Gold geology. The interbedded phyllite and quartzite was excavated and placed on haul trucks for the test fill “BGC Quartzite Blend”.

Photo 15: Testfill was placed at a 0.9 m loose left, steel plates were placed, surveyed.

Photo 16: Pelly's CS78B (approximately 13.5 ton compactor) was used with vibration on.

Photo 17: Each pass was surveyed for deflection and compaction.

Photo 18: Nuclear densometer was used to measure density.

Photo 19: The wall surface of the quartzite blend shoes angular fragments and vertical stability.

Photo 20: A water replacement test was conducted, the samples collected are waiting for JDS to acquire weight measurement device ordered by Tetra Tech to accurately measure weight to estimate in-situ density.

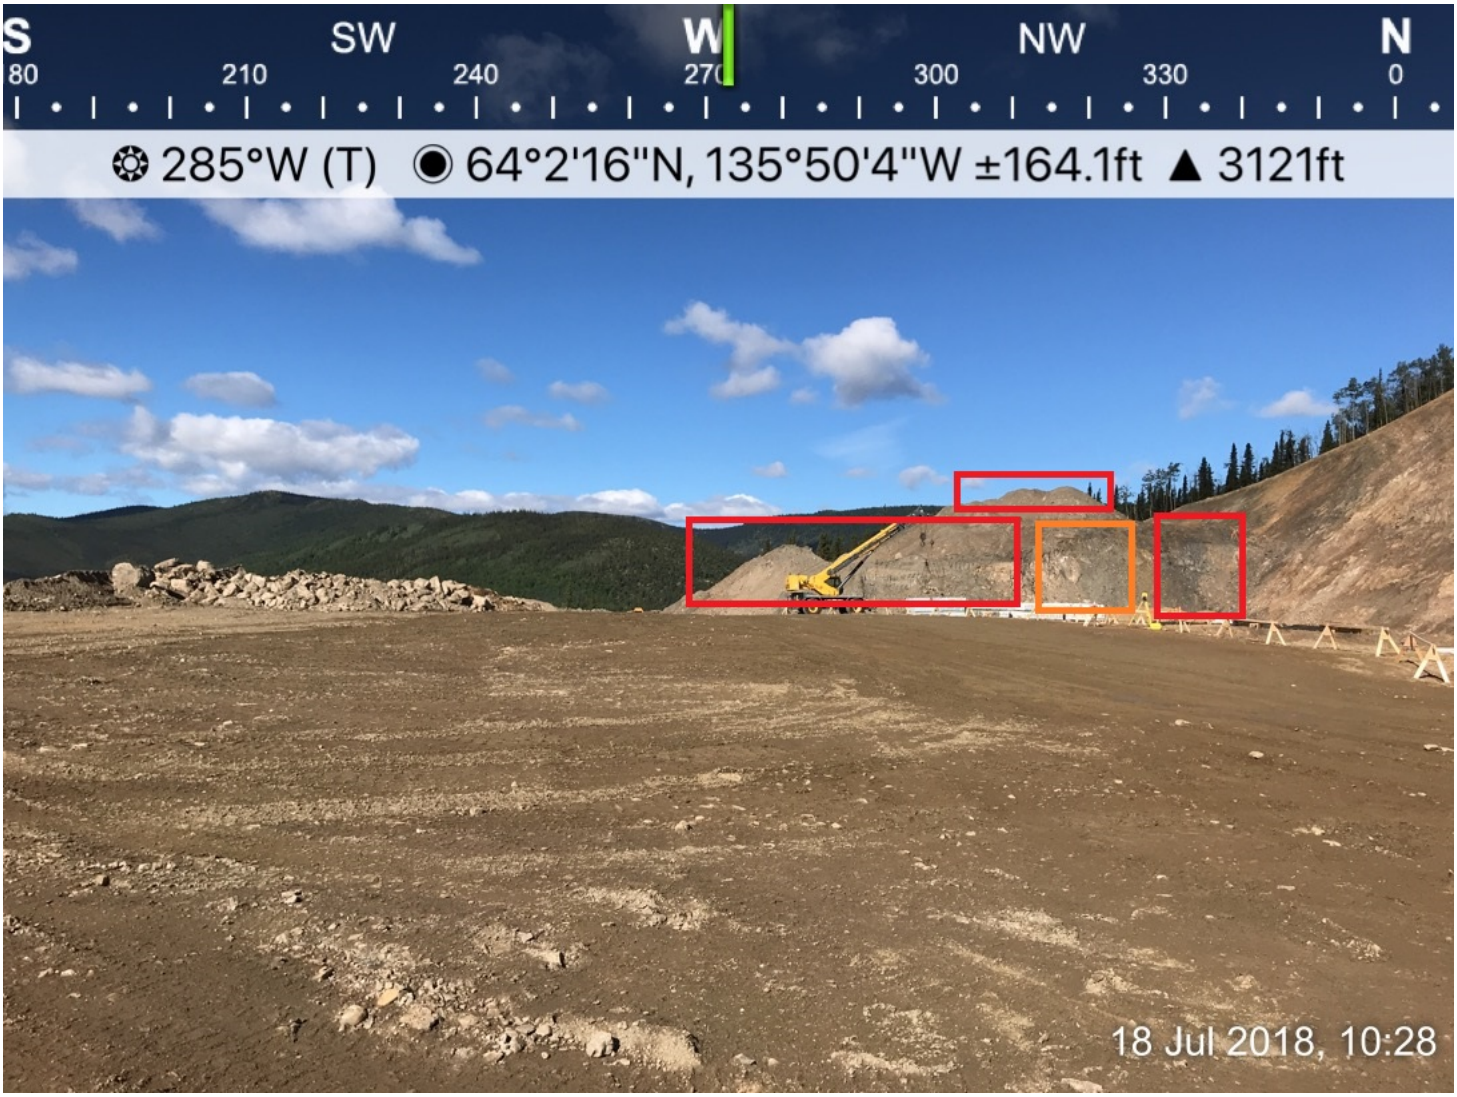

Photo 21: Quartzite blend was taken from orange square, avoiding red squares that were mapped as 75%+ phyllite content.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 22, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Harra Vardeleon	**Weather:**	Sunny 15ºC to 25ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued work on lift placements, dayshift continued lift 24, compacted and carried on to lift 25 (***Photos 1, 2 and 12)***
  - Pelly has started taking out over saturated stockpile from left abutment area near the artesian source (***Photo 3***)
  - Yesterdays test fill is pending JDS's weight scale arrival for confirmation of insitu densities, the area marked on orange seems to the best rockfill option at the ARD plant (***Photo 4***), the area on red is 75% to 100% phyllite which is not desirable for lift placement on the embankment due to low shear strengths (***Photo 4***) and should be avoided.
  - BGC and Victoria Gold Exploration Geology team was present the ARD and saw how phyllite can be at slightly higher moisture contents (***Photo 5).*** The residue of phyllite from the approved rockfill has become muck or thick sticky mud with very little moisture addition, this is why this material alone is not recommended for embankment construction.
  - JDS requested 3 testfills with what they called a dozer blend, the testfill was named JDS Phyllite Dozer Blend. 3 lift thicknesses were requested (0.3, 0.5 and 0.9 m), BGC and Victoria Gold Geology was present during the placement. (***Photo 6***). Due to high fine content and not passing the minimum requirement for rockfill (>30% particles of quartzite being at least 19 mm), BGC recommended conducting a shear strength test, with standard proctor and gradation through QC Tetra Tech.
  - Pelly and BGC conducted the 3 testfills as requested by JDS following the same procedures as yesterday. No water replacement test was done because this test is mainly for rockfills or testfills/lifts with high rock content, a nuclear density test was done on each lift, results on table below (***Photos 8 to 11***).
  - Victoria Gold Exploration Geology Team offered to help find quartzite and map area for consideration of suitable materials for material 7, the team found an outcrop (also presented in orange (photo 4) and followed it (Photo 7). At the end of the exercise, Victoria Gold Geologist Steve Wozniak presented BGC with a sketch of where the quartzite outcrop follows through the ARD (***Photo 12***).

- JDS Phyllite Dozer Blend ARD:
  - Per JDS request, 3 testfills were placed from a dozer pushing phyllite from the top of the stockpile to the bottom, this material recommended to be avoided BGC due to its very high phyllite content.
  - The testfill thicknesses were requested to be 0.3 m, 0.5 m and 0.9 m (confirmed with survey controls).
  - Steel plates were placed in 3 spots, each spot elevation was recorded with survey before compaction.
  - The compactor used was a CAT CS78B (12 to 13.5 tons at the drum), vibrating.
  - Each pass includes vibration going forward and backwards, a total of 4 passes was done. After each pass, vertical deflection from compression was recorded by survey (summarized on tables below).

JDS Phyllite Dozer Blend ARD lift thickness 0.3 m

Plate ID	Pre-compaction elevation (m)	After Pass 1 elevation (m)	After Pass 2 elevation (m)	After Pass 3 elevation (m)	After Pass 4 elevation (m)	Total compaction
1	948.31	948.30	948.30	948.29	948.29	0.02 m
2	948.30	948.28	948.28	948.28	948.28	0.02 m
3	948.33	948.31	948.29	948.30	948.30	0.03 m

  - Nuclear density tests showed a dry density range of 2148 to 2127 kg/m^3 and moisture content % of 4.3 to 4.4.
  - The expected compaction is 0.02 m, for every 0.3 m lift, the compacted lift would have an estimated thickness of 0.28 m.
  - This material showed deflection during compaction, optimum moisture content is recommended (Standard Proctor Test).
  - This material has been observed in literature and in the field to have low shear strength, a shear test is recommended.

JDS Phyllite Dozer Blend ARD lift thickness 0.5 m

Plate ID	Pre-compaction elevation (m)	After Pass 1 elevation (m)	After Pass 2 elevation (m)	After Pass 3 elevation (m)	After Pass 4 elevation (m)	Total compaction
1	948.37	948.33	948.32	948.31	948.31	0.06 m
2	948.28	948.27	948.26	948.25	948.25	0.03 m
3	948.31	948.29	948.27	948.25	948.26	0.05 m

- Nuclear density tests showed a dry density range of 2225 to 2288 kg/m^3 and moisture content % of 3.9 to 3.8.
- The expected compaction is varied due to material waving as compactor passed through lift, compaction may vary between 0.03 to 0.06 m.
- This material showed deflection during compaction, optimum moisture content is recommended (Standard Proctor Test).
- This material has been observed in literature and in the field to have low shear strength, a shear test is recommended.

JDS Phyllite Dozer Blend ARD lift thickness 0.9 m

Plate ID	Pre-compaction elevation (m)	After Pass 1 elevation (m)	After Pass 2 elevation (m)	After Pass 3 elevation (m)	After Pass 4 elevation (m)	Total compaction
1	948.49	948.47	948.47	948.47	948.47	0.02 m
2	948.50	948.49	948.49	948.49	948.48	0.02 m
3	948.50	948.47	948.46	948.46	948.45	0.05 m

- Nuclear density tests showed a dry density range of 2213 to 2202 kg/m^3 and moisture content % of 3.9 to 3.8.
- The expected compaction is varied due to material waving as compactor passed through lift, compaction may vary between 0.02 to 0.05 m.
- This material showed deflection during compaction, optimum moisture content is recommended (Standard Proctor Test).
- This material has been observed in literature and in the field to have low shear strength, a shear test is recommended.

- Observations and Recommendations (OPEN):
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.
  - BGC recommends avoiding using a phyllite only lift on embankment, the material has been observed to have low shear resistance and proper compaction will require adequate moisture conditioning that will require a standard proctor results as guidance. The BGC testfill from yesterday “BGC Quartzite Blend Test Fill ARD” has showed promise, still pending final weight of super sacs for in situ density estimation (JDS reported to have this scale on route).

- Embankment Placement Tracking:

1) QA/QC Results:

QA/QC Results
• QA/QC: o • BGC Recommendations: o None

2) Communications (no follow up required):

Personnel	Description
None	

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
EPCM-RFI-020	JDS requests clarification on ballast placement and spacing.	Open. Sent June 21. Pending response from BGC.
BGC-RFI-008	QC Management Plan	Open: Sent June 23. In process. Pending response from Pelly/JDS.
BGC-RFI-009	Embankment Zoning Plan	Open: Sent July 6. Pending response from Pelly/JDS.

Safety Issues: None

Photo 1: Day shift continued pushing material for lift 24.

Photo 2: Compaction of lift also followed.

Photo 3: Pelly continues to clean oversaturated materials from left abutment zone of HLF.

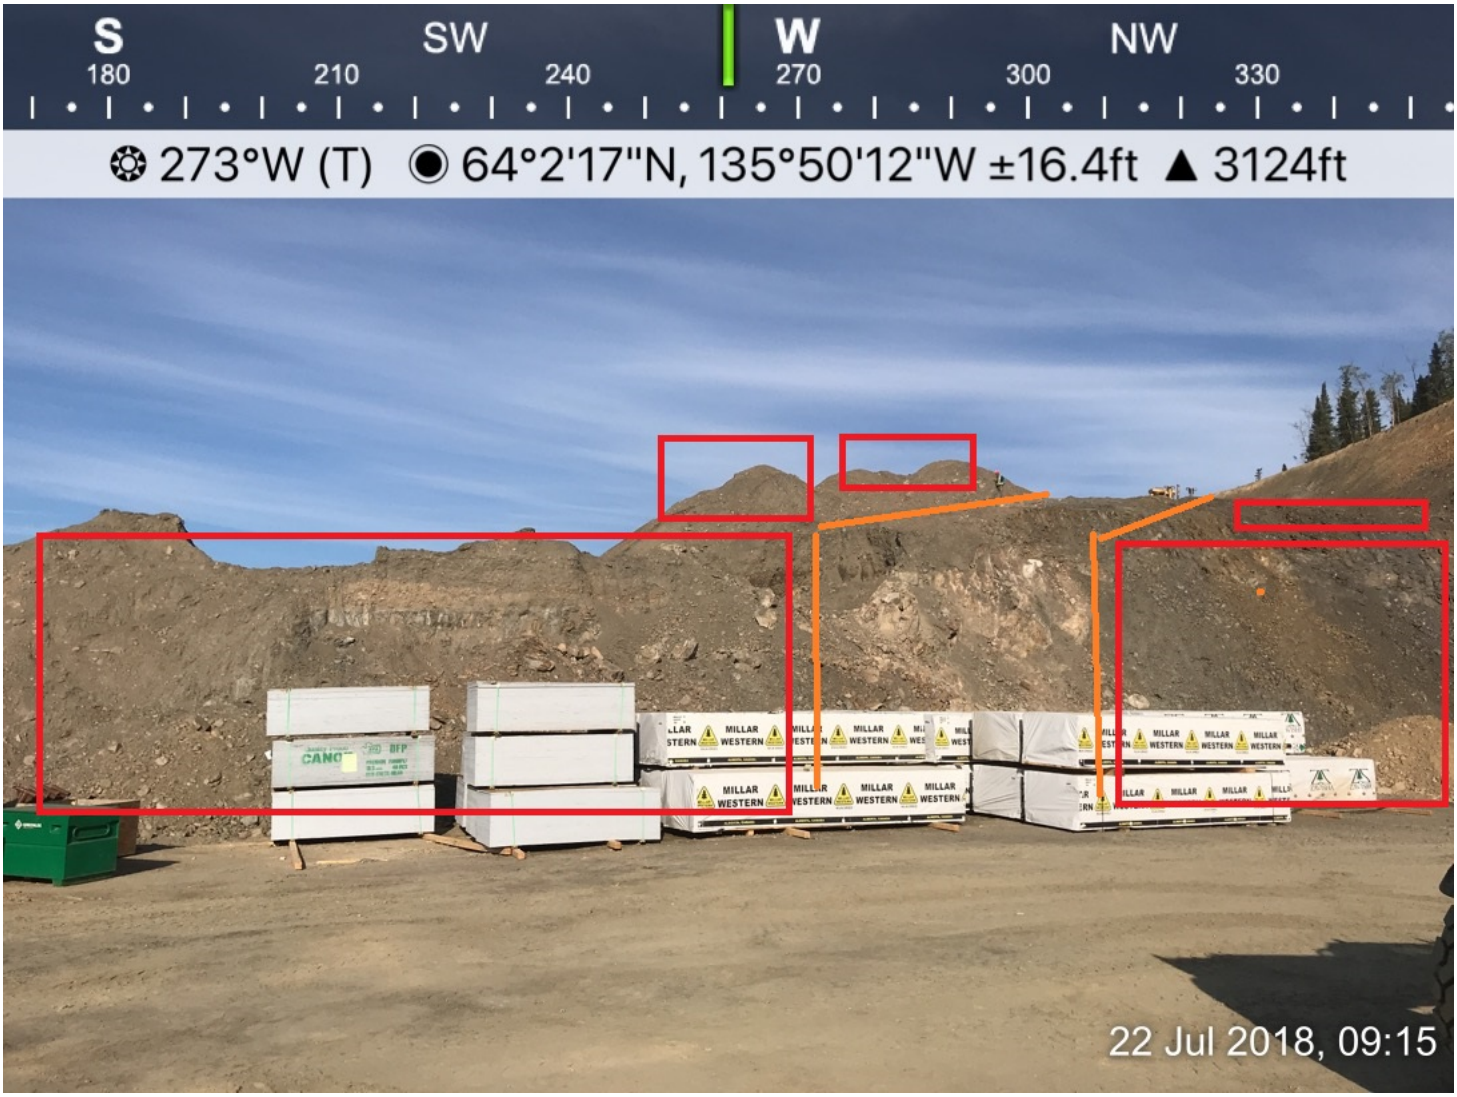

Photo 4: Yesterday's "Quartzite Blend Test Fill ARD" showed similar structure as the current rockfill material 7 being placed. The material excavated for the testfill would follow the orange band, red is very high phyllite concentrations with very little rockfill type materials. JDS asked to test the phyllite piles, bulldozed down the stockpile and this was called "JDS Phyllite Dozer Blend".

Photo 5: BGC and Victoria Gold Exploration Geology team observed how phyllite deposits would behave with slight over saturation, as this picture shows.

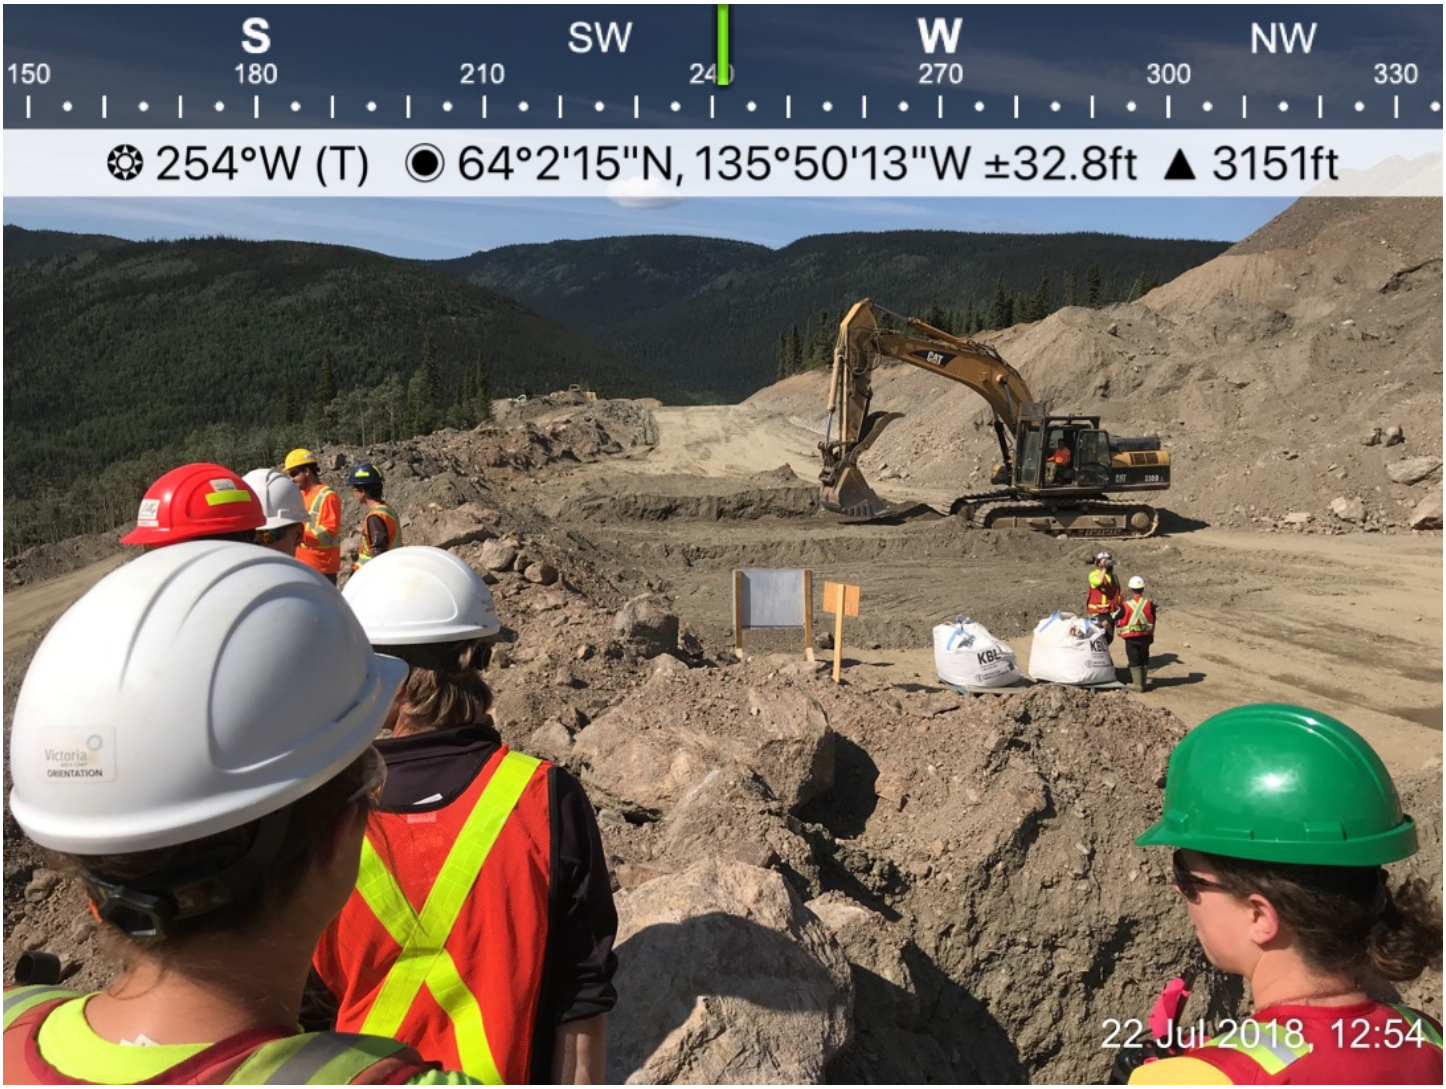

Photo 6: As requested per JDS, Pelly and BGC were present for the “JDS Phyllite Dozer Blend” Testfill, 3 lifts were requested to be tested (0.3 m, 0.5 m and 0.9 m), same survey controls and methods were used as yesterday.

Photo 7: Victoria Gold Exploration Geology team supported quartzite mapping to help Pelly and JDS find adequate rockfill material, the results of their mapping is presented on Photo 13.

Photo 8: JDS Phyllite Dozer Blend tesfills were graded with excavator and verified by survey.

Photo 9: Compacting was done with a CAT CS68B, vibrating. Each pass was measured for settlement and compaction.

Photo 10: After 4 passes, a nuclear density test was done, no water replacement was done because this material is quite fine and a nuclear density test is adequate.

Photo 11: An exploratory hole was dug with an excavator to see the layering after compaction, after compaction the layers seem weak and little fines and cohesion.

Photo 12: In the Embankment, Pelly continued to place loose lift material for lift 25.

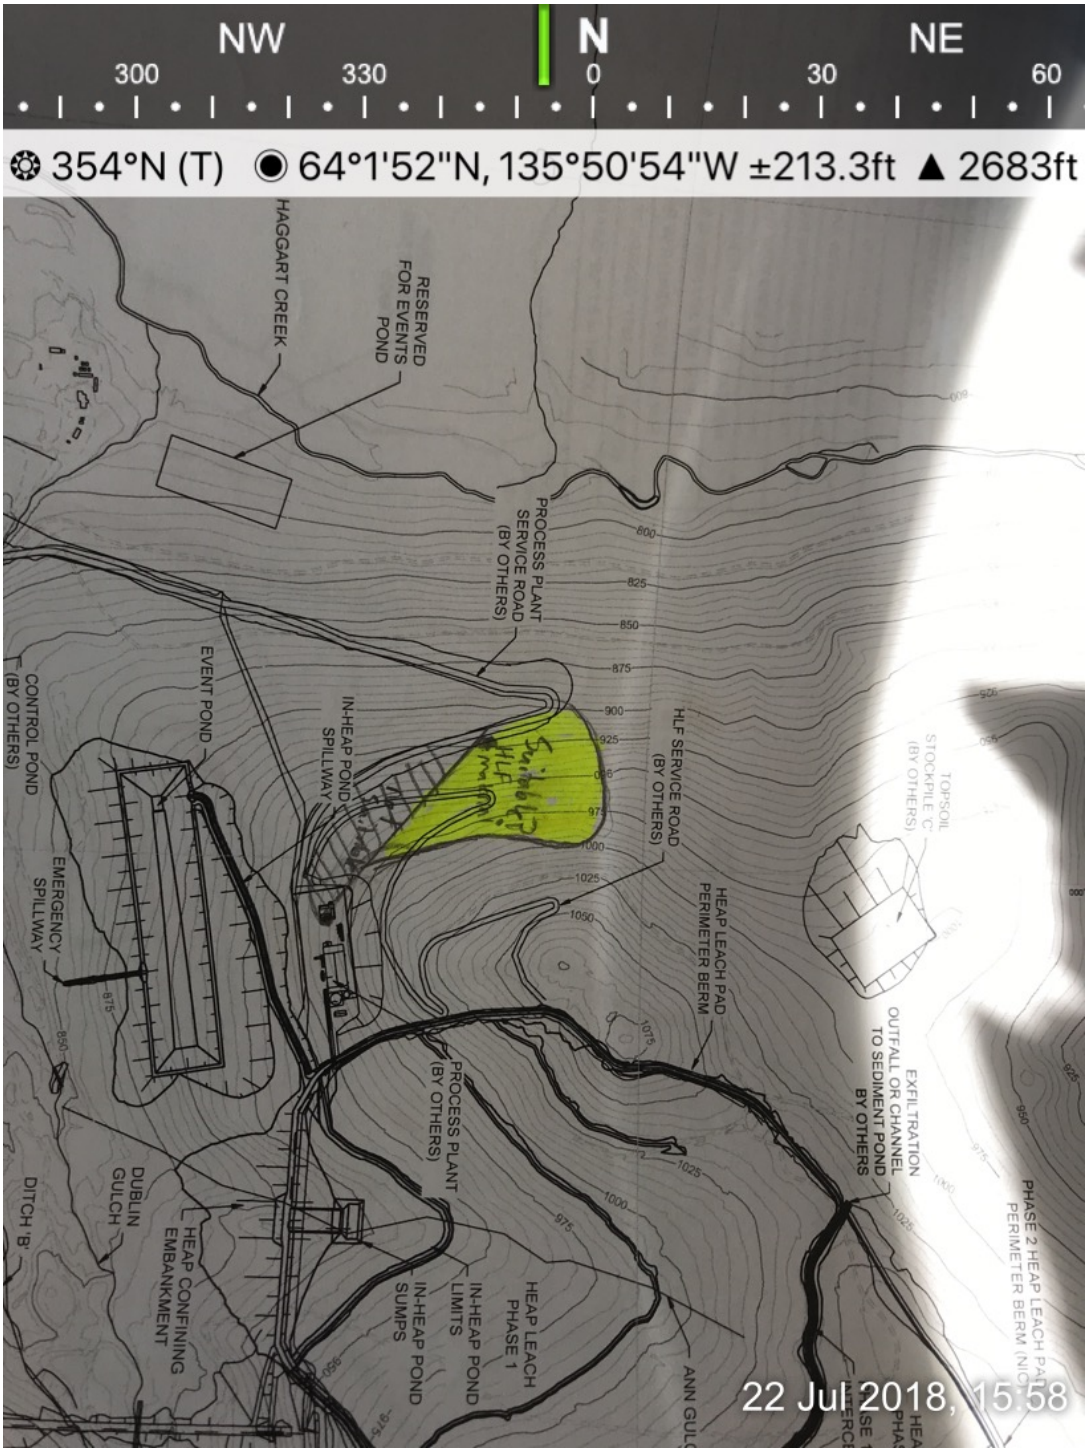

Photo 13: After the mapping exercise, Victoria Gold Geologist Steve Wozniak marked on a map where he thought the quartzite band could be followed for rockfill production.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 23, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Harra Vardeleon	**Weather:**	Sunny 15ºC to 30ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued work on lift placements, dayshift continued lift 26, and compacted lift by end of shift (***Photos 1, 10, 12, and 14)***
  - Rockfill Stockpile #2 almost depleted (***Photo 2)*** shows stockpile at start of shift and ***(Photo 11)*** shows it at end of dayshift.
  - Wet phyllite layers observed on bottom of stockpile areas (***Photos 3 and 6).***
  - Phyllite zones presented in red and good mixture zone from first test fill "Quartzite Blend Test Fill ARD" in orange, presented for consideration of rockfill (testfill showed good mix of quartzite and phyllite). (***Photo 4***).
  - Super sacs from Quartzite blend test fill ARD, water replacement test remain outside until JDS gets weight scale to measure weight to estimate density of rockfill (***Photo 5***).
  - Old material 3 stockpile continues to be removed, ice lenses melting was observed, over saturation and seeping from stockpile was also observed (***Photo 7***).
  - JDS has Pelly dozer push material on top of the ARD stockpile, BGC/Pelly/JDS/Victoria Gold Geology was present to observe the small stockpile. BGC asked JDS and Pelly to excavate to show the contents of stockpile. BGC asked JDS/Pelly to conduct gradation tests and proctor to see if this stockpile would meet the minimum requirement for rockfill (more than 30% particles equal or greater than 19 mm of Quartzite). Due to very dry conditions of stockpile area, BGC recommended a standard proctor to proper condition small stockpile. Approval pending tests and other considerations as needed to accept small batch for embankment lift placement (***Photos 8 and 9***).

- Observations and Recommendations (OPEN):
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.
  - BGC recommends avoiding using a phyllite only lift on embankment, the material has been observed to have low shear resistance and proper compaction will require adequate moisture conditioning that will require a standard proctor results as guidance. The BGC testfill from yesterday "BGC Quartzite Blend Test Fill ARD" has showed promise, still pending final weight of super sacs for in situ density estimation (JDS reported to have this scale on route).

BGC-RFI-008	QC Management Plan	Open: Sent June 23. In process. Pending response from Pelly/JDS.
BGC-RFI-009	Embankment Zoning Plan	Open: Sent July 6. Pending response from Pelly/JDS.

Safety Issues: None

Photo 1: Nightshift started lift 26 loose, day shift continued loose lift.

Photo 2: Rockfill Stockpile #2 running low (material 7), this remains the only official stockpile approved for placement, no other stockpiles have been located or stockpiled by JDS/Pelly for approval.

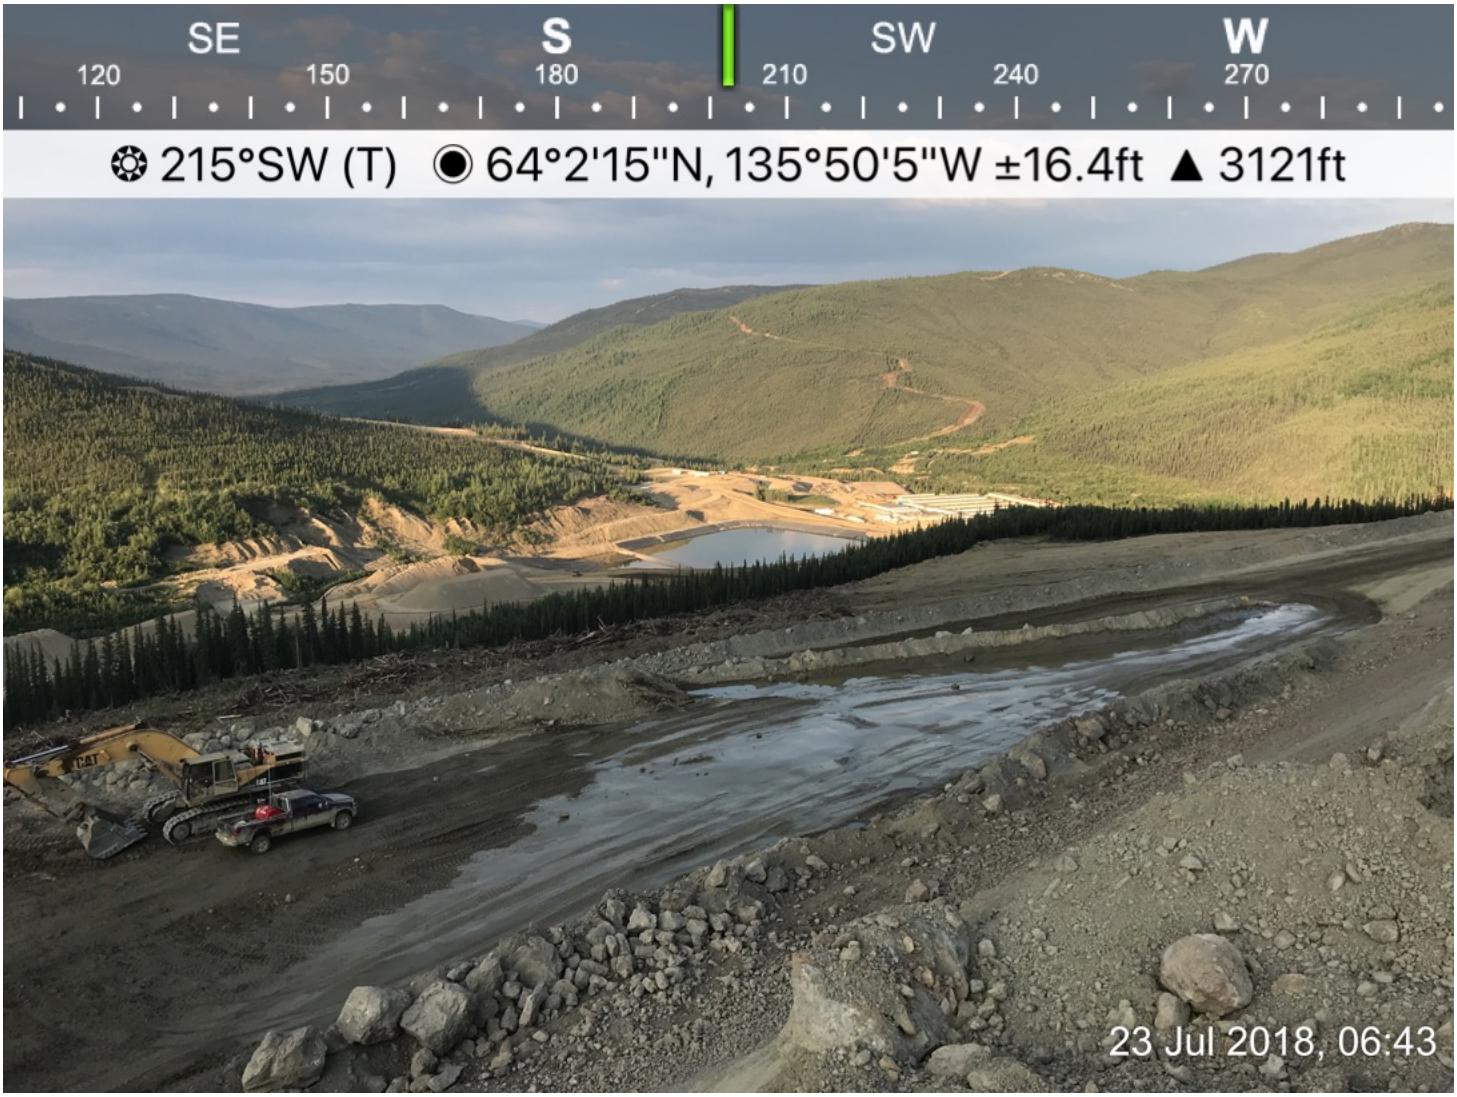

Photo 3: Phyllite layer that segregated to bottom of stockpile #2 continues to be saturated, showing low shear strength and moisture conditioning limits.

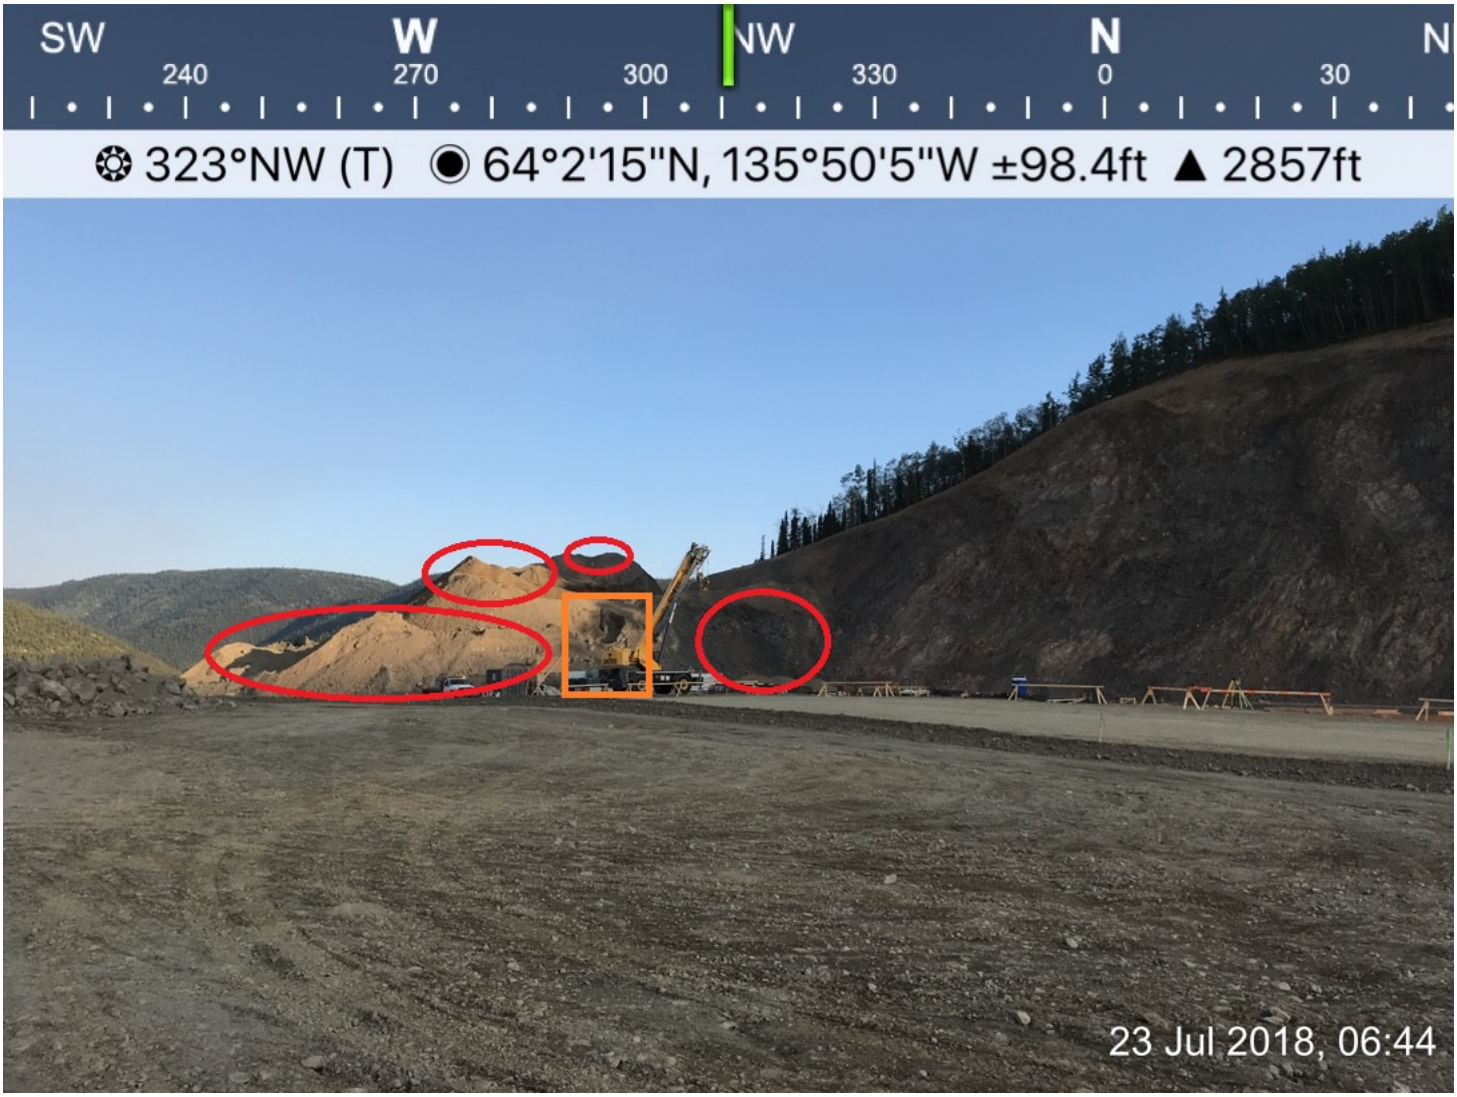

Photo 4: Phyllite concentration zones to be avoided are in red and quartzite outcrop in orange (good for rockfill material), been presented for a few days with geologic mapping.

Photo 5: Super sacs from testfill test (water replacement from Quartzite blend testfill) remains on site until weight scale from JDS arrives to finalize test.

Photo 6: Ground view of remaining rockfill stockpile #2 with phyllite on the ground (wet).

Photo 7: Old material 3 stockpile being removed as deemed unsuitable due to over saturation, frozen layers observed.

Photo 8: JDS asked Pelly to excavate another mixture blend up on top of the ARD stockpile.

Photo 9: JDS asked Pelly to excavate another mixture blend up on top of the ARD stockpile.

Photo 10: Due to very high temperatures, BGC asked Pelly to bring down the water truck before further compaction due to observed low moisture content.

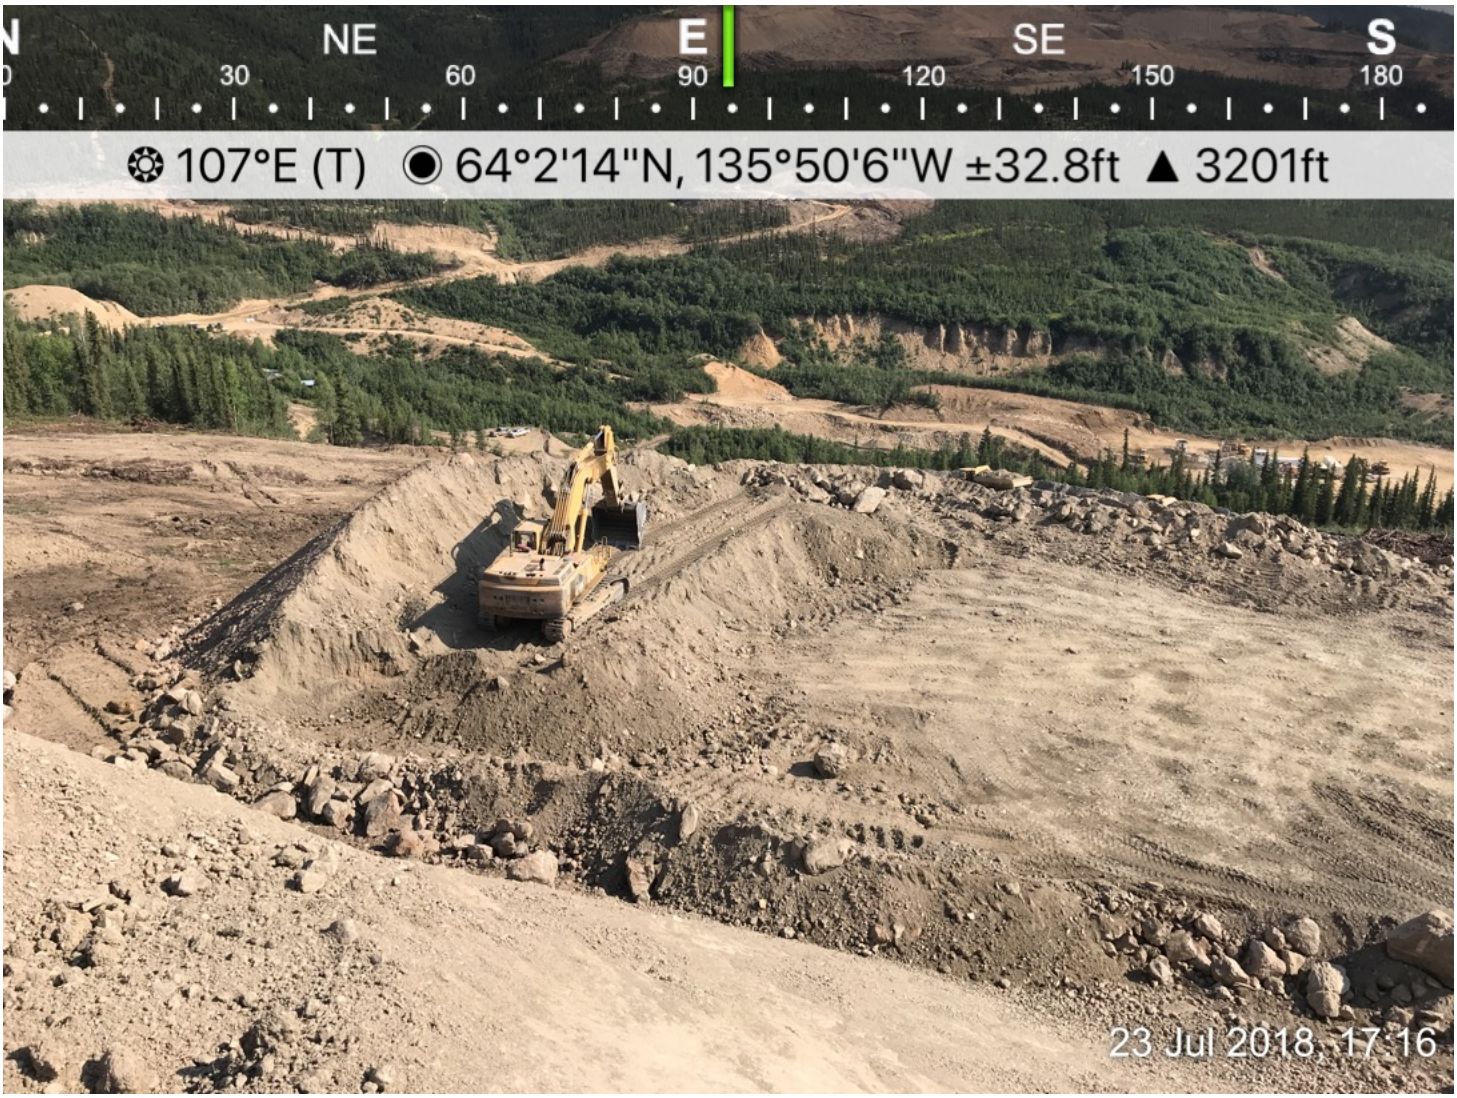

Photo 11: The remaining volume of Rockfill Stockpile 2 (material 7) approved by BGC for use, JDS continues to look for material. JDS was advised that test fills, and tests such as proctors, gradation and shear strength tests may be required for acceptance of embankment lift material.

Photo 12: Cobalt cleaning around crest area of HLF, pelly cleaning upstream of embankment foundation zone.

Photo 13: Dayshift Pelly team preparing right abutment foundation with dozer blade for nightshift material placement.

Photo 14: Lift 26 to be accepted after final compaction (right side observed to need another pass due to water truck).

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 24, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon	**Weather:**	Sunny 15°C to 30°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued work on lift placements, dayshift continued lift 29, and compacted lift by end of shift (***Photos 1).***
  - BGC approved the use of a pile of material blended from quartzite rich and phyllite rich material (***Photo 2***). Pelly did not know the ratio of the blend. Visually the blend appeared to be about 60% quartzite rockfill and 40 phyllite. BGC and Tetra Tech estimated approximately 15% to 25% rock >8". A sample scalped at material greater than >3" showed approximately 30% material between 80mm and 19mm. The following observations should be taken into account when using this stockpile:
    - The pile was not labeled and is situated in the middle of unapproved material piles. The pile should be properly labeled and delineated to ensure the wrong material is not delivered. If the wrong material is placed in the embankment it will have to be removed.
    - QC should confirm and document that the correct material was brought to the site and placed.
    - The material is approved as Material 7 -Rockfill. As such it should be placed using the same method spec approved for Material 7.
    - Tetra Tech reported 3 to 3.5% moisture. The material will need to be moisture conditioned at the pile while being loaded for placement.
    - The material in this pile was slightly higher in phyllite (visually estimated at 35% phyllite). As discussed at the site today and recommended in Field Memorandum CTFM-02, phyllite/quartzite material blends for use as Material 7 – Rockfill should be composed of 3 parts or more of quartzite Rockfill and 1 part phyllite. Future blends should adhere to these criteria.
  - QC of the method spec for rockfill placement is reported by Tetra Tech for the embankment night shift construction. The reporting is mostly complete and acceptable. BGC will provide comments and suggestions to the report. No QC tracking or reporting of the method spec is being performed for day shift. QC tracking and reporting is required for all construction at the HLF and will be included in the construction completion record. As fill placement is underway this should be implemented immediately. The QC Plan requested by BGC in BGC-RFI-008 should also be completed immediately for BGC's review.

- Observations and Recommendations (OPEN):
  - BGC communicated concerns regarding survey controls and QC plan for embankment construction to Pelly/JDS through BGC RFI 008.
  - BGC communicated concerns regarding construction sequencing of zones in the embankment to Pelly/JDS through BGC RFI 009, referring to CC204-RFI-022 response from BGC where considering of zones and construction considerations were presented.
  - BGC recommends avoiding using a phyllite only lift as a continuous embankment lift or in Material 7 - Rockfill zones, the material has been observed to have low shear resistance and proper compaction will require adequate moisture conditioning that will require a standard proctor results as guidance. BGC has recommended in CTFM-002 that a 3 part or more quartzite rockfill and 1 part phyllite blend be used if phyllite is to be used in the rockfill zones.
  - The BGC testfill from July 22 "BGC Quartzite Blend Test Fill ARD" has showed promise, still pending final weight of super sacs for in situ density estimation (JDS reported to have this scale on route). Material is being stored outside. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight.

- Embankment Placement Tracking:

Material 7 – Rockfill Lifts ID	Loose lift elev. (m)	Approved	Comments
19	881.95	Yes	N/A
20	882.60	Yes	N/A
21	883.30	Yes	N/A

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 25, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon	**Weather:**	Sunny 13ºC to 30ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued work on lift placements, dayshift continued lift 31, and compacted lift by end of shift (***Photos 1).***
  - Piping was fused in the pipe trench. (***Photo 2***)
  - Pelly cleared an area as a potential borrow source at the ADR. Surficially, the eastern portion of the area appeared to be a blend of phyllite and quartzite but predominately quartzite. The western portion appears to be predominately phyllite. The surface of both areas was composed of weathered rock. The surface of both areas produced material that is acceptable as Material 3. (***Photo 3 and 4***).
  - Pelly continued work on construction of the drain from the artesian source to the pipe trench. (***Photo 5***)
  - Pelly setup the procedure to moisture condition the blended material Rockfill stockpile at the ADR. (***Photo 6***)
  - BGC sent observations and recommendations to improve QC tracking and reporting for embankment construction.
  - BGC provided interpretation for depths where it is likely that rock suitable for use as Material 3 and Material 7 will be encountered. This interpretation was based on review of nearby boring logs and geophysics. The purpose of the interpretation is to allow Pelly/JDS to update the material take of quantities. The updated quantities will be used to plan the construction and zoning between Material 7 and Material 3 in the embankment.

- Observations and Recommendations (OPEN):
  - BGC has requested a QC plan for embankment construction from Pelly/JDS through BGC RFI 008 to ensure that QC is being performed and documented in a complete and accurate manner.
  - BGC recommends avoiding using a phyllite only lift as a continuous embankment lift or in Material 7 - Rockfill zones, the material has been observed to have low shear resistance and proper compaction will require adequate moisture conditioning that will require a standard proctor results as guidance. BGC has recommended in CTFM-002 that a 3 part or more quartzite rockfill and 1 part phyllite blend be used if phyllite is to be used in the rockfill zones.
  - The BGC testfill from July 22 “BGC Quartzite Blend Test Fill ARD” has showed promise, still pending final weight of super sacs for in situ density estimation (JDS reported to have this scale on route). Material is being stored outside. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight.
  - No QC tracking or reporting of the method spec is being performed for day shift. QC tracking and reporting is required for all construction at the HLF and will be included in the construction completion record. As fill placement is underway this should be implemented immediately. The QC Plan requested by BGC in BGC-RFI-008 should also be completed immediately for BGC’s review.

Client:	Victoria Gold	**Date and Shift:**	July 26, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon	**Weather:**	Sunny 11ºC to 28ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued work on lift placements for lift 31, which was started yesterday. Pelly had a shift change today and placement and compaction advanced slowly (***Photos 1).***
  - Piping was fused in the pipe trench. (***Photo 2***)
  - No work was performed at the new borrow source (ADR West) cleared by Pelly.
  - No work was performed at the drain for the artesian source.
  - Excavation of the test trench to investigate near surface rock weathering and to develop benching requirements began. (***Photo 3 and 4***).
  - Benching of weak material on the right abutment was performed under the direction of BGC. (***Photo 5***) Material excavated was spread for use on the lift. Benching of weaker material was discussed throughout 2017 and 2018 in person, in daily reports, and as written conditions for foundation approvals. It was also discussed in the memorandum FM-003 Observations and Recommendations Made for the Exposed Right Abutment Foundation delivered to JDS on June 17, 2018.
  - Moisture conditioning of the blended pile (Currently Unnamed – Rockfill Pile #?) continued. (***Photo 6***) It was reported to BGC that material from the foundation of this pile was excavated and delivered to embankment on the night shift. The material in the foundation is not approved for use. BGC reiterates that this pile, like all other piles, should be delineated, labeled, and managed in Pelly's Stockpile Management Plan. BGC will request that any future material observed or reported by QC to have been borrowed from beyond the extent of this approved pile be removed from the lift even if it has already been compacted or buried by another lift.
  - Pelly informed BGC that they would like to blend additional material to add to the Currently Unamend – Rockfill Pile #?. BGC requested that the Resident Engineer be present when this begins to ensure that the blend meets the requirements for the Rockfill used in the method spec.
  - No work was performed at the event pond.
  - Cobalt continued clearing material from the in-heap pond and heap leach area. (***Photos 7 and 8***)
  - Pelly continued excavate the Material 3 stockpile on the eastern portion of the embankment footprint for disposal (***Photo 9***). The material appears saturated throughout the excavation. (***Photo 10***). As stated previously, if it is decided that this material is to be used for construction then it will need drying (by land farming or similar method) or mixing with a dryer material.
  - BGC sent an email to JDS and Pelly to clarify QC requirements for the project. BGC also met with JDS, Pelly, and Tetra Tech to discuss this. BGC continues to work with Pelly, JDS, and Tetra Tech to ensure that enough QC tracking information is being collected and reported for the construction completion report.
  - Tetra Tech allocated a person to tracking the method spec on the day shift. BGC is working with Tetra Tech to ensure that the proper tracking and reporting is being performed.

- Observations and Recommendations (OPEN):
  - BGC has requested a QC plan for embankment construction from Pelly/JDS through BGC RFI 008 to ensure that QC is being performed and documented in a complete and accurate manner.
  - BGC recommends avoiding using a phyllite only lift as a continuous embankment lift or in Material 7 - Rockfill zones, the material has been observed to have low shear resistance and proper compaction will require adequate moisture conditioning that will require a standard proctor results as guidance. BGC has recommended in CTFM-002 that a 3 part or more quartzite rockfill and 1 part phyllite blend be used if phyllite is to be used in the rockfill zones.
  - The BGC testfill from July 22 "BGC Quartzite Blend Test Fill ARD" has showed promise, still pending final weight of super sacs for in situ density estimation (JDS reported to have this scale on route). Material is being stored outside. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon/ Briar Gonie (Vick Gold)	**Weather:**	Cloudy 13°C to 25°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly is currently constructing lift 32. (***Photos 1).***
  - Piping was fused in the pipe trench.
  - The remaining Material from the Currently Unnamed – Rockfill Stockpile became significantly finer. The use of the material as Rockfill was stopped. The remainder of this pile is approved as structural fill. (***Photo 2***)
  - Pelly borrowed the remaining blast rock from ADR East (***Photo 3***). Once this was exhausted Pelly began ripping rock at the ADR East/West boundary to generate more rockfill (***Photo 4***).
  - Pelly plans to clear all finer grained stockpiles currently on top of the ADR West borrow to allow for ripping and generation of new Rockfill. The finer grained stockpiles will be added to the Material 3 – Structural Fill inventory. Pelly should track, delineate, and label these new stockpiles. Pelly should update the drawings and volumes in their materials Management Plan to account for this material and all used materials. BGC would like a copy of this updated plan.
  - No work was performed at the drain for the artesian source.
  - Pelly continued with stripping at the Event Pond.
  - Cobalt continued clearing material from the in-heap pond and heap leach area.
  - Pelly continued excavate the Material 3 stockpile on the eastern portion of the embankment footprint for disposal. The material appears saturated throughout the excavation. As stated previously, if it is decided that this material is to be used for construction then it will need drying (by land farming or similar method) or mixing with a dryer material.
  - Two test fills were performed on Material 3 – Structural Fill (***Photos 5 and 6***). The test fills were completed late in evening. BGC will analyses the data on July 28 and provide final recommendations. The first test fill was completed using a 50cm lift. Preliminary analysis of the results from this test fill were promising and indicate that it is likely a lift thickness between 30cm and 50cm will be approved. The second test fill was completed with a 75 cm lift. Preliminary analysis of the results from the second test fill were not favorable and show little compaction below 50cm.
  - BGC has not received a daily report from Tetra Tech for QC on the day shift. These reports are being completed but have not been sent to BGC yet. Tetra Tech reports that they will be sending backlogged day shift daily reports on July 28. The backlogged reports will date back to July 25.

- Observations and Recommendations (OPEN):
  - BGC has requested a QC plan for embankment construction from Pelly/JDS through BGC RFI 008 to ensure that QC is being performed and documented in a complete and accurate manner.
  - BGC recommends avoiding using a phyllite only lift as a continuous embankment lift or in Material 7 - Rockfill zones, the material has been observed to have low shear resistance and proper compaction will require adequate moisture conditioning that will require a standard proctor results as guidance. BGC has recommended in CTFM-002 that a 3 part or more quartzite rockfill and 1 part phyllite blend be used if phyllite is to be used in the rockfill zones.
  - The BGC testfill from July 22 “BGC Quartzite Blend Test Fill ARD” has showed promise, still pending final weight of super sacs for in situ density estimation (JDS reported to have this scale on route). Material is being stored outside. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight.

- Embankment Placement Tracking:

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 28, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon/ Briar Gonie (Vick Gold)	**Weather:**	Cloudy 10°C to 23°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly is currently constructing lift 33. (***Photos 1).***
  - Pelly placed drain rock, geotextile, and material 2 cover in the pipe trench. (***Photo 2***)
  - Pelly continued development of ADR West as a borrow source. The surficial material being produced in the day shift was mostly suitable for Material 3 Structural Fill. (***Photo 3***). BGC QA will monitor the material generation to determine when the material becomes hard enough and produces large enough rocks in high quantities for use as rockfill.
  - Rocfill Stockpile #2 was depleted.
  - No work was performed at the drain for the artesian source.
  - No work was performed at the event pond.
  - Cobalt continued clearing material from the in-heap pond and heap leach area.
  - BGC, Pelly, and JDS agreed upon a zoning configuration that would allow immediate placement of Material 3 and that would allow for what Pelly believes will be efficient construction and placement. The configuration is a variation of an already approved zoning design. JDS will send an email to BGC with the design to allow us to send an approval in a response. The approval will go into the construction record.
  - Pelly began placement of the Material 3 Structural Fill lifts within the embankment per the agreed upon zoning. BGC approved 0.45m maximum loose lifts. BGC is developing a memo to document all requirements of the method spec and anticipates this to be completed July 29 or July 30. In the meantime construction and QC can continue with direct guidance in the field by BGC. Material 3 lifts 1, 2, and 3 were placed. (***Photo 4***)
  - Pelly continued to excavate the Material 3 stockpile on the eastern portion of the embankment footprint for disposal. The material appears saturated throughout the excavation. As stated previously, if it is decided that this material is to be used for construction then it will need drying (by land farming or similar method) or mixing with a dryer material.
  - BGC has not received a daily report from Tetra Tech for QC on the day shift. These reports are being completed but have not been sent to BGC yet. Tetra Tech reports that they will be sending backlogged day shift daily reports on July 29. The backlogged reports will date back to July 25.
  - At Pelly's request BGC approved a pilot study for using average survey elevations for a lift to determine the amount of fill needed to achieve 0.45m loose lifts. This study is being conducted because Pelly is concerned that outlier data in the survey could results in significantly smaller lifts than 0.45m. BGC will review the data collected during construction over the next two days. If Pelly's method appears to work well its use will continue. If there are significant issues with the method then Pelly will discontinue it and resume using the lowest point on the lift as a starting elevation for lift placement.

- Observations and Recommendations (OPEN):
  - BGC has requested a QC plan for embankment construction from Pelly/JDS through BGC RFI 008 to ensure that QC is being performed and documented in a complete and accurate manner.
  - BGC recommends avoiding using a phyllite only lift as a continuous embankment lift or in Material 7 - Rockfill zones, the material has been observed to have low shear resistance and proper compaction will require adequate moisture conditioning that will require a standard proctor results as guidance. BGC has recommended in CTFM-002 that a 3 part or more quartzite rockfill and 1 part phyllite blend be used if phyllite is to be used in the rockfill zones.
  - The BGC testfill from July 22 "BGC Quartzite Blend Test Fill ARD" has showed promise, still pending final weight of super sacs for in situ density estimation (JDS reported to have this scale on route). Material is being stored outside. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight.
  - Pelly should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly. Updating this plan will help in tracking

materials, ensuring that the wrong materials are not brought to the site, averting work stops if QA/QC are confused about the source, ect.

- Embankment Placement Tracking:

Material 7 – Rockfill Lifts ID	Loose lift elev. (m)	Approved	Comments

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC Reporting for construction at the embankment for the night shift. No day shift daily report was delivered to BGC today.
  - Lift tracking has temporarily moved from using the lowest point on the lift to using the average lowest point on the lift. The method will be evaluated over the course of a couple days to determine if it should be continued or if original method is more accurate.
  - QC tracking is now being performed on the day shift. BGC has been told that the first QC daily report for the day shift will be received on July 29. It will include backlogged daily reports back to July 25.
- BGC Recommendations:
  - QC tracking and reporting is being improved. QC tracking and reporting should clearly state if the construction is in or out of conformance with the method spec. QC Reporting should be delivered to the Engineer daily.

AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	July 29, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon/ Briar Gonie (Vick Gold)	**Weather:**	Cloudy 10°C to 27°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly is currently constructing Material 3 – 920 embankment lift 9. (***Photos 1).***
  - Pelly continued excavating the pipe trench.
  - Pelly loaded out some dryer material from the in-heap pond for use as material 3 in the 920 embankment. Most of the material delivered was suitable but its use was discontinued once overly saturated material began being delivered to the embankment. (***Photo 2***).
  - Pelly continued development of ADR West as a borrow source. The surficial material being produced in the day shift was a mix of Material 3 Structural Fill and Rockfill. (***Photo 3***). The material was segregated into separate piles.
  - No work was performed at the drain for the artesian source.
  - Some surface cleaning was performed at the event pond.
  - Cobalt continued clearing material from the in-heap pond and heap leach area. (***Photo 4***)
  - Pelly continued to excavate the Material 3 stockpile on the eastern portion of the embankment footprint for disposal.
  - At Pelly's request BGC approved a pilot study for using average survey elevations for a lift to determine the amount of fill needed to achieve 0.45m loose lifts. This study is being conducted because Pelly is concerned that outlier data in the survey could results in significantly smaller lifts than 0.45m. Data from the 1st day indicate that due to unlevel grading high spots cancel out low spots in the average resulting in the potential to overbuild lift thicknesses. BGC recommends that if Pelly would like to continue using an average they should create an average of all low spots only. Another acceptable method would be to choose the lowest point surveyed after manually removing the outliers.
  - Since the zone has changed to the 920 embankment configuration the original right abutment trench will not be able to be advanced until the upstream raise is constructed. Since data from this trench is needed for benching and to determine rock strength BGC started a new trench roughly at the crest alignment. (***Photo 5***) Data from this trench indicates that thinner phyllitic layers loose the clayey, plastic structure after 1m of depth. (***Photo 6***) BGC will continue to monitor this trench as the embankment advances.

- Observations and Recommendations (OPEN):
  - BGC has requested a QC plan for embankment construction from Pelly/JDS through BGC RFI 008 to ensure that QC is being performed and documented in a complete and accurate manner.
  - BGC recommends avoiding using a phyllite only lift as a continuous embankment lift or in Material 7 - Rockfill zones, the material has been observed to have low shear resistance and proper compaction will require adequate moisture conditioning that will require a standard proctor results as guidance. BGC has recommended in CTFM-002 that a 3 part or more quartzite rockfill and 1 part phyllite blend be used if phyllite is to be used in the rockfill zones.
  - The BGC testfill from July 22 "BGC Quartzite Blend Test Fill ARD" has showed promise, still pending final weight of super sacs for in situ density estimation (JDS reported to have this scale on route). Material is being stored outside. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight.
  - Pelly should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly. Updating this plan will help in tracking materials, ensuring that the wrong materials are not brought to the site, averting work stops if QA/QC are confused about the source, ect.
  - BGC is developing a memo to document all requirements for Material 3 placement and compaction and anticipates this to be completed July 30. In the meantime construction and QC can continue with direct guidance in the field by BGC.

- Embankment Placement Tracking:

Material 7 – Rockfill Lifts ID	Loose lift elev. (m)	Approved	Comments
24	885.40	Yes	N/A
25	886.15	Yes	N/A
26	886.90	Yes	N/A
27	887.60	Yes	N/A
28	888.30	Yes	N/A
29	888.90	Yes	N/A
30	889.60	Yes	N/A
31	890.30	Yes	N/A
32	891.00	Yes	N/A
No new rockfill lifts placed since July 28.			

*The loose maximum thickness per lift is 0.9 m, per Test fill memorandum submitted to JDS/Pelly.

Material 3 – Structural Fill ID	Loose lift elev. (m)	Approved	Comments
1	891.25	Yes	N/A
2	891.55	Yes	N/A
3	892.0	Yes	N/A
4	892.4	Yes	N/A
5	892.8	Yes	N/A
6	893.0	Pending	Pending
7	893.3	Pending	Pending
8	893.65	Pending	Pending

*The loose maximum thickness per lift is 0.45 m. Test fill memorandum pending.

1) QA/QC Results:

QA/QC Results
• QA/QC: o Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift. . o BGC received backlogged day shift QC reports from July 24 to July 28.

- BGC Recommendations:
  - Lift tracking has temporarily moved from using the lowest point on the lift to using the average lowest point on the lift. Data from the 1st day indicate that due to unlevel grading high spots cancel out low spots in the average resulting in the potential to overbuild lift thicknesses. BGC recommends that if Pelly would like to continue using an average they should create an average of all low spots only. Another acceptable method would be to choose the lowest point surveyed after manually removing the outliers.

2) Communications (no follow up required):

BGC Personnel:	Roy Morlan / Harra Vardeleon/ Briar Gonie (Vick Gold)	**Weather:**	Sunny 8°C to 29°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly is currently constructing Material 3 – 920 embankment lift 16. (***Photos 1).***
  - Pelly did not excavate the pipe trench.
  - Pelly did not work on material development at the ADR West borrow source today.
  - Pelly worked on stripping the Event Pond. (***Photo 2***). Material being generated was mostly topsoil and consisted of clay and sand layers with organics. Organics and unsuitable material was observed mostly in the 1st meter of the stripping area. Pelly should keep material generated from the 1st meter sperate from Material 3 and Material 7 stockpiles generated from the Event Pond.
  - No work was performed at the drain for the artesian source.
  - Cobalt continued clearing material from the in-heap pond and heap leach area. (***Photo 3***)
  - Pelly continued to excavate the Material 3 stockpile on the eastern portion of the embankment footprint for disposal.
  - Pelly implemented a scaled back survey for embankment construction. The intent of the scaled back survey is to aid in faster, more efficient embankment construction while still providing the proper survey control. The revised survey performed well. BGC will monitor the results of this modified survey over the next couple days to ensure it provides enough control.

- Observations and Recommendations (OPEN):
  - BGC has requested a QC plan for embankment construction from Pelly/JDS through BGC RFI 008 to ensure that QC is being performed and documented in a complete and accurate manner.
  - BGC recommends avoiding using a phyllite only lift as a continuous embankment lift or in Material 7 - Rockfill zones, the material has been observed to have low shear resistance and proper compaction will require adequate moisture conditioning that will require a standard proctor results as guidance. BGC has recommended in CTFM-002 that a 3 part or more quartzite rockfill and 1 part phyllite blend be used if phyllite is to be used in the rockfill zones.
  - Material from a test fill conducted on July 22 is being stored outside waiting for a scale to be delivered to weigh it for density testing. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight.
  - Pelly should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly. Updating this plan will help in tracking materials, ensuring that the wrong materials are not brought to the site, averting work stops if QA/QC are confused about the source, ect.
  - BGC is developing a memo to document all requirements for Material 3 placement and compaction and anticipates this to be completed July 30. In the meantime construction and QC can continue with direct guidance in the field by BGC.

1) QA/QC Results:

QA/QC Results
• QA/QC: o Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift. o Field embankment nuclear density testing for July 29 were delivered to BGC. • BGC Recommendations: o None.

2) Communications (no follow up required):

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly is currently constructing Material 3 – 920 embankment to elevation 899. (***Photos 1).***
  - Pelly did not excavate the pipe trench.
  - Pelly constructed a finger drain along the right abutment at BGCs direction. (***Photo 2 and 3***)
  - The test trench along the right abutment was extended. (***Photo 4***) Observations in the trench indicate that clayey layers observed in the right abutment appear to be caused by surficial weathering and improve to rock with depth. Clayey layers will continue to be excavated and benched to competent rock.
  - A highly weathered phyllite layer was removed from the right abutment through benching (***Photo 5***)
  - Pelly worked on material development at the ADR West borrow source today. (***Photo 6***)
  - Pelly did not work on stripping the Event Pond.
  - No work was performed at the drain for the artesian source.
  - Cobalt continued clearing material from the in-heap pond and heap leach area.
  - Pelly continued to excavate the Material 3 stockpile on the eastern portion of the embankment footprint for disposal.

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly is currently constructing Material 3 – 920 embankment to elevation 900.8. (***Photos 1).***
  - Pelly completed a rough excavation of the pipe trench up to the elevation of the closure sump.
  - Pelly completed clearing the remainder of the right abutment to type 3 foundation.
  - Pelly continued to excavate the closure sump area. (***Photo 2***)
  - The test trench along the right abutment was extended. (***Photo 3***)
  - Pelly worked on material development at the ADR West borrow source today. (***Photo 4***)
  - Pelly did not work on stripping the Event Pond.
  - No work was performed at the drain for the artesian source.
  - Pelly continued to excavate the Material 3 stockpile on the eastern portion of the embankment footprint for disposal. (***Photo 5***).
  - Pelly did not moisture condition the Material 3 during the day shift. A water truck arrived on site to moisture condition during the night shift, however, mechanical issues prevented them conditioning the material consistently. Pell has stated that they will be using a different pump on August 2 and will condition the entire day.
  - BGC approved the use of the haul truck ramps leading to 920 embankment as-is with the assumption that loose material along the sides of the ramps will be cleaned off and compacted. Wedges between the ramps and abutments will require excavation to create enough space for proper compaction of these areas.

- Observations and Recommendations (OPEN):
  - Material from a test fill conducted on July 22 is being stored outside waiting for a scale to be delivered to weigh it for density testing. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight.
  - Pelly should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly. Updating this plan will help in tracking materials, ensuring that the wrong materials are not brought to the site, averting work stops if QA/QC are confused about the source, ect.
  - BGC is developing a memo to document all requirements for Material 3 placement. In the meantime construction and QC can continue with direct guidance in the field by BGC.
  - JDS will arrange a call between Layfield, BGC, JDS, and TetraTech QA to discuss the plan to install liner along the 920 embankment face and how to protect and tie the liner to the 940 raise.

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift.
  - Field embankment nuclear density testing for August 1 were delivered to BGC.
- BGC Recommendations:
  - None.

2) Communications (no follow up required):

AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	August 02, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon/ Briar Gonie (Vic Gold)	**Weather:**	Some rain 13°C to 26°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly is currently constructing Material 3 – 920 embankment to elevation 902.7. (***Photos 1).***
  - Pelly continued shaping the pipe trench excavation and the closure sump (***Photo 2***).
  - Pelly worked on material development Event Pond today.
  - Pelly did not work on stripping at the ADR West today.
  - No work was performed at the drain for the artesian source.
  - Pelly continued to excavate the Material 3 stockpile on the eastern portion of the embankment footprint for disposal. (***Photo 3***).
  - Pelly did begin use of a new water truck for moisture conditioning. Since the water truck pump was not functioning properly Pelly gravity fed a 2" pump from the water truck. (***Photo 4***) The amount of water produced is very minimal and does not appear to have much of an impact on moisture. A means to condition the pile with more water will need to be devised. Pelly has reported that on Saturday August 3 they can begin us of a 3" pump.
  - Moisture in the placed lifts remains low. The majority of tests reported in the last 24 hours have failed moisture requirements. Densities in the lifts are adequate, therefore, BGC is not recommending removal of lifts or changes to placement yet. However, Pelly should continue to work on adding more moisture at the borrow. This may require choosing a Material 3 stockpile that has naturally higher moisture content; excavating weathered bedrock at the bottom of stockpiles (which appear to have between 5% and 7% moisture); and not excavating and direct hauling harder bedrock deposits (which appear to have low moisture content).
  - Pelly delivered a QC Plan for embankment construction for BGC to review. This plan was requested by BGC in BGC-RFI-008. BGC will review the plan and provide comments to Pelly.
  - BGC uploaded the IFC CAD package to the ftp for JDS and Underhill.
  - BGC requested the following information from Pelly via email in order to document that QC/QA testing and observations are being performed properly:
    - Volumes of each material type borrowed for June and July.
    - Copies of foundation and construction approvals for July.
    - Volumes of each material type placed for June and July.
    - An updated stockpile management plan.

- Observations and Recommendations (OPEN):
  - Material from a test fill conducted on July 22 is being stored outside waiting for a scale to be delivered to weigh it for density testing. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight.
  - Pelly should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly. Updating this plan will help in tracking materials, ensuring that the wrong materials are not brought to the site, averting work stops if QA/QC are confused about the source, ect.
  - BGC is developing a memo to document all requirements for Material 3 placement. The memo is currently under Sr. Review. In the meantime construction and QC can continue with direct guidance in the field by BGC.
  - JDS will arrange a call between Layfield, BGC, JDS, and TetraTech QA to discuss the plan to install liner along the 920 embankment face and how to protect and tie the liner to the 940 raise.
  - BGC approved the use of the haul truck ramps leading to 920 embankment as-is with the assumption that loose material along the sides of the ramps will be cleaned off and compacted. Wedges between the ramps and abutments will require excavation to create enough space for proper compaction of these areas. Lifts will have to be keyed into the ramps.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

1) QA/QC Results:

QA/QC Results
• QA/QC: o Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift. o Field embankment nuclear density testing for August 1 were delivered to BGC. • BGC Recommendations: o Structural Fill moisture is reported as consistently low. Pelly plans on using a larger pump to moisture condition starting Saturday, August 4. Density targets are being met in compaction, therefore, no lifts were rejected and no change in the method of placement has been implemented yet.

2) Communications (no follow up required):

None	

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
EPCM-RFI-020	JDS requests clarification on ballast placement and spacing.	Open. Sent June 21. Pending response from BGC.
BGC-RFI-008	QC Management Plan	Under review: Response delivered August 2.

Safety Issues: None

Photo 1: Material 3 (Structural Fill) construction at the embankment.

Photo 2: A portion of the seepage interceptor trench excavated around the closure sump.

Photo 3: Pelly and cobalt continued to excavate the unsuitable stockpile on the eastern portion of the embankment footprint.

Photo 4: Moisture conditioning at the ADR borrow.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	August 03, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon/ Briar Gonie (Vic Gold)	**Weather:**	Some rain 13°C to 21°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly completed placement of Material 3 – 920 embankment to elevation 902.82 m. (***Photos 1).*** Work on the 920 embankment has been suspended to complete the drains. Placement has resumed on the lower embankment. The lower embankment was raised to 892.18m. It is not required to excavate the ramps but it is required key into ramps in order to build horizontal lifts. Density testing in ramps showed close to 100% compaction. (***Photo 2***)
  - The test trench along the right abutment was extended.
  - Pelly continued shaping the pipe trench excavation and the closure sump.
  - Pelly extended the pipe trench drain construction (***Photo 3***).
  - Pelly worked on material development at the Event Pond today. Topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are beginning to be generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment. (***Photo 4***)
  - Pelly worked on stripping at the ADR West today.
  - No work was performed at the drain for the artesian source.
  - Pelly continued to excavate the Material 3 stockpile on the eastern portion of the embankment footprint for disposal.
  - There was no change to water trucks or pumps today. BGC worked with Pelly to reposition the water truck to best collect all the moisture being sprayed. Briar with Vic Gold Geology was stationed at the borrow to ensure moisture conditioning was done properly and to report issues that she observed. (***Photo 5***) Pelly has reported that on Saturday August 3 they will begin use of a water buggy and have a larger pump available.
  - Moisture in the placed lifts remains low, but slightly higher than the previous day. The average moisture reported on the day shift was 4.2% and 4.7% on the night shift, below the 5% recommended in the method spec. Moisture readings in the low 3% were reported. Dry density reported by Tetra Tech mostly appear sufficient. However, density results are trending downward and several tests reported between 95 and 96% compaction. Tests below 95% compaction will results in removal of those portions of the compacted lift. To avert this BGC will recommend that following moisture conditioning procedures be put in place until additional water can be sprayed on the piles:
    - Do not dig areas where the spray cannot reach, even if that slows excavation.
    - Do not load any trucks while the water truck is repositioning.
    - Do not load any trucks while the water trucks is away for refill.
  - BGC reviewed the QC Plan delivered by Pelly. It is adequate for closing off BGC-RFI-008. No staffing or scheduling information was included in the plan. However, as embankment construction is now well underway BGC communicates daily with Tetra Tech QC and Pelly's field staff to understand staffing and lab capacity limitations. BGC does continue to recommend that Pelly's planning ensures no gaps in QC coverage.

- Observations and Recommendations (OPEN):
  - Material from a test fill conducted on July 22 is being stored outside waiting for a scale to be delivered to weigh it for density testing. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight.
  - BGC is developing a memo to document all requirements for Material 3 placement. The memo is currently under Sr. Review. In the meantime construction and QC can continue with direct guidance in the field by BGC.
  - JDS will arrange a call between Layfield, BGC, JDS, and TetraTech QA to discuss the plan to install liner along the 920 embankment face and how to protect and tie the liner to the 940 raise.
  - BGC requested the following information from Pelly via email in order to document that QC/QA testing and observations are being performed properly:
    - Volumes of each material type borrowed for June and July.
    - Copies of foundation and construction approvals for July.
    - Volumes of each material type placed for June and July.
    - An updated stockpile management plan.

o Pelly should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly.
•

1) QA/QC Results:

QA/QC Results
• QA/QC: o Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift. o Field embankment nuclear density testing for August 3 were delivered to BGC. • BGC Recommendations: o Structural Fill moisture is reported as consistently low. AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	August 04, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon/ Briar Gonie (Vic Gold)	**Weather:**	Rain 14°C to 18°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Work on the 920 embankment has been suspended to complete the drains. The lower embankment was raised to 894.38m. (***Photo 1***)
  - Pelly backfilled the pipe trench to station 0+310m. (***Photo 2***).
  - Pelly worked on material development at the Event Pond today.(***Photo 3***)
  - Pelly worked on stripping at the ADR West today.
  - No work was performed at the drain for the artesian source.
  - Pelly continued to excavate the Material 3 stockpile on the eastern portion of the embankment footprint for disposal.
  - Rains and better execution during pile watering has improved moisture content. Pelly is still working on having additional watering trucks/pumps. Moisture still remains low but has improved.
  - Material brought from the ADR late in the day and throughout the night has a higher volume of 3" to 8" material. Also, material excavated from the closure sump area has a moisture of >6%. Both these conditions have aided densification of the placed lifts throughout yesterday. Most testing showed very good densification (>98% of the proctor density).
  - The following conditions remain in place until moistures improve. BGC will monitor the material being excavated throughout the day to determine if these restrictions can be laxed:
    - Do not dig areas where the spray cannot reach.
    - Do not load any trucks while the water truck is repositioning.
    - Do not load any trucks while the water trucks is away for refill.

- Observations and Recommendations (OPEN):
  - Material from a test fill conducted on July 22 is being stored outside waiting for a scale to be delivered to weigh it for density testing. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight.
  - BGC is developing a memo to document all requirements for Material 3 placement. The memo is currently under Sr. Review. In the meantime construction and QC can continue with direct guidance in the field by BGC.
  - JDS will arrange a call between Layfield, BGC, JDS, and TetraTech QA to discuss the plan to install liner along the 920 embankment face and how to protect and tie the liner to the 940 raise.
  - BGC requested the following information from Pelly via email in order to document that QC/QA testing and observations are being performed properly:
    - Volumes of each material type borrowed for June and July.
    - Copies of foundation and construction approvals for July.
    - Volumes of each material type placed for June and July.
    - An updated stockpile management plan.
  - Pelly should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly as discussed in BGC-RFI-003.
  - Topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are beginning to be generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment.

1) QA/QC Results:

QA/QC Results
• QA/QC: o Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift. o Field embankment nuclear density testing for August 4 were delivered to BGC. • BGC Recommendations: o Structural Fill moisture is reported as consistently low. Pelly plans on using a larger pump to moisture condition. Density targets are being met in compaction, therefore, no lifts were rejected and no change in the method of placement has been implemented yet.

2) Communications (no follow up required):

Personnel	Description
None	

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
EPCM-RFI-020	JDS requests clarification on ballast placement and spacing.	Open. Sent June 21. Pending response from BGC.
BGC-RFI-008	QC Management Plan	Closed.

Safety Issues: None

Photo 2: Drain construction.

Photo 3: Event pond excavation.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	August 05, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon/ Briar Gonie (Vic Gold)	**Weather:**	Rain 13ºC to 21ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Work on the 920 embankment has been suspended to complete the drains. The lower embankment was raised to 896.17m. (***Photo 1***)
  - Pelly excavated the drain to the artesian source. (***Photo 2***)
  - Pelly worked on material development at the Event Pond today.(***Photo 3***)
  - BGC and Pelly met at the event pond to discuss segregation of unsuitable material. Some organic rich material was being mixed with suitable material.
  - Material being generated at the Event Pond is finer than Material produced at the ADR. BGC met with Pelly at the Event Pond to discuss the construction of a two test fills (one 30cm thick and one 50cm thick) to evaluate how thick embankment lifts should be with this material. Tetra Tech collected samples from the material for proctor and gradation analysis. The material is very well graded with less than 5% material over 20mm. Optimum moisture was reported at 8.2% and maximum dry density achievable was reported at 2,175 kg/m3. Laboratory results are included as ***Attachment 1 and 2*** for reference.
  - Pelly worked on stripping at the ADR West today.
  - Pelly continued to excavate the Material 3 stockpile on the eastern portion of the embankment footprint for disposal. BGC inspected the core material to determine if it was usable for construction and it is also saturated. (***Photo 4***)
  - Pelly is still working on having additional watering trucks/pumps. Moisture still remains low but has improved. Improvement in moisture is likely due to more humid weather and stricter moisture conditioning procedures.
  - BGC delivered the Material 3 Test fill memo documenting the method specification developed for use of the Material 3 from the ADR in 0.45m lifts.

- Observations and Recommendations (OPEN):
  - Material from a test fill conducted on July 22 is being stored outside waiting for a scale to be delivered to weigh it for density testing. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight.
  - JDS will arrange a call between Layfield, BGC, JDS, and TetraTech QA to discuss the plan to install liner along the 920 embankment face and how to protect and tie the liner to the 940 raise.
  - BGC requested the following information from Pelly via email in order to document that QC/QA testing and observations are being performed properly:
    - Volumes of each material type borrowed for June and July.
    - Copies of foundation and construction approvals for July.
    - Volumes of each material type placed for June and July.
    - An updated stockpile management plan.
  - Pelly should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly as discussed in BGC-RFI-003.
  - Topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are beginning to be generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment.
  - The following conditions should remain in place until moistures improve consistently. BGC will monitor the material being excavated throughout the day to determine if these restrictions can be laxed:
    - Do not dig areas where the spray cannot reach.
    - Do not load any haul trucks while the water truck is repositioning.
    - Do not load any haul trucks while the water trucks is away for refill.

1) QA/QC Results:

QA/QC Results
• QA/QC: o Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift. o Field embankment nuclear density testing for August 5 were delivered to BGC. o Tetra Tech completed analysis of the Material 3-4 sample collected from stripping at the Event Pond. • BGC Recommendations: o Structural Fill moisture is reported as consistently low. Pelly plans on using a larger pump to moisture condition. Density targets are being met in compaction, therefore, no lifts were rejected and no change in the method of placement has been implemented yet.

2) Communications (no follow up required):

Personnel	Description
None	

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
EPCM-RFI-020	JDS requests clarification on ballast placement and spacing.	Open. Sent June 21. Pending response from BGC.

Safety Issues: None

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon	**Weather:**	Rain 12°C to 18°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - There was no placement on the lower lift today. Work resumed on the upper embankment and material was placed to 904.5m (***Photo 1***)
  - Due to consistent heavy rains moisture conditioning has been suspended. Moisture will be monitored by BGC and Tetra Tech.
  - Approximately 30% of the top lift placed on the August 6 night shift was overly saturated. This likely occurred from heavy rains during generation of the material at the ADR, hauling, and placement. The affected portion of the lift was excavated, mixed, re-spread, and compacted (***Photo 2***). In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible. BGC recommends not allowing material lifts to sit for long durations (over 30 min) during very heavy downpours. Performing one pass quickly with the compactor will also help seal the surface until proper compaction can be performed.
  - Drain rock placement and cover for the drain to the artesian source was completed. (***Photo 3***)
  - BGC inspected and approved the use of concrete aggregate as drain rock in the artesian source drain. (***Photo 4***)
  - Equipment exposed a portion of the underdrain filter cloth. This area was hand excavated and laid back over the drain material properly. (***Photo 5***)
  - Pelly worked on material development at the Event Pond today.(***Photo 6***)
  - Pelly worked on stripping at the ADR West today.
  - The Material 3 stockpile on the eastern portion of the embankment footprint was excavated for disposal.
  - A call was held between Layfield, BGC, Pelly, and JDS to discuss liner installation. Items discussed include:
    - Installation logistics such as access, acceptable weather during installation, and installation sequence.
    - Layfield will provide BGC a QC plan for liner installation prior to mobilization. BGC will follow up with Layfield.

- Observations and Recommendations (OPEN):
  - Material from a test fill conducted on July 22 is being stored outside waiting for a scale to be delivered to weigh it for density testing. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight.
  - BGC requested the following information from Pelly via email in order to document that QC/QA testing and observations are being performed properly:
    - Volumes of each material type borrowed for June and July.
    - Copies of foundation and construction approvals for July.
    - Volumes of each material type placed for June and July.
    - An updated stockpile management plan.
  - Pelly should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly as discussed in BGC-RFI-003.
  - Topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are beginning to be generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment.
  - Material being generated at the Event Pond is finer than Material produced at the ADR. Test fills will be conducted to determine how it can be used.

1) QA/QC Results:

QA/QC Results
• QA/QC: o Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift. o Field embankment nuclear density testing for August 7 were delivered to BGC. o Tetra Tech completed analysis of fines in the ODF material delivered to the artesian source drain. • BGC Recommendations: o Due to heavy rains moisture will be monitored by BGC and adjustments made as needed.

BGC Personnel:	Roy Morlan / Harra Vardeleon/Elliot Matthews	**Weather:**	Rain 11°C to 17°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - There was no placement on the lower lift today. Work resumed on the upper embankment and material was placed to 904.5m. A section of the previous days lift was removed due to oversaturation. Placement was also delayed due to poor haul road conditions. (***Photo 1***)
  - Due to consistent heavy rains moisture conditioning has been suspended. Moisture will be monitored by BGC and Tetra Tech.
  - The plug and cover was completed over the artesian source drain. (***Photo 2***)
  - Excavation of the closure sump pipe trench was completed to the design and lined with geotextile. Some collapse of the pipe trench occurred during installation which will result in some minor repairs. The repairs will be completed tomorrow. (***Photo 3***)
  - Pelly worked on material development at the Event Pond today.
  - Pelly worked on stripping at the ADR West today.
  - The Material 3 stockpile on the eastern portion of the embankment footprint was excavated for disposal.
  - Pelly provided volumes of material placed in the embankment up to July 7. Pelly also provided current approval documentation. BGC will review both for completeness tomorrow.

- Observations and Recommendations (OPEN):
  - Material from a test fill conducted on July 22 is being stored outside waiting for a scale to be delivered to weigh it for density testing. BGC recommends that the samples be weighed as soon as possible and be protected from rain to ensure that rain/ air drying has a minimal effect on weight. (Pending)
  - BGC requested the following information from Pelly via email in order to document that QC/QA testing and observations are being performed properly:
    - Volumes of each material type borrowed for June and July. (Pending)
    - Copies of foundation and construction approvals for July. (Delivered 08/08/18)
    - Volumes of each material type placed for June and July. (Total to date volume provided 08/08/18)
    - An updated stockpile management plan. (Pending)
  - Pelly/JDS should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly as discussed in BGC-RFI-003. (Pending)
  - Topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are beginning to be generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment. (ongoing)
  - Material being generated at the Event Pond is finer than Material produced at the ADR. Test fills will be conducted to determine how it can be used. (Pending, delayed due to weather)
  - In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible. BGC recommends not allowing material lifts to sit for long durations (over 30 min) during very heavy downpours. Performing one pass quickly with the compactor will also help seal the surface until proper compaction can be performed. (ongoing)
  - Layfield will provide BGC a QC plan for liner installation prior to mobilization. BGC will follow up with Layfield. (Pending)

1) QA/QC Results:

QA/QC Results
• QA/QC: o Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift. o Field embankment nuclear density testing for August 8 were delivered to BGC. • BGC Recommendations: o Due to heavy rains moisture will be monitored by BGC and adjustments made as needed.

2) Communications (no follow up required):

Personnel	Description
None	

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
EPCM-RFI-020	JDS requests clarification on ballast placement and spacing.	Open. Sent June 21. Pending response from BGC.

Safety Issues: None

Photo 1: Material 3 (Structural Fill) construction at the upper (920) embankment.

Photo 2: Installation of drain plug.

Photo 3: Construction at the closure pipe trench.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	August 09, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon/Elliot Matthews	**Weather:**	Rain 9ºC to 12ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - There was no placement on the lower lift today. Material was placed to 904.8m in the upper embankment. Shift change slowed work down significantly on both the day and night shift. Issues with the previous nights lifts caused delays on the day shift. Large sections had to be excavated to 1m to remove a previous lift which appears to have been placed saturated. Since removal of portions of saturated lifts has occurred each of the past 3 days BGC recommends walking the dozer across completed lifts at the beginning of each shift. This will help identify problem areas before they are buried. This procedure should only take 15 minutes. (***Photo 1***)
  - Night shift placement sequencing should be improved. There was low production on the night shift and Tetra Tech reported that a large wait time between spreading and compacting was the cause. It was also reported that lifts were left unpacked for hours, which would cause oversaturation if conditions were rainy. 80% of the material placed on the last lift was left uncompacted during shift change. BGC will discuss this with Pelly. The procedure to spread and compact should be improved before heavy rains resume to prevent over saturation of lifts. Oversaturated lifts will have to be removed and placed again.
  - Material being generated from the ADR cut is getting rockier. We will likely have to transition to a less rocky material in the coming days. (***Photo 2***)
  - Pelly worked on material development at the Event Pond today.
  - Pelly worked on stripping at the ADR West today.
  - The Material 3 stockpile on the eastern portion of the embankment footprint was excavated for disposal.
  - Pelly provided volumes for Material 3 and Material 7 placed in the embankment up to July. Volumes of Material 2 and all types of drainrock are also required monthly as those materials have QC testing and tracking. In general all materials used in the permanent construction should be reported monthly in order for BGC to verify and document that QC requirements are being met.
  - The scale for weighing large volumes of soil has arrived. It is anticipated that the material will be weighed tomorrow.

- Observations and Recommendations (OPEN):
  - BGC requested the following information from Pelly via email in order to document that QC/QA testing and observations are being performed properly:
    - Volumes of each material type borrowed for June and July. (Pending)
    - Copies of foundation and construction approvals for July. (Completed 08/08/18)
    - Volumes of each material type placed for June and July. (Partially completed 08/08/18)
    - An updated stockpile management plan. (Partially completed 08/09/18)
  - Pelly/JDS should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly as discussed in BGC-RFI-003. (Partially completed 08/09/18)
  - At the Event Pond topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are being generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankm1ent. (ongoing)
  - Material being generated at the Event Pond is finer than Material produced at the ADR. Test fills will be conducted to determine how it can be used. (Pending, delayed due to weather)
  - In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible. BGC recommends not allowing material lifts to sit for long durations (over 30 min) during very heavy downpours. Performing one pass quickly with the compactor will also help seal the surface until proper compaction can be performed. It is important to haul (ongoing)
  - Layfield will provide BGC a QC plan for liner installation prior to mobilization. BGC will follow up with Layfield. (Pending).

1) QA/QC Results:

QA/QC Results
• QA/QC: o Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift. o Field embankment nuclear density testing for August 9 were delivered to BGC. • BGC Recommendations: o Moisture will be monitored by BGC and adjustments made as needed.

EPCM-RFI-020	JDS requests clarification on ballast placement and spacing.	Open. Sent June 21. Pending response from BGC.

Safety Issues: None

Photo 1: Material 3 (Structural Fill) construction at the upper (920) embankment.

Photo 2: Rockier material being produced at the ADR.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	August 10, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon/Elliot Matthews	**Weather:**	Mostly Sunny 7°C to 16°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - There was no placement on the lower lift today. Material was placed to 905.94m in the upper embankment. (***Photo 1***).
  - Placement remains slow even though weather was fair over the past 24 hours. BGC observed that this is likely due to new operators and field managers being brought up to speed with construction improvements developed by the last rotation crew. Slowdowns today appear to be related to material spreading. Material was spread in a radial patter (vs in straight lines running upstream to downstream). The radial patter made compaction and dumping around the dozer difficult. This also resulted in loose lifts being exposed longer which may result in oversaturation during heavy rains. Past placement using straight lift spreading, upstream to downstream appeared to allow better flow of haul trucks and compaction.
  - The pipe trench under drain and closure pipe trench were advanced. The closure pipe was buried up to the closure with Material 5 and trench wrapped. The pipe trench was backfilled with Material 3. Geotextile will be wrapped around the pipe trench tomorrow. (***Photo 2***)
  - The investigation trench was extended on the right abutment. (***Photo 3***)
  - The artesian source drain was covered with additional sand, which was compacted with a plate tamper in preparation for lift placement. (***Photo 4***)
  - Pelly did not work on material development at the Event Pond today. (***Photo 5***)
  - Pelly did not work on stripping at the ADR West today.
  - The Material 3 stockpile on the eastern portion of the embankment footprint was excavated for disposal. Material being excavated from the area is saturated and, in some parts, still frozen.
  - Issues with the 9,000 kg compactor prevented completion of the test fills today. A test fill using Event Pond material should be performed using the 13,000 kg compactor if the 9,000 kg is not available. This should ideally happen before weather deteriorates.

- Observations and Recommendations (OPEN):
  - BGC requested the following information from Pelly via email in order to document that QC/QA testing and observations are being performed properly:
    - Volumes of each material type borrowed for June and July. (Pending)
    - Copies of foundation and construction approvals for July. (Completed 08/08/18)
    - Volumes of each material type placed for June and July. (Partially completed 08/08/18, pending Material 2 and Material 5 volumes)
    - An updated stockpile management plan. (Partially completed 08/09/18)
  - Pelly/JDS should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly as discussed in BGC-RFI-003. (Partially completed 08/09/18, edits to drawing to show unsuitable stockpiles at the Event Pond pending)
  - At the Event Pond topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are being generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankm1ent. (ongoing)
  - Material being generated at the Event Pond is finer than Material produced at the ADR. Test fills will be conducted to determine how it can be used. (Pending, delayed due to weather and equipment issues)
  - In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible. BGC recommends not allowing material lifts to sit for long durations (over 30 min) during very heavy downpours. Performing one pass quickly with the compactor will also help seal the surface until proper compaction can be performed. It is important to haul (ongoing)
  - Layfield will provide BGC a QC plan for liner installation prior to mobilization. BGC will follow up with Layfield. (Pending).

- Material being generated from the ADR cut is getting rockier. We will likely have to transition to a less rocky material in the coming days. (Ongoing)

1) QA/QC Results:

QA/QC Results
• QA/QC: o Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift. o Field embankment nuclear density testing for August 10 were delivered to BGC. • BGC Recommendations: o Moisture will be monitored by BGC and adjustments made as needed.

2) Communications (no follow up required):

Personnel	Description
None	

3) Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
EPCM-RFI-020	JDS requests clarification on ballast placement and spacing.	Open. Sent June 21. Pending response from BGC.

Safety Issues: None

Photo 1: Material 3 (Structural Fill) construction at the upper (920) embankment. Placement method allowed larger areas of loose lifts to be exposed for longer periods of time.

Photo 2: Closure pipe trench wrapped in geotextile.

Photo 3: Investigation trench excavation on the right abutment.

Photo 4: Additional sand placed over the artesian source drain to allow embankment fill.

Photo 5: Event pond area.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	August 11, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon/Elliot Matthews	**Weather:**	Mostly Sunny 7°C to 20°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - There was no placement on the lower lift today. Material was placed to 906.7m in the upper embankment. (***Photo 1***).
  - The pipe trench under drain and interceptor trench were advanced. (***Photo 2***)
  - The artesian source drain was covered with structural fill and compacted with no vibration.
  - A seep was reported by Pelly late today on the east of the artesian drain at a higher elevation. BGC will inspect this seep tomorrow.
  - Pelly did not work on material development at the Event Pond today.
  - Pelly did not work on stripping at the ADR West today.
  - Pelly moved from borrowing the ADR West to Material 3 Stockpile 01.
  - The Material 3 Stockpile 01 has areas that are unsuitable. These areas need to be segregated from the usable material (***Photo 3***). Unsuitable is being stockpiled to the right and left of where they are digging now. These waste piles should be hauled and dumped somewhere away from where borrowing is occurring. The new place should be put on the materials management plan so there is no chance it ends up back at the embankment. A couple loads of bad material were delivered to the embankment during the night shift (***Photo 04***).
  - The Material 3 stockpile on the eastern portion of the embankment footprint was excavated for disposal. Material being excavated from the area is saturated and, in some parts, still frozen.
  - A test fill was completed today on material stockpiled at the Event Pond using the 11,000 kg Volvo compactor. BGC is reviewing the data and will issue a memorandum with the findings. A preliminary review of the results indicate that finer grained structural fill excavated from upper portions of the Event Pond will need to be placed in 0.3 maximum loose lifts and compacted using at least 5 passes with a 11,000 kg vibratory compactor. (***Photo 5***)
  - While excavating material for the test fill it is apparent that high organic topsoil has been mixed with suitable structural fill leaving some of this material unsuitable. During borrowing of this material BGC should be present in order to determine what areas are suitable and which are not. This may require approval and rejection of loads on a truck by truck basis. Future material generated should have topsoil (material high in organcs such as logs, branches, moss, and root clumps) pushed into the waste piles at the toe. BGC also recommends that the waste piles at the toe be included on the Material Management Plan and be labeled in the field to prevent accidental borrow.

- Observations and Recommendations (OPEN):
  - BGC requested the following information from Pelly via email in order to document that QC/QA testing and observations are being performed properly:
    - Volumes of each material type borrowed for June and July. (Pending)
    - Copies of foundation and construction approvals for July. (Completed 08/08/18)
    - Volumes of each material type placed for June and July. (Partially completed 08/08/18, pending Material 2 and Material 5 volumes)
    - An updated stockpile management plan. (Partially completed 08/09/18)
  - Pelly/JDS should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly as discussed in BGC-RFI-003. (Partially completed 08/09/18, edits to drawing to show unsuitable stockpiles at the Event Pond pending)
  - At the Event Pond topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are being generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment. (ongoing)
  - In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible. BGC recommends not allowing large surface areas of uncompacted material to be exposed to rain for long durations (over 30 min) during very heavy downpours. Performing one pass quickly with the compactor will also help seal the surface until proper compaction can be performed. (ongoing)

- Layfield will provide BGC a QC plan for liner installation prior to mobilization. BGC will follow up with Layfield. (Pending).

1) QA/QC Results:

QA/QC Results
• QA/QC: o Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift. o Field embankment nuclear density testing for August 11 were delivered to BGC. • BGC Recommendations: o Moisture will be monitored by BGC and adjustments made as needed.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon/Elliot Matthews	**Weather:**	Some rain 11°C to 18°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - There was no placement on the lower lift today. Material was placed to 907.67m in the upper embankment. (***Photo 1***).
  - The seep reported yesterday on the eastern embankment was not visible today because piles of material were placed in the area. As the foundation is cleared on the east side of the embankment BGC will observe for seeps.
  - Pelly did not work on material development at the Event Pond today.
  - Pelly worked on stripping at the ADR West today.
  - Borrow continued at ADR Material 3 Stockpile 01.
  - The Material 3 stockpile on the eastern portion of the embankment is almost gone. Preparation of embankment foundation is underway.
  - An area of the eastern portion of the embankment was approved to Type 3 foundation. (***Photo 2***)

- Observations and Recommendations (OPEN):
  - BGC requested the following information from Pelly via email in order to document that QC/QA testing and observations are being performed properly:
    - Volumes of each material type borrowed for June and July. (Pending)
    - Copies of foundation and construction approvals for July. (Completed 08/08/18)
    - Volumes of each material type placed for June and July. (Partially completed 08/08/18, pending Material 2 and Material 5 volumes)
    - An updated stockpile management plan. (Partially completed 08/09/18)
  - Pelly/JDS should update the drawings and volumes in their materials Management Plan. BGC would like a copy of this updated plan. BGC recommends this plan be updated bi-weekly as discussed in BGC-RFI-003. (Partially completed 08/09/18, edits to drawing to show unsuitable stockpiles at the Event Pond pending)
  - At the Event Pond topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are being generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment. Additionally, suitable material has been mixed with unsuitable material in the current stockpile at the Event Pond. Material will have to be segregated during loading to sort out unsuitable material. (ongoing)
  - In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible. BGC recommends not allowing large surface areas of uncompacted material to be exposed to rain for long durations (over 30 min) during very heavy downpours. Performing one pass quickly with the compactor will also help seal the surface until proper compaction can be performed. (ongoing)

Safety Issues: None

Photo 1: Material 3 (Structural Fill) construction at the upper (920) embankment.

Photo 2: Large area on the eastern portion of the embankment within the 920 starter dam footprint that was approved to Type 3 foundation.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	August 13, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Harra Vardeleon/Elliot Matthews/Troy Meyer	**Weather:**	Rain 11°C to 21°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - There was no placement on the lower lift today. Material was placed to 908.97m in the upper embankment. (***Photo 1***).
  - The seep reported yesterday was visible again. It may caused by surface flow through fractured bedrock. BGC discussed with Pelly the construction of a drain on the eastern portion of the embankment to deal with similar seeps.
  - Pelly excavated most of the foundation on the eastern portion of the embankment to Type 3 bedrock (***Photo 2***). Three test pits were dug in the central portion of the valley. Up to 3.5m of excavation is still required at the toe. (***Photo 3***).
  - Pelly did not work on material development at the Event Pond today.
  - Pelly worked on stripping at the ADR West today.
  - Borrow continued at ADR Material 3 Stockpile 01.
  - The Material 3 stockpile on the eastern portion of the embankment is gone.
  - JDS provided BGC monthly borrow totals to BGC for QA tracking.
  - Areas within the in-heap pond/impoundment still require earthwork. BGC reviewed current topography vs instances of ground ice observed in the test pits below elevation 960m. Portions on the western slope still require an estimated 1.6m of excavation (***Figure 1***). Ground ice was not found on areas on the west side but excavation through bedrock is still required to shape the impoundment (***Figure 2***). Ground ice and wet flowing soils were observed in test pits at the center valley. Much of this area has already been excavated. However, inspection by BGC will be required to determine if suitable subgrade has been reached (***Figure 1***).
  - An portion of the Material 3 Stockpile 01 toe sits on the 940 slope of HLF. This area will need to be excavated to suitable subgrade as part of this seasons construction. (***Figure 2***)

- Observations and Recommendations (OPEN):
  - BGC requested bi-weekly, or at least monthly updates to volumes produced and placed. BGC also requested bi-weekly or monthly updates to the Stockpile Management Plan. Some information was provided. The following information is still pending.
    - Volumes of each material type placed for June and July. (Partially completed 08/08/18, pending Material 2 and Material 5 volumes)
    - An updated stockpile management plan. (Partially completed 08/09/18, missing labels and current waste piles are not on the plan. BGC asked that this plan be updated bi-weekly as discussed in BGC-RFI-003.)
  - At the Event Pond topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are being generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment. Additionally, suitable material has been mixed with unsuitable material in the current stockpile at the Event Pond. Material will have to be segregated during loading to sort out unsuitable material. Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer /Elliot Matthews	**Weather:**	Intermittent Rain 8°C to 16°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - There was no placement on the lower lift today. Material was placed to 909.15m in the upper embankment. (***Photo 1***).
  - Pelly began the construction of a drain on the eastern portion of the embankment to pick up the observed seeps in the upper valley bottom. The seep began to flow heavier upon excavation of the trench indicating ground water flow just below the surface through fractured bedrock (***Photo 2***).
  - Pelly continued excavation of the foundation in the lower portion of the eastern portion of the embankment to Type 3 bedrock (***Photo 3***). The colluvium was observed to be very stiff with no ice.
  - An exploration trench was excavated in the right abutment slope and logged by BGC (***Photo 4***).
  - Pelly worked on shaping the PLS sump area (***Photo 5***).
  - Pelly did not work on material development at the Event Pond today.
  - Pelly worked on stripping at the ADR West today.
  - Borrow continued at ADR Material 3 Stockpile 01.
  - Areas within the in-heap pond/impoundment still require earthwork. BGC reviewed current topography vs instances of ground ice observed in the test pits below elevation 960m. Portions on the western slope still require an estimated 1.6m of excavation (***Figure 1***). Ground ice was not found on areas on the west side but excavation through bedrock is still required to shape the impoundment (***Figure 2***). However, inspection by BGC will be required to determine if suitable subgrade has been reached (***Figure 1***).
  - A portion of the Material 3 Stockpile 01 toe sits on the 940 slope of HLF. This area will need to be excavated to suitable subgrade as part of this seasons construction (***Figure 2***).

- Observations and Recommendations (OPEN):
  - BGC requested bi-weekly, or at least monthly updates to volumes produced and placed. BGC also requested bi-weekly or monthly updates to the Stockpile Management Plan. Some information was provided. The following information is still pending.
    - Volumes of each material type placed for June and July. (Partially completed 08/08/18, pending Material 2 and Material 5 volumes)
    - An updated stockpile management plan. (Partially completed 08/09/18, missing labels and current waste piles are not on the plan. BGC asked that this plan be updated bi-weekly as discussed in BGC-RFI-003.)
  - At the Event Pond topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are being generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment. Additionally, suitable material has been mixed with unsuitable material in the current stockpile at the Event Pond. Material will have to be segregated during loading to sort out unsuitable material. (ongoing)
  - In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible. BGC recommends not allowing large surface areas of uncompacted material to be exposed to rain for long durations (over 30 min) during very heavy downpours. Performing one pass quickly with the compactor will also help seal the surface until proper compaction can be performed. (ongoing)
  - The Material 3 Stockpile 01 has areas that are unsuitable. These areas need to be segregated from the usable material. (Ongoing)
  - Material excavated from the PLS sump area can be blended with imported material from the ADR at a max ratio of one 777 to two 40T rock truck loads. Depending on the composition of the materials, the ratio may be adjusted by BGC.
  - A test fill was completed on material stockpiled at the Event Pond using the 11,000 kg Volvo compactor. BGC is reviewing the data and will issue a memorandum with the findings. A preliminary review of the results indicate that finer grained structural fill excavated from upper portions of the Event Pond will need to be placed in 0.3 maximum loose lifts and compacted using at least 5 passes with a 11,000 kg vibratory compactor. (Pending BGC action)

- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road. BGC recieved as-built survey from JDS to evaluate adjustment of the west HLF perimeter road alignment.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF. This will need to be confirmed based on actual observed field conditions and further stability analyses.

1) QA/QC Results:

QA/QC Results
• QA/QC: o Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift. o Field embankment nuclear density testing for August 14 were delivered to BGC. • BGC Recommendations: o Moisture will be monitored by BGC and adjustments made as needed.

Client:	Victoria Gold	**Date and Shift:**	August 16, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer / Elliot Matthews	**Weather:**	Intermittent Rain 8°C to 16°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - There was no placement on the lower lift today. Material was placed to 911.3m in the upper embankment. (***Photo 1***).
  - Pelly continued the construction of a drain on the eastern portion of the embankment to pick up the observed seeps in the upper valley bottom (***Photos 2 and 3***). A small amount of flow was observed in the trench during construction.
  - Pelly continued excavation of the foundation in the lower portion of the eastern portion of the embankment to Type 3 bedrock (***Photo 4***). The colluvium was observed to be very stiff with no ice.
  - Pelly worked on shaping the PLS sump area.
  - Pelly did not work on material development at the Event Pond today.
  - Pelly worked on stripping at the ADR West today.
  - Borrow continued at ADR Material 3 Stockpile 01 and ADR cut (**Photo 5**).
  - A rock rolled down the upstream face of the embankment and struck the exposed closure pipe creating a blunt scrape and gouge about 2 mm deep by 2 cm long (**Photo 6**). Pipe with gouges or cuts in excess of 10 percent of the product wall should not be used. Scrapes or gouges cannot be repaired by filling-in with extrusion or hot air welding. The wall thickness of the 150mm SDR-11 pipe is 15.3 mm. The damaged section should be removed and replaced if the gouge depth is more than 1.5 mm.

- Observations and Recommendations (OPEN):
  - BGC requested bi-weekly, or at least monthly updates to volumes produced and placed. BGC also requested bi-weekly or monthly updates to the Stockpile Management Plan. Some information was provided. The following information is still pending.
    - Volumes of each material type placed for June and July. (Partially completed 08/08/18, pending Material 2 and Material 5 volumes)
    - An updated stockpile management plan. (Partially completed 08/09/18, missing labels and current waste piles are not on the plan. BGC asked that this plan be updated bi-weekly as discussed in BGC-RFI-003.)
  - At the Event Pond topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are being generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment. Additionally, suitable material has been mixed with unsuitable material in the current stockpile at the Event Pond. Material will have to be segregated during loading to sort out unsuitable material. (ongoing)
  - In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible. BGC recommends not allowing large surface areas of uncompacted material to be exposed to rain for long durations (over 30 min) during very heavy downpours. Performing one pass quickly with the compactor will also help seal the surface until proper compaction can be performed. (ongoing)
  - The Material 3 Stockpile 01 has areas that are unsuitable. These areas need to be segregated from the usable material. (Ongoing)
  - Material excavated from the PLS sump area can be blended with imported material from the ADR at a max ratio of one 777 to two 40T rock truck loads. Depending on the composition of the materials, the ratio may be adjusted by BGC.
  - A test fill was completed on material stockpiled at the Event Pond using the 11,000 kg Volvo compactor. BGC is reviewing the data and will issue a memorandum with the findings. A preliminary review of the results indicate that finer grained structural fill excavated from upper portions of the Event Pond will need to be placed in 0.3 maximum loose lifts and compacted using at least 5 passes with a 11,000 kg vibratory compactor. (Pending BGC action).

- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road. BGC received as-built survey from JDS to evaluate adjustment of the west HLF perimeter road alignment.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF. This will need to be confirmed based on actual observed field conditions and further stability analyses.

1) QA/QC Results:

QA/QC Results
• QA/QC: o Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift. o Field embankment nuclear density testing for August 14 were delivered to BGC. • BGC Recommendations: o Moisture will be monitored by BGC and adjustments made as needed.

2) Communications (no follow up required):

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	August 17, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer / Elliot Matthews	**Weather:**	Cloudy 4°C to 13°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - There was no placement on the lower west embankment area today. Material was placed to approx. 913m in the upper embankment. (***Photo 1***).
  - Pelly placed structural fill (Material 3) in the eastern portion of the embankment (***Photo 2***). Material was placed to approx. 890m.
  - Pelly worked on shaping the PLS sump area.
  - Pelly continued development at the Event Pond today.
  - Pelly worked on stripping at the ADR West today.
  - Borrow continued at ADR Material 3 Stockpile 01 and ADR cut. A few truck loads of Material 3 from Stockpile 01 was contaminated with organics and was rejected (**Photo 3**). Moisture content of the placed fill was measured by Tetra Tech to be below 4% in the afternoon. Moisture conditioning at the borrow source was initiated (**Photo 4**).
  - Pelly constructed a temporary drain pipe connected to the west underdrain pipe to allow drainage of sumps for water control (**Photo 5**).

- Observations and Recommendations (OPEN):
  - BGC requested bi-weekly, or at least monthly updates to volumes produced and placed. BGC also requested bi-weekly or monthly updates to the Stockpile Management Plan. Some information was provided. The following information is still pending.
    - Volumes of each material type placed for June and July. (Partially completed 08/08/18, pending Material 2 and Material 5 volumes)
    - An updated stockpile management plan. (Partially completed 08/09/18, missing labels and current waste piles are not on the plan. BGC asked that this plan be updated bi-weekly as discussed in BGC-RFI-003.)
  - At the Event Pond topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are being generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment. Additionally, suitable material has been mixed with unsuitable material in the current stockpile at the Event Pond. Material will have to be segregated during loading to sort out unsuitable material. (ongoing)
  - In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible.   - In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible. BGC recommends not allowing large surface areas of uncompacted material to be exposed to rain for long durations (over 30 min) during very heavy downpours. Performing one pass quickly with the compactor will also help seal the surface until proper compaction can be performed. (ongoing)
  - The Material 3 Stockpile 01 has areas that are unsuitable. These areas need to be segregated from the usable material. (Ongoing)
  - Material excavated from the PLS sump area can be blended with imported material from the ADR at a max ratio of one 777 to two 40T rock truck loads. Depending on the composition of the materials, the ratio may be adjusted by BGC.
  - A test fill was completed on material stockpiled at the Event Pond using the 11,000 kg Volvo compactor. BGC is reviewing the data and will issue a memorandum with the findings. A preliminary review of the results indicate that finer grained structural fill excavated from upper portions of the Event Pond will need to be placed in 0.3 maximum loose lifts and compacted using at least 5 passes with a 11,000 kg vibratory compactor. (Pending BGC action).
  - The temporary termination of the underdrain and closure pipes below the toe of the embankment was inspected by BGC. The outer two underdrain pipes are flowing and the underdrain gravel is also carrying some flow. The ends of the pipes are currently wrapped with geotextile **(Photo 6)**. The geotextile should be removed and the pipes allow to flow freely to promote self-cleaning. A plan should be developed to protect the pipes through the winter and allow flow to continue.
- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road. BGC received as-built survey from JDS to evaluate adjustment of the west HLF perimeter road alignment.

Client:	Victoria Gold	**Date and Shift:**	August 22, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer / Dan Granda/ Elliot Matthews	**Weather:**	Rain 5°C to 10°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Troy Meyer left site today.
  - There was no fill placement on upper west embankment area today.
  - Due to rainstorm, surface soils were transported to the downstream sump, Pelly was notified right away and cleaned the sump (***Photo 1***).
  - Pelly placed structural fill (Material 3) in the lower embankment (***Photos 2 and 3***). Material was placed to approx. 902m.
  - Pelly extended the underdrains north of the PLS sump **(Photo 4)**.
  - Borrow of structural fill (Material 3) continued at the ADR west borrow area.
  - Hauling of structural fill from the Event Pond excavation was continued, Pelly instructed to avoid ice rich areas **(Photo 5)**.

- Observations and Recommendations (OPEN):
  - BGC requested bi-weekly, or at least monthly updates to volumes produced and placed. BGC also requested bi-weekly or monthly updates to the Stockpile Management Plan. Some information was provided. The following information is still pending.
    - Volumes of each material type placed for June and July. (Partially completed 08/08/18, pending Material 2 and Material 5 volumes)
    - An updated stockpile management plan. (Partially completed 08/09/18, missing labels and current waste piles are not on the plan. BGC asked that this plan be updated bi-weekly as discussed in BGC-RFI-003.)
  - At the Event Pond topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are being generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment. Additionally, suitable material has been mixed with unsuitable material in the current stockpile at the Event Pond. Material will have to be segregated during loading to sort out unsuitable material. (ongoing)
  - In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible. BGC recommends not allowing large surface areas of uncompacted material to be exposed to rain for long durations (over 30 min) during very heavy downpours. Performing one pass quickly with the compactor will also help seal the surface until proper compaction can be performed. (ongoing)
  - The Material 3 Stockpile 01 has areas that are unsuitable. These areas need to be segregated from the usable material. (Ongoing)
  - Material excavated from the PLS sump area can be blended with imported material from the ADR at a max ratio of one 777 to two 40T rock truck loads. Depending on the composition of the materials, the ratio may be adjusted by BGC.
  - Per 1 pm weekly meeting with JDS/Pelly/Layfield/Cobalt/BGC/Victoria Gold, Layfield deployment has been postponed to Sept 10th, BGC informed Tetra Tech of updated schedule for liner installation.
  - BGC preparing memo to help with winter preparations for embankment.
  - BGC recommends Pelly to inspect downstream sump more frequently due to rain events on this week's forecast.
- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road. BGC received as-built survey from JDS to evaluate adjustment of the west HLF perimeter road alignment.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF. This will need to be confirmed based on actual observed field conditions and further stability analyses.

QA/QC Results

- QA/QC:

- Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift.
- Field embankment nuclear density testing for August 21 were delivered to BGC.

- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Photo 3: Material 3 (Structural Fill) density/moisture testing at the lower east embankment.

Photo 4: Extension of underdrain trench upgradient of PLS sump area.

Photo 5: Event Pond excavation of Material 3 borrow material, BGC noticed ice and permafrost zone, Pelly was informed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	August 23, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Elliot Matthews	**Weather:**	Rain/Overcast 5°C to 10°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - There was no fill placement on upper west embankment area today.
  - Frozen areas in event pond work zone were identified and discussed with Pelly (***Photo 1***).
  - Pelly placed structural fill (Material 3) in the lower embankment (***Photos 2 and 3***). Material was placed to approx. 904m.
  - Pelly extended the underdrains north of the PLS sump **(Photo 4)**.
  - Borrow of structural fill (Material 3) continued at the ADR west borrow area. Area was moisture conditioned as source was dry despite rainfall events.
  - Hauling of structural fill from the Event Pond excavation was continued, Pelly instructed to avoid ice rich areas.
  - Drains in HLF upstream were prepared (**Photo 5**).
  - Phyllite sample was taken from HLF upstream zone for testing (**Photo 6**).

- Observations and Recommendations (OPEN):
  - BGC requested bi-weekly, or at least monthly updates to volumes produced and placed. BGC also requested bi-weekly or monthly updates to the Stockpile Management Plan. Some information was provided. The following information is still pending.
    - Volumes of each material type placed for June and July. (Partially completed 08/08/18, pending Material 2 and Material 5 volumes)
    - An updated stockpile management plan. (Partially completed 08/09/18, missing labels and current waste piles are not on the plan. BGC asked that this plan be updated bi-weekly as discussed in BGC-RFI-003.)
  - At the Event Pond topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are being generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment. Additionally, suitable material has been mixed with unsuitable material in the current stockpile at the Event Pond. Material will have to be segregated during loading to sort out unsuitable material. (ongoing)
  - In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible. BGC recommends not allowing large surface areas of uncompacted material to be exposed to rain for long durations (over 30 min) during very heavy downpours. Performing one pass quickly with the compactor will also help seal the surface until proper compaction can be performed. (ongoing)
  - The Material 3 Stockpile 01 has areas that are unsuitable. These areas need to be segregated from the usable material. (Ongoing)
  - Material excavated from the PLS sump area can be blended with imported material from the ADR at a max ratio of one 777 to two 40T rock truck loads. Depending on the composition of the materials, the ratio may be adjusted by BGC.
  - BGC preparing memo to help with winter preparations for embankment.
  - BGC recommends Pelly to inspect downstream sump more frequently due to rain events on this week's forecast.
- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road. BGC received as-built survey from JDS to evaluate adjustment of the west HLF perimeter road alignment.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF. This will need to be confirmed based on actual observed field conditions and further stability analyses.

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift.
  - Field embankment nuclear density testing for August 21 were delivered to BGC.

- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Elliot Matthews	**Weather:**	Overcast/Sunny 6°C to 12°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - There was no fill placement on upper west embankment area today.
  - Event pond continued to be worked on.
  - Downstream sump was inspected, observed to be working without issues (***Photo 1***).
  - Pelly placed structural fill (Material 3) in the lower embankment (***Photos 2 and 3***). Material was placed to approx. 910m.
  - Pelly extended the underdrains north of the PLS sump **(Photo 4)**.
  - Borrow of structural fill (Material 3) continued at the ADR west borrow area.
  - Drains in HLF upstream were prepared (**Photo 5**). Excessive seepage from material removed upstream caused mud and water to overwhelm drain, Pelly installed pump and a small sump to contain mud.
  - Upstream most sections of the underdrain were contaminated with mud, related to Cobalt's material removal upstream of work area, Pelly and JDS were communicated that this material needed to be replaced before approval of underdrain. (**Photo 6**).
  - Geotextile damage observed by the mud contaminated area of underdrain, this will need to be repaired before approval of underdrain (**Photo 7**).
  - Removal of access road to heap leach area (Cobalt's work area) has started as embankment continues to be built (**Photo 8**).
- Observations and Recommendations (OPEN):
  - BGC requested bi-weekly, or at least monthly updates to volumes produced and placed. BGC also requested bi-weekly or monthly updates to the Stockpile Management Plan. Some information was provided. The following information is still pending.
    - Volumes of each material type placed for June and July. (Partially completed 08/08/18, pending Material 2 and Material 5 volumes)
    - An updated stockpile management plan. (Partially completed 08/09/18, missing labels and current waste piles are not on the plan. BGC asked that this plan be updated bi-weekly as discussed in BGC-RFI-003.)
  - At the Event Pond topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are being generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment. Observations and Recommendations

- Observations and Recommendations (Today):
  - Event pond continued to be worked on.
  - Pelly placed structural fill (Material 3) in the lower embankment (***Photo 1***). Material was placed to approx. 912m.
  - Pelly continues work upstream on underdrains **(Photo 2)**.
  - Borrow of structural fill (Material 3) continued at the ADR west borrow area.
  - Pelly continues to haul material from ARD source areas (**Photo 3**).
- Observations and Recommendations (OPEN):
  - BGC requested bi-weekly, or at least monthly updates to volumes produced and placed. BGC also requested bi-weekly or monthly updates to the Stockpile Management Plan. Some information was provided. The following information is still pending.
    - Volumes of each material type placed for June and July. (Partially completed 08/08/18, pending Material 2 and Material 5 volumes)
    - An updated stockpile management plan. (Partially completed 08/09/18, missing labels and current waste piles are not on the plan. BGC asked that this plan be updated bi-weekly as discussed in BGC-RFI-003.)
  - At the Event Pond topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are being generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment. Additionally, suitable material has been mixed with unsuitable material in the current stockpile at the Event Pond. Material will have to be segregated during loading to sort out unsuitable material. (ongoing)
  - In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible. BGC recommends not allowing large surface areas of uncompacted material to be exposed to rain for long durations (over 30 min) during very heavy downpours. Performing one pass quickly with the compactor will also help seal the surface until proper compaction can be performed. (ongoing)
  - The Material 3 Stockpile 01 has areas that are unsuitable. These areas need to be segregated from the usable material. (Ongoing)
  - Material excavated from the PLS sump area can be blended with imported material from the ADR at a max ratio of one 777 to two 40T rock truck loads. Depending on the composition of the materials, the ratio may be adjusted by BGC.
  - BGC preparing memo to help with winter preparations for embankment.
  - BGC recommends Pelly to inspect downstream sump more frequently due to rain events on this week's forecast.
- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road. BGC received as-built survey from JDS to evaluate adjustment of the west HLF perimeter road alignment.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF. This will need to be confirmed based on actual observed field conditions and further stability analyses.

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift.
  - Field embankment nuclear density testing for August 21 were delivered to BGC.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Photo 2: Pelly cleaning and preparing underdrain extension upstream.

Photo 3: Pelly continues to move material from ADR source area.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	August 30, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Elliot Matthews / Ethan Faber	**Weather:**	Overcast/Rain 0°C to 5°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Elliot Matthews leaves site, Ethan Faber comes to site (BGC QA Engineer cross-shift)
  - Pelly started using new haul road access.
  - Event pond continued to be worked on.
  - Pelly placed structural fill (Material 3) in the lower embankment (***Photo 1***). Material was placed to approx. 914m.
  - East abutment foundation was prepared (***Photo 2***).
  - Study trench was excavated, confirming bedrock (type 3) transitioning into type 2 (***Photo 3***).
  - Pelly continues work upstream on underdrains **(Photo 4)**.
  - Finger drain on west upper abutment was extended and is now capturing new seeps from clean out (**Photo 5**).
  - Borrow of structural fill (Material 3) continued at the ADR west borrow area.
  - Pelly continues to haul material from ARD source areas.
- Observations and Recommendations (OPEN):
  - BGC requested bi-weekly, or at least monthly updates to volumes produced and placed. BGC also requested bi-weekly or monthly updates to the Stockpile Management Plan. Some information was provided. The following information is still pending.
    - Volumes of each material type placed for June and July. (Partially completed 08/08/18, pending Material 2 and Material 5 volumes)
    - An updated stockpile management plan. (Partially completed 08/09/18, missing labels and current waste piles are not on the plan. BGC asked that this plan be updated bi-weekly as discussed in BGC-RFI-003.)
  - At the Event Pond topsoil pushed is unsuitable due to high organics. However, areas of usable Material 3 are being generated. Pelly should segregate usable material from unsuitable material. Pelly should update the stockpile management plan and communicate to their operators to ensure suitable material is not wasted and that unsuitable material is not brought to the embankment. Additionally, suitable material has been mixed with unsuitable material in the current stockpile at the Event Pond. Material will have to be segregated during loading to sort out unsuitable material. (ongoing)
  - In times of heavy rains overly wet material is not uncommon. To help prevent this it is important to compact spread lifts as quickly as possible. BGC recommends not allowing large surface areas of uncompacted material to be exposed to rain for long durations (over 30 min) during very heavy downpours. Performing one pass quickly with the compactor will also help seal the surface until proper compaction can be performed. (ongoing)
  - The Material 3 Stockpile 01 has areas that are unsuitable. These areas need to be segregated from the usable material. (Ongoing)
  - Material excavated from the PLS sump area can be blended with imported material from the ADR at a max ratio of one 777 to two 40T rock truck loads. Depending on the composition of the materials, the ratio may be adjusted by BGC.
  - BGC preparing memo to help with winter preparations for embankment.
  - BGC recommends Pelly to inspect downstream sump more frequently due to rain events on this week's forecast.
- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road. BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 1, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda/ Roy Morlan / Ethan Faber / Troy Meyer	**Weather:**	Overcast -2ºC to 13ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Roy Morlan arrived on site today. Dan Granda left site today.
  - Excavation at the Event Pond continued (***Photo 1***).
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 2***). Material was placed to approximately 917.27m. Material sourced from the ADR cut was generally dry (approximately 2% moisture). Material sourced from the Event Pond was about 5% moisture (closer to optimal). Density tests measured were between 95 and 100% compaction vs the proctor. Material was tested after compaction using the vibratory rollers. Dryer material tested closer to 100% compaction after haul truck traffic over the roller compacted lifts. BGC will be checking densities along the edges of the embankment lifts which typically do not get the benefit of haul truck compaction.
  - Tetra Tech's night shift reported that a portion of one of the under drain laterals was damaged during removal of material from the eastern portion of the impoundment. BGC and Pelly will inspect in the morning.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. **(Photo 3)**.
  - Pelly continued work extending the underdrains upstream.
  - Material 3 used in the embankment construction today was sourced from the ADR Borrow and the Event Pond cut (***Photo 4***). Material being generated from the Event Pond was variable. Some material is being hauled to the embankment for construction, some (finer material) is being stockpiled for construction of the Event Pond berms, and some material is being wasted. JDS and Pelly should update the material management plan to track the volumes and locations of these materials to ensure that they are not used incorrectly. BGC would also like an update of the volumes of material produced and placed as of August 31. This will help with planning on what material can be placed before the end of the season and how to protect stockpiled material from becoming over saturated over the winter season.
- Observations and Recommendations (OPEN):
  - BGC requested bi-weekly, or at least monthly updates to volumes produced and placed. BGC also requested bi-weekly or monthly updates to the Stockpile Management Plan. Some information was provided. The following information is still pending.
    - Volumes of each material type placed for June, July, August. (Partially completed 08/08/18, pending Material 2 and Material 5 volumes)
    - An updated stockpile management plan. (Partially completed 08/09/18, missing labels and current waste piles are not on the plan. BGC asked that this plan be updated bi-weekly as discussed in BGC-RFI-003.)
  - Material excavated from the PLS sump area can be blended with imported material from the ADR at a max ratio of one 777 to two 40T rock truck loads. Depending on the composition of the materials, the ratio may be adjusted by BGC. (Ongoing)
  - BGC prepared memo to help with winter preparations for embankment, in final review before submittal.
  - BGC recommends Pelly to inspect downstream sump more frequently due to rain events on this week's forecast.
- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF. A trench should be dug in this area to verify material properties and to note any features that could potentially cause stability issues.

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC Reporting for construction at the embankment for the night shift and day shift.
  - Field embankment nuclear density testing for September 1 were delivered to BGC.
- BGC Recommendations:

- Moisture will be monitored by BGC and adjustments made as needed.

Client:	Victoria Gold	**Date and Shift:**	September 2, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber / Troy Meyer	**Weather:**	Overcast 1°C to 13°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Excavation at the Event Pond continued (***Photo 1***).
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 2***). Material was placed to 918.0m.
  - The lateral drain damaged yesterday was repaired (***Photo 3***).
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. **(Photo 4)**.
  - Pelly continued work extending the underdrains upstream (***Photo 5***).
  - JDS provided volumes for the existing stockpiles produced by Neway. Approximately 57,000 m3 of ODF is stockpiled currently. Approximately 50,000 m3 will be needed this season to complete the impoundment/sump area.
- Observations and Recommendations (OPEN):
  - Material excavated from the PLS sump area can be blended with imported material from the ADR at a max ratio of one 777 to two 40T rock truck loads. Depending on the composition of the materials, the ratio may be adjusted by BGC. (Ongoing)
  - BGC recommends Pelly to inspect downstream sump more frequently due to rain events on this week's forecast. (ongoing)
  - Material being generated from the Event Pond was variable. Some material is being hauled to the embankment for construction, some (finer material) is being stockpiled for construction of the Event Pond berms, and some material is being wasted. JDS and Pelly should update the material management plan to track the volumes and locations of these materials to ensure that they are not used incorrectly. This will also help with planning on what material can be placed before the end of the season and how to protect stockpiled material from becoming over saturated over the winter season. (ongoing)

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 3, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber / Troy Meyer	**Weather:**	Overcast -4°C to 12°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Excavation at the Event Pond continued (***Photo 1***).
  - Areas within the Event Pond excavation were frozen (***Photo 2***). A rough delineation of the area was made by BGC and Pelly. Pelly resumed borrow outside the area of frozen material. BGC and Pelly dug 3 test pits to delineate the frozen material in the area. It appears that the frozen material is present on the norther portion of the borrow starting at 0.5m bgs to 1m bgs. The frozen zone gets thicker to the south starting at 0.5m bgs to at least 2m bgs. (***Figure 1***). Pelly is currently borrowing around the frozen zone. BGC recommends that the frozen zone be removed prior to continuing borrow in this area to ensure that frozen material is not accidently hauled to the embankment.
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 3***). Material was placed to 918.85m.
  - Ice rich – frozen material from the Event Pond borrow was placed at the embankment on the night shift (September 3). The zones where this material was placed did not meet density and were oversaturated. Attempts were made to compact these zones but were unsuccessful. These zones where removed and wasted (***Photos 4***). The excavated area was replaced with suitable material.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. **(Photo 5)**.
  - A test pit was dug on the eastern portion of the impoundment to investigate potentially frozen material within a wet area (***Photo 6***). No frozen material was observed in the test pit. The material is likely saturated due to upstream seeps.
  - A second test pit was dug along the eastern portion of the impoundment area to determine the depth and location of a lateral drain. (***Photo 7***)
  - Pelly continued work extending the underdrains upstream.
  - Pelly provided BGC with foundation approval forms for Sections 15 through 25.
- Observations and Recommendations (OPEN):
  - Material excavated from the PLS sump area can be blended with imported material from the ADR at a max ratio of one 777 to two 40T rock truck loads. Depending on the composition of the materials, the ratio may be adjusted by BGC. (Ongoing)
  - BGC recommends Pelly to inspect downstream sump more frequently due to rain events on this week's forecast. (ongoing)
  - Material being generated from the Event Pond was variable. Some material is being hauled to the embankment for construction, some (finer material) is being stockpiled for construction of the Event Pond berms, and some material is being wasted. JDS and Pelly should update the material management plan to track the volumes and locations of these materials to ensure that they are not used incorrectly. This will also help with planning on what material can be placed before the end of the season and how to protect stockpiled material from becoming over saturated over the winter season. (ongoing)
- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF. A trench should be dug in this area to verify material properties and to note any features that could potentially cause stability issues.

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC Daily Reports up to September 1. Daily reports for September 2 and 3 are still pending.
  - Field density and moisture testing were provided to BGC up to September 1. Reports for September 2 and 3 are still pending.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Photo 4: Material excavated from embankment lift because it would not meet density and moisture requirements.

Photo 5 : Shaping in the impoundment area.

Photo 6 : Test pit dug in the eastern area of the impoundment. Material was moist but did not contain ground ice.

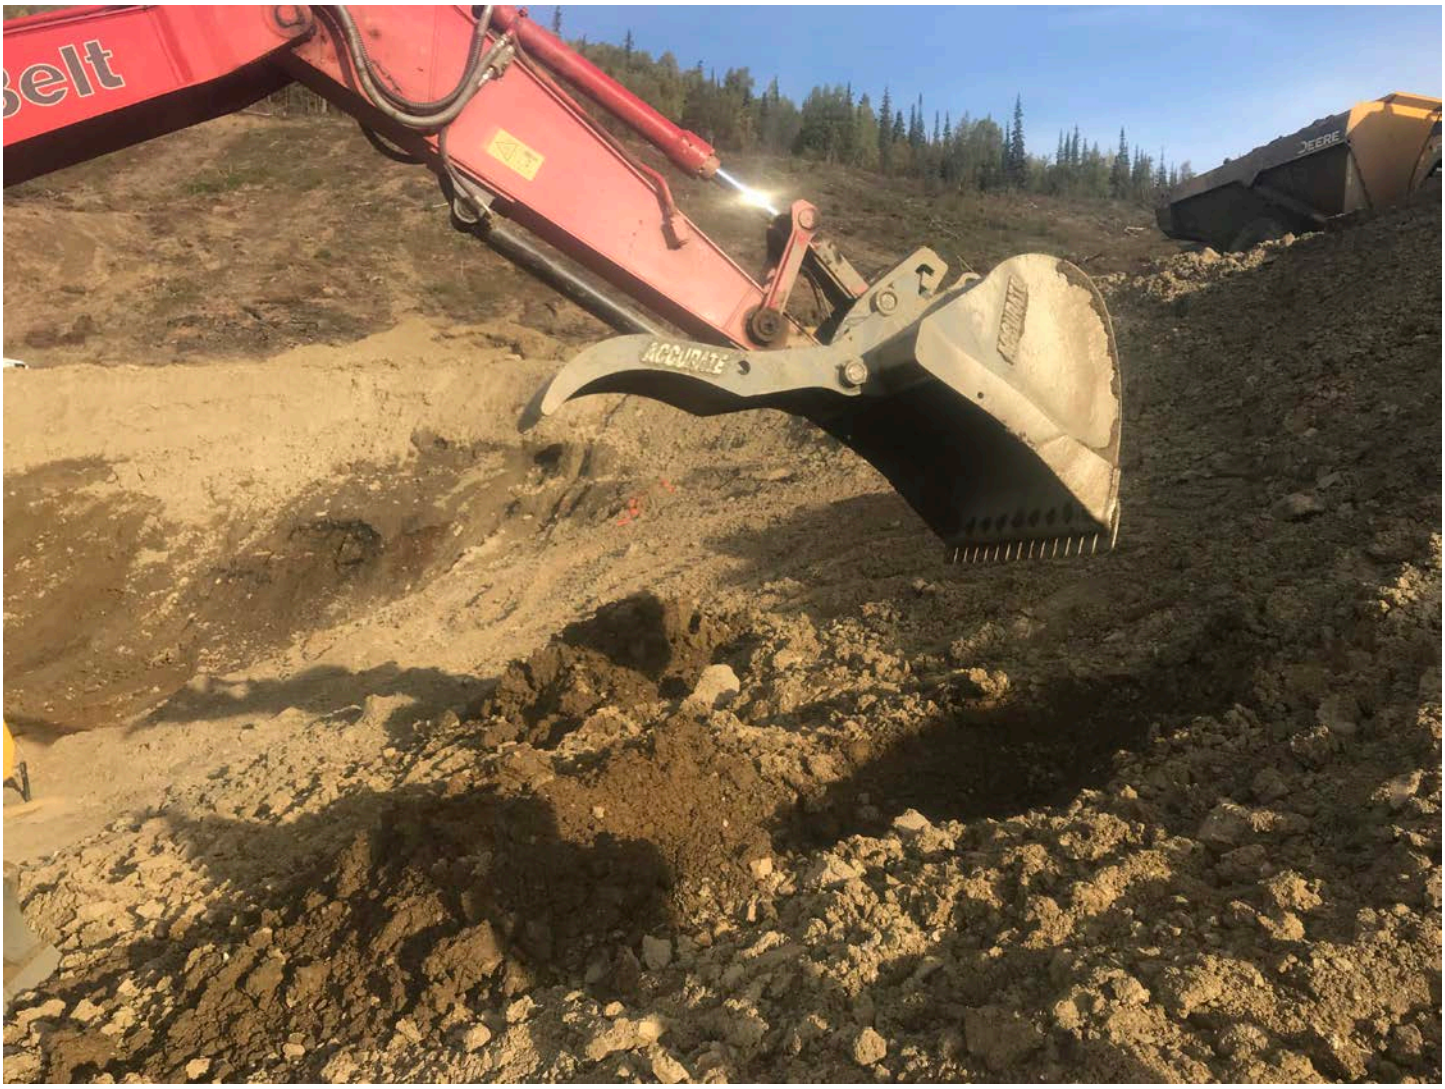

Photo 7 : Second test pit dug in the impoundment area to determine the configuration of the lateral drain. Heavy seep were observed within the 1 st meter of this test pit.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 4, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber / Troy Meyer	**Weather:**	Overcast 5°C to 14°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Test pits were dug at the event pond. The test pits were excavated east of where ice was encountered in the excavation (***Figure 1***). The maximum depth excavated was 5.5m bgs. Although cold material was encountered no ice was observed. The material observed in all of the test pits was usable as Material 3 in the embankment (***Photo 1***) with the exception of an approximately 1.5m layer of topsoil observed in Test Pit 3 (***Photo 2***). BGC will provide test pit logs for Pelly and JDS.
  - It is likely that ice rich ground will be encountered in the Event Pond area where there are pockets or zones of phyllitic material. During borrow when phyllitic material (identified as a gray, clayey material) is encountered BGC should be notified to inspect the borrow cut. Ice or flowing water has been routinely found either in these phyllitic layers or direction above them if the phyllitic layer is degraded to clay and acts as an aquitard. Since ice rich material creates zones of oversaturation and low density when used for lift construction, identifying this material at the source before placement will help ensure that placed lifts will not have to be removed.
  - Topsoil removal continued at the Event Pond.
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 3***). Material was placed to 919.93m.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation.
  - BGC and Pelly discussed an additional drain to capture a seep identified within the impoundment areas (***Photo 4***).
  - Cobalt and JDS excavated test pits at the top of the Lime Silo cut. BGC will log the test pits tomorrow.
  - Pelly briefly borrowed material from a waste pile located next to ADR borrow and delivered it to the embankment (***Photo 5***). Pelly should label this pile in the field and include it in their stockpile management plan to prevent this from happening again. Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) near the ADR cut.
    - Waste topsoil within the footprint of the Event Pond.
    - Waste topsoil at the toe of the Event Pond.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond.
  - Pelly continued work extending the underdrains upstream.
- Observations and Recommendations (OPEN):
  - Material excavated from the PLS sump area can be blended with imported material from the ADR at a max ratio of one 777 to two 40T rock truck loads. Depending on the composition of the materials, the ratio may be adjusted by BGC. (Ongoing)
  - BGC recommends Pelly to inspect downstream sump more frequently due to rain events on this week's forecast. (ongoing)
  - Material being generated from the Event Pond was variable. Some material is being hauled to the embankment for construction, some (finer material) is being stockpiled for construction of the Event Pond berms, and some material is being wasted. JDS and Pelly should update the material management plan to track the volumes and locations of these materials to ensure that they are not used incorrectly. This will also help with planning on what material can be placed before the end of the season and how to protect stockpiled material from becoming over saturated over the winter season. (ongoing)
- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF. A trench should be dug in this area to verify material properties and to note any features that could potentially cause stability issues.

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC Daily Reports up to September 4.
  - Field density and moisture testing were provided to BGC up to September 4.

- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 5, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber / Troy Meyer	**Weather:**	Overcast 4ºC to 12ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - No work was performed at the Event Pond.
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 1***). Material was placed to 921.1m.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2***).
  - A finger drain was constructed leading north from lateral drain L1. (***Photo 3***)
  - BGC logged the test pits excavated near the top of the silo cut (***Photo 4***). BGC will provide logs to JDS after they have been completed and reviewed.
  - BGC visited two locations that can potentially be used to produce ODF. The first area (near the electrical substation, ***Photo 5***) was a mix of strong, quartz rich metasediments and weaker metamorphic rock. This will likely be a good source for ODF material but may produce more reject and potentially slightly weaker drain rock. The material observed in the second area (near the ROM Road, ***Photo 6***) was much more competent and was composed of hard, quartz rich, partially silicified metasediments. This area would likely produce stronger drain material with less reject. An email summarizing this visit and BGC's observations was sent to JDS. BGC asked that JDS produce a small pile of ODF from each of these locations to determine gradation and durability through laboratory testing.
  - At JDS's request BGC visited the foundation for the Transfer Tower. BGC was asked to provide an opinion on whether there was bedrock throughout the bottom of the excavation. There was bedrock throughout the bottom of the excavation (***Photo 7***). BGC provided two emails stating this, at JDS's request. Although BGC is happy to provide assistance with non-scope items (IE, non-HLF items), we strongly recommend that matters related to foundation subgrade for critical structures include input and approval by the projects Designer to ensure that it meets the design intent.
- Observations and Recommendations (Open/Ongoing):
  - Material being generated from the Event Pond was variable. Some material is being hauled to the embankment for construction, some (finer material) is being stockpiled for construction of the Event Pond berms, and some material is being wasted. JDS and Pelly should update the material management plan to track the volumes and locations of these materials to ensure that they are not used incorrectly. This will also help with planning on what material can be placed before the end of the season and how to protect stockpiled material from becoming over saturated over the winter season. Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) near the ADR cut.
    - Waste topsoil within the footprint of the Event Pond.
    - Waste topsoil at the toe of the Event Pond.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond.
  - It is likely that ice rich ground will be encountered in the Event Pond area where there are pockets or zones of phyllitic material. During borrow when phyllitic material (identified as a gray, clayey material) is encountered BGC should be notified to inspect the borrow cut. Ice or flowing water has been routinely found either in these phyllitic layers or direction above them if the phyllitic layer is degraded to clay and acts as an aquitard. Since ice rich material creates zones of oversaturation and low density when used for lift construction, identifying this material at the source before placement will help ensure that placed lifts will not have to be removed.
- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF. A trench should be dug in this area to verify material properties and to note any features that could potentially cause stability issues.

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC Daily Reports up to September 5.
  - Field density and moisture testing were provided to BGC up to September 5.

- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 6, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber / Troy Meyer	**Weather:**	Overcast 0°C to 12°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - No work was performed at the Event Pond.
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 1***). Material was placed to 921.9m.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2***). Wet material was placed in some isolated spots late evening or early morning yesterday, which had to be removed. Dry material was used throughout the day and no further issues were encountered.
  - The test trench through the right abutment was continued to the top of the abutment. (***Photo 3***).
  - BGC provided JDS a realignment of the western HL perimeter road moving it 30m away from the ADR cut.

- Observations and Recommendations (Open/Ongoing):
  - Material being generated from the Event Pond was variable. Some material is being hauled to the embankment for construction, some (finer material) is being stockpiled for construction of the Event Pond berms, and some material is being wasted. JDS and Pelly should update the material management plan to track the volumes and locations of these materials to ensure that they are not used incorrectly. This will also help with planning on what material can be placed before the end of the season and how to protect stockpiled material from becoming over saturated over the winter season. Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) near the ADR cut.
    - Waste topsoil within the footprint of the Event Pond.
    - Waste topsoil at the toe of the Event Pond.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond.
  - It is likely that ice rich ground will be encountered in the Event Pond area where there are pockets or zones of phyllitic material. During borrow when phyllitic material (identified as a gray, clayey material) is encountered BGC should be notified to inspect the borrow cut. Ice or flowing water has been routinely found either in these phyllitic layers or direction above them if the phyllitic layer is degraded to clay and acts as an aquitard. Since ice rich material creates zones of oversaturation and low density when used for lift construction, identifying this material at the source before placement will help ensure that placed lifts will not have to be removed.
  - BGC asked that JDS produce a small pile of ODF from the Electrical Substation and the ROM Road areas so they can be analyzed for gradation and durability.

- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF. A trench should be dug in this area to verify material properties and to note any features that could potentially cause stability issues.

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC Daily Reports up to September 6.
  - Field density and moisture testing were provided to BGC up to September 6.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 7, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber / Troy Meyer	**Weather:**	Clear 5ºC to 15ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - No work was performed at the Event Pond.
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 1***). Material was placed to 922.9m.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2 and 3***).
  - An area of frozen ground was discovered near the 940 west lateral drain. Excavation of this area began. (***Photo 4***).
  - The area excavated over the right abutment continues to thaw. However, the base of the excavation appears to be in bedrock. (***Photo 5***)
  - QC on night shift reported that Pelly resumed borrow at the Event Pond.
  - BGC and Pelly caught up on official foundation approvals for the embankment. Foundation approvals 16 through 25 were signed for the record.
  - Frozen ground was identified in several test pits excavated late July on the west side of the lined impoundment area. BGC recommended that an area be excavated deeper than design grade in this area to remove ice (***Figure 1***). Since then this area has been partially exposed during shaping and road construction. This has resulted in at least partial melt of the ground ice (***Photo 6***). BGC has asked that the locations of the test pits where ground ice was found be marked by survey and in the field for reference. Ground ice in soils will have to be removed prior to placement of liner. If Pelly would like to re-evaluate the presence/thickness of ground ice to better estimate the level of effort remaining BGC recommends test pits within this area. BGC would like to be present during the excavation of these test pits to confirm and log the presence of ground ice, as is required in the Foundation Improvement Plan.
  - Pelly provided an updated stockpile management plan figure showing the location and volumes of Material 3 and some of the waste piles.

- Observations and Recommendations (Open/Ongoing):
  - Material being generated from the Event Pond was variable. JDS and Pelly should update the material management plan to track the volumes and locations of these materials to ensure that they are not used incorrectly. This will also help with planning on what material can be placed before the end of the season and how to protect stockpiled material from becoming over saturated over the winter season. Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) near the ADR cut.
    - Waste topsoil at the toe of the Event Pond.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond.
  - It is likely that ice rich ground will be encountered in the Event Pond area where there are pockets or zones of phyllitic material. During borrow when phyllitic material (identified as a gray, clayey material) is encountered BGC should be notified to inspect the borrow cut. Ice or flowing water has been routinely found either in these phyllitic layers or direction above them if the phyllitic layer is degraded to clay and acts as an aquitard. Since ice rich material creates zones of oversaturation and low density when used for lift construction, identifying this material at the source before placement will help ensure that placed lifts will not have to be removed.
  - BGC asked that JDS produce a small pile of ODF from the Electrical Substation and the ROM Road areas so they can be analyzed for gradation and durability.

- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF.

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC Daily Reports up to September 7.

- Field density and moisture testing were provided to BGC up to September 7.

- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Safety Issues: None

Photo 1: Embankment construction.

Photo 2: Shaping and compacting the eastern portion of the impoundment area.

Photo 3: Shaping in the central portion of the impoundment/sump area.

Photo 4: Frozen ground being excavated on the western portion of the impoundment area near the lateral/ drain trench junction.

Photo 5: Frozen/ unsuitable material cut with the western portion of the embankment footprint.

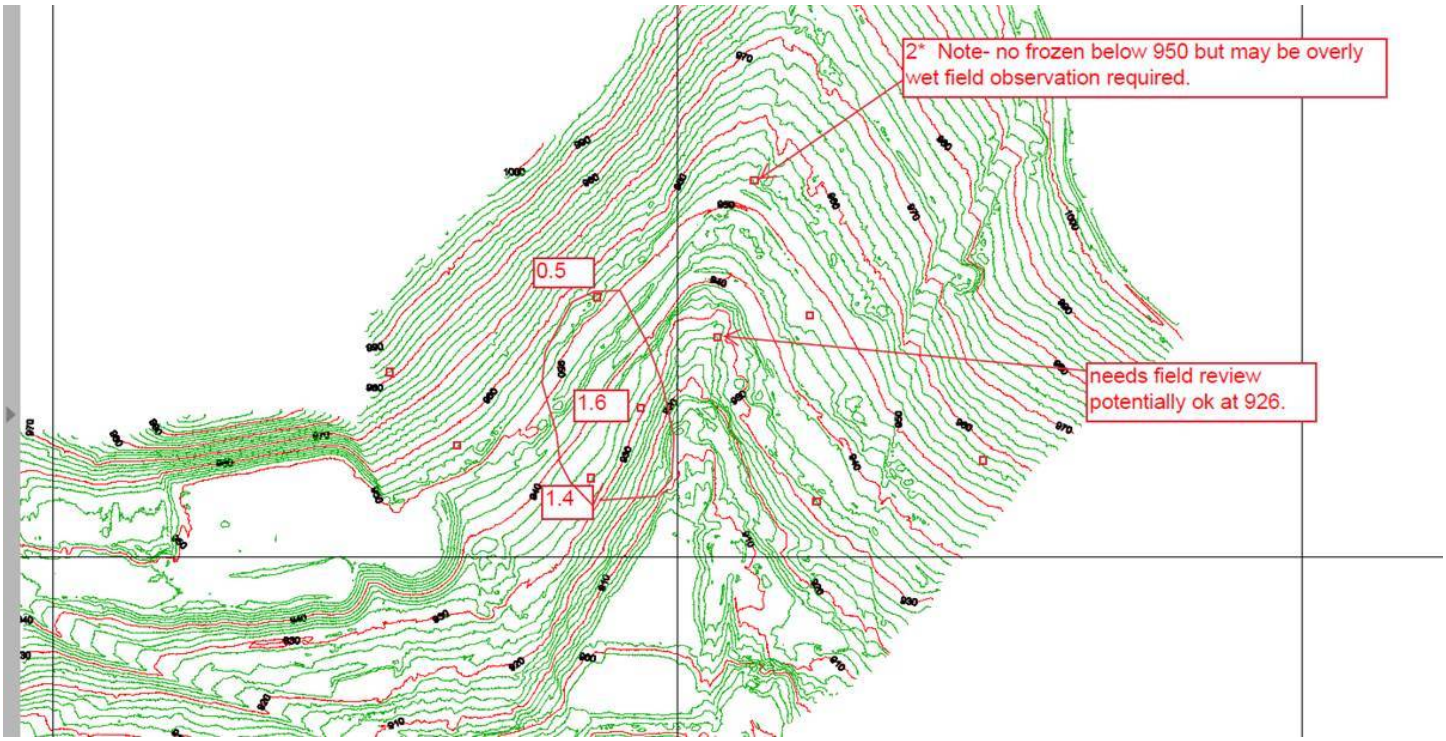

Photo 3: Area recommended for excavation deeper than design grade. Numbers are meters below design grade to remove ice observed in the test pits. This recommendation was made soon after completion of the test pits in late July. Since then work has exposed frozen ground in the area and caused melt. This area should be inspected again if Pelly would like an idea of how much effort will be needed to remove ice.

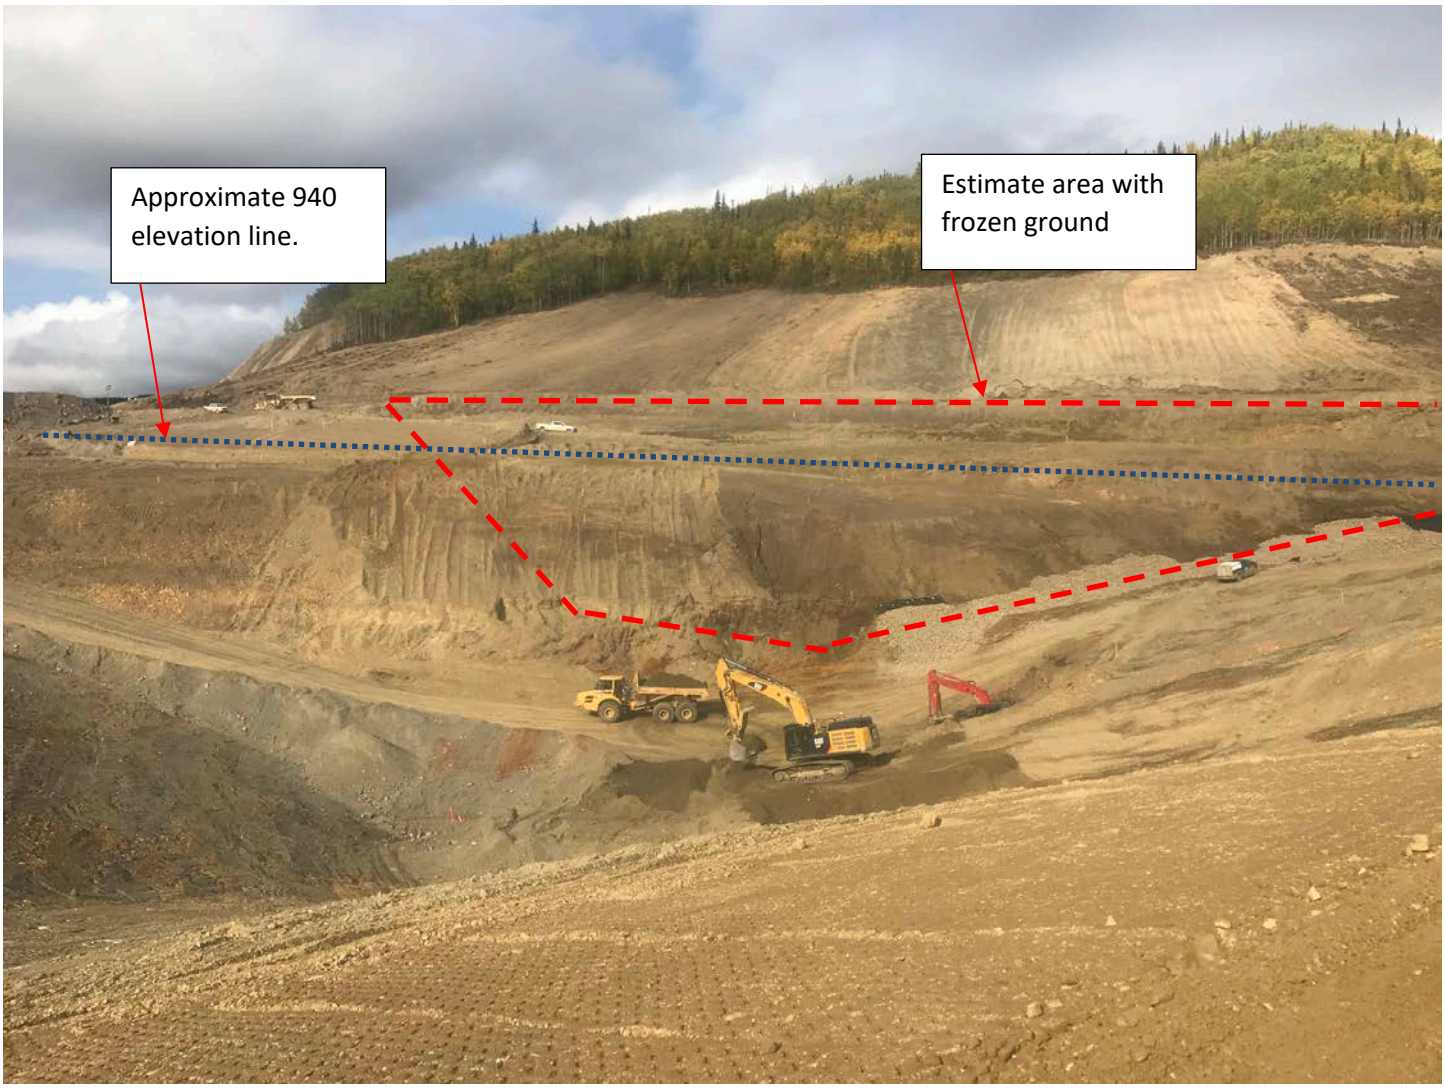

Photo 6: Estimate extent of frozen soils based on test pits excavated in late July. Ice has been melting since test pits were completed. However, ground ice in soil has still been found recently.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 8, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber / Troy Meyer	**Weather:**	Clear 4ºC to 16ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - No work was performed at the Event Pond.
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 1***). Material was placed to 923.7m.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2 and 3***).
  - The area of frozen ground found yesterday was excavated. Additional frozen ground to the west and south likely exists. (***Photo 4***). Test pits will be dug tomorrow to investigate.
  - Some material being excavated from the Event Pond was gap graded. This was happening because the material was being directly dug by an excavator vs having a dozer rip and push the material first. None of the material was rejected and no constructed lifts were removed. Pelly moved a dozer to Event Pond to rip the material prior to loading which corrected the problem. (***Photo 5***)
  - Survey marked the test pits where frozen ground was observed on the west side of the embankment. BGC and Pelly will excavate more test pits in the area to verify either that the ground ice has melted and the ground can be built on or that the ground ice still is present and has to be removed.

- Observations and Recommendations (Open/Ongoing):
  - Material being generated from the Event Pond was variable. JDS and Pelly should update the material management plan to track the volumes and locations of these materials to ensure that they are not used incorrectly. This will also help with planning on what material can be placed before the end of the season and how to protect stockpiled material from becoming over saturated over the winter season. Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) near the ADR cut.
    - Waste topsoil at the toe of the Event Pond.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond.
  - It is likely that ice rich ground will be encountered in the Event Pond area where there are pockets or zones of phyllitic material. During borrow when phyllitic material (identified as a gray, clayey material) is encountered BGC should be notified to inspect the borrow cut. Ice or flowing water has been routinely found either in these phyllitic layers or direction above them if the phyllitic layer is degraded to clay and acts as an aquitard. Since ice rich material creates zones of oversaturation and low density when used for lift construction, identifying this material at the source before placement will help ensure that placed lifts will not have to be removed.
  - BGC asked that JDS produce a small pile of ODF from the Electrical Substation and the ROM Road areas so they can be analyzed for gradation and durability.

- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF.

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC Daily Reports up to September 8.
  - Field density and moisture testing were provided to BGC up to September 8.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 9, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber / Troy Meyer	**Weather:**	Clear 4ºC to 16ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - No work was performed at the Event Pond.
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 1***). Material was placed to 924.8m.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2***).
  - An area of frozen ground was being excavated by Cobalt directly over the right abutment. (***Photo 3***).
  - The wedge of colluvium and rock between the embankment and event pond cut is frozen and ice rich. (***Figure 1***). Since this area is close to the event pond cut it would could cause instability while melting. BGC recommends that frozen soils be removed from this area if they don't melt before constructing the Event Pond Cut.
  - The area where ice rich soils were found in test pits excavated in July was shaped and excavated to bedrock. None of the soils excavated from this area were frozen and likely melted over the summer. Bedrock reached was frozen and contained ice. BGC and Pelly are devising methods to control water from this exposed, melting ice during construction. (***Photo 4***).
  - The soils around the joint between the lateral drain L3 and the pipe trench was frozen and ice rich. They were removed and Pelly began backfilling this area to reconstruct the drain trench in fill. (***Photo 5***)
  - Material 2 (Reject Sand) was used to level the area on the east side of the impoundment to prepare for liner installation. (***Photo 6***)
  - BGC provided an alternative design to the liner to concrete connection.
  - BGC is developing a change the crest alignment at the left abutment to ensure this area is built on competent bedrock. Underhill's most recent topographic survey will be needed to finalize this design change. JDS will provide this survey tomorrow.

- Observations and Recommendations (Open/Ongoing):
  - Material being generated from the Event Pond was variable. JDS and Pelly should update the material management plan to track the volumes and locations of these materials to ensure that they are not used incorrectly. This will also help with planning on what material can be placed before the end of the season and how to protect stockpiled material from becoming over saturated over the winter season. Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) near the ADR cut.
    - Waste topsoil at the toe of the Event Pond.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond.
  - It is likely that ice rich ground will be encountered in the Event Pond area where there are pockets or zones of phyllitic material. During borrow when phyllitic material (identified as a gray, clayey material) is encountered BGC should be notified to inspect the borrow cut. Ice or flowing water has been routinely found either in these phyllitic layers or direction above them if the phyllitic layer is degraded to clay and acts as an aquitard. Since ice rich material creates zones of oversaturation and low density when used for lift construction, identifying this material at the source before placement will help ensure that placed lifts will not have to be removed.
  - BGC asked that JDS produce a small pile of ODF from the Electrical Substation and the ROM Road areas so they can be analyzed for gradation and durability.

- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF.

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC Daily Reports up to September 9.
  - Field density and moisture testing were provided to BGC up to September 9.
- BGC Recommendations:

- Moisture will be monitored by BGC and adjustments made as needed.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber	**Weather:**	Sunny 3°C to 11°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Work continued at the Event Pond.
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 1***). Material was placed to 926.8m.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2***).
  - Liner was installed on a portion of the East In-Heap Pond area. (***Photo 3***).
  - An area of frozen ground is being excavated by Cobalt directly over the right abutment.
  - Work continued on the area around the West 940 Lateral Drain.
  - BGC reviewed topo data provided by Pelly for the east side of the of the in-heap pond. This area was approved for liner installation.
  - JDS provided BGC recently collected topographic data for the embankment area to evaluate against the left abutment bend.

- Observations and Recommendations (Open/Ongoing):
  - Material being generated from the Event Pond was variable. JDS and Pelly should update the material management plan to track the volumes and locations of these materials to ensure that they are not used incorrectly. This will also help with planning on what material can be placed before the end of the season and how to protect stockpiled material from becoming over saturated over the winter season. Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) near the ADR cut.
    - Waste topsoil at the toe of the Event Pond.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond.
  - It is likely that ice rich ground will be encountered in the Event Pond area where there are pockets or zones of phyllitic material. During borrow when phyllitic material (identified as a gray, clayey material) is encountered BGC should be notified to inspect the borrow cut. Ice or flowing water has been routinely found either in these phyllitic layers or direction above them if the phyllitic layer is degraded to clay and acts as an aquitard. Since ice rich material creates zones of oversaturation and low density when used for lift construction, identifying this material at the source before placement will help ensure that placed lifts will not have to be removed.
  - A wedge of colluvium and rock between the embankment and event pond cut is frozen and ice rich. This area is close to the event pond cut and may cause instability while melting. BGC recommends that frozen soils be removed from this area.

- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF.

QA/QC Results

- QA/QC:
  - Tetra Tech provided HLF earthworks QC Daily Reports for September 11.
  - Field density and moisture testing were provided to BGC for September 11.
  - Tetra Tech provided QC Daily Reports for liner installation on September 11.
  - Tetra Tech delivered the Gradation results for the ODF produced from the Substation and ROM Road sources.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Photo 1: Embankment construction.

Photo 2: Shaping and compacting the impoundment area.

Photo 3: Liner installation at the East In-Heap Pond/ Heap Pad area.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 12, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Ethan Faber/ Elliot Mathews	**Weather:**	Cloudy -3ºC to 9ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Elliot Mathews with BGC arrived on site. Ethan Faber will leave tomorrow.
  - Work continued at the Event Pond. Pelly stopped excavating on the night shift due to the presence of ice rich materials.
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 1***). Material was placed to 927.6m.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2***).
  - Liner was installed on a portion of the East In-Heap Pond area. (***Photo 3***).
  - An area of frozen ground is being excavated by Cobalt directly over the right abutment.
  - Work continued on the area around the West 940 Lateral Drain. A pocket of frozen colluvium was discovered north of the completed drain. When following it the frozen material sloped under an approved area of the drain. The drain and frozen material was dug up. (***Photo 4 and 5***) Ice rich, thaw unstable, or frost susceptible soils, even if found under approved completed construction, will have to be removed per the Foundation Improvement Plan. (**Figure 1**). As this area is excavated if frost slopes under the completed drain trench, the drain trench will have to be removed and rebuilt. The construction is currently moving towards the west side of the impoundment and heap leach pad where ice rich, thaw unstable soils are known to be present. If the risk of removing completed construction is not acceptable to JDS and Pelly then BGC recommends completing test pits or drilling in all approved areas before construction begins there. Test pit/drilling spacing will be provided or approved by BGC and will be dependent on the area shape and size.
  - BGC approved Section 29 of the embankment foundation.
  - BGC approved a grade break of 2.5:1 to 1.5:1 at on the downstream embankment face starting at 930.5m to allow for a wider crest in the area where the impoundment piping will be installed.
  - BGC, Pelly, and JDS discussed methods to control melt water daylighting on the west side of the impoundment. The area will first be shaped then wet areas will be addressed using placing blast rock against wet slopes or new drains. Areas shaped in soils will be test pitted to verify that no frozen, ice rick, thaw unstable soils are present.

- Observations and Recommendations (Open/Ongoing):
  - Material being generated from the Event Pond was variable. JDS and Pelly should update the material management plan to track the volumes and locations of these materials to ensure that they are not used incorrectly. This will also help with planning on what material can be placed before the end of the season and how to protect stockpiled material from becoming over saturated over the winter season. Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) near the ADR cut.
    - Waste topsoil at the toe of the Event Pond.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond.
  - It is likely that ice rich ground will be encountered in the Event Pond area where there are pockets or zones of phyllitic material. During borrow when phyllitic material (identified as a gray, clayey material) is encountered BGC should be notified to inspect the borrow cut. Ice or flowing water has been routinely found either in these phyllitic layers or direction above them if the phyllitic layer is degraded to clay and acts as an aquitard. Since ice rich material creates zones of oversaturation and low density when used for lift construction, identifying this material at the source before placement will help ensure that placed lifts will not have to be removed.

- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF.

QA/QC Results

- QA/QC:
  - Tetra Tech provided HLF earthworks QC Daily Reports for September 12.

- Field density and moisture testing were provided to BGC for September 12.
- Tetra Tech provided QC Daily Reports for liner installation on September 12.

- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 13, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Mathews	**Weather:**	Cloudy 5°C to 11°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Ethan Faber left site
  - Work continued at the Event Pond. BGC and Pelly delineated icy materials and developed a plan to borrow the area.
  - I pile of ice-rich material was created during the clean up the of the Event Pond borrow. This pile is located approximately 15m west of the area being borrowed. Pelly stated that they plan to let this material sit to allow it to melt. BGC should inspect this pile again before use. The pile should be labeled and included in the stockpile management plan so it is not accidentally borrowed. (***Figure 1***)
  - Material excavated from the east side of the in-heap pond area was used as structural fill in the embankment.
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 1***). Material was placed to 928.5m.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2***).
  - The area where thaw unstable frozen soils were found was backfilled. BGC delineated where rock was observed. Frozen soils were left in place above the rock to the north and west of the backfilled area (***Photo 3***). Pelly stated that once they continue clearing this area they will excavate out their construction to remove these frozen areas. This thaw unstable soils will have to be removed even if ice melts.
  - Liner was installed on a portion of the East In-Heap Pond area. (***Photo 4***).
  - An area of frozen ground is being excavated by Cobalt directly over the right abutment. (***Photo 5***)

- Observations and Recommendations (Open/Ongoing):
  - Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) near the ADR cut.
    - Waste topsoil at the toe of the Event Pond.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond.
  - It is likely that ice rich ground will be encountered in the Event Pond area where there are pockets or zones of phyllitic material. During borrow when icy material is encountered BGC should be notified to inspect the borrow cut. Material with ice is not permitted in for use as fill in any part of the HLF construction.
  - Frozen, ice-rich, thaw unstable, and frost susceptible soils found during the course of construction will have to be removed. This includes instances where these materials are discovered to dip below already approved construction. This is required in the Foundation Improvement Plan approved for construction of the HLF.

- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF.
  - BGC approved a grade break of 2.5:1 to 1.5:1 at on the downstream embankment face starting at 930.5m to allow for a wider crest in the area where the impoundment piping will be installed.

QA/QC Results

- QA/QC:
  - Tetra Tech provided HLF earthworks QC Daily Reports for September 13.
  - Field density and moisture testing were provided to BGC for September 13.
  - Tetra Tech provided QC Daily Reports for liner installation on September 13.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 14, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Mathews	**Weather:**	Cloudy -3°C to 10°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Work continued at the Event Pond. (***Photo 1***)
  - The pile of icy material at the event pond was added to and has grown in size. It is located against the area where good material is being borrowed. The pile was accidently borrowed during both the day and night shift today. QA and QC caught this early each time and was able to stop it. The pile should be labeled and included in the stockpile management plan so it is not accidentally borrowed. As part of the management plan Pelly should consider moving the pile further away from the good borrow source if accidental borrow continues to be an issue. (***Figure 1***)
  - Material excavated from the west side of the in-heap pond was tested and failed density and moisture in spots. This material is significantly finer. BGC has recommended it stopped being used in the embankment unless placed in 30 cm loose lifts. The material looks like it would be well suited for Material 1 or Material 2 under the liner. However, it should be placed in maximum 30cm loose lifts in these areas as well. QA and QC will continue to monitor this material when it is used to ensure it is meeting specification requirements. Further modifications to the placement and compaction methods may be needed. (***Photo 2 and Figure 2***)
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 3***). Material was placed to 929.5m.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 4***).
  - The lateral drain excavated when frozen material was found was re-built (West 940 Lateral Drain). Pipe for the lateral was connected to the underdrain trench using electro-fusion. (***Photo 5***).
  - Liner was installed on a portion of the East In-Heap Pond area. (***Photo 6***).
  - An area of frozen ground is being excavated by Cobalt directly over the right abutment. (***Photo 7***)
  - The re-alignment of the left abutment road was verified vs the most recent topographic data provided by JDS. A final figure and CAD file for the re-alignment was sent to JDS. BGC has requested an RFI from JDS/Pelly to allow for formal tracking of this change.
  - Layfield reported issues placing liner on slopes steeper than 2.5:1. Liner slipping is an issue as well as crew safety. Layfield has requested that surfaces be no steeper than 2.5:1 for future approved subgrade.

- Observations and Recommendations (Open/Ongoing):
  - Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) near the ADR cut.
    - Waste topsoil at the toe of the Event Pond.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond.
    - Ice rich material near the Event Pond borrow.
  - It is likely that ice rich ground will be encountered in the Event Pond area. During borrow when icy material is encountered BGC should be notified to inspect the borrow cut. Material with ice is not permitted in for use as fill in any part of the HLF construction.
  - Frozen, ice-rich, thaw unstable, and frost susceptible soils found during the course of construction will have to be removed. This includes instances where these materials are discovered to dip below already approved construction. This is required in the Foundation Improvement Plan approved for construction of the HLF.
  - An area of thaw unstable soils was built against near the West 940 Lateral. Pelly plans to excavate this construction at a later date to remove the thaw unstable soil once the 940 liner area preparation is complete.

- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF.
  - BGC approved a grade break of 2.5:1 to 1.5:1 at on the downstream embankment face starting at 930.5m to allow for a wider crest in the area where the impoundment piping will be installed.

QA/QC Results

- QA/QC:

- Tetra Tech provided HLF earthworks QC Daily Reports for September 14.
- Field density and moisture testing were provided to BGC for September 14.
- Tetra Tech provided QC Daily Reports for liner installation on September 14.

- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 15, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Mathews	**Weather:**	Sunny -6ºC to 12ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - No work was performed at the Event Pond.
  - The embankment construction continued using a mix of material from the ADR West and the Material 3 stockpile on the ADR East. A couple of times the stockpile at the ADR East was dug too deep and organic rich material was brought to the site. BGC had this material removed from the lifts. (***Photo 1***). On the night shift a mix of material from the ADR West and material from clearing the West HLF area were used. The material from the West HLF was significantly finer so it was placed in 30cm loose lifts and required 3 passes with a 12 ton compactor and 4 passes with a 9 ton compactor.
  - Pelly placed structural fill (Material 3) at the embankment (***Photo 2***). Material was placed to 930.5m.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 3***).
  - A portion of the West 940 Lateral Drain was completed. (***Photo 4***)
  - Liner installation continued. The geonet portion of liner was installed in part of the eastern in-heap pond area. (***Photo 5***).
  - An area of frozen ground is being excavated by Cobalt directly over the right abutment. (***Photo 6***)
  - Nighttime temperatures will be below freezing for the next 5 to 7 days. QA and QC will monitor Material 3 temperatures at night and early morning and determine if lift scarification will be necessary.

- Observations and Recommendations (Open/Ongoing):
  - The pile of icy material at the event pond was accidently borrowed several times. BGC placed a sign on the material to help the operators identify it. The pile should be labeled properly by Pelly or JDS and included in the stockpile management plan so it is not accidentally borrowed. As part of the management plan Pelly should consider moving the pile further away from the good borrow source if accidental borrow continues to be an issue. Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - It is likely that ice rich ground will be encountered in the Event Pond area. During borrow when icy material is encountered BGC should be notified to inspect the borrow cut. Material with ice is not permitted in for use as fill in any part of the HLF construction.
  - Frozen, ice-rich, thaw unstable, and frost susceptible soils found during the course of construction will have to be removed. This includes instances where these materials are discovered to dip below already approved construction. This is required in the Foundation Improvement Plan approved for construction of the HLF.
  - An area of thaw unstable soils was built against near the West 940 Lateral. Pelly plans to excavate this construction at a later date to remove the thaw unstable soil once the 940 liner area preparation is complete. (***Photo 4***)

- Engineering:
  - BGC has analyzed the stability of the as-built ADR cut west of the HLF. The results indicate a required minimum setback of 30m from the crest of the cut to the centerline of the perimeter road.
  - An initial preliminary setback of 30m has been suggested for the planned lime silo cut on the east side of the HLF.
  - BGC approved a grade break of 2.5:1 to 1.5:1 at on the downstream embankment face starting at 930.5m to allow for a wider crest in the area where the impoundment piping will be installed.
  - Layfield reported issues placing liner on slopes steeper than 2.5:1. Liner slipping is an issue as well as crew safety. Layfield has requested that surfaces be no steeper than 2.5:1 for future approved subgrade. BGC approved the use of slopes up to 2:1 in small, discontinuous areas. However, if the installation contractor is reporting real world observations that could affect the integrity of the liner or the safety of workers these should be taken into account. BGC recommends that if slopes steeper than 2.5:1 are expected Pelly/JDS should provide BGC and Layfield with a drawing showing the extent of these areas. BGC, Pelly, JDS, and Layfield should then meet to discuss potential issues and a path forward.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 16, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Mathews	**Weather:**	Sunny -1°C to 13°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - The Event Pond was used for borrow today.
  - The embankment construction continued using a mix of material from the ADR West and the Event Pond. (***Photo 1***). Material was placed to 930.5m. An approximately 10m x 4m area was removed from the compacted lift placed on the day shift because it was constructed with unsuitable material brought from the Event Pond. The issue was identified and corrected quickly and no further issues were reported on the night shift.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2***). Pelly chose to connect the infiltration trench dug on this area to the under drains. This was approved and overseen by BGC. (***Photo 3***)
  - Another portion of the West 940 Lateral Drain was completed. (***Photo 4***)
  - Liner installation continued. The geonet portion of liner was installed in part of the eastern in-heap pond area. (***Photo 5***).
  - An area of frozen ground is being excavated by Cobalt directly over the right abutment. (***Photo 6***). JDS discussed the possibility of revising the spillway in the area where this material is being excavated due to the need for substantial fill in this area. BGC requested the most recent topographic data to evaluate this.

- Observations and Recommendations (Open/Ongoing):
  - The pile of icy material at the event pond was accidently borrowed several times. BGC placed a sign on the material to help the operators identify it. The pile should be labeled properly by Pelly or JDS and included in the stockpile management plan so it is not accidentally borrowed. As part of the management plan Pelly should consider moving the pile further away from the good borrow source if accidental borrow continues to be an issue. Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - It is likely that ice rich ground will be encountered in the Event Pond area. During borrow when icy material is encountered BGC should be notified to inspect the borrow cut. Material with ice is not permitted in for use as fill in any part of the HLF construction.
  - Frozen, ice-rich, thaw unstable, and frost susceptible soils found during the course of construction will have to be removed. This includes instances where these materials are discovered to dip below already approved construction. This is required in the Foundation Improvement Plan approved for construction of the HLF.
  - An area of thaw unstable soils was built against near the West 940 Lateral. Pelly plans to excavate this construction at a later date to remove the thaw unstable soil once the 940 liner area preparation is complete.
  - Nighttime temperatures will be below freezing until September 22. QA and QC will monitor Material 3 temperatures at night and early morning and determine if lift scarification will be necessary.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 17, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Mathews	**Weather:**	Sunny -6ºC to 14ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - The Event Pond was used for borrow today.
  - The embankment construction continued using a mix of material from the ADR West and the Event Pond. (***Photo 1***). Material was placed to 932.85m.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2***).
  - BGC has recommended the use of finer material in smaller lifts for shaping of the in-heap pond, especially at the finished grade where liner will be placed. In some areas Material 3 has been used for filling, which is acceptable but will need additional work to prepare it for liner placement. Areas that are too rocky or have protrusions or voids greater than 0.5" should be covered with Material 2 to create a smooth, dry surface for the liner installation.
  - Liner installation continued. The geonet portion of liner was installed in part of the eastern in-heap pond area. (***Photo 3***).
  - An area of frozen ground is being excavated by Cobalt directly over the right abutment. (***Photo 4***). JDS discussed the possibility of revising the spillway in the area where this material is being excavated due to the need for substantial fill in this area. BGC requested the most recent topographic data to evaluate this.
  - The embankment right abutment cannot be completed because of work being done to remove ice rich material from the footprint. In the meantime the embankment raise continues. When the right abutment and spillway are completed they will have to be tied in (benched) to the raise construction. This will require a significant amount of excavation into the completed embankment.
  - BGC provided the CAD file for embankment grade change at the pipe installation corridor.
  - BGC drafter the following RFI's: BGC-RFI-010, BGC-RFI-011, BGC-RFI-012.

- Observations and Recommendations (Open/Ongoing):
  - The pile of icy material at the event pond was accidently borrowed several times. BGC placed a sign on the material to help the operators identify it. The pile should be labeled properly by Pelly or JDS and included in the stockpile management plan so it is not accidentally borrowed. As part of the management plan Pelly should consider moving the pile further away from the good borrow source if accidental borrow continues to be an issue. Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - It is likely that ice rich ground will be encountered in the Event Pond area. During borrow when icy material is encountered BGC should be notified to inspect the borrow cut. Material with ice is not permitted in for use as fill in any part of the HLF construction.
  - Frozen, ice-rich, thaw unstable, and frost susceptible soils found during the course of construction will have to be removed. This includes instances where these materials are discovered to dip below already approved construction. This is required in the Foundation Improvement Plan approved for construction of the HLF.
  - An area of thaw unstable soils was built against near the West 940 Lateral. Pelly plans to excavate this construction at a later date to remove the thaw unstable soil once the 940 liner area preparation is complete.
  - Nighttime temperatures will be below freezing until September 22. QA and QC will monitor Material 3 temperatures at night and early morning and determine if lift scarification will be necessary.
  - Layfield reported issues placing liner on slopes steeper than 2.5:1. Liner slipping is an issue as well as crew safety. Layfield has requested that surfaces be no steeper than 2.5:1 for future approved subgrade. BGC approved the use of slopes up to 2:1 in small, discontinuous areas. However, if the installation contractor is reporting real world observations that could affect the integrity of the liner or the safety of workers these should be taken into account. BGC recommends that if slopes steeper than 2.5:1 are expected Pelly/JDS should provide BGC and Layfield with a drawing showing the extent of these areas. BGC, Pelly, JDS, and Layfield should then meet to discuss potential issues and a path forward.

- Engineering:

- BGC will look at options for completion of the right abutment and spillway invert once JDS has provided an updated topographic map showing the current known bedrock surface.

QA/QC Results

- QA/QC:
  - Tetra Tech provided HLF earthworks QC Daily Reports for September 17.
  - Field density and moisture testing were provided to BGC for September 17.
  - Tetra Tech provided QC Daily Reports for liner installation on September 17.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 19, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Mathews	**Weather:**	Sunny -7ºC to 12ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - The Event Pond was used for borrow today.
  - Test pits were dug through the frozen material stockpiles at the Event Pond. The piles are still frozen and cannot be used for HLF construction. (***Photo 1***)
  - The embankment construction continued using a mix of material from the ADR West and the Event Pond. (***Photo 2***). Material was placed to 936.8m. During placement areas were being delivered with rocky, gap graded material. This was rectified quickly once the issue was brought up to Pelly.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 3***).
  - Liner installation continued. (***Photo 4***).
  - An area of frozen ground is being excavated by Pelly directly over the right abutment. (***Photo 5***).

- Observations and Recommendations (Open/Ongoing):
  - The pile of icy material at the event pond was accidently borrowed several times. BGC placed a sign on the material to help the operators identify it. The pile should be labeled properly by Pelly or JDS and included in the stockpile management plan so it is not accidentally borrowed. As part of the management plan Pelly should consider moving the pile further away from the good borrow source if accidental borrow continues to be an issue. Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - It is likely that ice rich ground will be encountered in the Event Pond area. During borrow when icy material is encountered BGC should be notified to inspect the borrow cut. Material with ice is not permitted in for use as fill in any part of the HLF construction.
  - Frozen, ice-rich, thaw unstable, and frost susceptible soils found during the course of construction will have to be removed. This includes instances where these materials are discovered to dip below already approved construction. This is required in the Foundation Improvement Plan approved for construction of the HLF.
  - An area of thaw unstable soils was built against near the West 940 Lateral. Pelly plans to excavate this construction at a later date to remove the thaw unstable soil once the 940 liner area preparation is complete.
  - Nighttime temperatures will be below freezing until September 22. QA and QC will monitor Material 3 temperatures at night and early morning and determine if lift scarification will be necessary.
  - Layfield reported issues placing liner on slopes steeper than 2.5:1. Liner slipping is an issue as well as crew safety. Layfield has requested that surfaces be no steeper than 2.5:1 for future approved subgrade. BGC approved the use of slopes up to 2:1 in small, discontinuous areas. However, if the installation contractor is reporting real world observations that could affect the integrity of the liner or the safety of workers these should be taken into account. BGC recommends that if slopes steeper than 2.5:1 are expected Pelly/JDS should provide BGC and Layfield with a drawing showing the extent of these areas. BGC, Pelly, JDS, and Layfield should then meet to discuss potential issues and a path forward.
  - BGC has recommended the use of finer material in smaller lifts for shaping of the in-heap pond, especially at the finished grade where liner will be placed. In some areas Material 3 has been used for filling, which is acceptable but will need additional work to prepare it for liner placement. Areas that are too rocky or have protrusions or voids greater than 0.5” should be covered with Material 2 to create a smooth, dry surface for the liner installation.
  - The embankment right abutment cannot be completed because of work being done to remove ice rich material from the footprint. In the meantime the embankment raise continues. When the right abutment and spillway are completed they will have to be tied in (benched) to the raise construction. This will require a significant amount of excavation into the completed embankment.

- Engineering:
  - BGC will look at options for completion of the right abutment and spillway invert once JDS has provided an updated topographic map showing the current known bedrock surface.

QA/QC Results

- QA/QC:
  - Tetra Tech provided HLF earthworks QC Daily Reports for September 19.
  - Field density and moisture testing were provided to BGC for September 19.
  - Tetra Tech provided QC Daily Reports for liner installation on September 19.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 21, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Mathews	**Weather:**	Sunny -7°C to 11°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - The main portion of the embankment construction was completed using a mix of material from the ADR West and embankment road material. (***Photo 1***). Material was placed to 939.5m, which is the final crest elevation. The western area of the embankment will be completed next.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2***).
  - A new surface for liner approval was provided to BGC by Pelly. (***Figure 1***) This drawing was shared with Tetra Tech. BGC, Tetra Tech, Layfield, and JDS visited the area to be approved. Minor work is needed to complete the area but surface and shape are acceptable.
  - Liner installation continued. (***Photo 3***).
  - An area of frozen ground is being excavated by Pelly directly over the right abutment. (***Photo 4***).
  - Pelly had 2 questions related to changes in the design and/or specifications for the HLF. For expediency these questions were answered. However, Pelly should provide RFI's to allow Victoria Gold to track these changes. The items were related to:
    - Slope of East Perimeter Road.
    - Piping details.

- Observations and Recommendations (Open/Ongoing):
  - Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - Material with ice is not permitted in for use as fill in any part of the HLF construction.
  - Frozen, ice-rich, thaw unstable, and frost susceptible soils found during the course of construction will have to be removed. BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 23, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Elliot Mathews	**Weather:**	Light Rain 0°C to 12°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed on the western area of the embankment. (***Photo 1***). Pelly focused on regrading the cut slope in this area for safety and this limited the amount of material placed.
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2***) The area where Pelly is shaping now will likely have frozen, ice rich, thaw unstable soils and will have to be excavated. This was communicated to Pelly. (***Photo 3***)
  - Liner installation continued. (***Photo 4***).
  - An area of frozen ground is being excavated by Pelly directly over the right abutment. (***Photo 5***). A wedge of frozen but not ice rich material is located between two area of ice rich ground in the excavation cut slope. This material from the surface looks acceptable as subgrade, however, it should be verified with test pits if Pelly/JDS want to construct on it. The material is finer than Material 3 used for the embankment. It would be suitable for use as Material 1.

- Observations and Recommendations (Open/Ongoing):
  - Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - Material with ice is not permitted in for use as fill in any part of the HLF construction.
  - Frozen, ice-rich, thaw unstable, and frost susceptible soils found during the course of construction will have to be removed. This includes instances where these materials are discovered to dip below already approved construction. This is required in the Foundation Improvement Plan approved for construction of the HLF.
  - An area of thaw unstable soils was built against near the West 940 Lateral. Pelly plans to excavate this construction at a later date to remove the thaw unstable soil once the 940 liner area preparation is complete.

BGC-RFI-011	Acknowledgement of receipt of changes made to the west perimeter road.	Open. Sent September 17, 2018.
BGC-RFI-012	Acknowledgement of receipt of changes made to grade break on the downstream embankment slope.	Open. Sent September 17, 2018.
CC204-RFI-043	Pelly is requesting revisions to the CAD file BGC provided as reference.	Open. Received September 24, 2018.
CC204-RFI-042	Pelly requesting info on HLF PLS Header and Recovery Piping	Closed. Received September 25, 2018. Response sent September 25, 2018.
CC204-RFI-041	Pelly is requesting details and requirements for the extension of the PLS header pipes from the PLS sump through the impoundment area	Further clarification on what is requested needed (Meeting to discuss preferred)

Safety Issues: None

Photo 3: Liner installation.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	September 26, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer/ Dan Granda / Elliot Mathews	**Weather:**	Sunny/overcast -5°C to 10°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed on the western area of the embankment. (***Photo 1***).
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2***) The area where Pelly is shaping now will likely have frozen, ice rich, thaw unstable soils and will have to be excavated. This was communicated to Pelly.
  - BGC/Pelly/JDS met (12:15 PM) at the embankment to discuss frozen, ice rich, thaw unstable soils being excavated, progress on west embankment area continues.
  - Liner installation continued. (***Photo 3***).
  - Pelly provided slope grade in in-heap pond and sump area for BGC to review and approve. BGC verified the shape vs the design, comments provided to Pelly, construction is on track.
  - BGC inspected downstream sump and underdrains for winterization progress (***Photo 4***).

- Observations and Recommendations (Open/Ongoing):
  - Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - Material with ice is not permitted in for use as fill in any part of the HLF construction.
  - Frozen, ice-rich, thaw unstable, and frost susceptible soils found during the course of construction will have to be removed. This includes instances where these materials are discovered to dip below already approved construction. This is required in the Foundation Improvement Plan approved for construction of the HLF.
  - An area of thaw unstable soils was built against near the West 940 Lateral. Pelly plans to excavate this construction at a later date to remove the thaw unstable soil once the 940 liner area preparation is complete.
  - Layfield reported issues placing liner on slopes steeper than 2.5:1. Liner slipping is an issue as well as crew safety. Layfield has requested that surfaces be no steeper than 2.5:1 for future approved subgrade. BGC approved the use of slopes up to 2:1 in small, discontinuous areas. However, if the installation contractor is reporting real world observations that could affect the integrity of the liner or the safety of workers these should be taken into account. BGC recommends that if slopes steeper than 2.5:1 are expected Pelly/JDS should provide BGC and Layfield with a drawing showing the extent of these areas. BGC, Pelly, JDS, and Layfield should then meet to discuss potential issues and a path forward.
  - BGC has recommended the use of finer material in smaller lifts for shaping of the in-heap pond, especially at the finished grade where liner will be placed.

- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided HLF earthworks QC Daily Reports for September 26.
  - Field density and moisture testing were provided to BGC for September 26.
  - Tetra Tech provided QC Daily Reports for liner installation on September 26.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

CC204-RFI-041	Pelly is requesting details and requirements for the extension of the PLS header pipes from the PLS sump through the impoundment area	BGC discussed with Pelly. Pelly to provide plan to use ordered joints. BGC will evaluate and respond.
EPCM-RFI-047	HLF Geocomposite Liner	Sent October 1, 2018. Response from BGC October 1, 2018.

Safety Issues: None

Photo 1: Lift placement at the embankment.

Photo 2: Pelly working on upstream embankment face for liner placement.

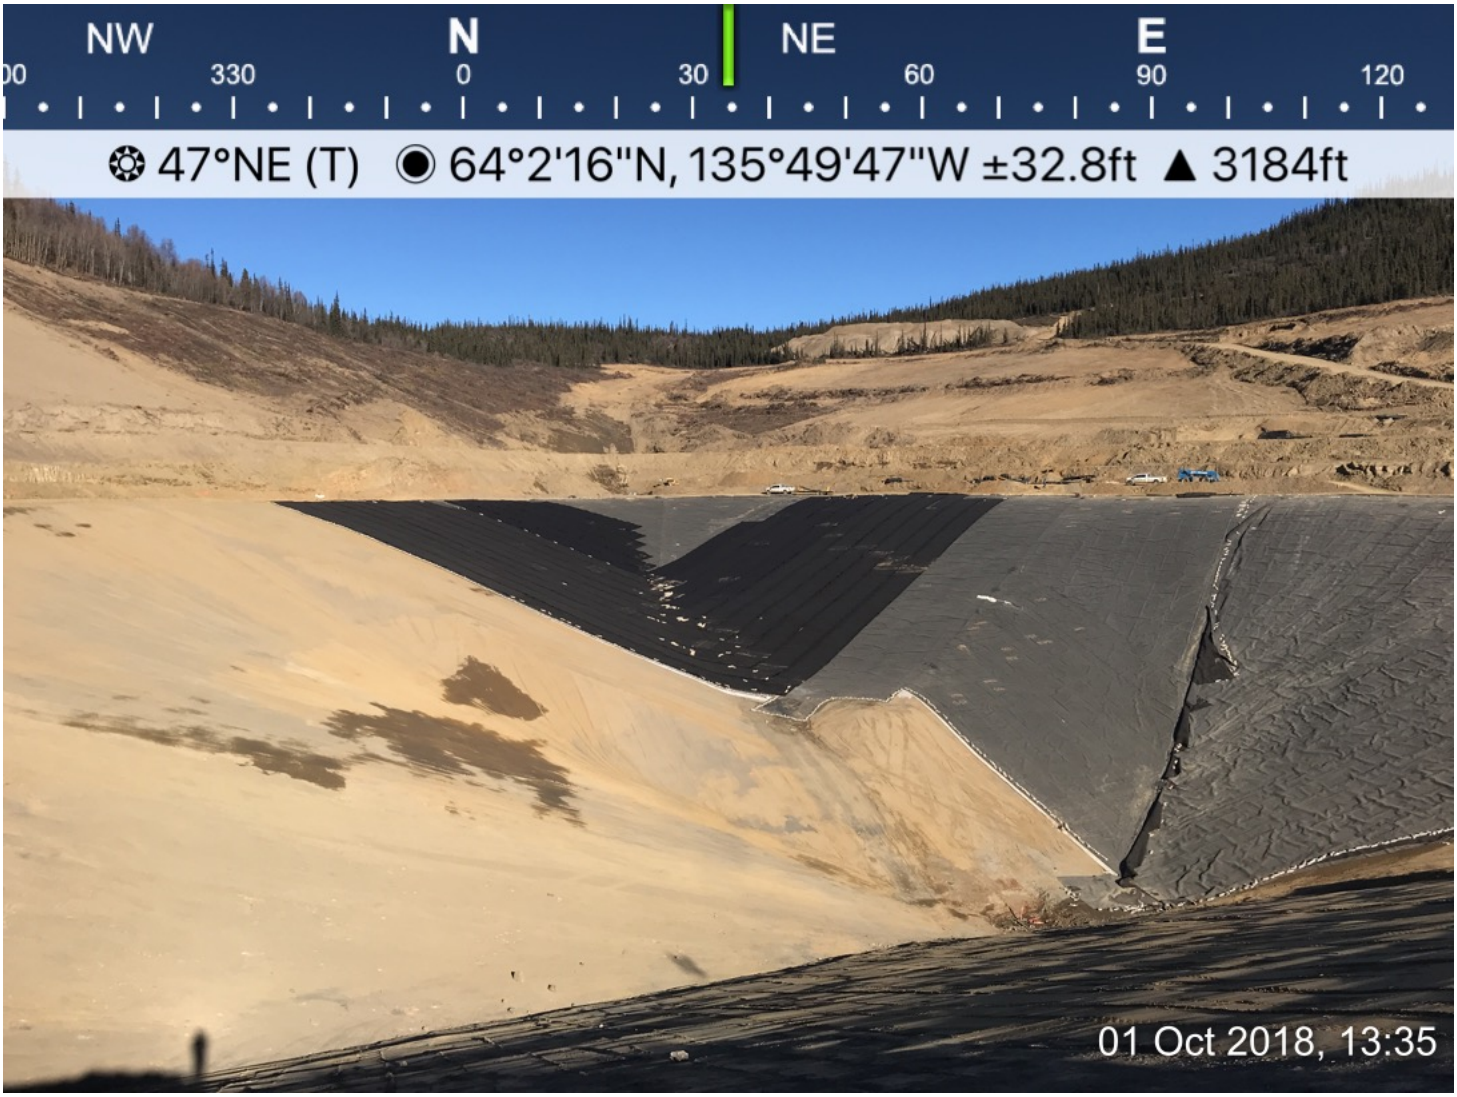

Photo 3: Liner installation.

Photo 4: Pelly smoothing out downstream slope face of embankment as part of winterization plan.

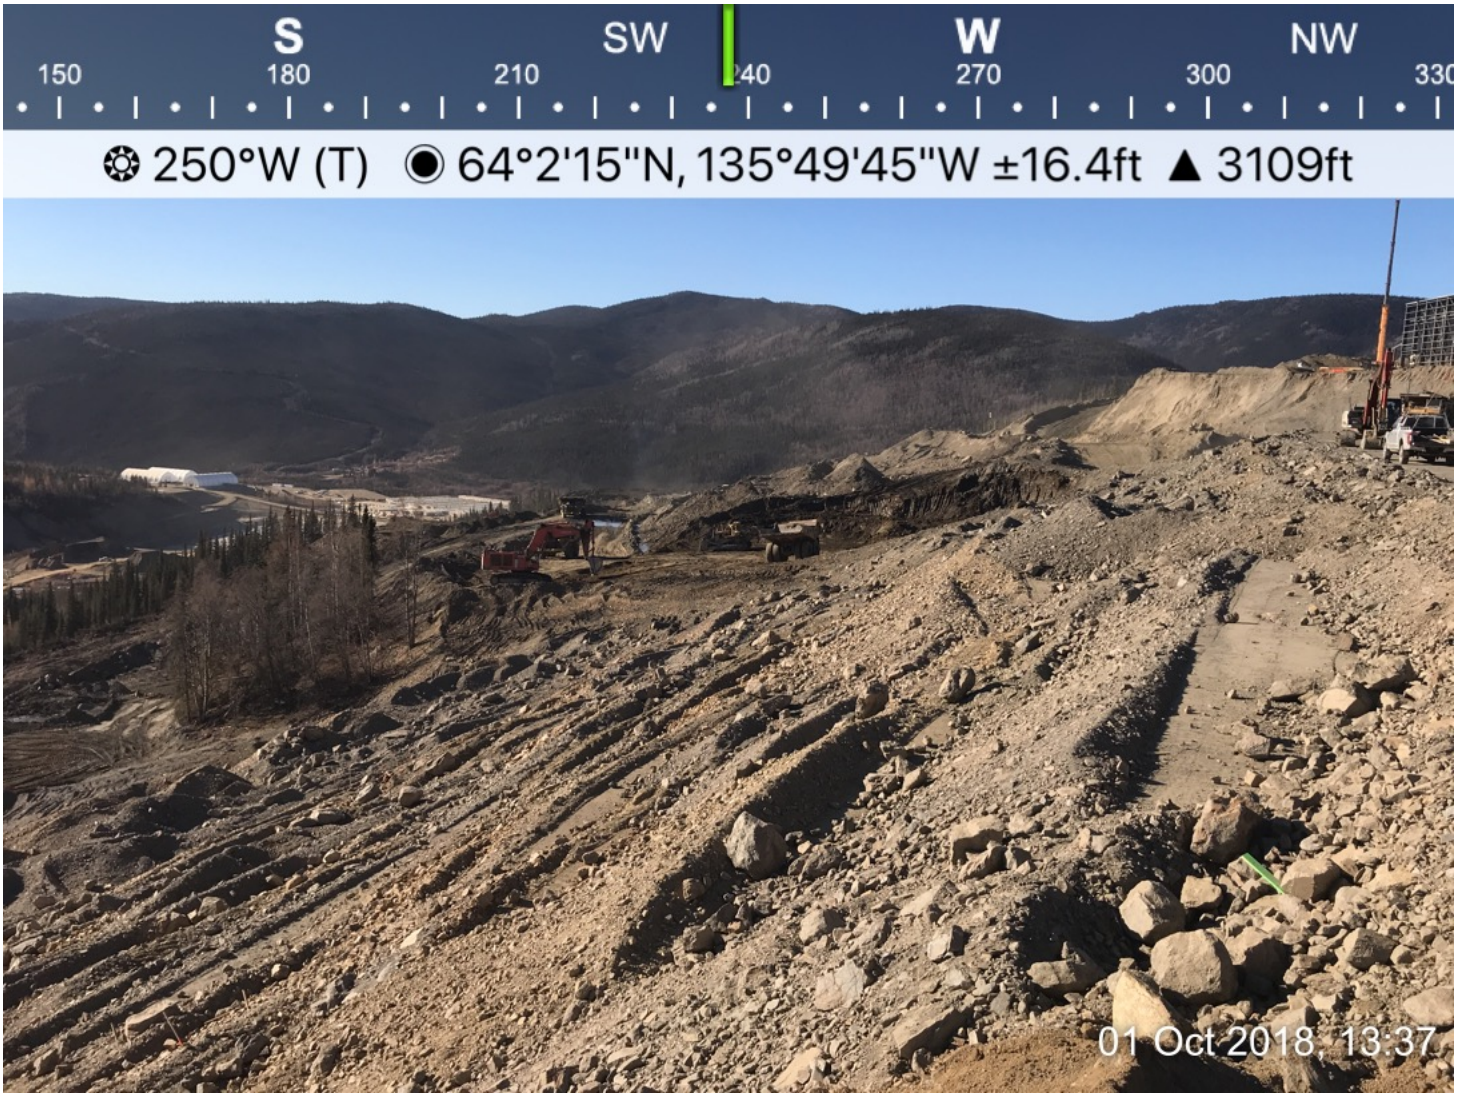

Photo 5: Pelly hauling and cleaning waste materials at event pond work zone and spillway area.

Photo 6: Soil heave was noticed yesterday and trench was excavated, trench will be backfilled with competent material for toe of event pond.

Photo 7: Event pond drain placement.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 2, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer/ Dan Granda / Elliot Mathews	**Weather:**	Sunny -8ºC to 5ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed on the western area of the embankment. (***Photo 1***).
  - Pelly continues work on shaping the impoundment area in preparation for liner installation. (***Photo 2***)
  - Liner installation continued. (***Photo 3***).
  - Winter is coming. BGC discussed with Pelly the status of the winterization progress, Pelly waiting on exfiltration tests to be completed by JDS before starting work in the downstream underdrains area.
  - Pelly started shaping the downstream slope of the embankment. (***Photo 4***).
  - Pelly is cleaning and hauling waste material on event pond and spillway work area (***Photo 5***).
  - Event pond drain was installed (***Photo 6***).

- Observations and Recommendations (Open/Ongoing):
  - Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - Material with ice is not permitted in for use as fill in any part of the HLF construction.
  - Frozen, ice-rich, thaw unstable, and frost susceptible soils found during the course of construction will have to be removed. This includes instances where these materials are discovered to dip below already approved construction. This is required in the Foundation Improvement Plan approved for construction of the HLF.
  - An area of thaw unstable soils was built against near the West 940 Lateral. Pelly plans to excavate this construction at a later date to remove the thaw unstable soil once the 940 liner area preparation is complete.
  - Layfield reported issues placing liner on slopes steeper than 2.5:1. Liner slipping is an issue as well as crew safety. Layfield has requested that surfaces be no steeper than 2.5:1 for future approved subgrade. BGC approved the use of slopes up to 2:1 in small, discontinuous areas. However, if the installation contractor is reporting real world observations that could affect the integrity of the liner or the safety of workers these should be taken into account. BGC recommends that if slopes steeper than 2.5:1 are expected Pelly/JDS should provide BGC and Layfield with a drawing showing the extent of these areas. BGC, Pelly, JDS, and Layfield should then meet to discuss potential issues and a path forward.
  - BGC has recommended the use of finer material in smaller lifts for shaping of the in-heap pond, especially at the finished grade where liner will be placed.

- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided HLF earthworks QC Daily Reports for September 30.
  - Field density and moisture testing were provided to BGC for September 30.
  - Tetra Tech provided QC Daily Reports for liner installation on September 30.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Personnel	Description
None	

Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
BGC-RFI-010	Acknowledgement of receipt of changes made to the east abutment and perimeter road.	Open. Sent September 17, 2018.
BGC-RFI-011	Acknowledgement of receipt of changes made to the west perimeter road.	Open. Sent September 17, 2018.
BGC-RFI-012	Acknowledgement of receipt of changes made to grade break on the downstream embankment slope.	Open. Sent September 17, 2018.
BGC-RFI-018	Event Pond Excavation Specification	Sent September 29, 2018.
CC204-RFI-041	Pelly is requesting details and requirements for the extension of the PLS header pipes from the PLS sump through the impoundment area	BGC discussed with Pelly. Pelly to provide plan to use ordered joints. BGC will evaluate and respond.
BGC-RFI-019	Closure Sump Steel Plate Detail	Sent October 1, 2018.
BGC-RFI-020	HLF VALID Liner Testing	Sent October 2, 2018.

Safety Issues: None

Photo 1: Pelly shaping impoundment zone on west side of embankment.

Photo 2: Layfield laid liner on the crest to impoundment sump.

Photo 3: Pelly continued digging out new are for underdrain winterization.

Photo 4: Working on the sump area.

Photo 5: Event pond progress.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 8, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Elliot Mathews	**Weather:**	Sunny -13°C to 4°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly is shaping slopes by the west abutment. (***Photo 1***).
  - Layfield placed liner on impoundment. (***Photo 2***).
  - No work from Heavy North was observed**.** Was asked to provide survey data of placement and pipe work.
  - Pelly did not work shaping the downstream slope of the embankment today. Estimated 50-60% complete.
  - Pelly is cleaning and hauling waste material on event pond.
  - Pelly began work for underdrain winter protection by placing river boulders, geotextile and geomembranes (***Photos 3 and 4***).
  - Event pond downstream lifts compacted (***Photo 5***).
- Observations and Recommendations (Open/Ongoing):
  - Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - Material with ice is not permitted in for use as fill in any part of the HLF construction.
  - Frozen, ice-rich, thaw unstable, and frost susceptible soils found during the course of construction will have to be removed. This includes instances where these materials are discovered to dip below already approved construction. This is required in the Foundation Improvement Plan approved for construction of the HLF.
  - An area of thaw unstable soils was built against near the West 940 Lateral. Pelly plans to excavate this construction at a later date to remove the thaw unstable soil once the 940 liner area preparation is complete.
  - Layfield reported issues placing liner on slopes steeper than 2.5:1. Liner slipping is an issue as well as crew safety. Layfield has requested that surfaces be no steeper than 2.5:1 for future approved subgrade. BGC approved the use of slopes up to 2:1 in small, discontinuous areas. However, if the installation contractor is reporting real world observations that could affect the integrity of the liner or the safety of workers these should be taken into account. BGC recommends that if slopes steeper than 2.5:1 are expected Pelly/JDS should provide BGC and Layfield with a drawing showing the extent of these areas. BGC, Pelly, JDS, and Layfield should then meet to discuss potential issues and a path forward.
  - BGC has recommended the use of finer material in smaller lifts for shaping of the in-heap pond, especially at the finished grade where liner will be placed.

- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided HLF earthworks QC Daily Reports for October 7.
  - Field density and moisture testing were provided to BGC for October 7.
  - Tetra Tech provided QC Daily Reports for liner installation on October 7.
  - Tetra Tech provided QC Daily Reports for event pond on October 8.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
BGC-RFI-018	Event Pond Excavation Specification	Sent September 29, 2018. Waiting confirmation of receipt.
CC204-RFI-041	Pelly is requesting details and requirements for the extension of the PLS header pipes from the PLS sump through the impoundment area	BGC discussed with Pelly. Pelly to provide plan to use ordered joints. BGC will evaluate and respond.
BGC-RFI-019	Closure Sump Steel Plate Detail	Sent October 1, 2018. Waiting confirmation of receipt.
BGC-RFI-020	HLF VALID Liner Testing	Sent October 2, 2018. Waiting confirmation of receipt.
CC204-RFI-044	PLS Piping Installation Rub Sheets	Sent October 8, 2018.

Safety Issues: None

Photo 1: Pelly shaping impoundment zone on west side of embankment.

Photo 2: Layfield laid liner on impoundment.

Photo 3: Pelly began placing river boulders in the exfiltration zone, marking pipe outlets for fill placement.

Photo 4: Winterization of downstream underdrains continues.

Photo 5: Event pond progress.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 9, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda	**Weather:**	Sunny -15°C to 2°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Elliot Matthews leaves site.
  - Pelly is now placing fill material to get surface ready for liner installation. (***Photo 1***).
  - Layfield placed liner on impoundment. (***Photo 2***).
  - No work from Heavy North was observed**.** Was asked to provide survey data of placement and pipe work via RFI.
  - Pelly shaped the downstream slope of the embankment today. Estimated 60-75% complete.
  - Pelly is cleaning and hauling waste material on event pond.
  - Pelly placed drain material, geotextile and fill for winterization (***Photos 3 and 4***).
  - Event pond downstream lifts compacted and QC test passed/lift accepted (***Photos 5 and 6***).

- Observations and Recommendations (Open/Ongoing):
  - Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - Layfield reported issues placing liner on slopes steeper than 2.5:1. Liner slipping is an issue as well as crew safety. Layfield has requested that surfaces be no steeper than 2.5:1 for future approved subgrade. BGC approved the use of slopes up to 2:1 in small, discontinuous areas. However, if the installation contractor is reporting real world observations that could affect the integrity of the liner or the safety of workers these should be taken into account. BGC recommends that if slopes steeper than 2.5:1 are expected Pelly/JDS should provide BGC and Layfield with a drawing showing the extent of these areas. BGC, Pelly, JDS, and Layfield should then meet to discuss potential issues and a path forward.
  - BGC has recommended the use of finer material in smaller lifts for shaping of the in-heap pond, especially at the finished grade where liner will be placed.

- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided HLF earthworks QC Daily Reports for October 9.
  - Field density and moisture testing were provided to BGC for October 9.
  - Tetra Tech provided QC Daily Reports for liner installation on October 9.
  - Tetra Tech provided QC Daily Reports for event pond on October 9.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
BGC-RFI-018	Event Pond Excavation Specification	Sent September 29, 2018. Waiting confirmation of receipt.
CC204-RFI-041	Pelly is requesting details and requirements for the extension of the PLS header pipes from the PLS sump through the impoundment area	BGC discussed with Pelly. Pelly to provide plan to use ordered joints. BGC will evaluate and respond.
BGC-RFI-019	Closure Sump Steel Plate Detail	Sent October 1, 2018. Waiting confirmation of receipt.
BGC-RFI-020	HLF VALID Liner Testing	Sent October 2, 2018. Waiting confirmation of receipt.
CC204-RFI-044	PLS Piping Installation Rub Sheets	Sent October 8, 2018. Response sent to JDS/Pelly October 9, 2018. Closed.
BGC-RFI-021	Steel plate installation and closure drain pipe (Asking for as-built survey)	Open. Sent Oct 9, 2018.
BGC-RFI-022	Event Pond Water Management Plan	Open. Sent Oct 9, 2018.

Safety Issues: None

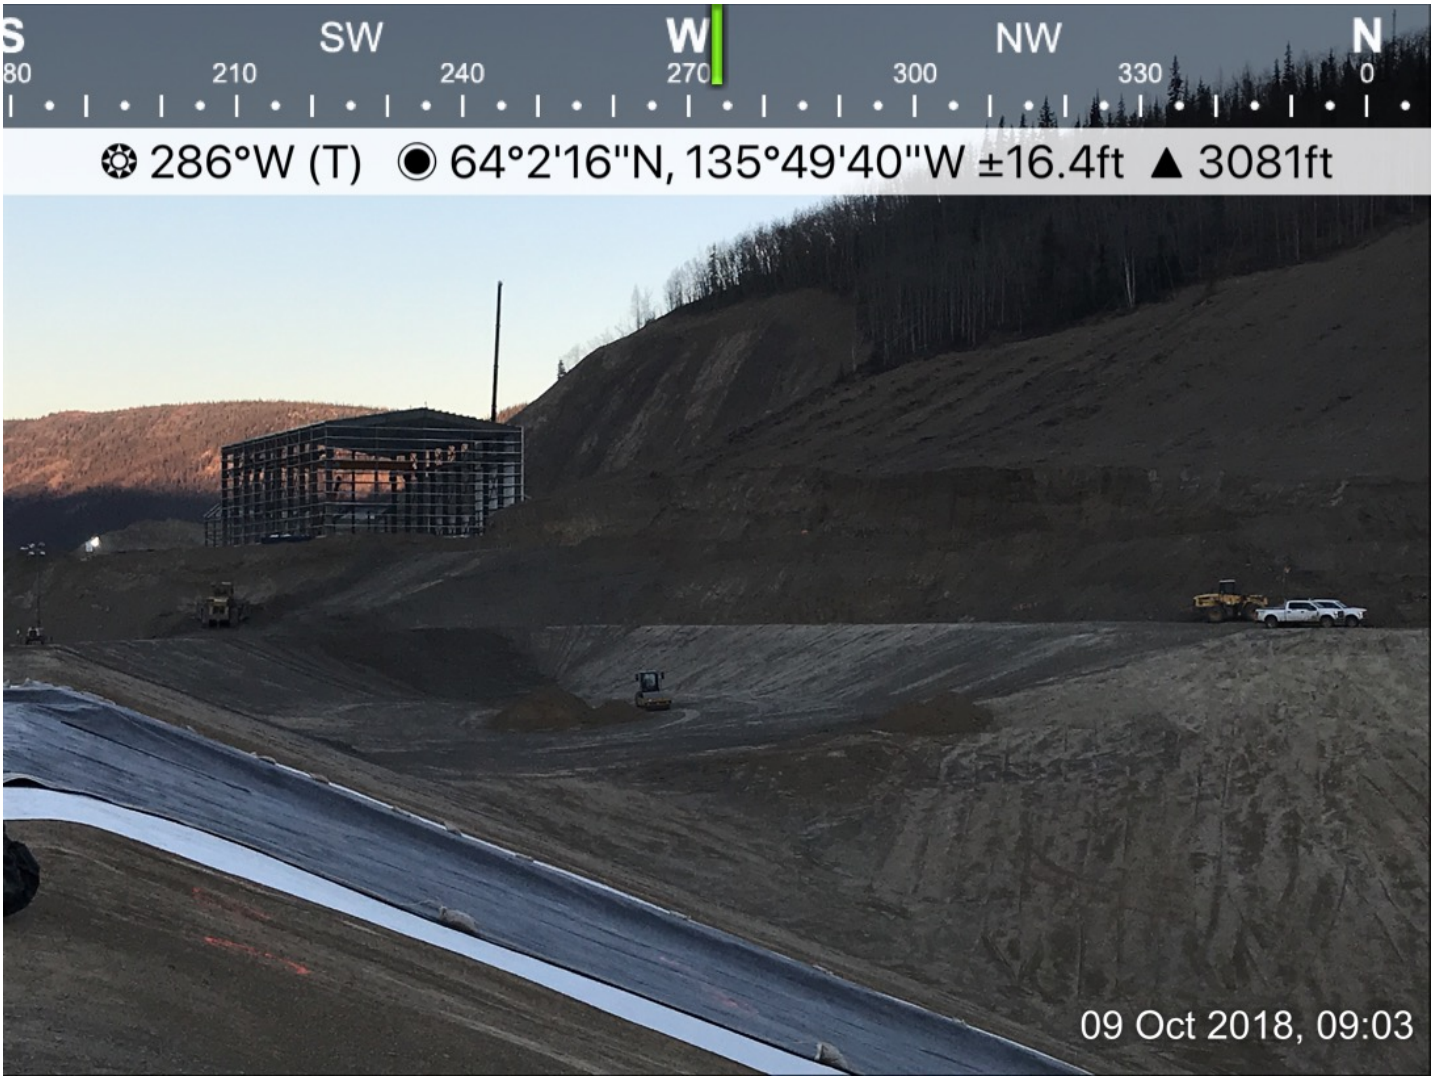

Photo 1: Pelly shaping impoundment zone on west side of embankment and placing fill material for liner installation preparation.

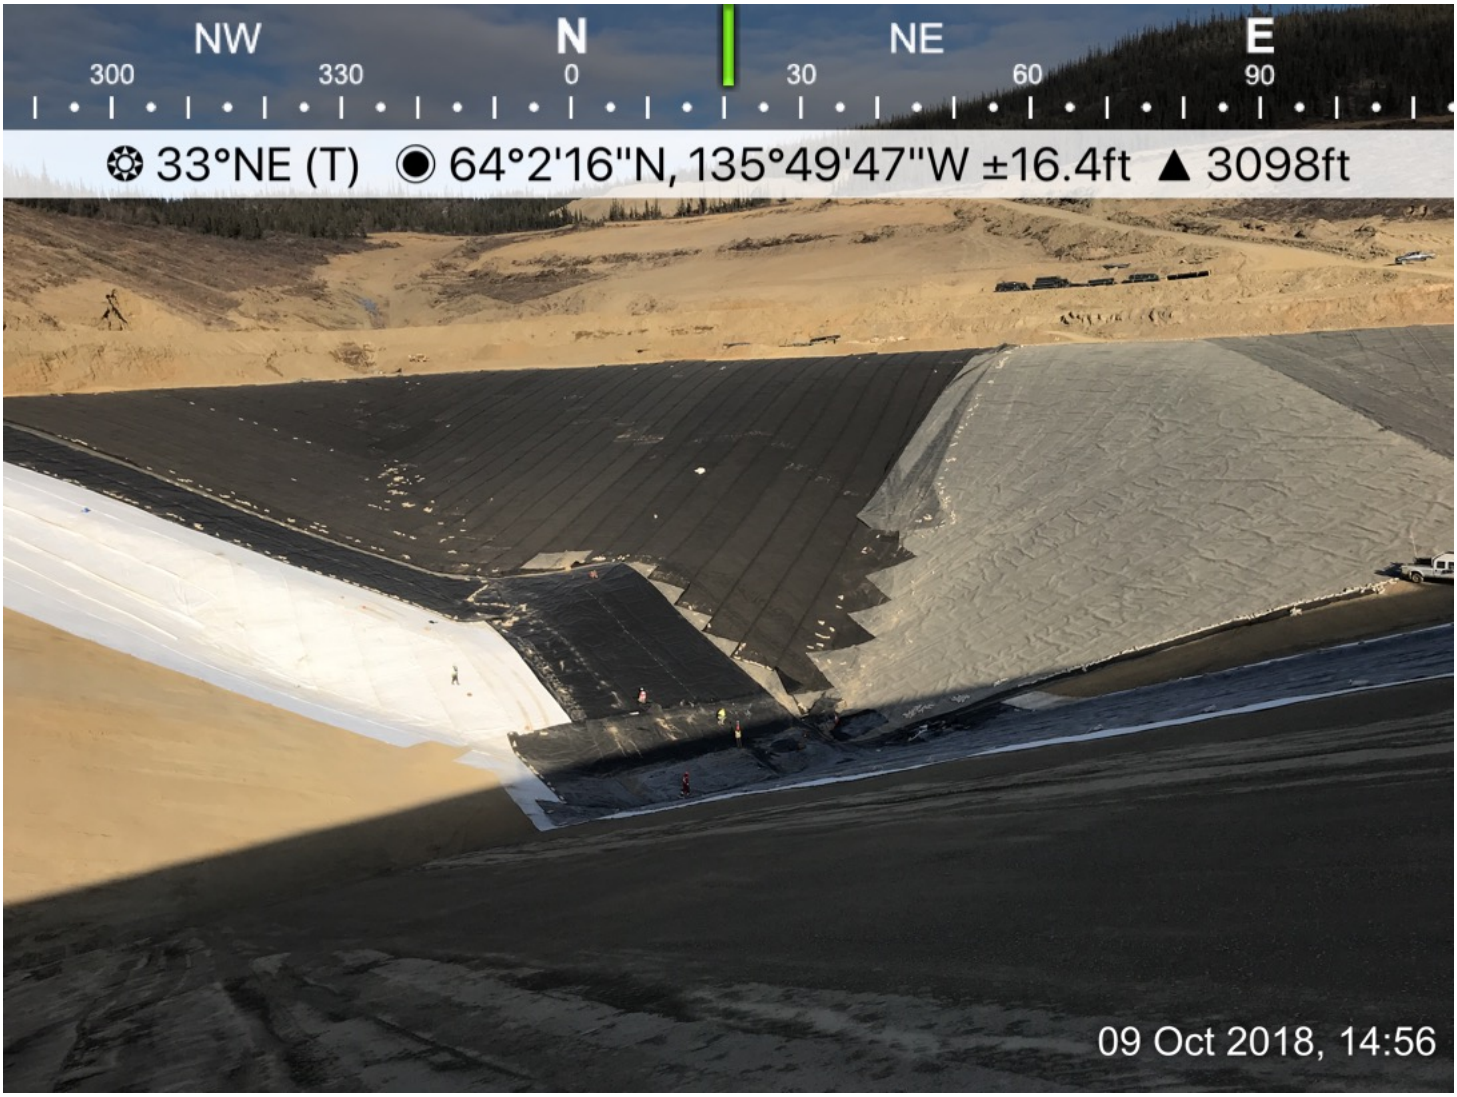

Photo 2: Layfield laid liner on impoundment.

Photo 3: Pelly placed layers of fill on top of geotextile/geomembrane to cover underdrains for winter.

Photo 4: Winterization of downstream underdrains continued with placing fill on top of exfiltration pond.

Photo 5: Event pond progress.

Photo 6: Event pond QC passed compaction and moisture %, lift accepted.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 10, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda	**Weather:**	Sunny -17°C to 2°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly is now placing fill material to get surface ready for liner installation. (***Photo 1***).
  - Layfield placed liner on impoundment. (***Photo 2***).
  - No work from Heavy North was observed***.*** BGC asked JDS/Heavy North to provide survey data of placement of steel plates and pipe work via RFI.
  - Pelly is cleaning and hauling waste material on event pond.
  - Pelly finished winterization of underdrains under JDS direction, BGC has asked for survey confirmation of height of fill on top of underdrains (***Photo 3***).
  - Event pond drain was extended upstream (***Photo 4***), BGC approved connections and grades with survey data available.
  - Pelly continues construction of Event Pond (***Photo 5***). BGC and Pelly observed ice build up, Pelly mobilized excavator to expose foundation for BGC inspection. BGC noted that ice was isolated, cleaned up to bedrock and accepted for lift placement (***Photos 6 and 7***).
  - Event pond downstream lifts compacted and QC test passed/lift accepted (***Photo 8***). BGC noted to Pelly that low moisture is desirable in cold temperature compaction, RFI to JDS was sent to help plan material sources to continue event pond construction.
  - Pelly shaped the downstream slope of the embankment today (***Photo 9).*** Estimated 75-85% complete.

- Observations and Recommendations (Open/Ongoing):
  - Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - Layfield reported issues placing liner on slopes steeper than 2.5:1. Liner slipping is an issue as well as crew safety. Layfield has requested that surfaces be no steeper than 2.5:1 for future approved subgrade. BGC approved the use of slopes up to 2:1 in small, discontinuous areas. However, if the installation contractor is reporting real world observations that could affect the integrity of the liner or the safety of workers these should be taken into account. BGC recommends that if slopes steeper than 2.5:1 are expected Pelly/JDS should provide BGC and Layfield with a drawing showing the extent of these areas. BGC, Pelly, JDS, and Layfield should then meet to discuss potential issues and a path forward.
  - BGC has recommended the use of finer material in smaller lifts for shaping of the in-heap pond, especially at the finished grade where liner will be placed.

- Engineering:
  - None

BGC-RFI-019	Closure Sump Steel Plate Detail	Sent October 1, 2018. Waiting confirmation of receipt.
BGC-RFI-020	HLF VALID Liner Testing	Sent October 2, 2018. Waiting confirmation of receipt.
CC204-RFI-044	PLS Piping Installation Rub Sheets	Sent October 8, 2018. Response sent to JDS/Pelly October 9, 2018. Closed.
BGC-RFI-021	Steel plate installation and closure drain pipe (Asking for as-built survey)	Open. Sent Oct 9, 2018.
BGC-RFI-022	Event Pond Water Management Plan	Open. Sent Oct 9, 2018.
BGC-RFI-023	Event Pond Material Source Plan	Open. Sent Oct 10, 2018.

Safety Issues: None

Photo 1: Pelly shaping impoundment zone on west side of embankment and placing fill material for liner installation preparation.

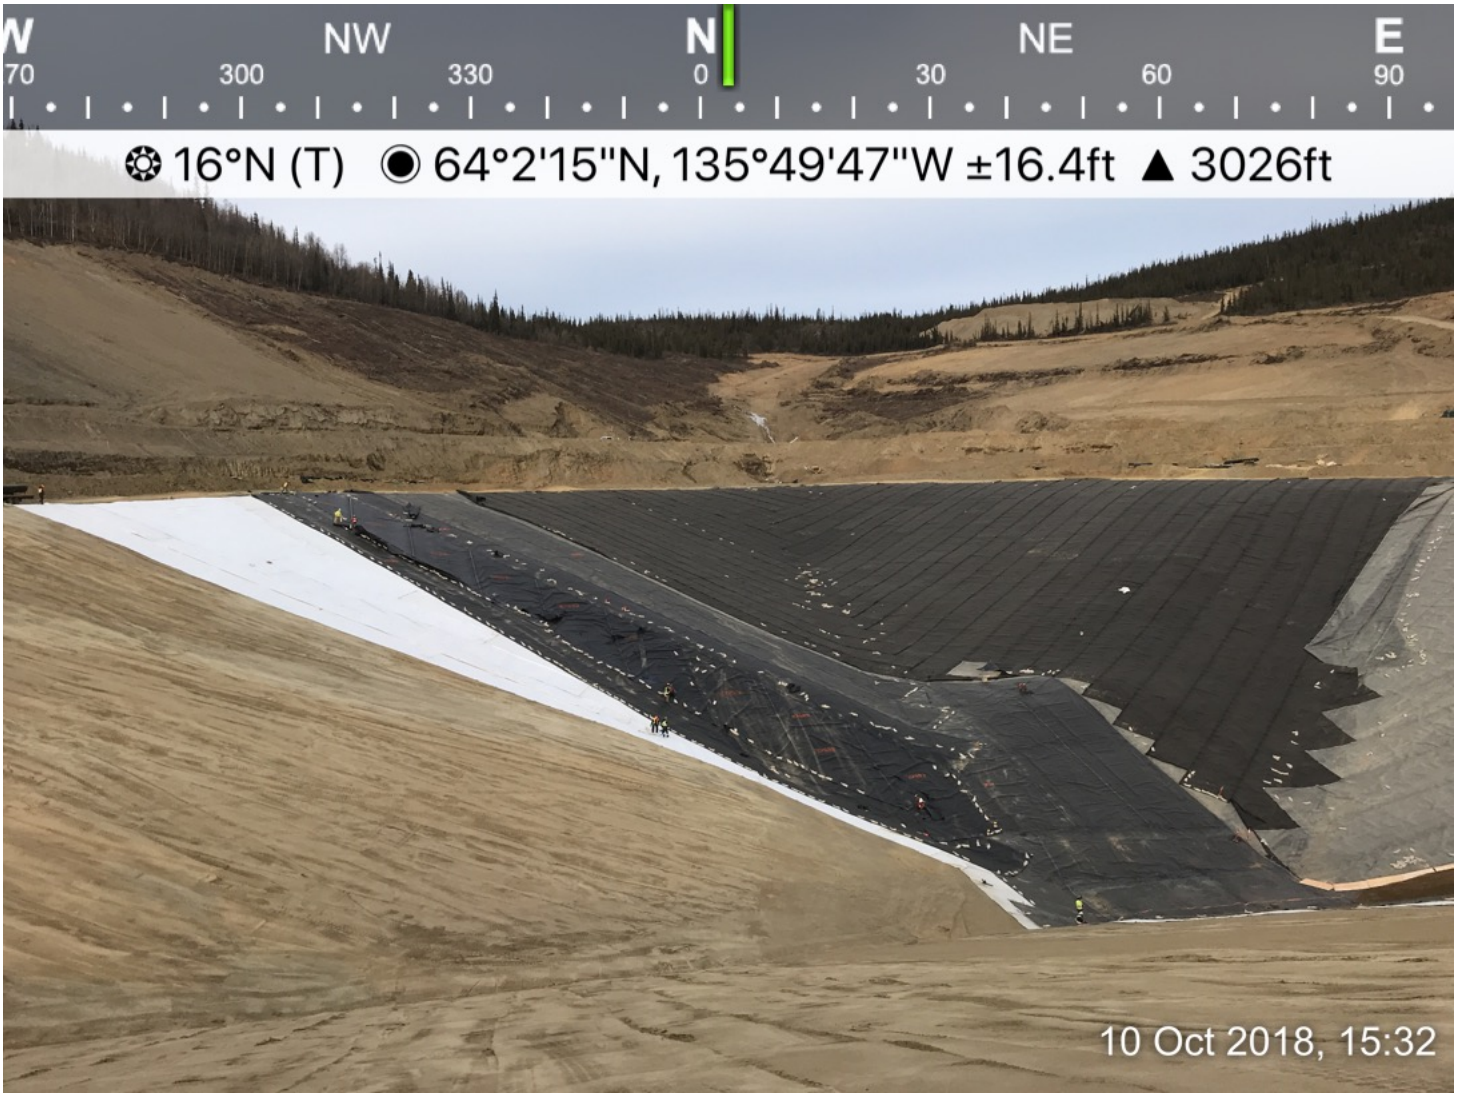

Photo 2: Layfield laid liner on impoundment.

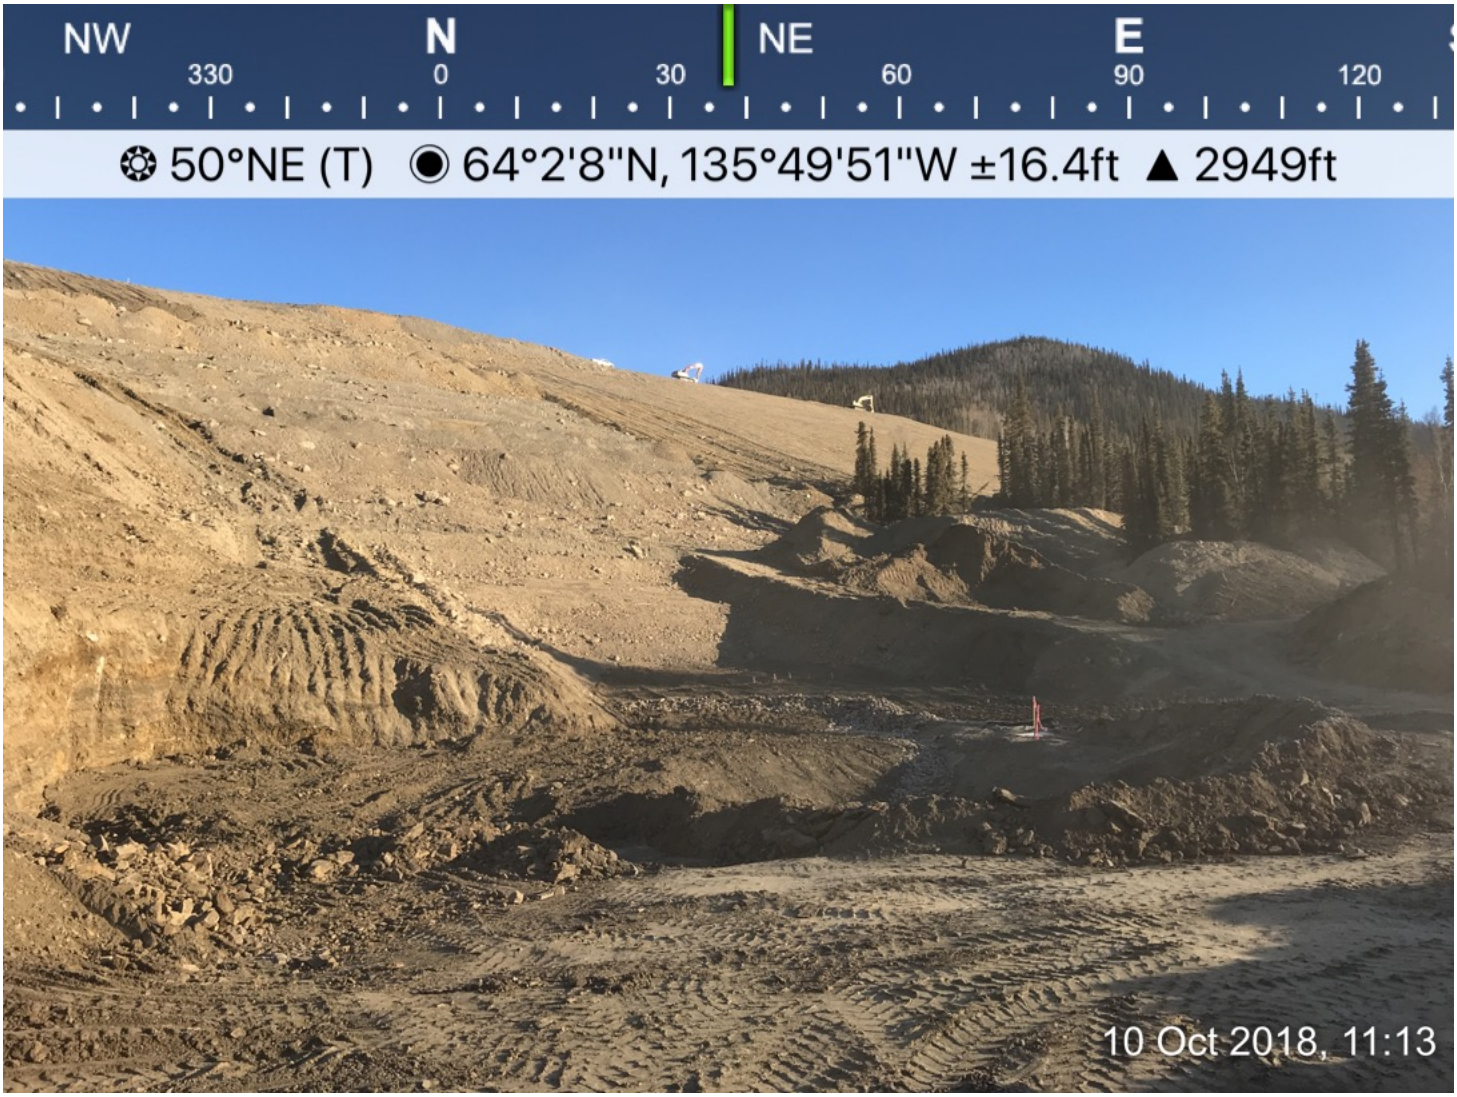

Photo 3: Pelly finished winterization of underdrains downstream of embankment, waiting for final survey to confirm cover height.

Photo 4: Event pond drain extended upstream.

Photo 5: Event pond progress and ice build up on foundation (East side).

Photo 6: Pelly removed ice promptly for foundation approval on Event pond

Photo 7: BGC inspected foundation, no ice or permafrost present, bedrock was scraped clean and accepted for lift placement for Event pond construction

Photo 8: Event pond QC passed compaction and moisture %, lift accepted. Good materials are running low, JDS was asked to plan material sources to continue construction efforts.

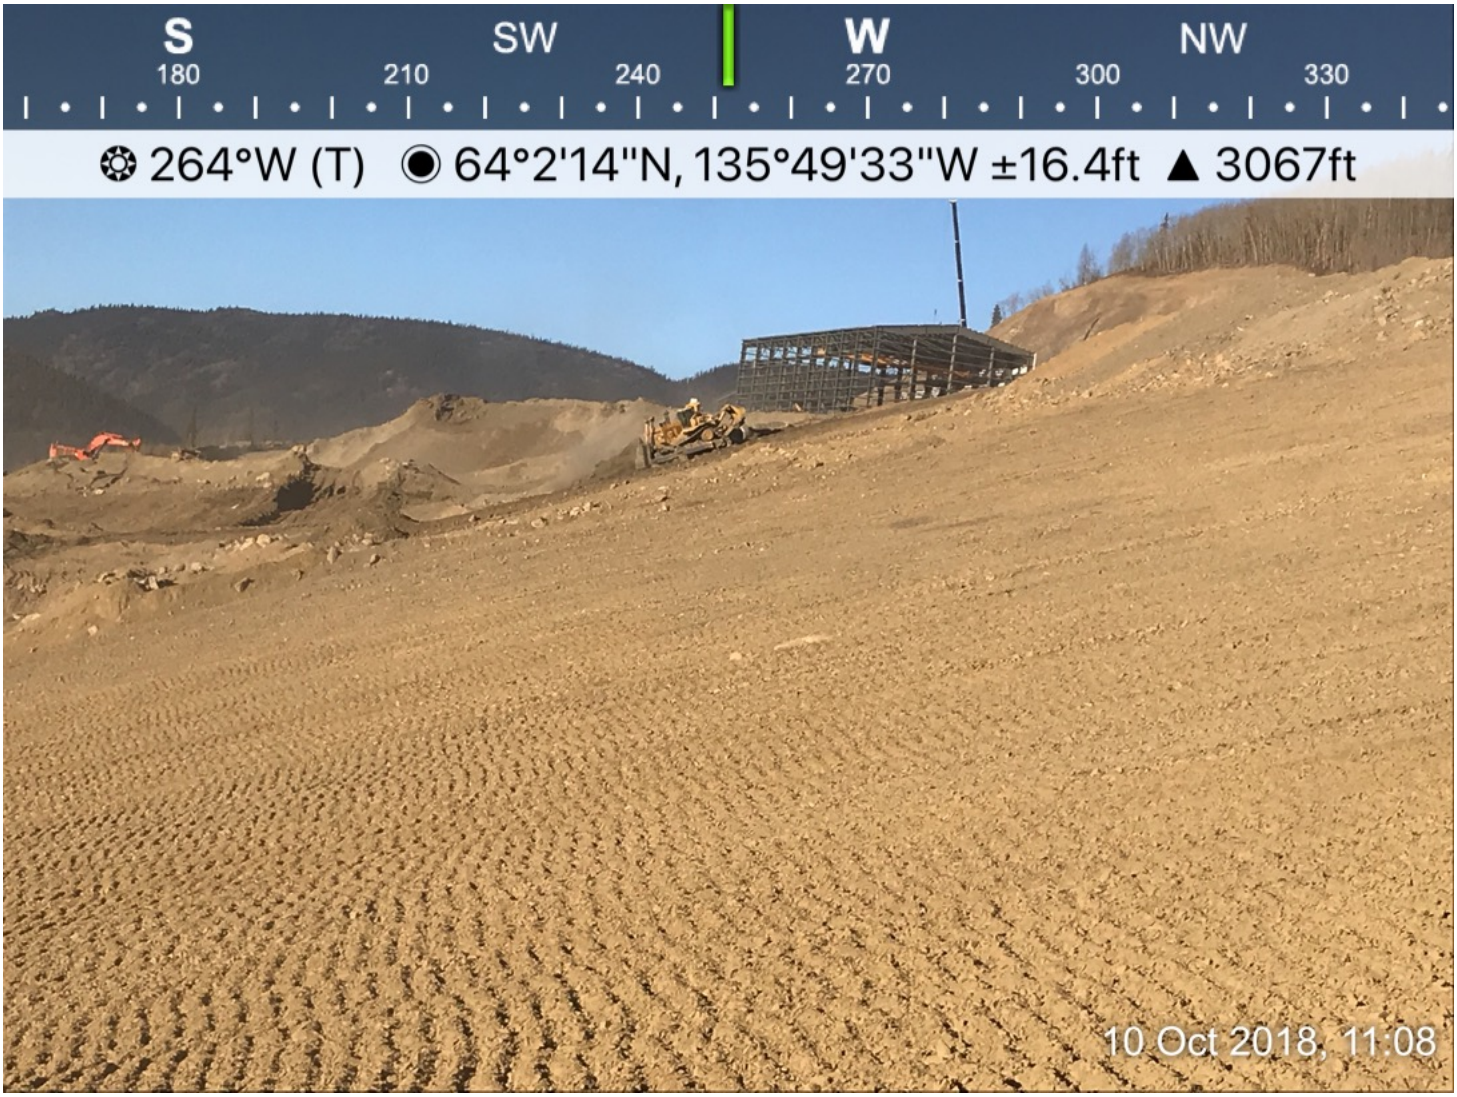

Photo 9: Pelly continued the downstream grading of the embankment slope for winterization.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 11, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda	**Weather:**	Snow/Overcast -4°C to 2°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly is now placing fill material to get surface ready for liner installation. (***Photo 1***).
  - Layfield cleaned snow off liner on impoundment. (***Photo 2***).
  - BGC asked JDS/Heavy North to provide survey data of placement of steel plates and pipe work via RFI.
  - Pelly is cleaning and hauling waste material on event pond.
  - Pelly finished winterization of underdrains under JDS direction, BGC has asked for survey confirmation of height of fill on top of underdrains (***Photo 3***).
  - Event pond lift on East side was rejected due to over saturation and water pumping out of surface (***Photos 4 and 5***), BGC asked Pelly to remove lift, Tetra Tech took sample of material being used for testing.
  - BGC communicated to JDS and Pelly that both BGC and Tetra Tech need to know 24 hours in advance of all sources of material for the event pond to develop compaction and moisture criteria for lifts, RFI sent to help achieve this.
  - Pelly shaped the downstream slope of the embankment today (***Photo 6).*** Due to snow, estimation of completion is not available at this time.
  - Pelly notified BGC of a new source for material, temporary labeled as "Event Pond Switch Back", BGC tentatively approved the material for lifts on the event pond, pending proctor and moisture results from Tetra Tech. (***Photos 7 and 8***).
  - BGC aided Pelly on site with regards to the spillway re-design submitted to JDS.
  - BGC provided JDS with the spillway re-design CAD drawings, JDS passed on the information to Pelly.

- Observations and Recommendations (Open/Ongoing):
  - Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - Layfield reported issues placing liner on slopes steeper than 2.5:1. Liner slipping is an issue as well as crew safety. Layfield has requested that surfaces be no steeper than 2.5:1 for future approved subgrade. BGC approved the use of slopes up to 2:1 in small, discontinuous areas. However, if the installation contractor is reporting real world observations that could affect the integrity of the liner or the safety of workers these should be taken into account. BGC recommends that if slopes steeper than 2.5:1 are expected Pelly/JDS should provide BGC and Layfield with a drawing showing the extent of these areas. BGC, Pelly, JDS, and Layfield should then meet to discuss potential issues and a path forward.
  - BGC has recommended the use of finer material in smaller lifts for shaping of the in-heap pond, especially at the finished grade where liner will be placed.

- Engineering:
  - None

QA/QC Results

- QA/QC:

Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
BGC-RFI-018	Event Pond Excavation Specification	Sent September 29, 2018. Waiting confirmation of receipt.
CC204-RFI-041	Pelly is requesting details and requirements for the extension of the PLS header pipes from the PLS sump through the impoundment area	BGC discussed with Pelly. Pelly to provide plan to use ordered joints. BGC will evaluate and respond.
BGC-RFI-019	Closure Sump Steel Plate Detail	Sent October 1, 2018. Waiting confirmation of receipt.
BGC-RFI-020	HLF VALID Liner Testing	Sent October 2, 2018. Waiting confirmation of receipt.
CC204-RFI-044	PLS Piping Installation Rub Sheets	Sent October 8, 2018. Response sent to JDS/Pelly October 9, 2018. Closed.
BGC-RFI-021	Steel plate installation and closure drain pipe (Asking for as-built survey)	Open. Sent Oct 9, 2018.
BGC-RFI-022	Event Pond Water Management Plan	Open. Sent Oct 9, 2018.
BGC-RFI-023	Event Pond Material Source Plan	Open. Sent Oct 10, 2018.

Safety Issues: BGC reported a Cobalt Mechanic Truck going 60 km/hr down Dublin Road at kilometer 1. BGC tried to tell the Cobalt employee to slow down but he refused. BGC will now be taking the ADR road to the event pond and embankment for inspections given Cobalt has been cited numerous times and no action has taken place to resolve safety concerns. Tetra Tech and Pelly have also experienced aggressive driving and speeding from Cobalt drivers and have been copied on the formal email from BGC to JDS regarding safety on Dublin Road.

Snow and icy conditions are safety concerns for all mine site vehicles on haul roads with high grades.

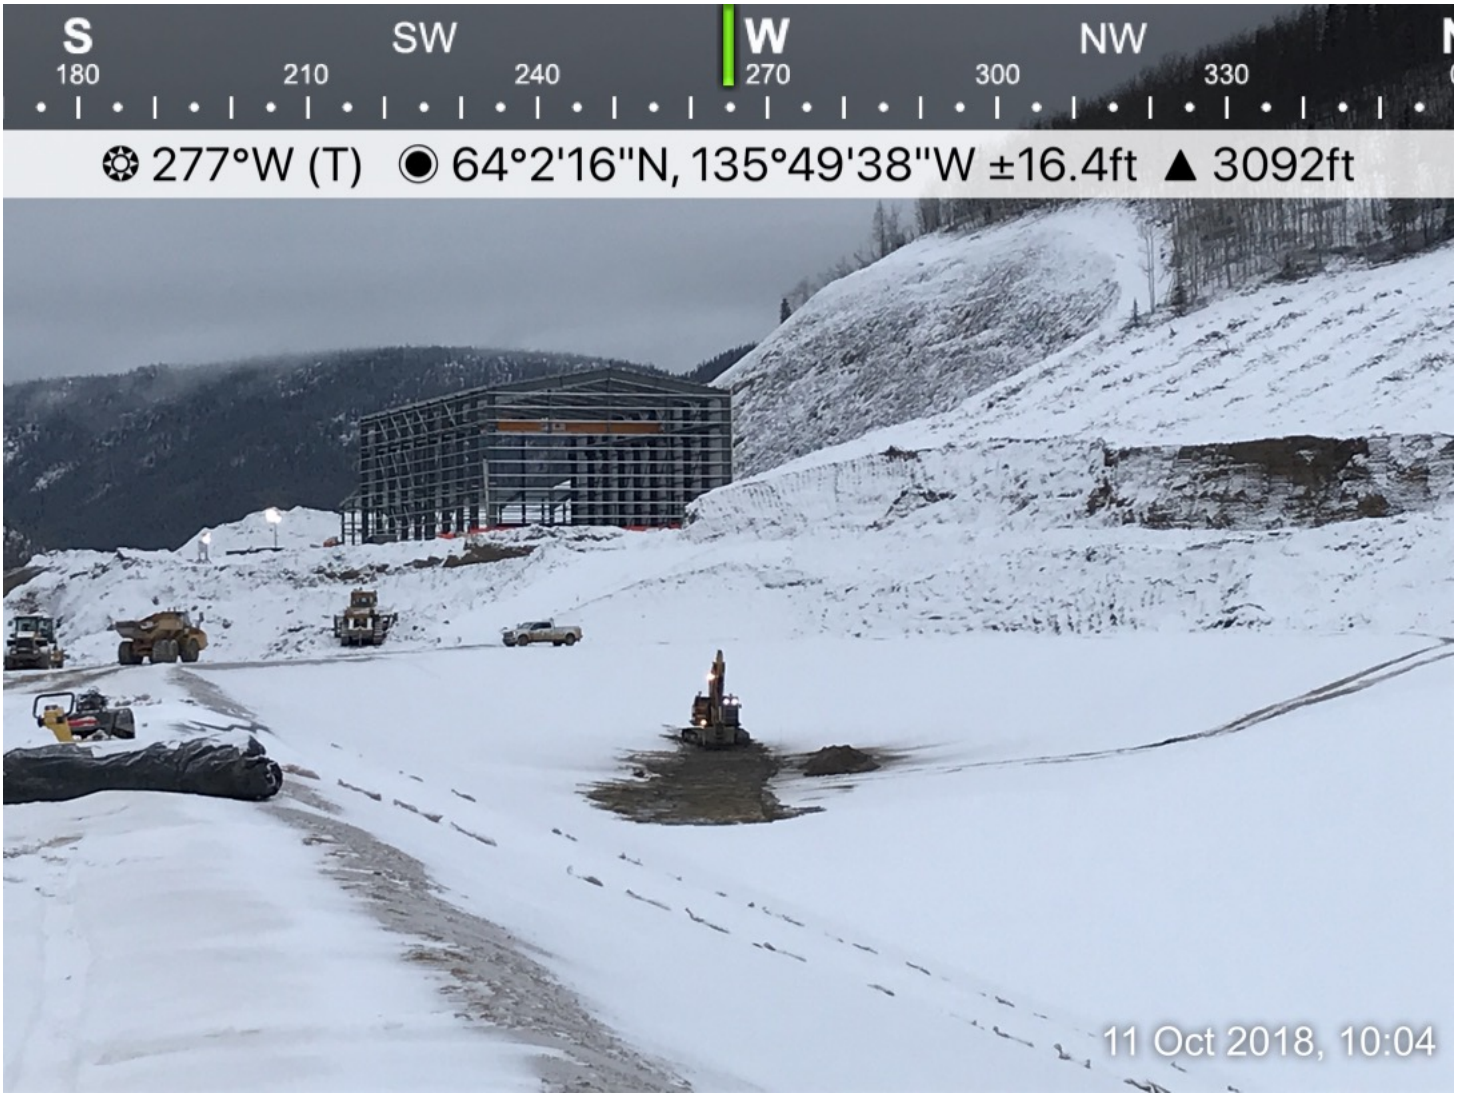

Photo 1: Pelly shaping impoundment zone on west side of embankment and placing fill material for liner installation preparation.

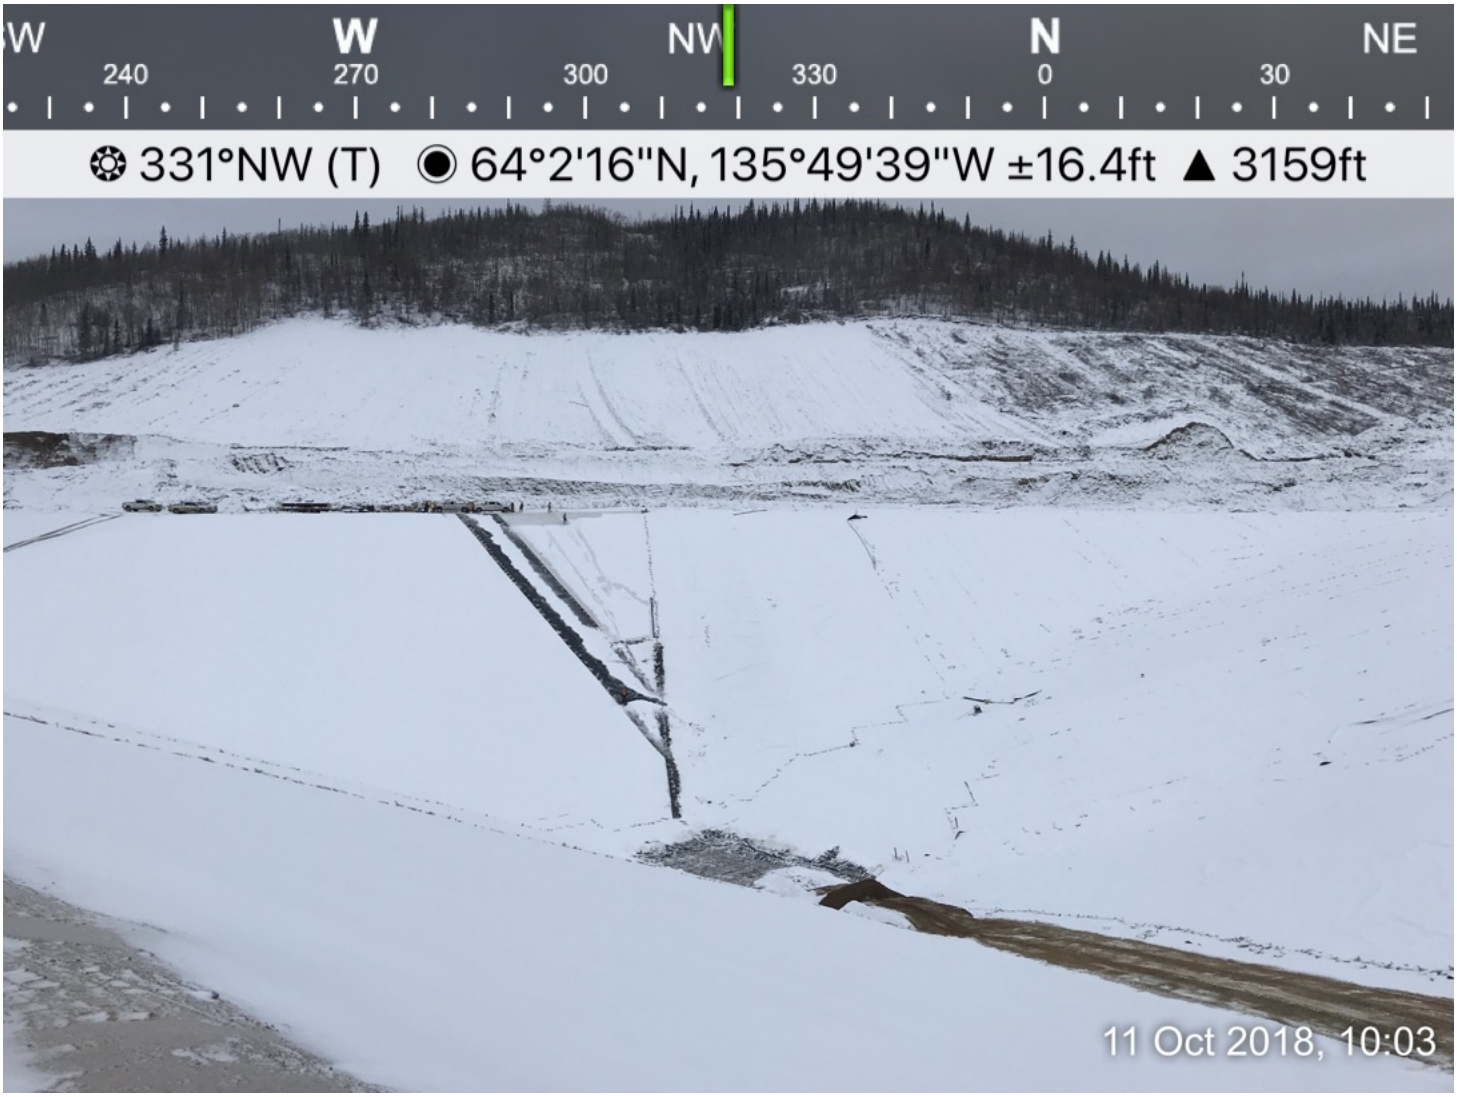

Photo 2: Layfield clean snow on impoundment.

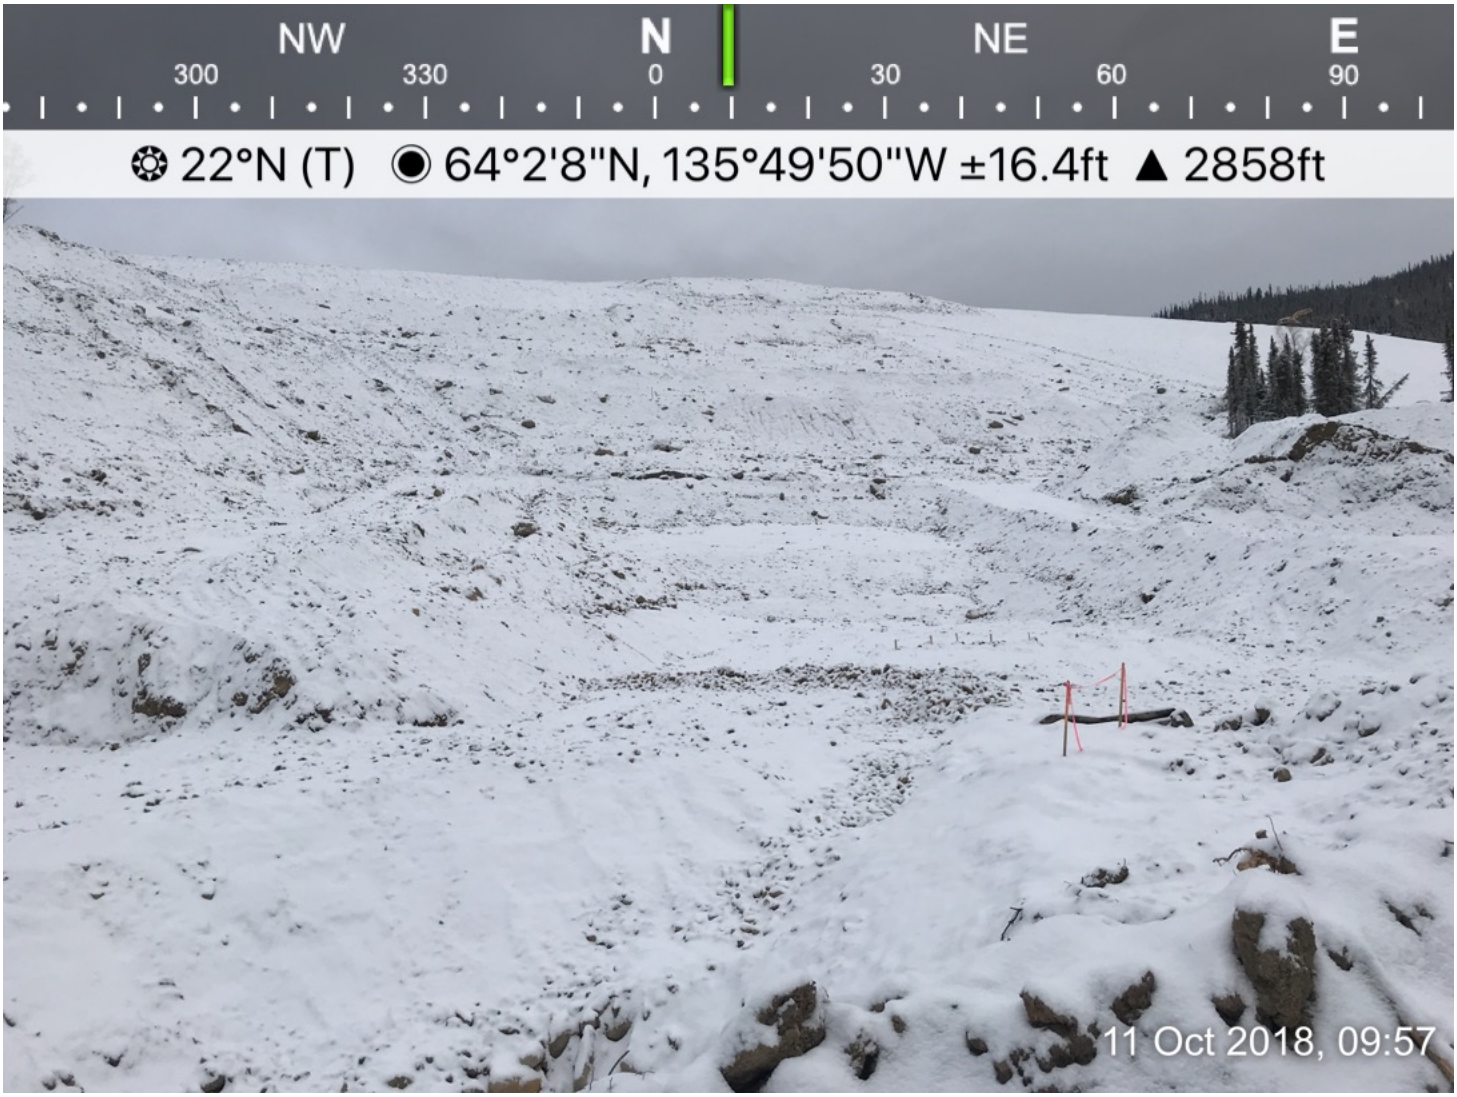

Photo 3: Pelly finished winterization of underdrains downstream of embankment, waiting for final survey to confirm cover height.

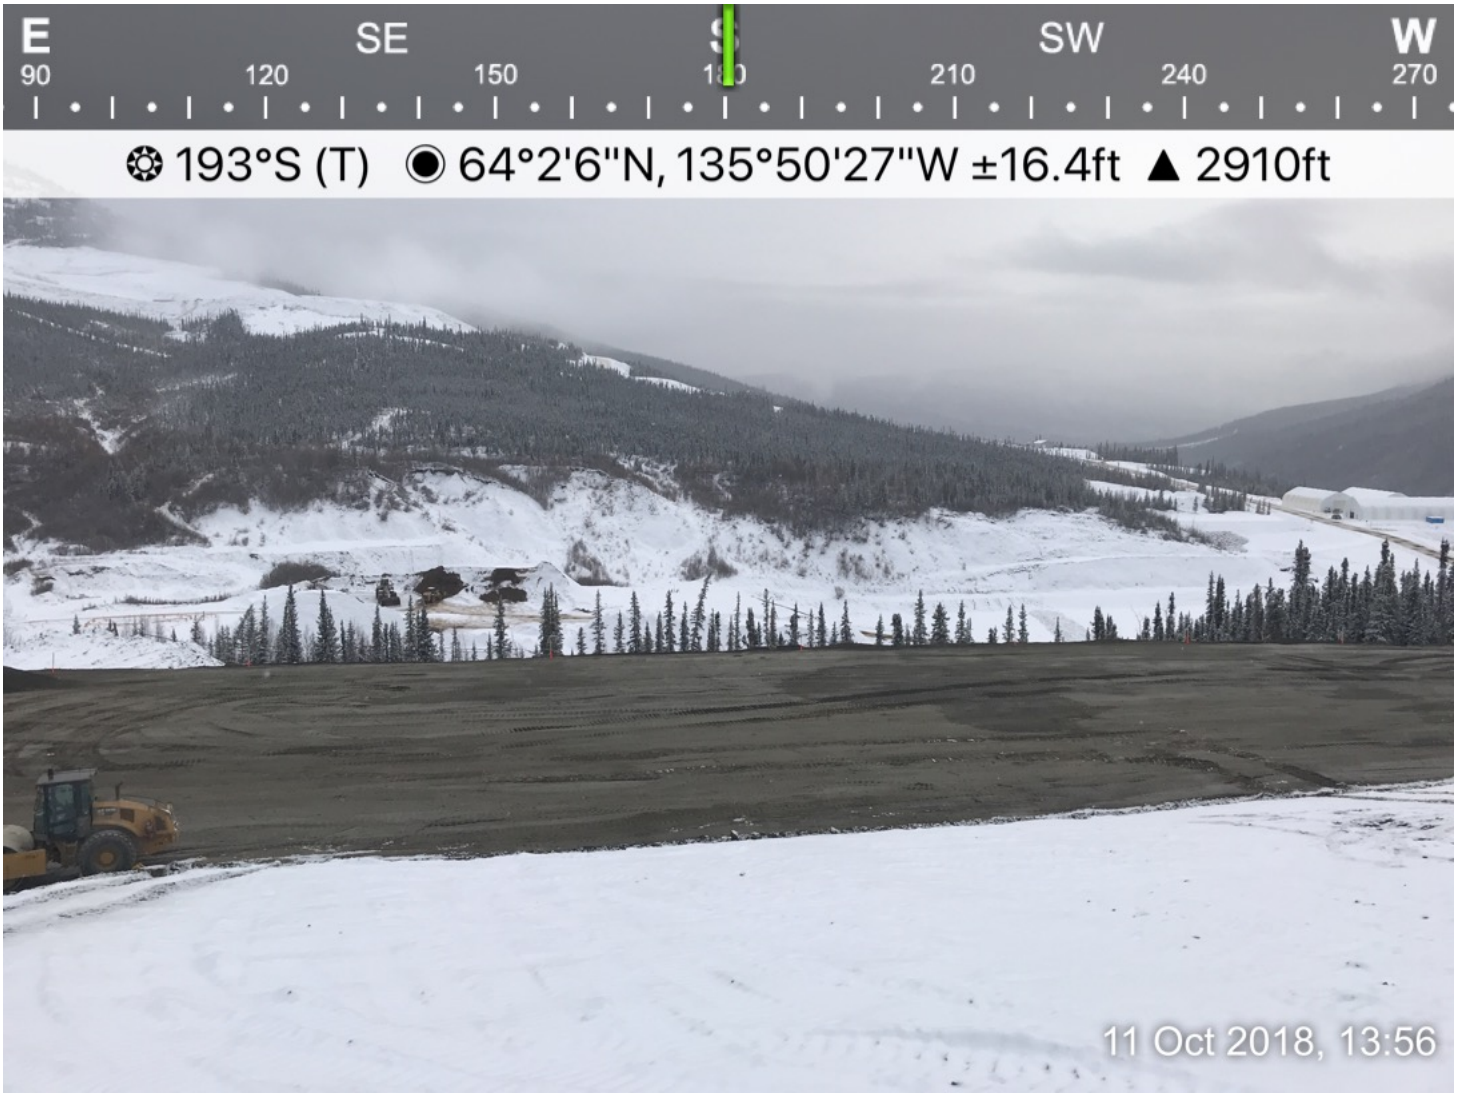

Photo 4: Event pond east side embankment has over saturation (seen on patches of dark grey).

Photo 5: Event pond lift was tested for density but over saturated with over 10%, water was pumping out and BGC rejected lift for removal (West side). Oversaturation on winter construction means ice jacking, void generation and potential removal of lifts in the Spring 2019 due to poor construction.

Photo 6: Pelly used a D10 to continue shaping downstream slope

Photo 7: Pelly notified BGC of a new source for material, temporary labeled as “Event Pond Switch Back”, BGC tentatively approved the material for lifts on the event pond, pending proctor and moisture results from Tetra Tech.

Photo 8: Pelly notified BGC of a new source for material, temporary labeled as “Event Pond Switch Back”, BGC tentatively approved the material for lifts on the event pond, pending proctor and moisture results from Tetra Tech

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 12, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Troy Meyer	**Weather:**	Cloudy/Fog -5°C to 4°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Troy Meyer (BGC) arrived to site.
  - Pelly regraded slopes on west side of the impoundment, as-built survey presented to BGC and accepted. (***Photo 1***).
  - Layfield cleaned snow off liner on impoundment. (***Photo 2***).
  - BGC asked JDS/Heavy North to provide survey data of placement of steel plates and pipe work via RFI.
  - Pelly is cleaning and hauling waste material on event pond.
  - Heavy North has placed ODF on east abutment area to sump. Heavy North placed ODF without communicating with Layfield and blocked areas that needed testing, this material was removed for tests to be completed. Ice chunks on ODF were also noted and gradation tests on ODF show it to compliant with specifications (***Photos 3 and 4***).
  - Event pond lift that had saturation over 10% that was not removed or scraped off yesterday exhibited ice jacking as visible in this picture Pelly instructed to remove this lift completely before placing a new lift (***Photo 5***).
  - Event pond lift on East side was rejected due to over saturation and water pumping out of surface (***Photos 4 and 5***), BGC asked Pelly to remove lift, Tetra Tech took sample of material being used for testing.
  - Event pond lift 26B was tested for moisture and density, lift was accepted and Pelly continued work on Event Pond (***Photos 6 and 7***).
  - BGC communicated to JDS and Pelly that both BGC and Tetra Tech need to know 24 hours in advance of all sources of material for the event pond to develop compaction and moisture criteria for lifts, RFI sent to help achieve this.
  - Pelly shaped the downstream slope of the embankment today**.** Due to snow, estimation of completion is not available at this time.
  - BGC aided Pelly on site with regards to the spillway re-design submitted to JDS.
  - BGC provided JDS with the spillway re-design CAD drawings, JDS passed on the information to Pelly.
  - There are currently 3 RFI Clarifications that remain to be signed/accepted formally by JDS and 5 RFI from BGC to JDS that remain unanswered.

- Observations and Recommendations (Open/Ongoing):
  - Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - Layfield reported issues placing liner on slopes steeper than 2.5:1. Liner slipping is an issue as well as crew safety. Layfield has requested that surfaces be no steeper than 2.5:1 for future approved subgrade. BGC approved the use of slopes up to 2:1 in small, discontinuous areas. However, if the installation contractor is reporting real world observations that could affect the integrity of the liner or the safety of workers these should be taken into account. BGC recommends that if slopes steeper than 2.5:1 are expected Pelly/JDS should provide BGC and Layfield with a drawing showing the extent of these areas. BGC, Pelly, JDS, and Layfield should then meet to discuss potential issues and a path forward.
  - BGC has recommended the use of finer material in smaller lifts for shaping of the in-heap pond, especially at the finished grade where liner will be placed.

- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided HLF earthworks QC Daily Reports for October 10.
  - Field density and moisture testing were provided to BGC for October 10.

- Tetra Tech provided QC Daily Reports for liner installation on October 10.
- Tetra Tech provided QC Daily Reports for event pond on October 10.

- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
BGC-RFI-018	Event Pond Excavation Specification	Sent September 29, 2018. Waiting confirmation of receipt.
BGC-RFI-019	Closure Sump Steel Plate Detail	Sent October 1, 2018. Waiting confirmation of receipt.
BGC-RFI-020	HLF VALID Liner Testing	Sent October 2, 2018. Waiting confirmation of receipt.
BGC-RFI-021	Steel plate installation and closure drain pipe (Asking for as-built survey)	Open. Sent Oct 9, 2018.
BGC-RFI-022	Event Pond Water Management Plan	Open. Sent Oct 9, 2018.
BGC-RFI-023	Event Pond Material Source Plan	Open. Sent Oct 10, 2018.
BGC-RFI-024	Event Pond Material Stockpile Management	Open. Sent Oct 12, 2018.
BGC-RFI-025	Event Pond Water Winterization Plan	Open. Sent Oct 12, 2018.

Safety Issues: None today

Photo 1: Pelly shaping impoundment zone on west side of embankment and placing fill material for liner installation preparation. Survey as-built confirmed slopes were to design, shaping was accepted.

Photo 2: Layfield cleaned snow on impoundment.

Photo 3: Heavy North started placing ODF material, ice chunks were noted.

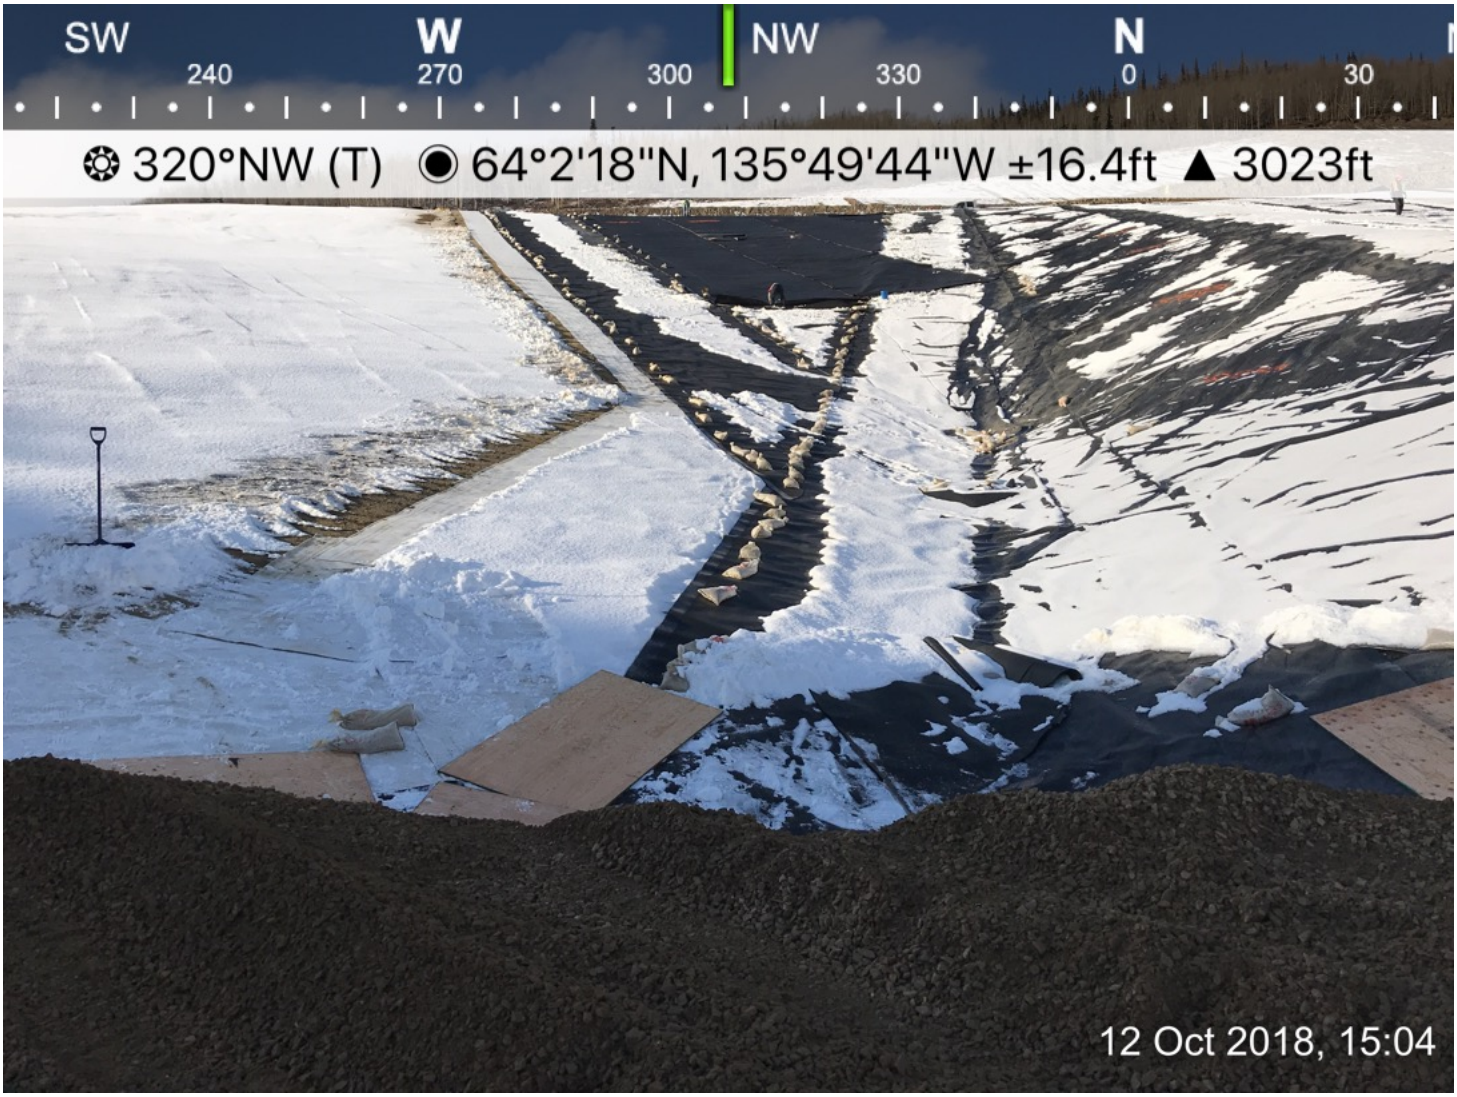

Photo 4: Heavy North placed ODF and blocked areas that needed testing by Layfield, it was instructed to remove material by areas not tested for Layfield to conduct tests necessary to finalize installation.

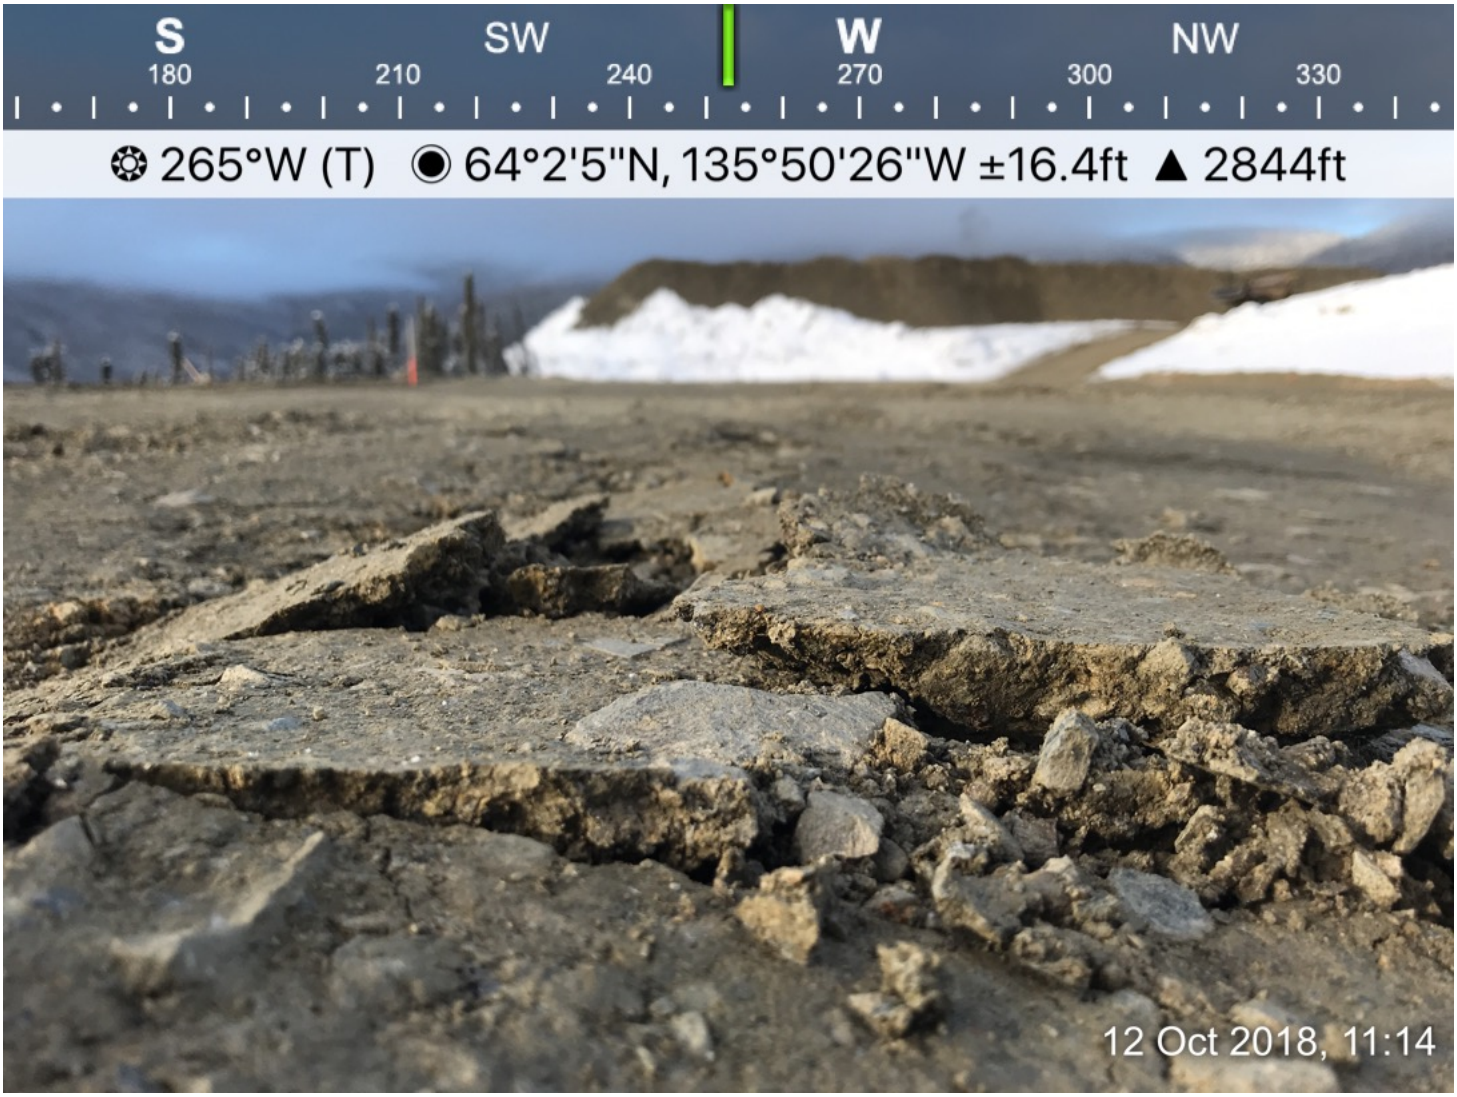

Photo 5: Event pond lift that had saturation over 10% that was not removed or scraped off yesterday exhibited ice jacking as visible in this picture Pelly instructed to remove this lift completely before placing a new lift.

Photo 6: QC density tests on new lift #26B were approved by meeting low moisture content and density.

Photo 7: Upon approval of lift, Pelly continued to place on the east side of the event pond, foundation on east most side was also approved.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 13, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Troy Meyer	**Weather:**	Cloudy/Fog/Snow -5°C to 4°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly has completed the work in the HLF embankment and in-heap and has been approved by BGC.
  - Pelly has completed and confirmed the cover of the underdrains with at least 4 m of cover (***Photo 1),*** approved by BGC.
  - Pelly has completed the winterization grading of the downstream slope of the embankment (***Photos 1 to 3***), approved by BGC.
  - Pelly has completed the slope backs and shaping of the west abutment areas, free of ice and seeps ***(Photo 4***), approved by BGC.
  - Pelly has completed the remaining impoundment area shaping and material placement for liner installation ***(Photo 5)***.
  - Pelly will now focus on the "Spillway" earthworks (***Photo 6***) and "Event Pond" earthworks.
  - Layfield cleaned snow off liner on impoundment. (***Photo 7***).
  - BGC asked JDS/Heavy North to provide survey data of placement of steel plates and pipe work via RFI. No response has been received to date.
  - Pelly continues cleaning and hauling waste material on event pond.
  - Heavy North has placed ODF on east abutment area to sump. Heavy North placed ODF without communicating with Layfield and blocked areas that needed testing, this material was removed for tests to be completed. Ice chunks on ODF were also noted and gradation tests on ODF show it to compliant with.
  - Heavy North disregarded RFI-013 Design Clarification signed by JDS and began constructing without placing the two layers of geotextile, Layfield/Tetra Tech notified BGC (**Photo 8**).
  - Event pond lift that had saturation over 10% that was not removed or scraped off yesterday exhibited ice jacking, Pelly instructed to remove this lift completely before placing a new lift.
  - Pelly continued work on the East side of the event pond with foundation preparation and approval from BGC by placing lifts with drier materials that met density and moisture content (also accepted by BGC). Pelly was instructed to compact lifts continuously during a snow storm to avoid freezing by maintaining energy on the lift, QC tests confirmed lift density and moisture content, BGC accepted lift placed on the snow storm (***Photos 9 to 12***).
  - BGC communicated to JDS and Pelly that both BGC and Tetra Tech need to know 24 hours in advance of all sources of material for the event pond to develop compaction and moisture criteria for lifts, RFI sent to help achieve this.
  - BGC provided JDS with the spillway re-design CAD drawings, JDS passed on the information to Pelly.
  - There are currently 3 RFI Clarifications that remain to be signed/accepted formally by JDS and 5 RFIs from BGC to JDS that remain unanswered.

- Observations and Recommendations (Open/Ongoing):
  - Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - BGC and JDS visited a potential material source by the ADR ***(Photo 13),*** testfill is required to determine quality, compaction requirements and lift allowance for use on event pond construction.
  - During snow storm, it is recommended to run packers on event pond to provide compaction and kinetic energy on lift to help maintain density and moisture content.

- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided HLF earthworks QC Daily Reports for October 13.

- Field density and moisture testing were provided to BGC for October 13.
- Tetra Tech provided QC Daily Reports for liner installation on October 13.
- Tetra Tech provided QC Daily Reports for event pond on October 13.

- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
BGC-RFI-018	Event Pond Excavation Specification	Sent September 29, 2018. Waiting confirmation of receipt. BGC printed copy and left on desk of JDS for confirmation of receipt.
BGC-RFI-019	Closure Sump Steel Plate Detail	Sent October 1, 2018. Waiting confirmation of receipt. BGC printed copy and left on desk of JDS for confirmation of receipt.
BGC-RFI-020	HLF VALID Liner Testing	Sent October 2, 2018. Waiting confirmation of receipt. BGC printed copy and left on desk of JDS for confirmation of receipt.
BGC-RFI-021	Steel plate installation and closure drain pipe (Asking for as-built survey)	Open. Sent Oct 9, 2018.
BGC-RFI-022	Event Pond Water Management Plan	Open. Sent Oct 9, 2018.
BGC-RFI-023	Event Pond Material Source Plan	Open. Sent Oct 10, 2018.
BGC-RFI-024	Event Pond Material Stockpile Management	Open. Sent Oct 12, 2018.
BGC-RFI-025	Event Pond Water Winterization Plan	Open. Sent Oct 12, 2018.

Safety Issues: None today

Photo 1 Pelly finished sloping the downstream side of the embankment for winterization, BGC accepted slope. Underdrain winterization was also completed with 4 m of cover, BGC accepted underdrain winterization.

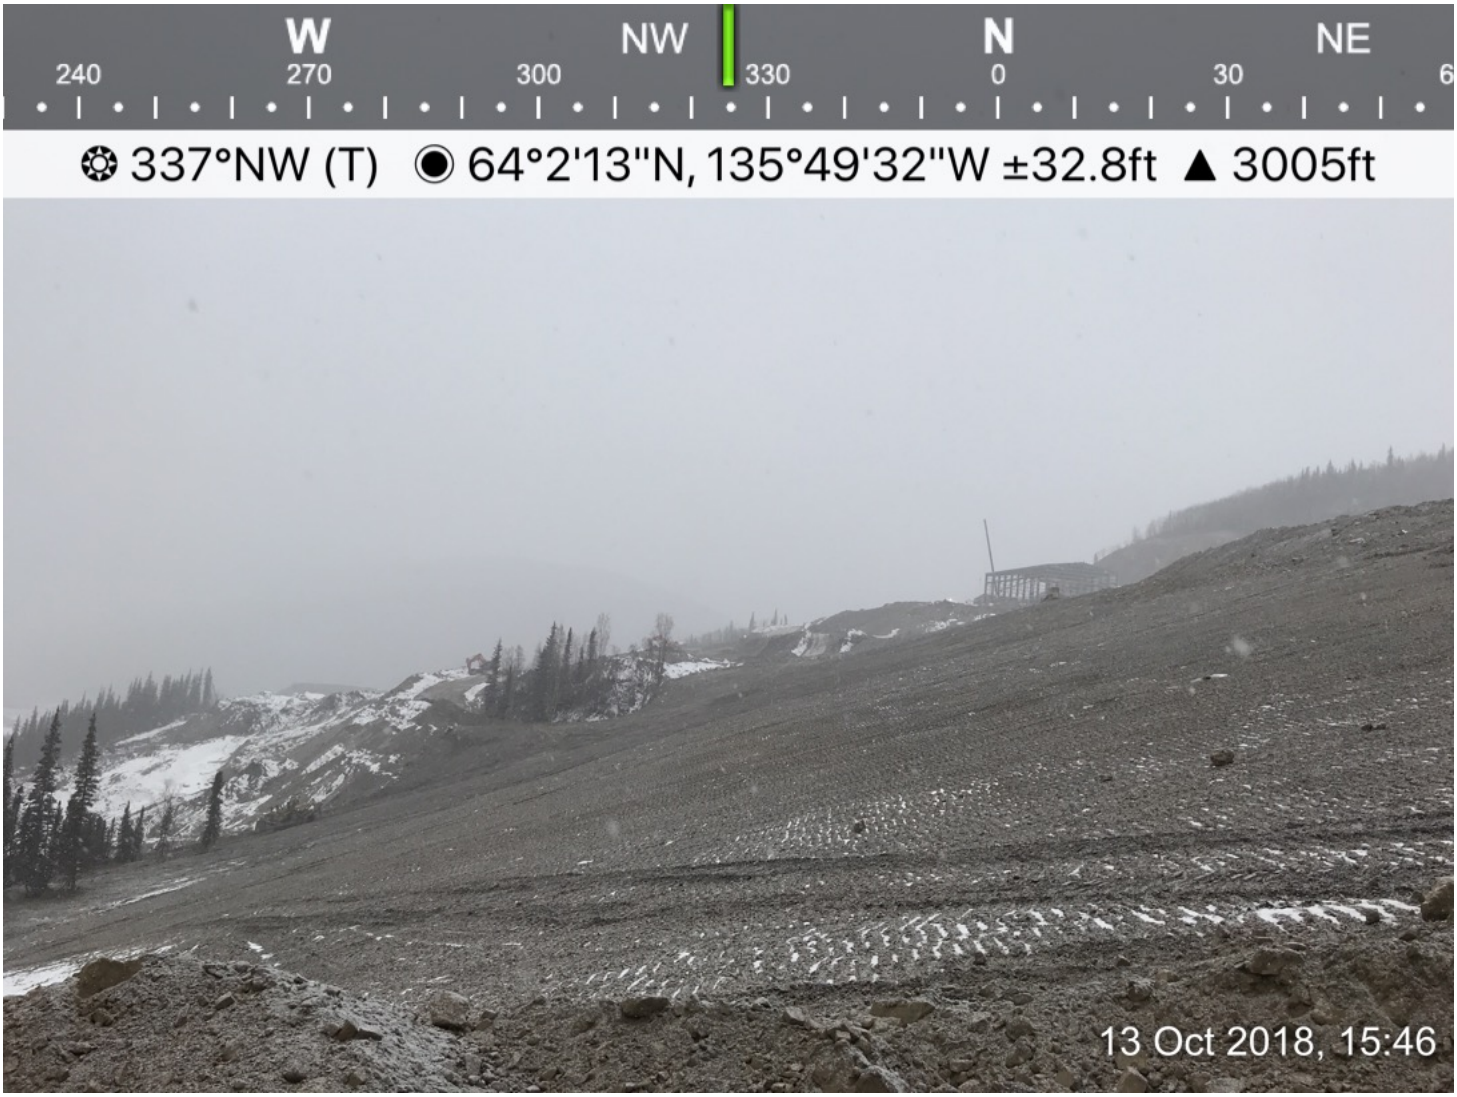

Photo 2: Pelly finished sloping the downstream side of the embankment for winterization, BGC accepted slope.

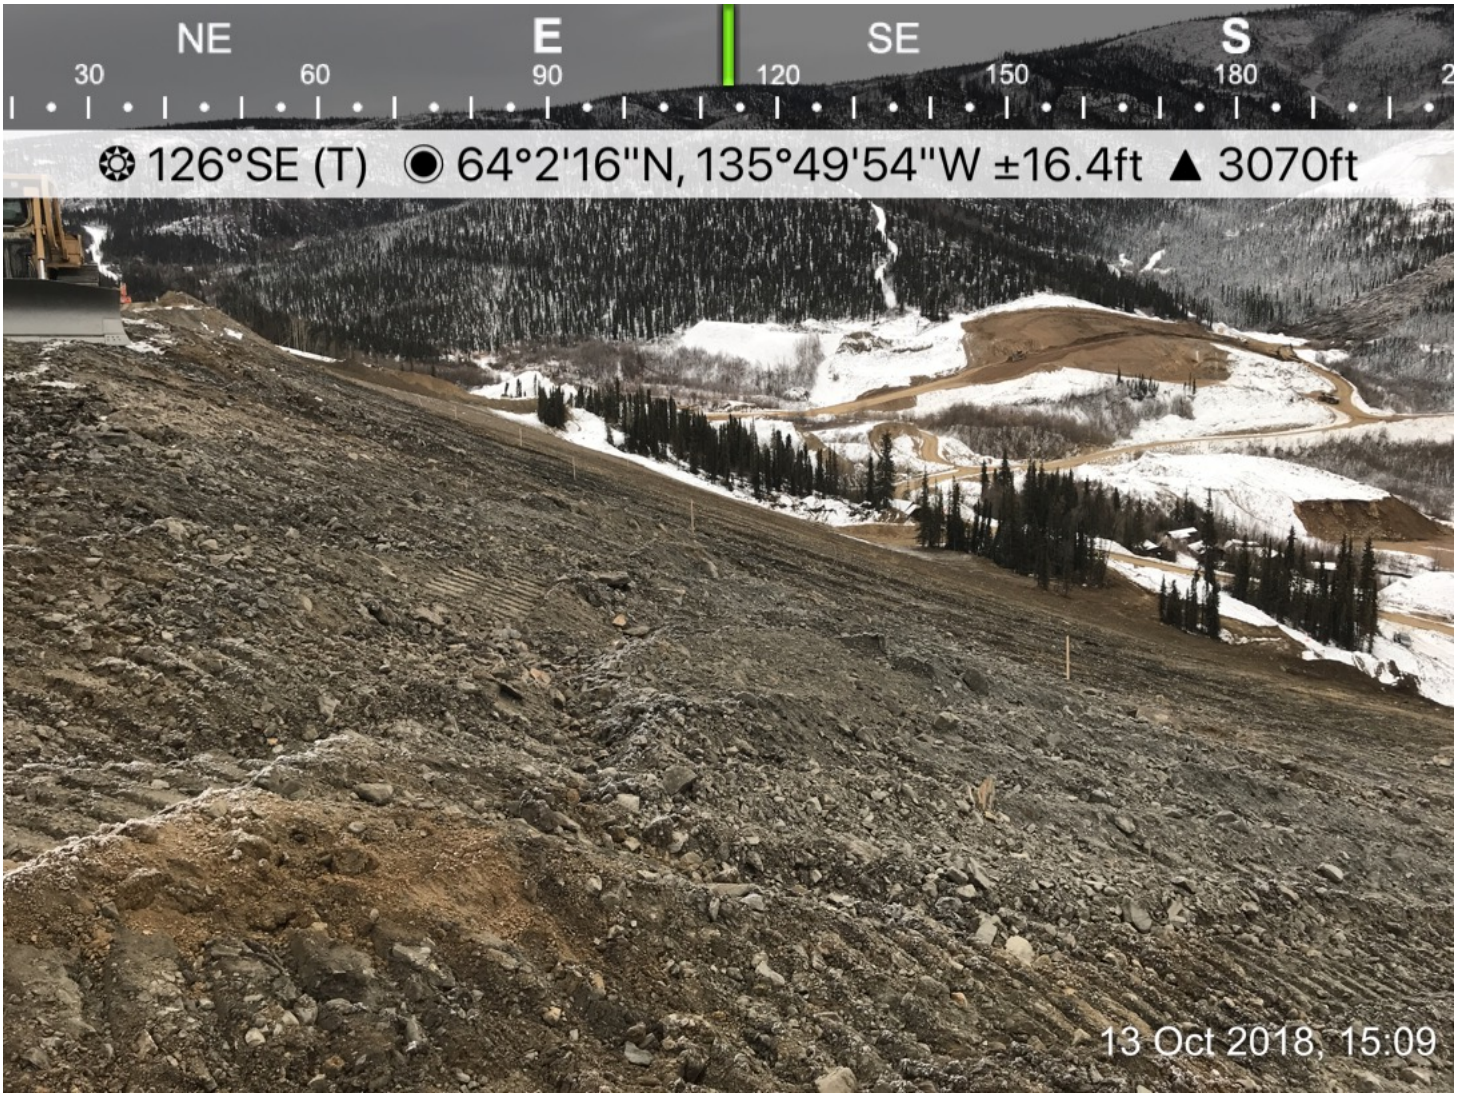

Photo 3: Pelly finished sloping the downstream side of the embankment for winterization, BGC accepted slope.

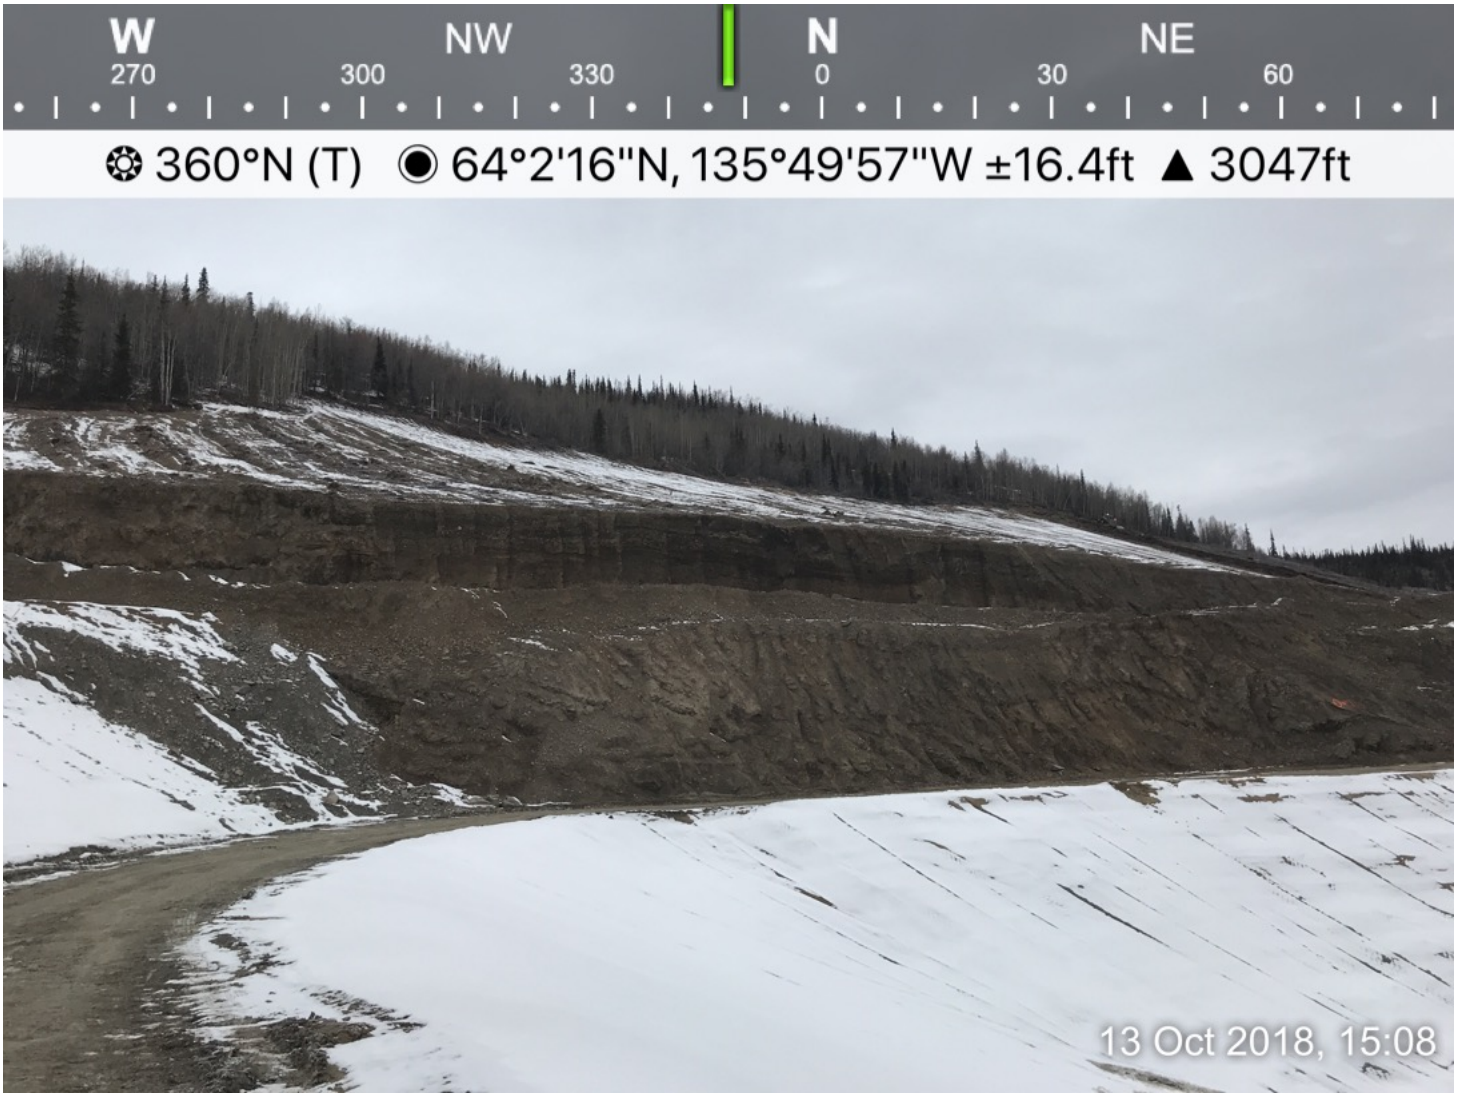

Photo 4: Pelly finished sloping and shaping slopes by the west abutment, BGC accepted surfaces (free of ice and seeps).

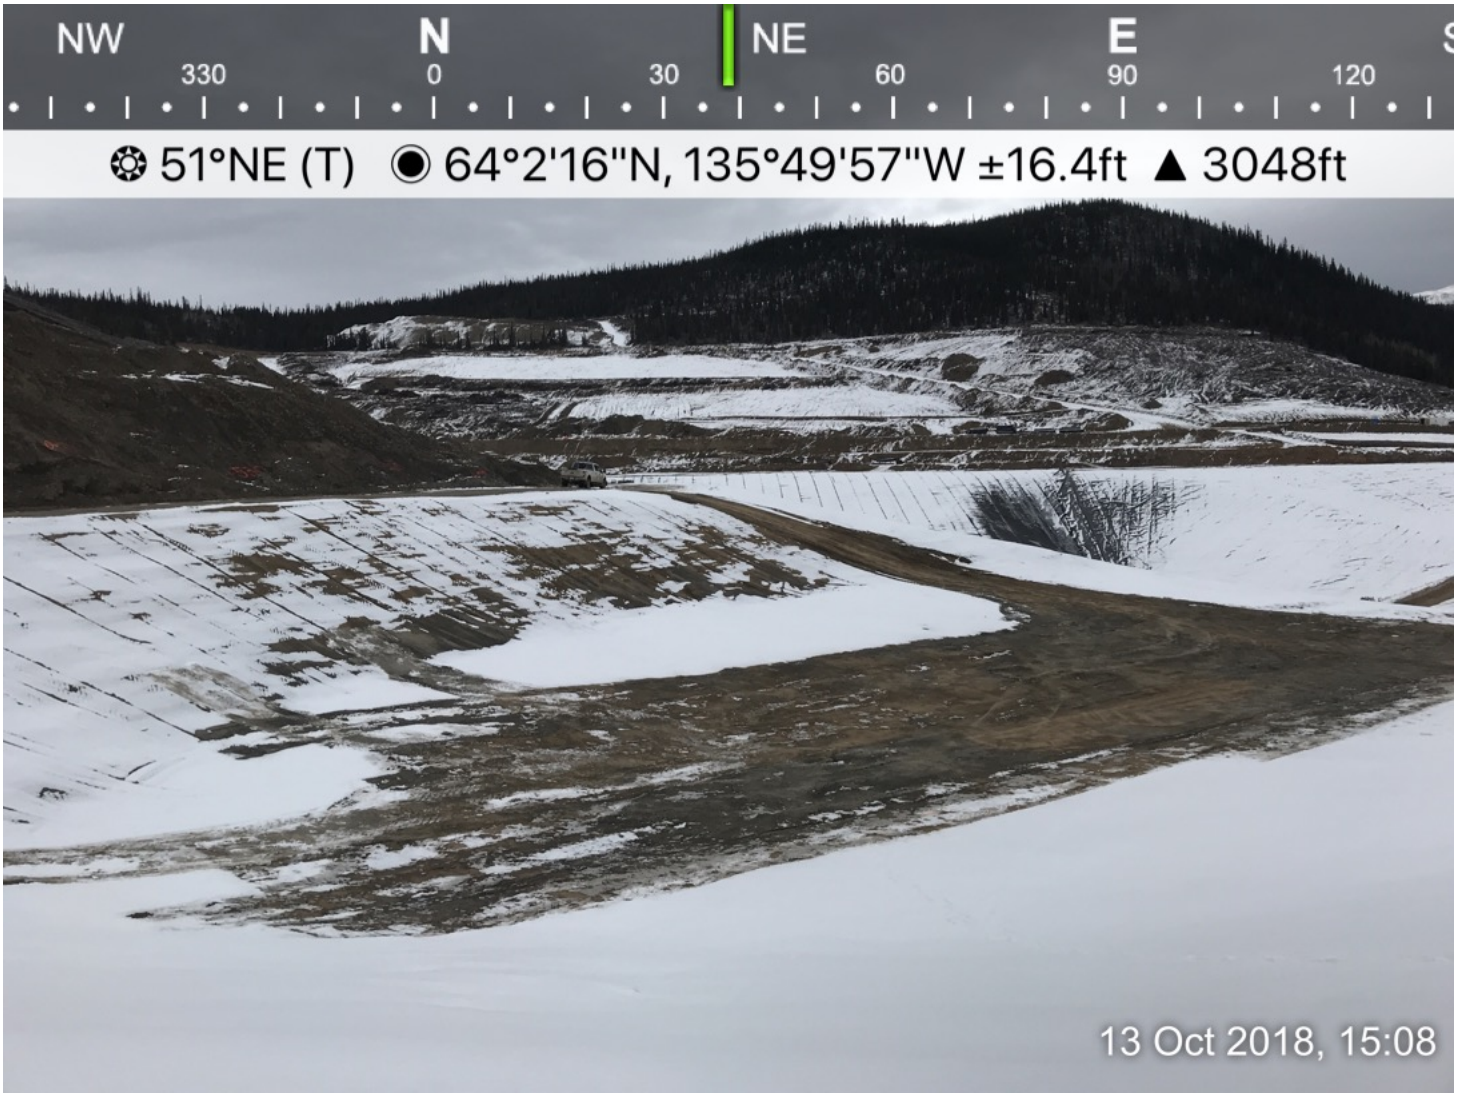

Photo 5: West side of embankment was completed by Pelly and accepted by BGC.

Photo 6: Pelly compacted area preparation for Spillway.

Photo 7: Layfield cleaned snow. Heavy North placed ODF at the sump.

Photo 8: Heavy North disregarded RFI-013 Design Clarification signed by JDS and began constructing without placing the two layers of geotextile, Layfield/Tetra Tech notified BGC.

Photo 9: Event pond progress continues as BGC approved East side foundation preparations and lifts on east side, west side saturated lift remains to be removed before work can begin on West side.

Photo 10: Tetra Tech conducted QC tests on new lift and BGC accepted results and lift.

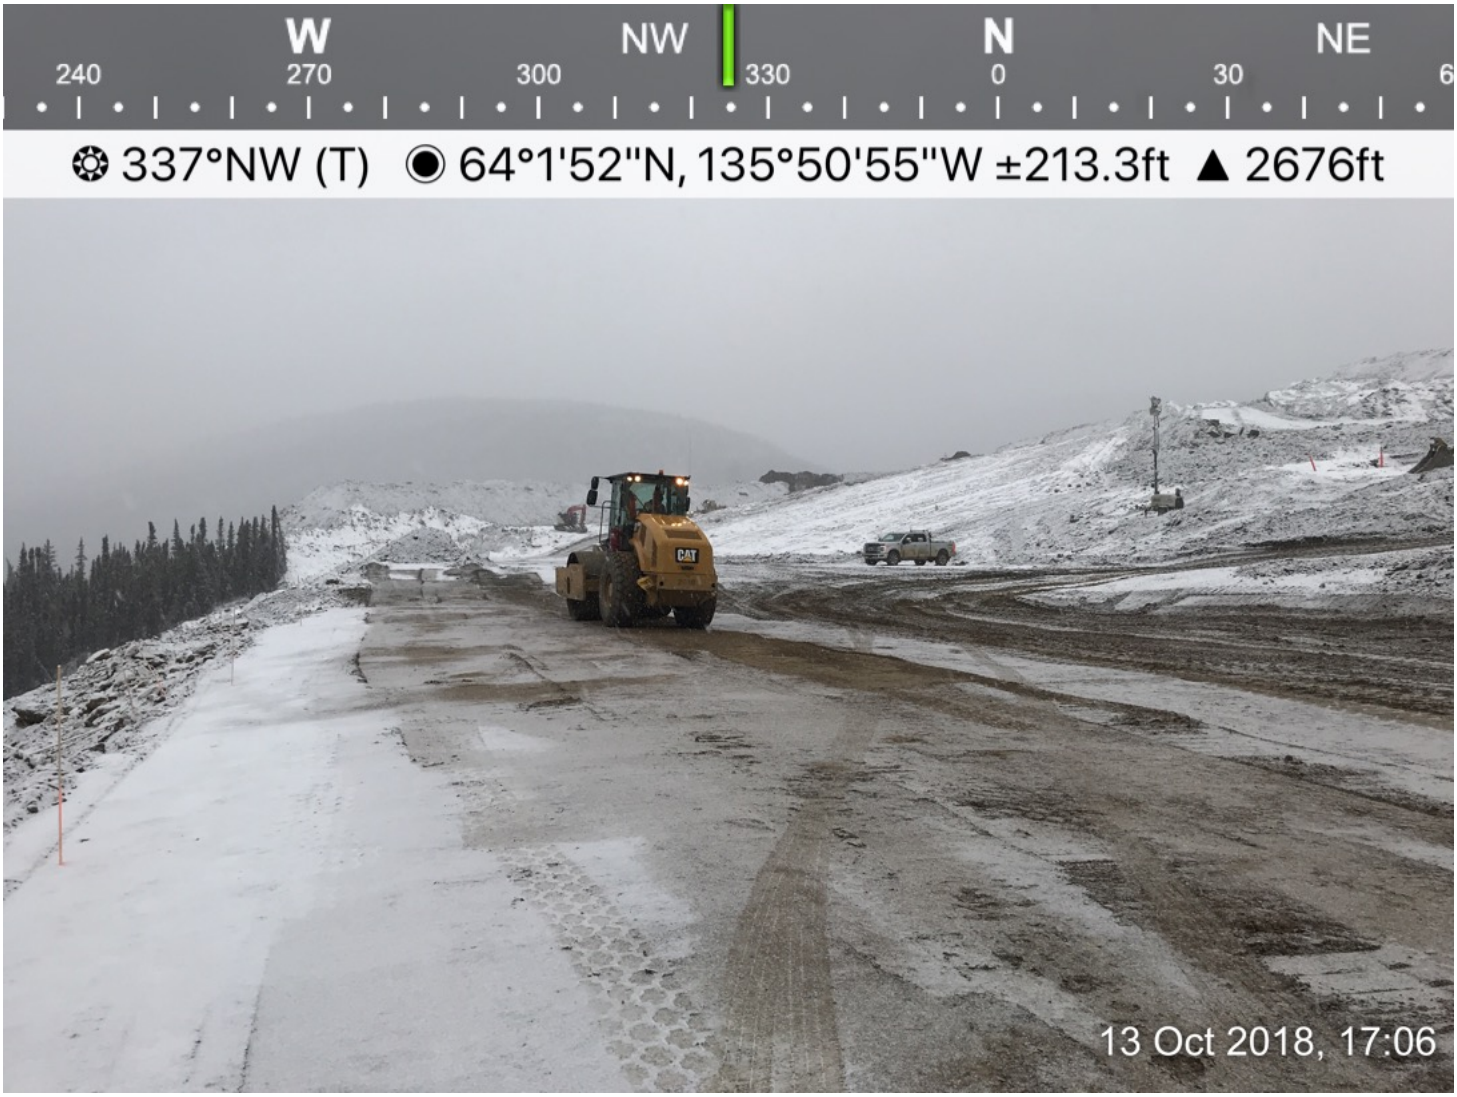

Photo 11: Snow storm saturated lift on the event pond, BGC instructed Pelly to continue packing to keep energy on lift from forming ice.

Photo 12: Tetra Tech conducted density and moisture tests on lift and BGC accepted density and moisture content.

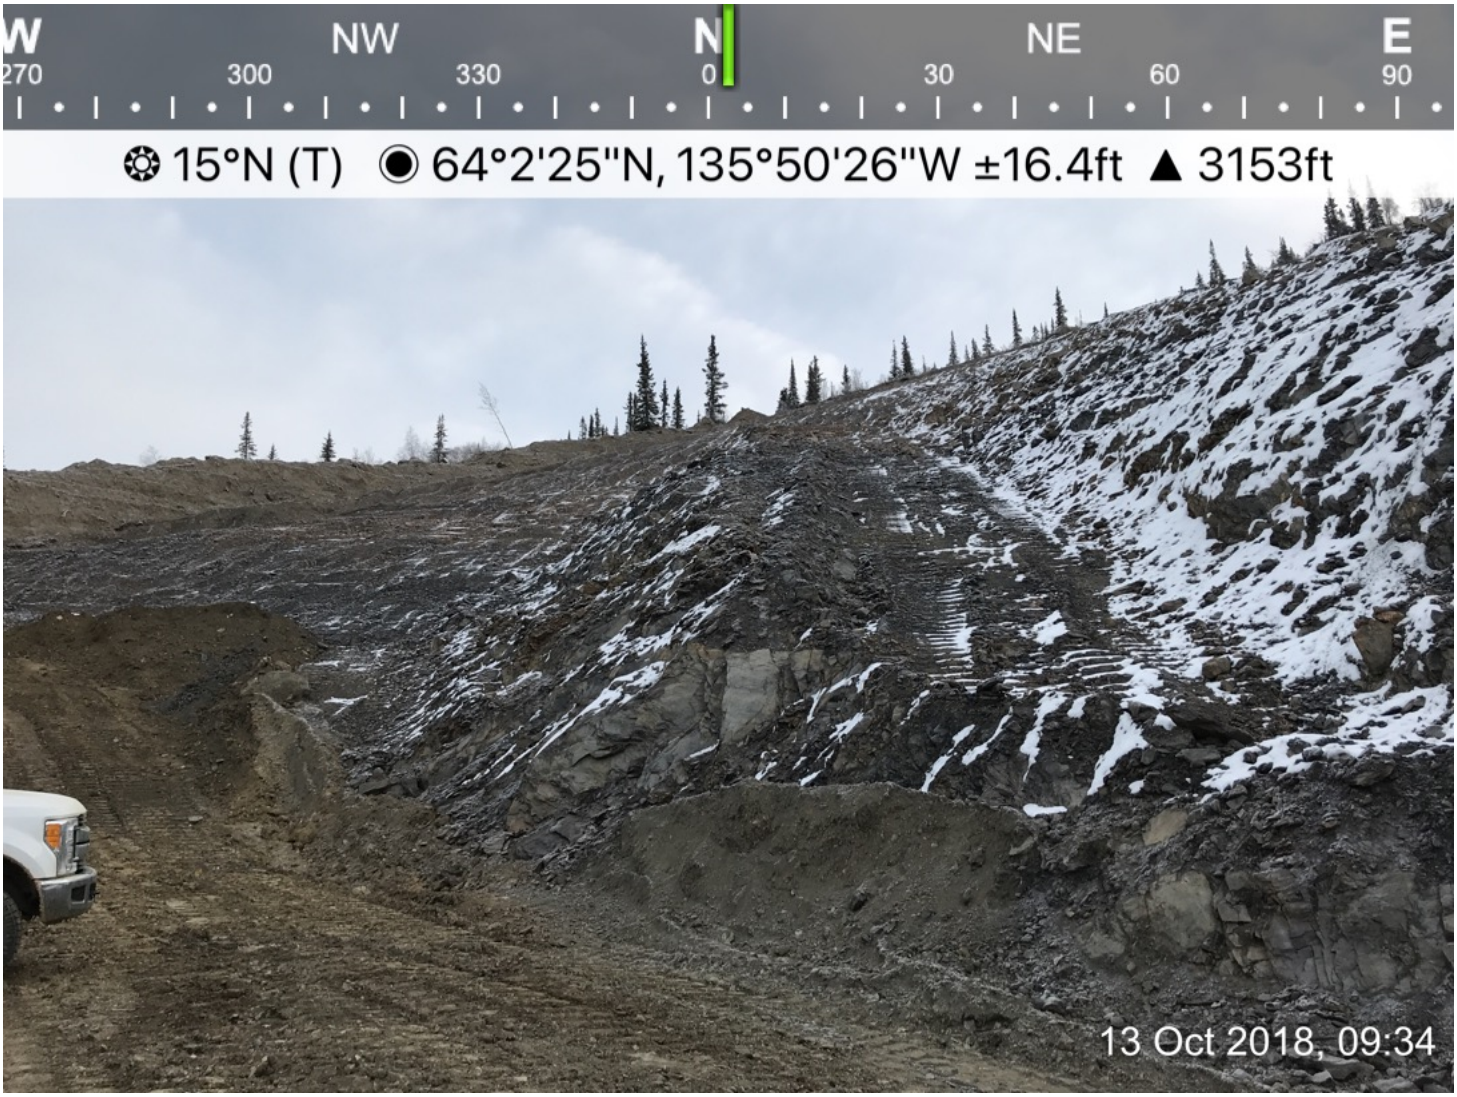

Photo 13: Potential ADR source for Event Pond Construction visited by BGC/JDS.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 13, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Troy Meyer	**Weather:**	Cloudy/Fog/Snow -5°C to 4°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly has completed the work in the HLF embankment and in-heap and has been approved by BGC.
  - Pelly has completed and confirmed the cover of the underdrains with at least 4 m of cover (***Photo 1),*** approved by BGC.
  - Pelly has completed the winterization grading of the downstream slope of the embankment (***Photos 1 to 3***), approved by BGC.
  - Pelly has completed the slope backs and shaping of the west abutment areas, free of ice and seeps ***(Photo 4***), approved by BGC.
  - Pelly has completed the remaining impoundment area shaping and material placement for liner installation ***(Photo 5)***.
  - Pelly will now focus on the "Spillway" earthworks (***Photo 6***) and "Event Pond" earthworks.
  - Layfield cleaned snow off liner on impoundment. (***Photo 7***).
  - BGC asked JDS/Heavy North to provide survey data of placement of steel plates and pipe work via RFI. No response has been received to date.
  - Pelly continues cleaning and hauling waste material on event pond.
  - Heavy North has placed ODF on east abutment area to sump. Heavy North placed ODF without communicating with Layfield and blocked areas that needed testing, this material was removed for tests to be completed. Ice chunks on ODF were also noted and gradation tests on ODF show it to compliant with.
  - Heavy North disregarded RFI-013 Design Clarification signed by JDS and began constructing without placing the two layers of geotextile, Layfield/Tetra Tech notified BGC (**Photo 8**).
  - Event pond lift that had saturation over 10% that was not removed or scraped off yesterday exhibited ice jacking, Pelly instructed to remove this lift completely before placing a new lift.
  - Pelly continued work on the East side of the event pond with foundation preparation and approval from BGC by placing lifts with drier materials that met density and moisture content (also accepted by BGC). Pelly was instructed to compact lifts continuously during a snow storm to avoid freezing by maintaining energy on the lift, QC tests confirmed lift density and moisture content, BGC accepted lift placed on the snow storm (***Photos 9 to 12***).
  - BGC communicated to JDS and Pelly that both BGC and Tetra Tech need to know 24 hours in advance of all sources of material for the event pond to develop compaction and moisture criteria for lifts, RFI sent to help achieve this.
  - BGC provided JDS with the spillway re-design CAD drawings, JDS passed on the information to Pelly.
  - There are currently 3 RFI Clarifications that remain to be signed/accepted formally by JDS and 5 RFIs from BGC to JDS that remain unanswered.

- Observations and Recommendations (Open/Ongoing):
  - Piles located near borrow sources that are pending labels and inclusion in the stockpile management plan are:
    - Waste pile(s) approximately 15m west of the ADR cut.
    - Waste topsoil approximately 50m south of the Event Pond footprint.
    - Material 1 – Site Grading Fill stockpile/borrow on the western portion of the Event Pond footprint.
    - Ice rich material directly adjacent to the Event Pond Material 3 borrow within the Event Pond footprint.
  - BGC and JDS visited a potential material source by the ADR ***(Photo 13),*** testfill is required to determine quality, compaction requirements and lift allowance for use on event pond construction.
  - During snow storm, it is recommended to run packers on event pond to provide compaction and kinetic energy on lift to help maintain density and moisture content.

BGC-RFI-025	Event Pond Water Winterization Plan	Open. Sent Oct 12, 2018.

Safety Issues: None today

Photo 1: Pelly shaping impoundment zone on west side of embankment and placing fill material for liner installation preparation. Survey as-built confirmed slopes were to design, shaping was accepted.

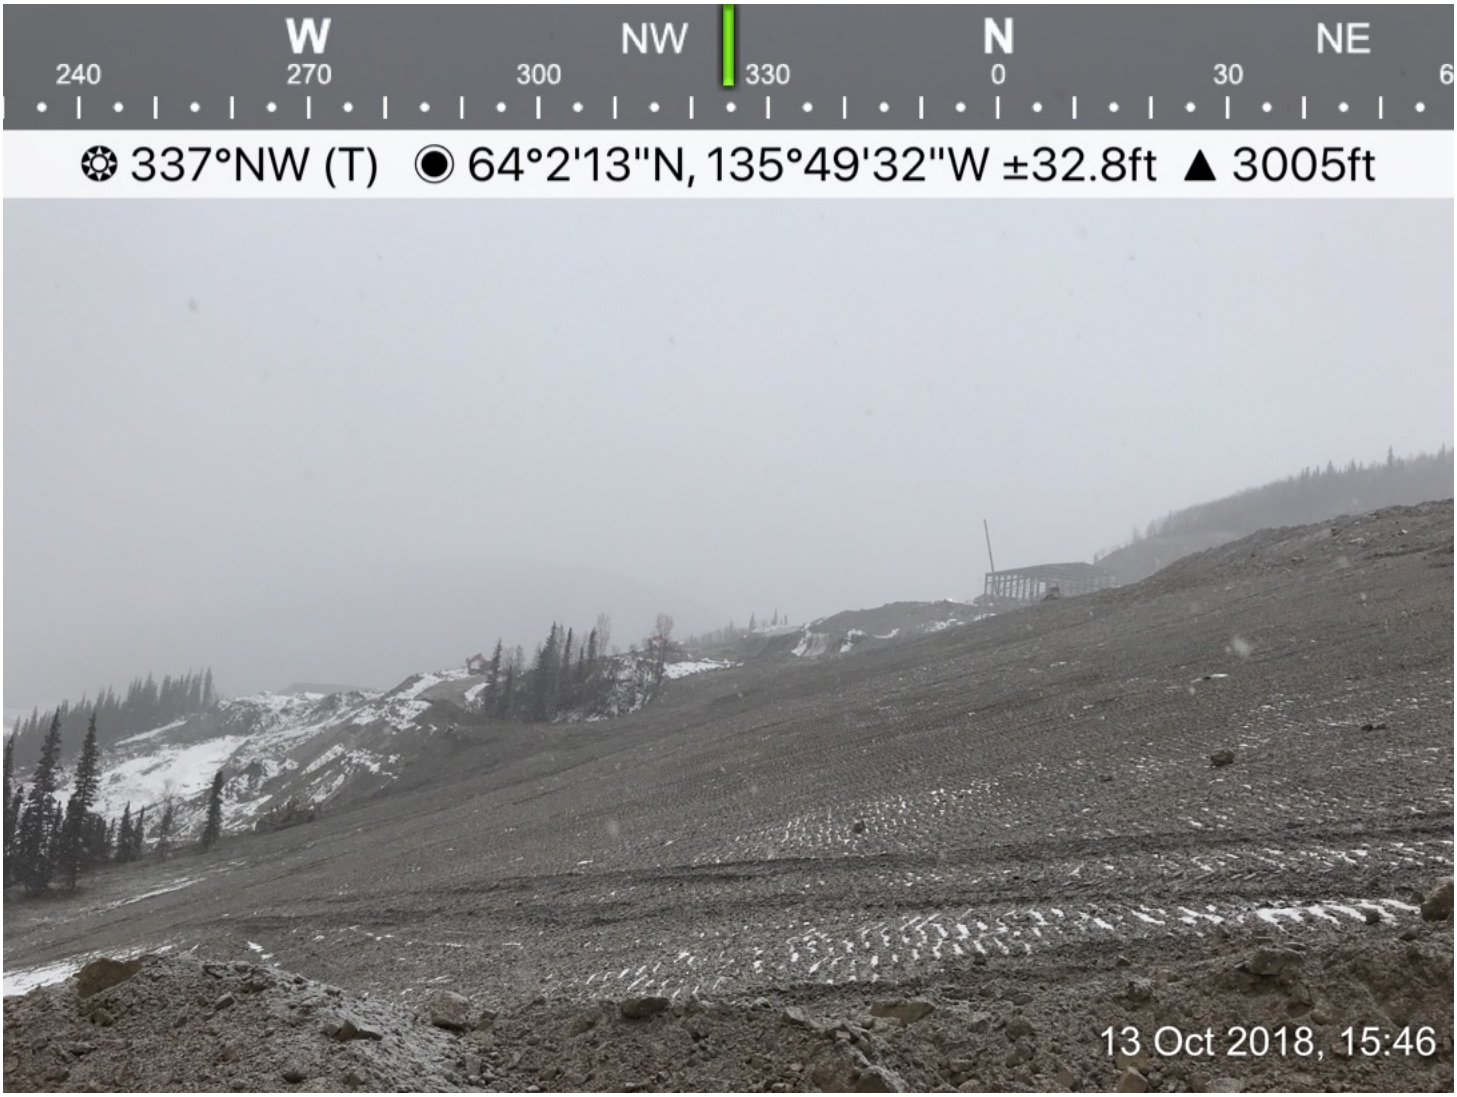

Photo 2: Layfield cleaned snow on impoundment.

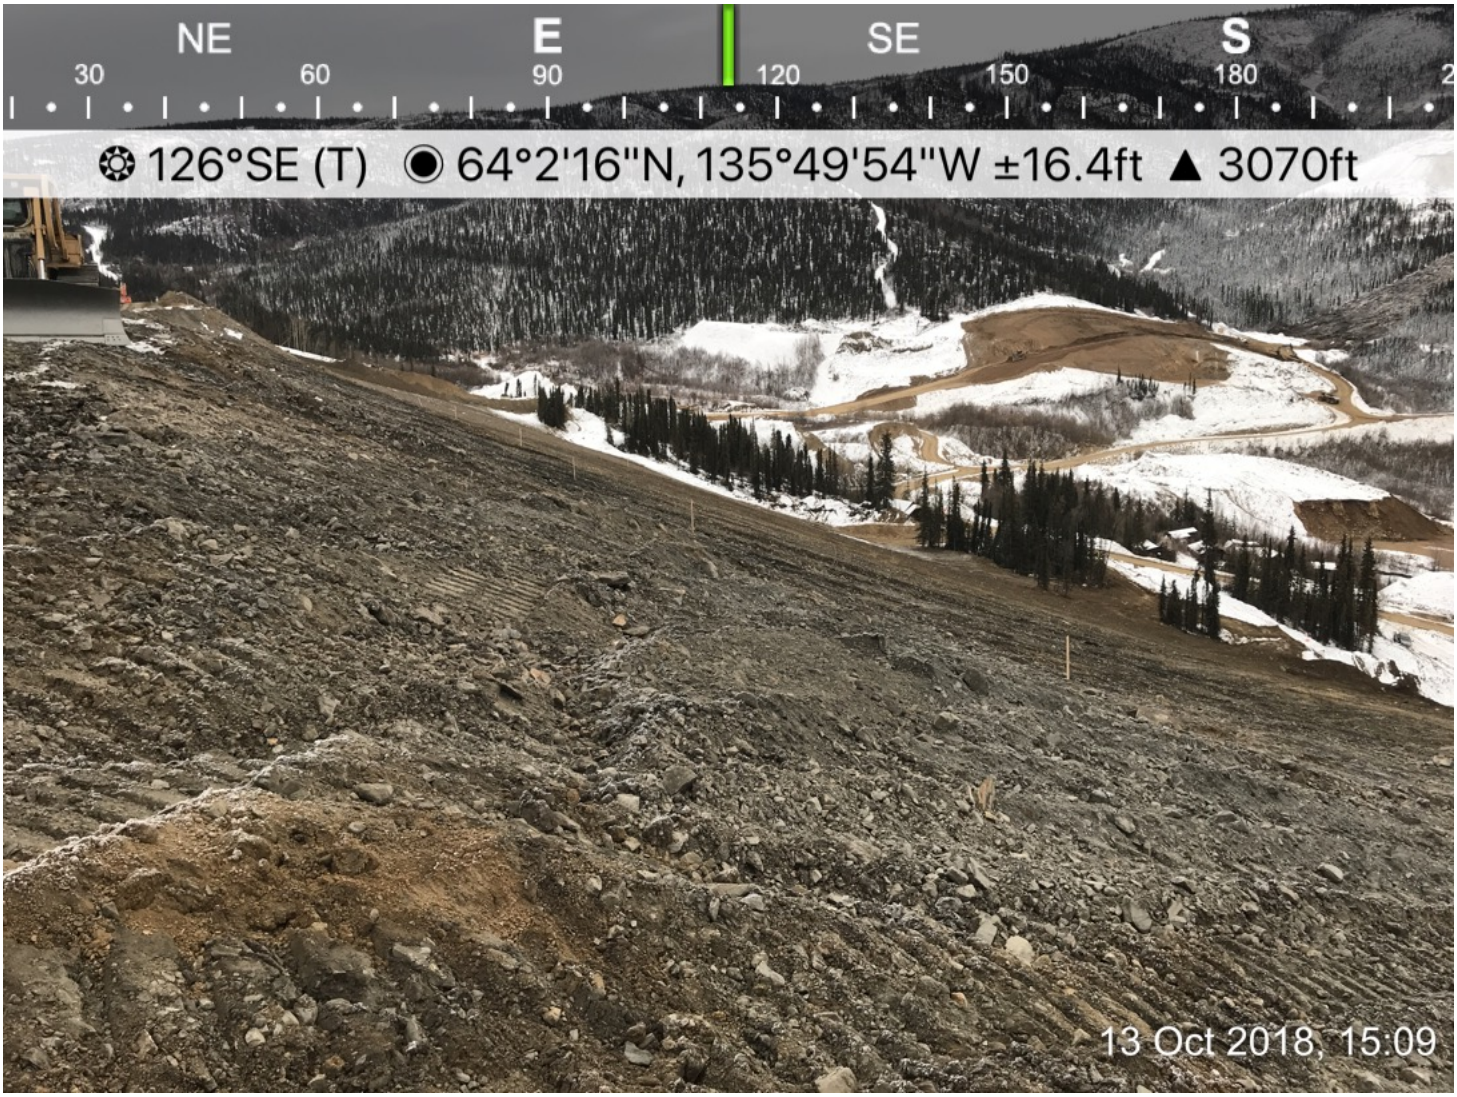

Photo 3: Heavy North started placing ODF material, ice chunks were noted.

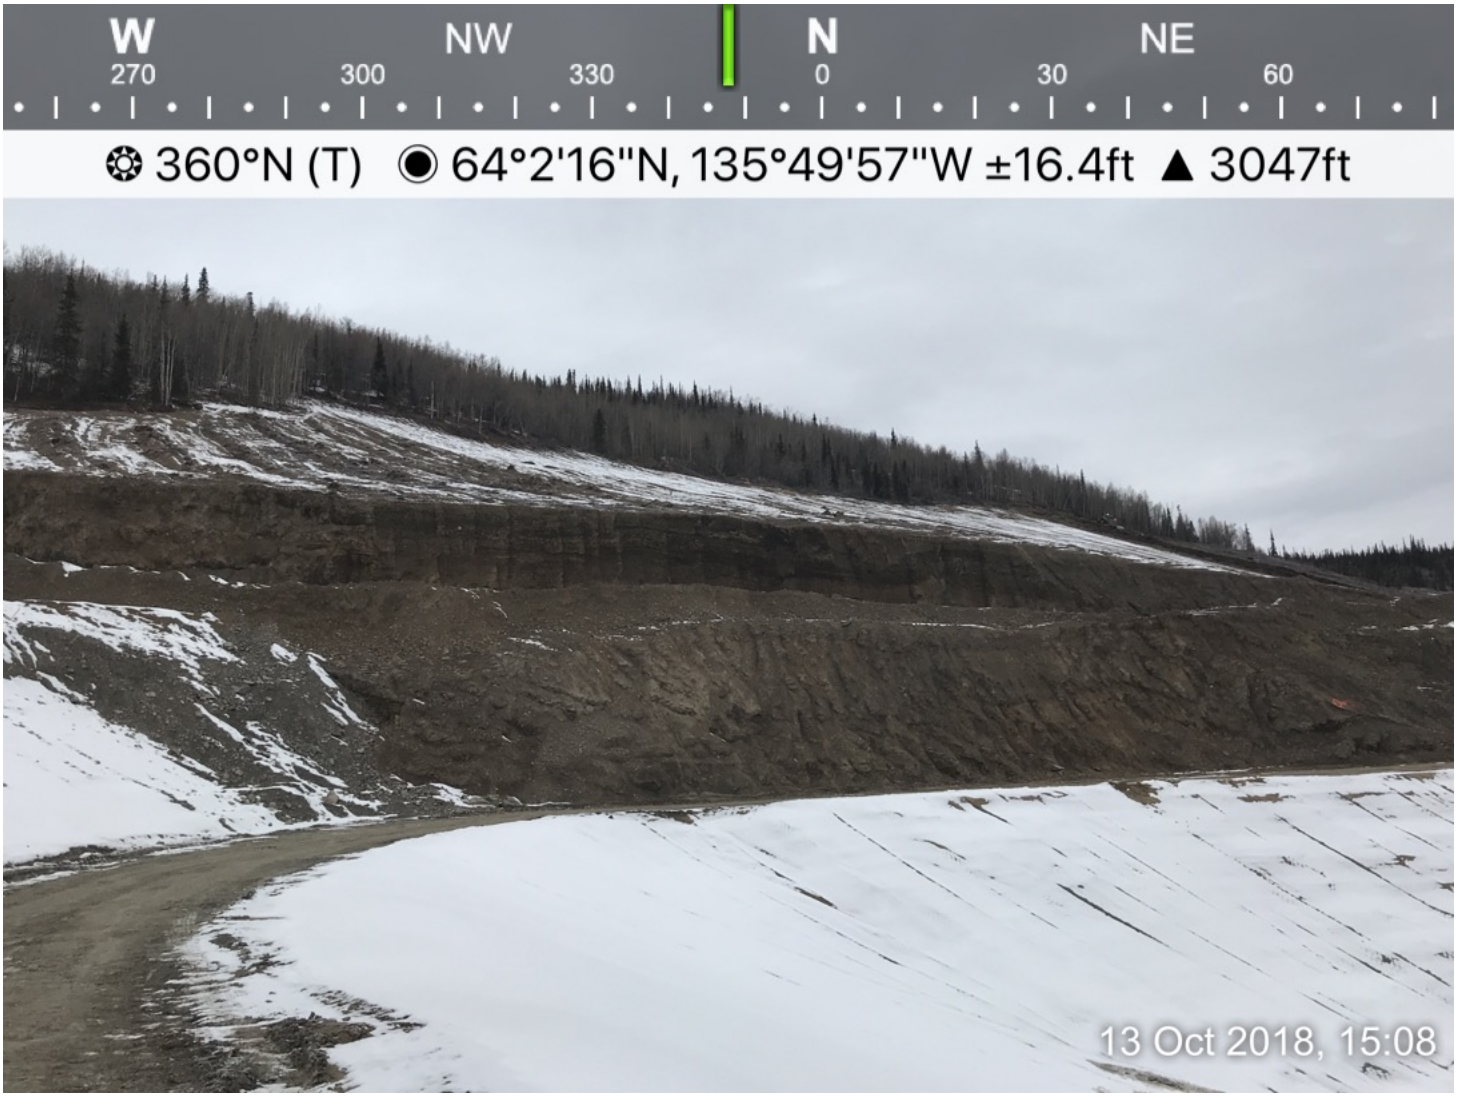

Photo 4: Heavy North placed ODF and blocked areas that needed testing by Layfield, it was instructed to remove material by areas not tested for Layfield to conduct tests necessary to finalize installation.

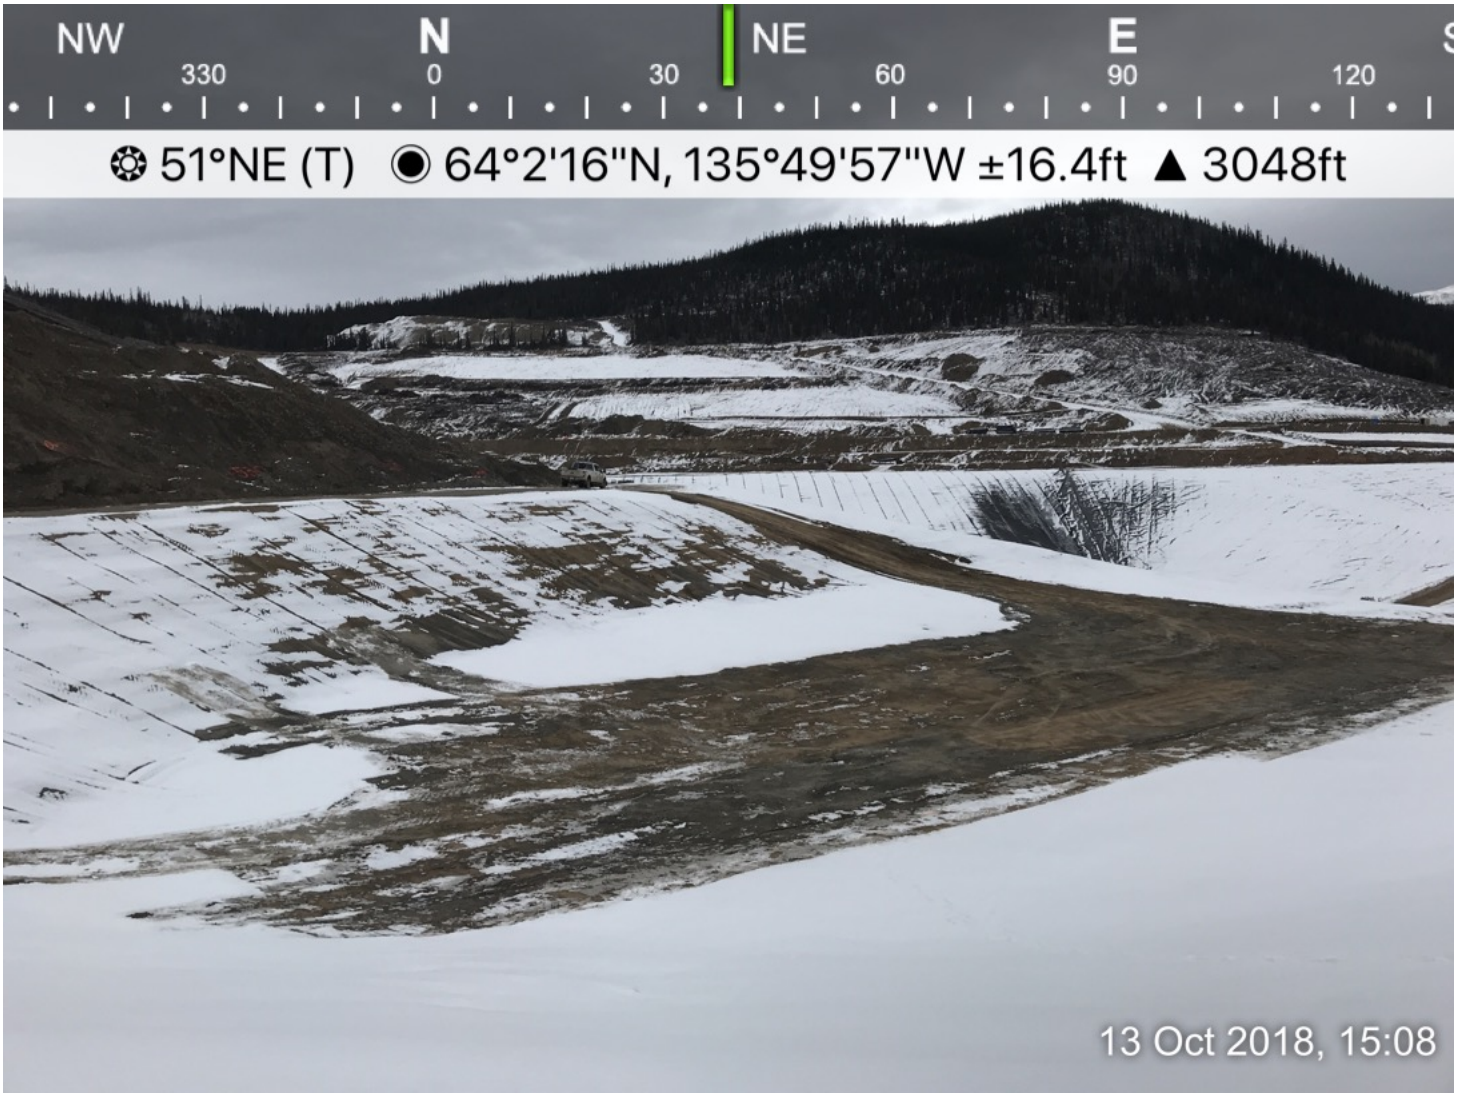

Photo 5: Event pond lift that had saturation over 10% that was not removed or scraped off yesterday exhibited ice jacking as visible in this picture Pelly instructed to remove this lift completely before placing a new lift.

Photo 6: QC density tests on new lift #26B were approved by meeting low moisture content and density.

Photo 7: Upon approval of lift, Pelly continued to place on the east side of the event pond, foundation on east most side was also approved.

Photo 8: Heavy North disregarded RFI-013 Design Clarification signed by JDS and began constructing without placing the two layers of geotextile, Layfield/Tetra Tech notified BGC.

Photo 9: Event pond progress continues as BGC approved East side foundation preparations and lifts on east side, west side saturated lift remains to be removed before work can begin on West side.

Photo 10: Tetra Tech conducted QC tests on new lift and BGC accepted results and lift.

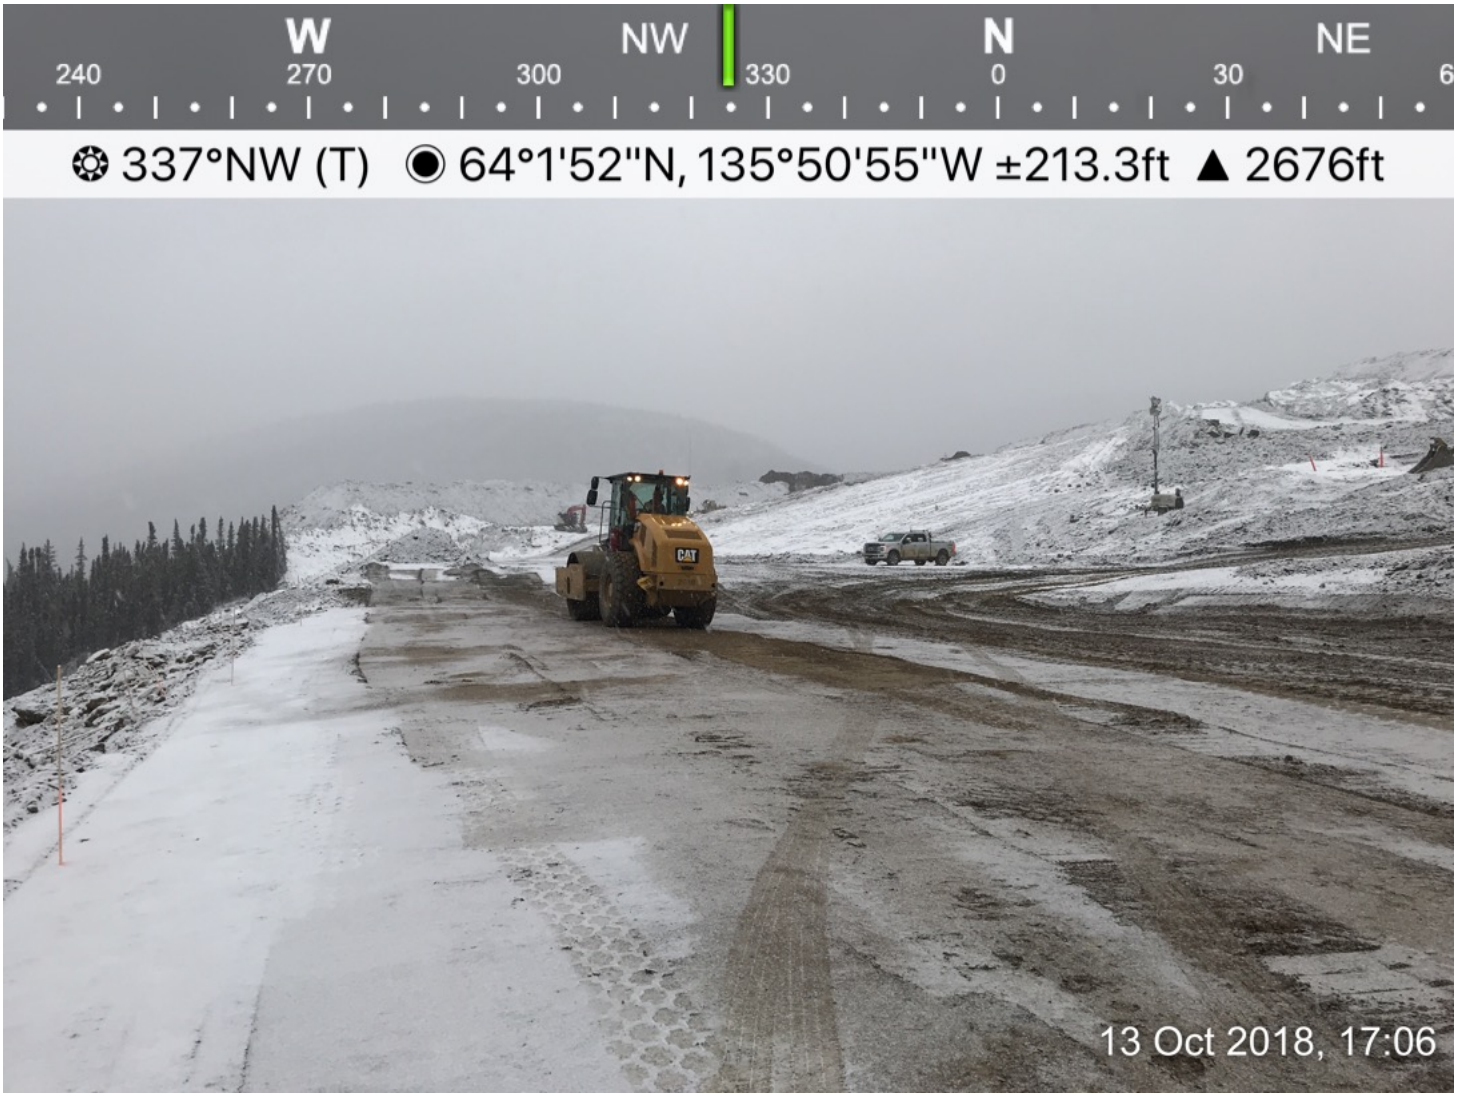

Photo 11: Snow storm saturated lift on the event pond, BGC instructed Pelly to continue packing to keep energy on lift from forming ice.

Photo 12: Tetra Tech conduct density and moisture tests on lift and BGC accepted density and moisture content.

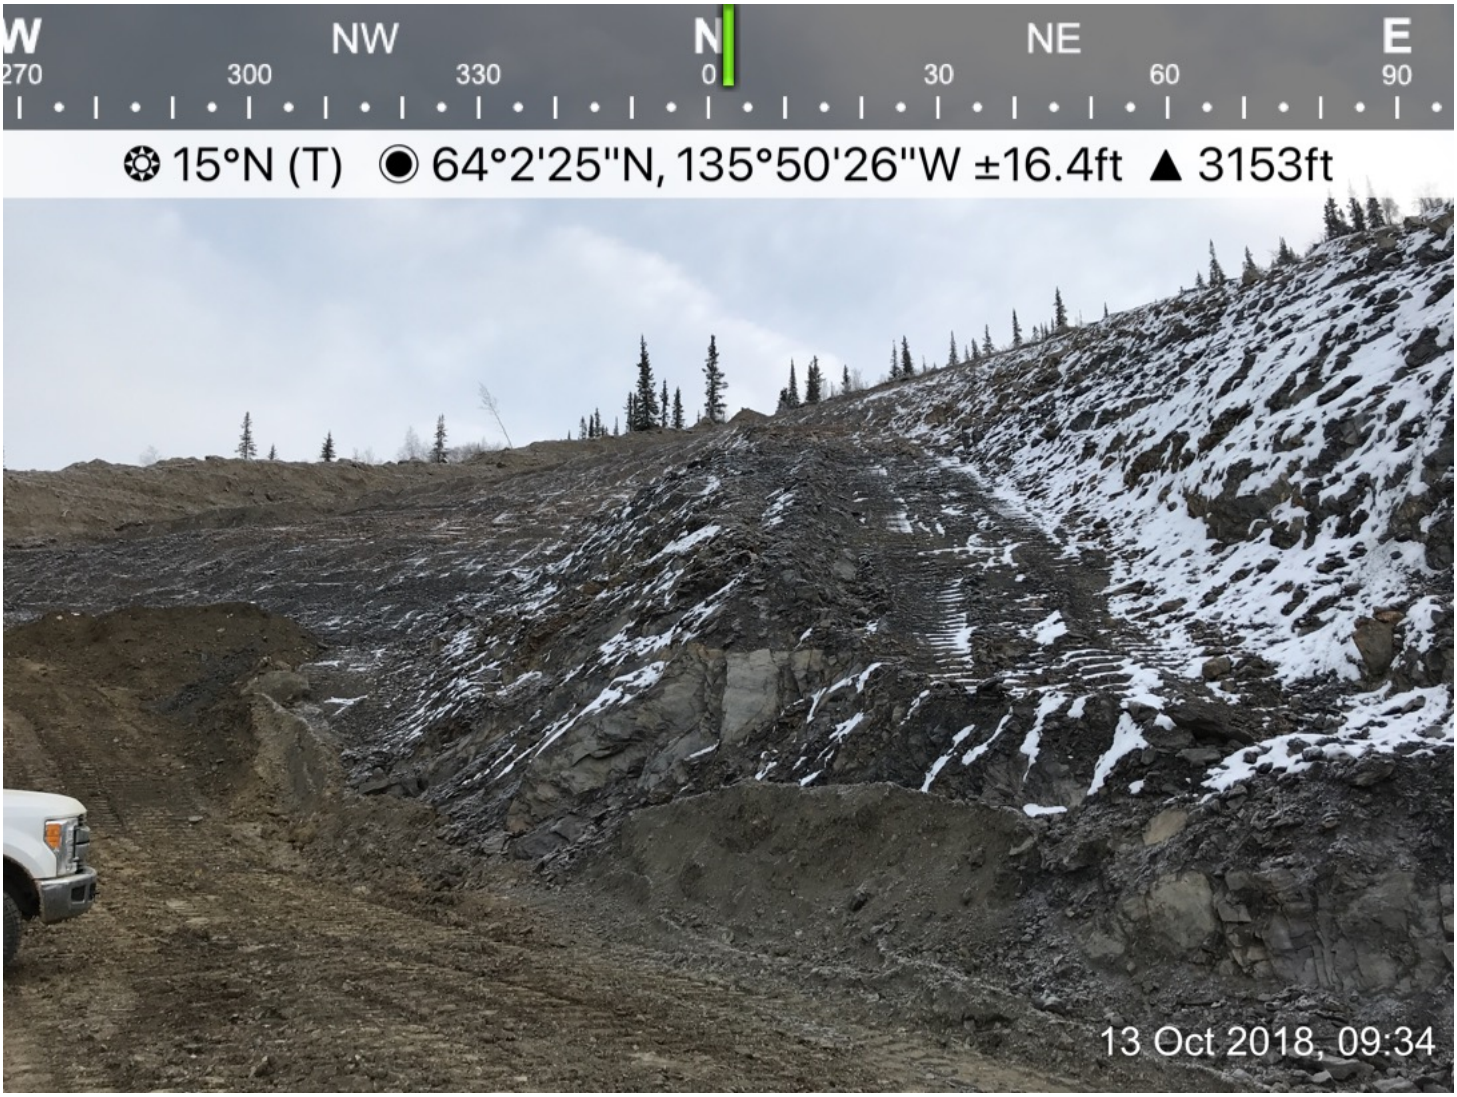

Photo 13: Potential ADR source for Event Pond Construction visited by BGC/JDS.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 14, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Dan Granda / Troy Meyer	**Weather:**	Fog/Sunny -3°C to 2°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continues to work in the event pond. Pelly scraped off the rejected lift, placed a new lift with drier material composed of more quartzite. BGC took a sample and QC tested density and moisture, lifts were accepted (***Photos 1 to 4).***
  - Pelly cleaned east side and northern upper sections of the event pond foundation, BGC approved zones with survey spray paint and communicated with field supervisors and Pelly Engineer.
  - Pelly continued placing and compacting material for preparation of spillway area (***Photo 5***).
  - Snow affected work areas for Heavy North and Layfield, both teams cleaned snow to proceed with liner installation and ODF placement (***Photos 6 and 7***).
  - BGC asked JDS/Heavy North to provide survey data of placement of steel plates and pipe work via RFI. No response has been received to date.
  - Pelly continues cleaning and hauling waste material on event pond.
  - BGC communicated to JDS and Pelly that both BGC and Tetra Tech need to know 24 hours in advance of all sources of material for the event pond to develop compaction and moisture criteria for lifts, RFI sent to help achieve this. BGC may reject lifts if the material placed is frost susceptible, RFIs to help plan have been sent out.
  - BGC provided JDS with the spillway re-design CAD drawings, JDS passed on the information to Pelly.
  - There are currently 3 RFI Clarifications that remain to be signed/accepted formally by JDS and 5 RFIs from BGC to JDS that remain unanswered.
  - JDS has proposed to BGC the creation of a new pit for ADR material access for event pond construction. BGC noted to JDS that a testfill will be needed to come up with lift size, compactor passes and necessary protocol/procedures for lift placement. It is assumed the material will be a mixture of quartzite and phyllite, similar to embankment material but this remains to be determined.
  - Pelly asked BGC if an access road bordering the west side of the embankment could be placed. BGC agreed under the condition of such road not being a cut into the embankment and having a grade that guides runoff away from the groin and embankment.

- Observations and Recommendations (Open/Ongoing):
  - Lack of stockpile management and labels will start causing confusion on materials that are suitable and unsuitable for event pond. BGC may reject lifts that contain excessive phyllite, organics or over saturated fines deemed unsuitable but hauled due to lack of stockpile management (RFI 023 and 024 still pending response/action).
  - During snow storms, it is recommended to run packers on event pond to provide compaction and kinetic energy on lift to help maintain density and moisture content.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do may result in rework and repairs during Spring.

- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided HLF earthworks QC Daily Reports for October 13.
  - Field density and moisture testing were provided to BGC for October 13.
  - Tetra Tech provided QC Daily Reports for liner installation on October 14.
  - Tetra Tech provided QC Daily Reports for event pond on October 13.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Communications (no follow up required):

Open Inspection Instructions (II)/Non-Conformance Reports (NCR)/Request for Information (RFI):

ID	Description	Status
BGC-RFI-018	Event Pond Excavation Specification	Sent September 29, 2018. Waiting confirmation of receipt. BGC printed copy and left on desk of JDS for confirmation of receipt Oct 13, 2018.
BGC-RFI-019	Closure Sump Steel Plate Detail	Sent October 1, 2018. Waiting confirmation of receipt. BGC printed copy and left on desk of JDS for confirmation of receipt Oct 13, 2018.
BGC-RFI-020	HLF VALID Liner Testing	Sent October 2, 2018. Waiting confirmation of receipt. BGC printed copy and left on desk of JDS for confirmation of receipt Oct 13, 2018.
BGC-RFI-021	Steel plate installation and closure drain pipe (Asking for as-built survey)	Open. Sent Oct 9, 2018.
BGC-RFI-022	Event Pond Water Management Plan	Open. Sent Oct 9, 2018.
BGC-RFI-023	Event Pond Material Source Plan	Open. Sent Oct 10, 2018.
BGC-RFI-024	Event Pond Material Stockpile Management	Open. Sent Oct 12, 2018.
BGC-RFI-025	Event Pond Water Winterization Plan	Open. Sent Oct 12, 2018.

Safety Issues: None this shift.

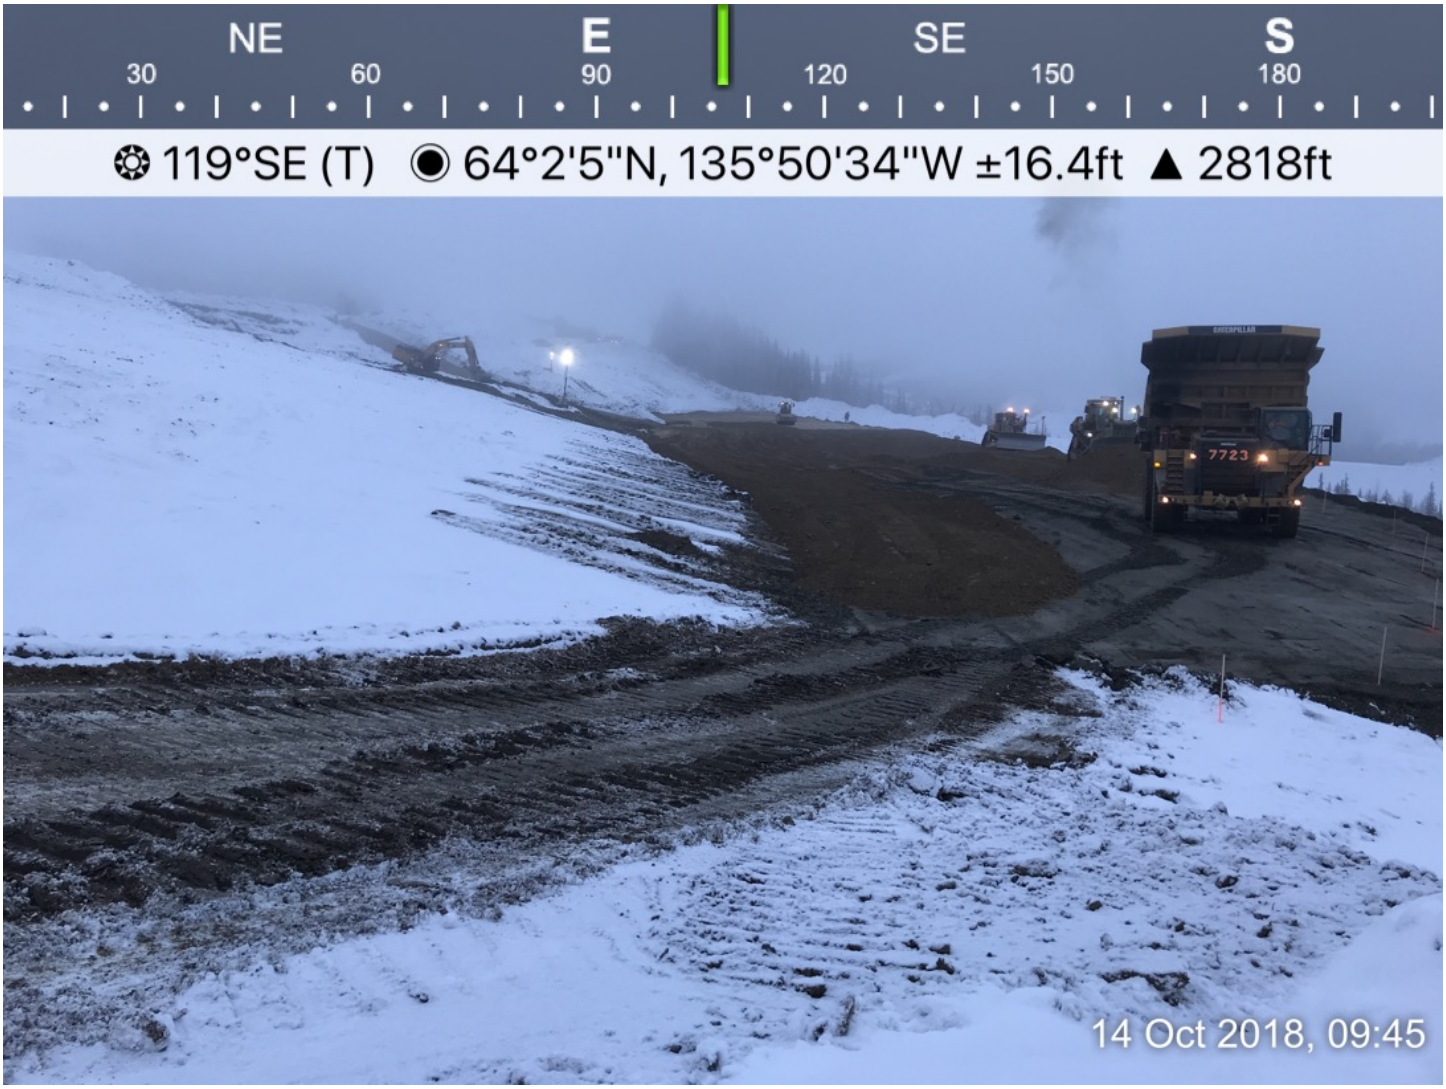

Photo 1: Pelly removed the rejected lift and placed material on top.

Photo 2: BGC took a sample for Tetra Tech to test of the loose lift for QA/QC records (Standard proctor to be performed, results pending).

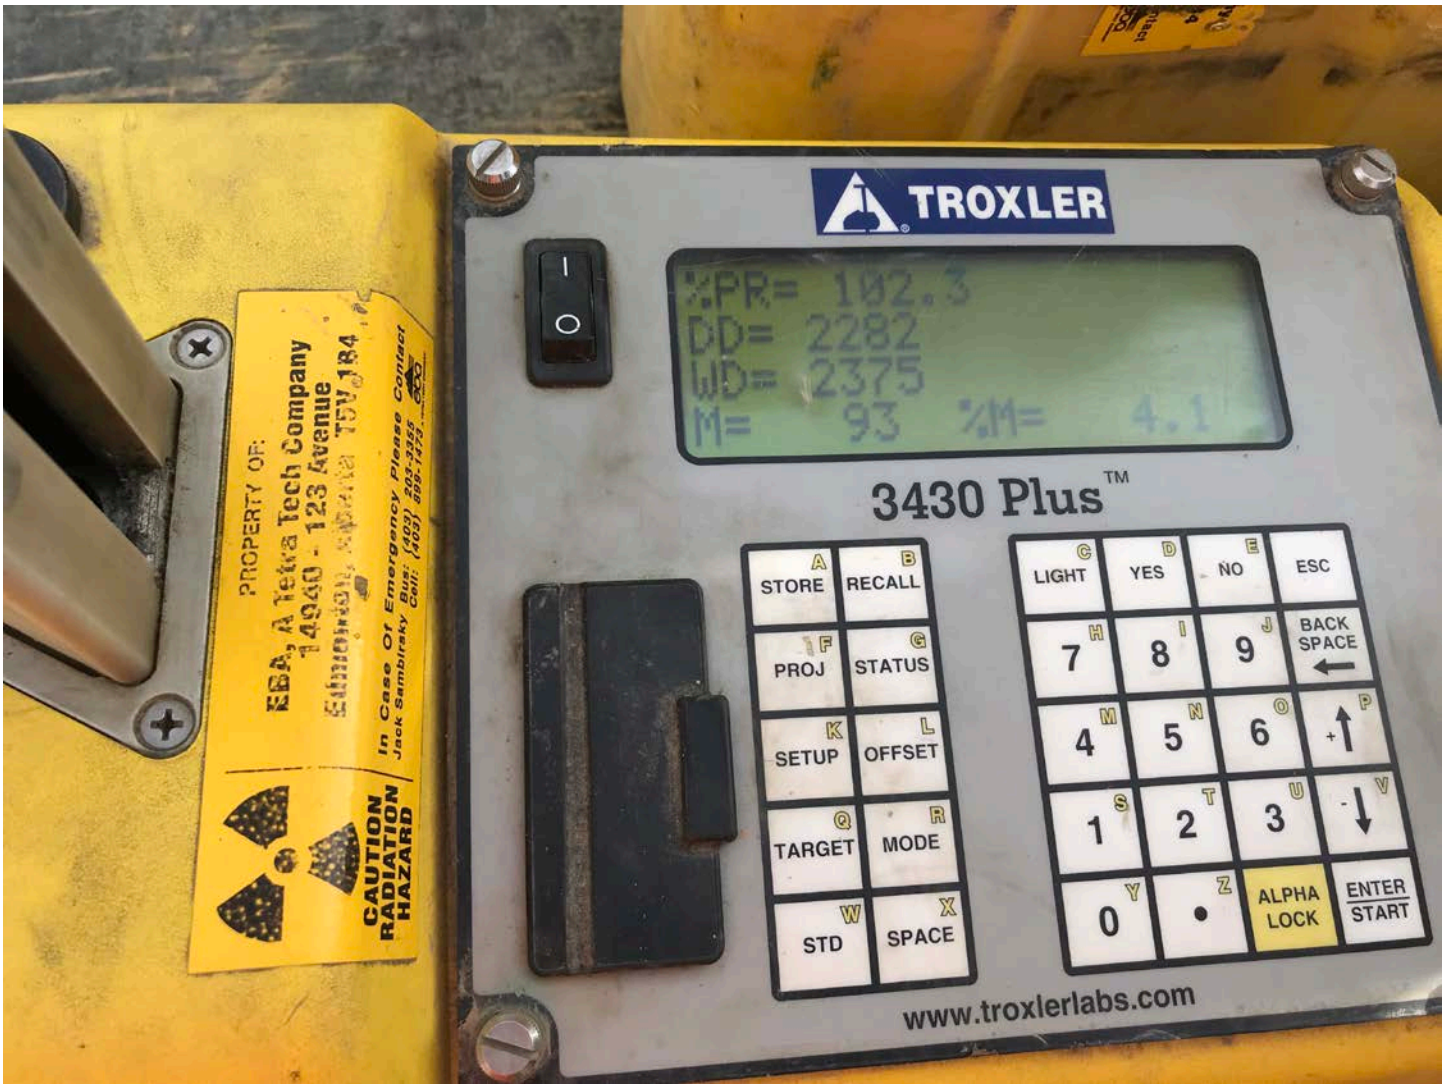

Photo 3: QC Tetra Tech did a nuclear density test in the afternoon with BGC present, the lift was accepted, the lift had more quartzite than previous lifts and lower moisture content despite the high humidity of the day.

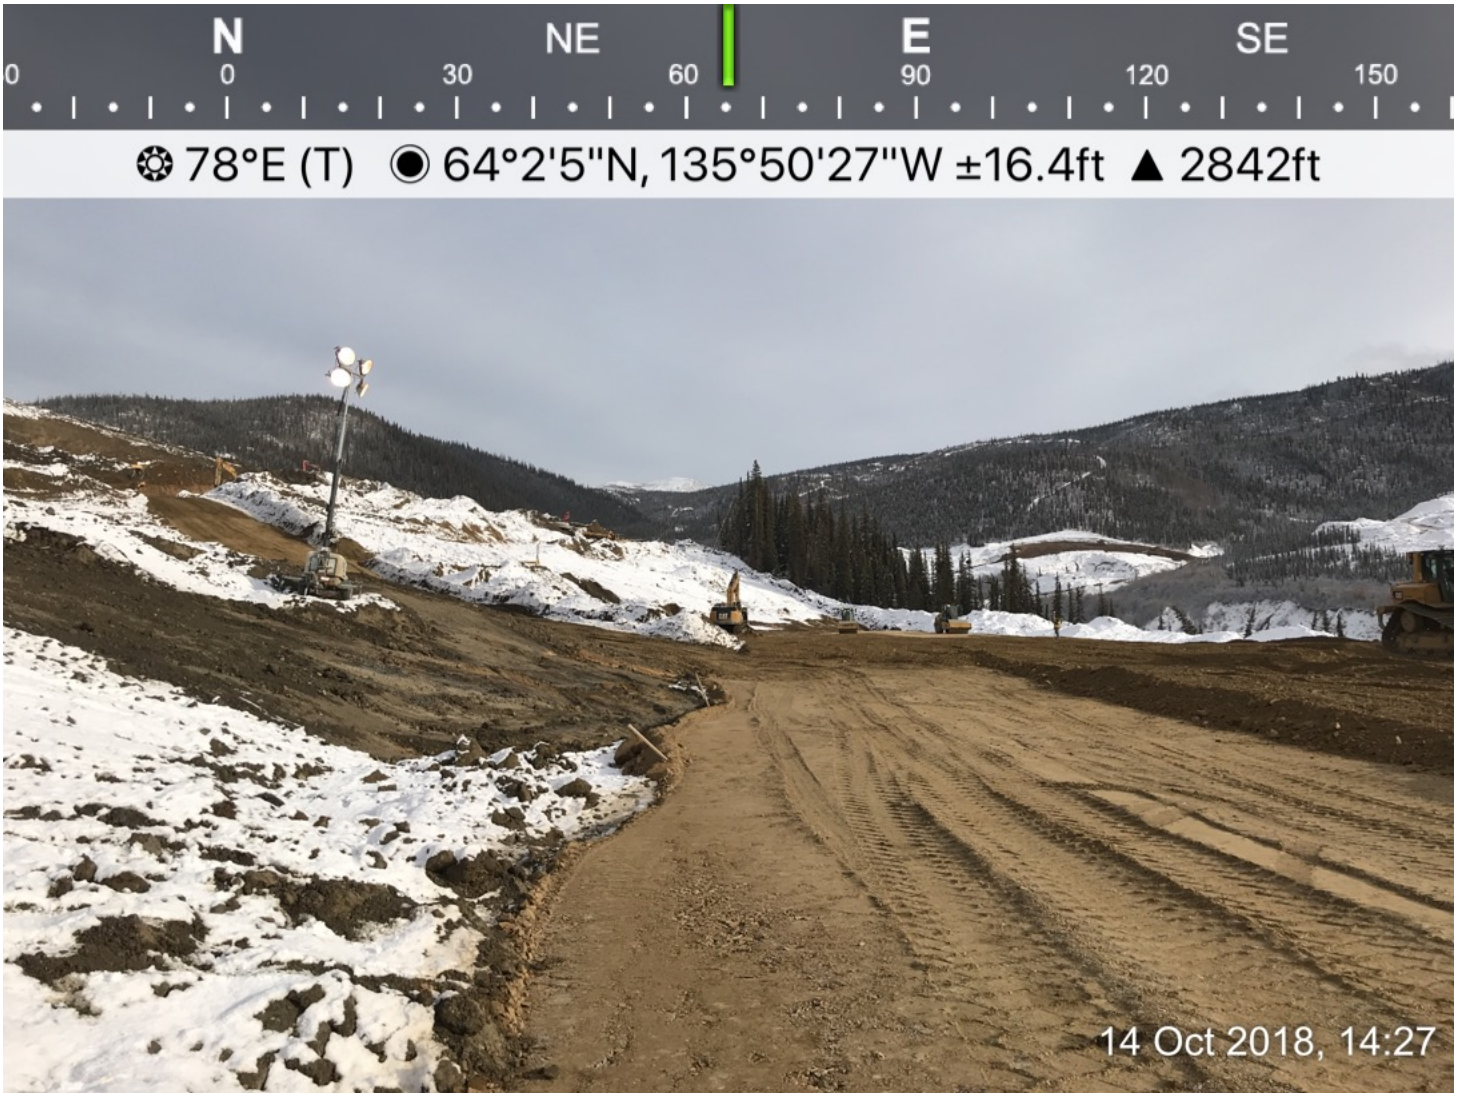

Photo 4: Accepted lift, Pelly continued clearing foundation areas which were approved by BGC and placing material.

Photo 5: Pelly continued placing and compacting material for preparation of spillway area.

Photo 6: Snow affected work areas for Heavy North and Layfield, both teams cleaned snow to proceed with liner installation and ODF placement.

Photo 7: Heavy north continues to place ODF from sump to crest and Layfield conducting checks of liner with Tetra Tech representative.

BGC Personnel:	Dan Granda / Troy Meyer	**Weather:**	Sunny/cloudy -10°C to 2°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continues to work in the event pond. Pelly continues to place lifts with visible quartzite material, QC tests verified density and moisture content and BGC accepted lifts (***Photos 1 to 3).***
  - Pelly begins compacting upper areas of event pond foundation approved by BGC for material placement (***Photo 4)***.
  - Pelly continued placing and compacting material for preparation of spillway area (***Photo 5***).
  - Snow affected work areas for Heavy North and Layfield, both teams cleaned snow to proceed with liner installation and ODF placement (***Photo 6***).
  - BGC approved sections of east side of Event Pond ***(Photos 7 and 8),*** there were areas not approved and communicated to Pelly that will require removal of over saturated/thawing highly weathered phyllite zones.
  - BGC asked JDS/Heavy North to provide survey data of placement of steel plates and pipe work via RFI. No response has been received to date.
  - Pelly continues cleaning and hauling waste material on event pond.
  - BGC communicated to JDS and Pelly that both BGC and Tetra Tech need to know 24 hours in advance of all sources of material for the event pond to develop compaction and moisture criteria for lifts, RFI sent to help achieve this. BGC may reject lifts if the material placed is frost susceptible, RFIs to help plan have been sent out.
  - BGC provided JDS with the spillway re-design CAD drawings, JDS passed on the information to Pelly.
  - There are currently 3 RFI Clarifications that remain to be signed/accepted formally by JDS and 5 RFIs from BGC to JDS that remain unanswered.
  - JDS has proposed to BGC the creation of a new pit for ADR material access for event pond construction. BGC noted to JDS that a testfill will be needed to come up with lift size, compactor passes and necessary protocol/procedures for lift placement. It is assumed the material will be a mixture of quartzite and phyllite, similar to embankment material but this remains to be determined.

- Observations and Recommendations (Open/Ongoing):
  - Lack of stockpile management and labels will start causing confusion on materials that are suitable and unsuitable for event pond. BGC may reject lifts that contain excessive phyllite, organics or over saturated fines deemed unsuitable but hauled due to lack of stockpile management (RFI 023 and 024 still pending response/action).

BGC-RFI-018	Event Pond Excavation Specification	Sent September 29, 2018. Waiting confirmation of receipt. BGC printed copy and left on desk of JDS for confirmation of receipt Oct 13, 2018.
BGC-RFI-019	Closure Sump Steel Plate Detail	Sent October 1, 2018. Waiting confirmation of receipt. BGC printed copy and left on desk of JDS for confirmation of receipt Oct 13, 2018.
BGC-RFI-020	HLF VALID Liner Testing	Sent October 2, 2018. Waiting confirmation of receipt. BGC printed copy and left on desk of JDS for confirmation of receipt Oct 13, 2018.
BGC-RFI-021	Steel plate installation and closure drain pipe (Asking for as-built survey)	Open. Sent Oct 9, 2018.
BGC-RFI-022	Event Pond Water Management Plan	Open. Sent Oct 9, 2018.
BGC-RFI-023	Event Pond Material Source Plan	Open. Sent Oct 10, 2018.
BGC-RFI-024	Event Pond Material Stockpile Management	Open. Sent Oct 12, 2018.
BGC-RFI-025	Event Pond Water Winterization Plan	Open. Sent Oct 12, 2018.

Safety Issues: None this shift.

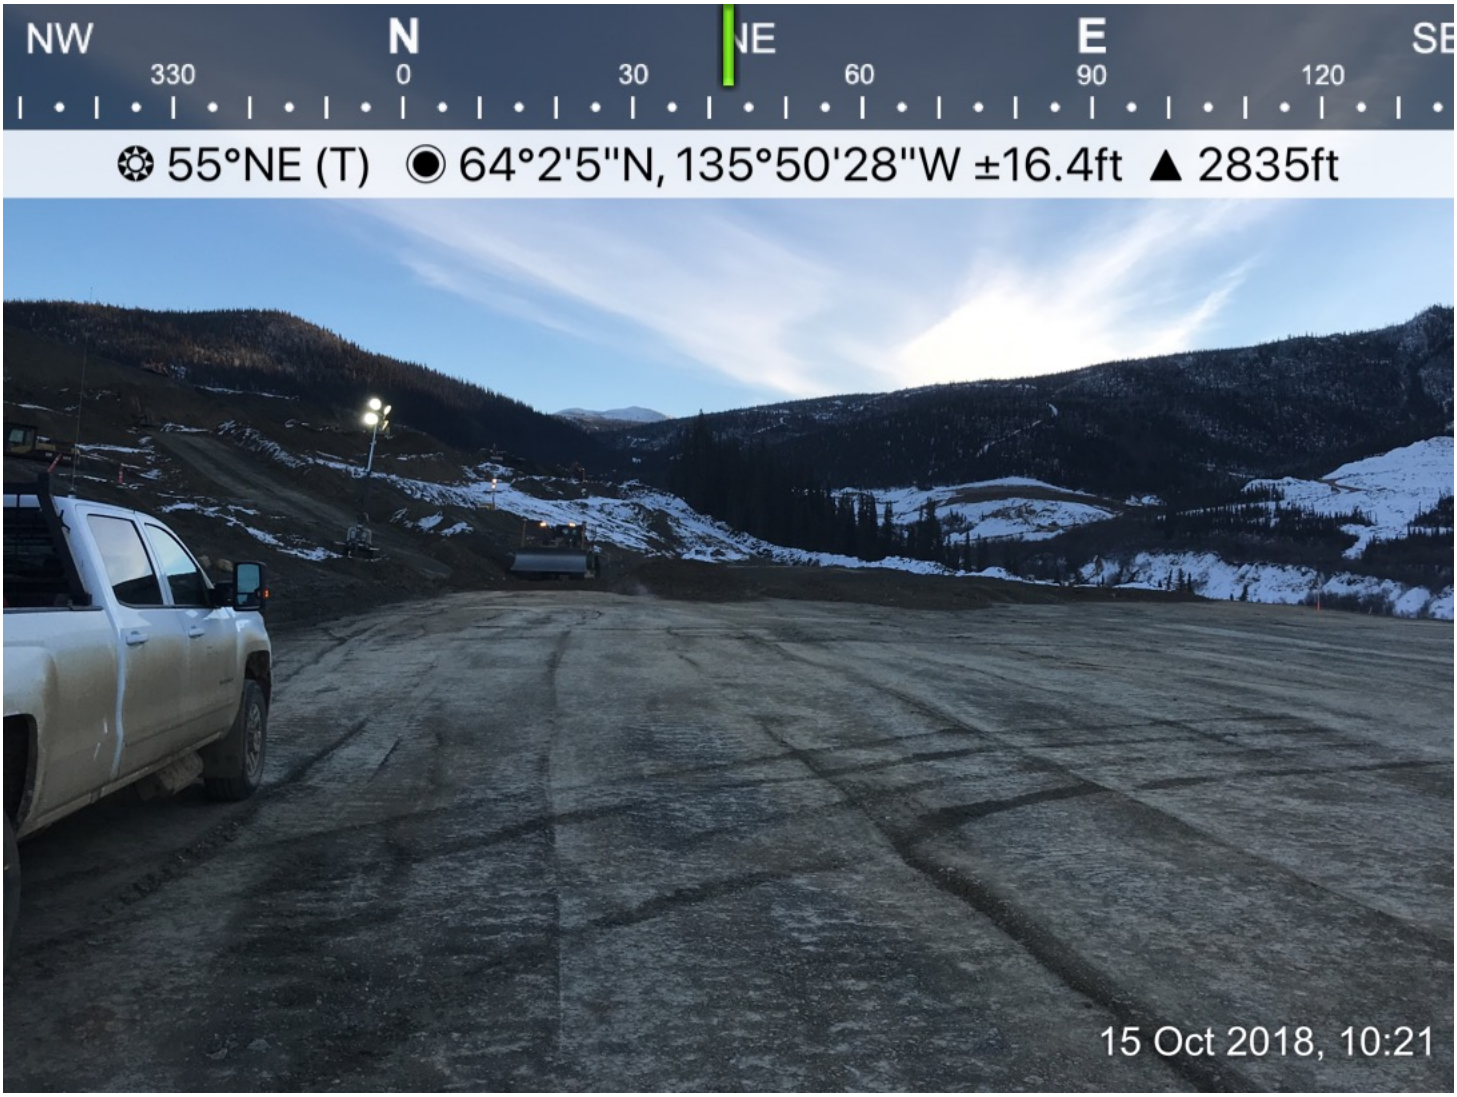

Photo 1: Pelly continues to place lifts on Event Pond, currently doing 5 passes for compaction.

Photo 2: QC Tetra Tech did a nuclear density test with BGC present, the lift was accepted, the lift was observed to be similar in composition from yesterday.

Photo 3: QC test results for 5 passes with current compactor, Pelly asked to continue with 5 passes until bigger compactor is fixed.

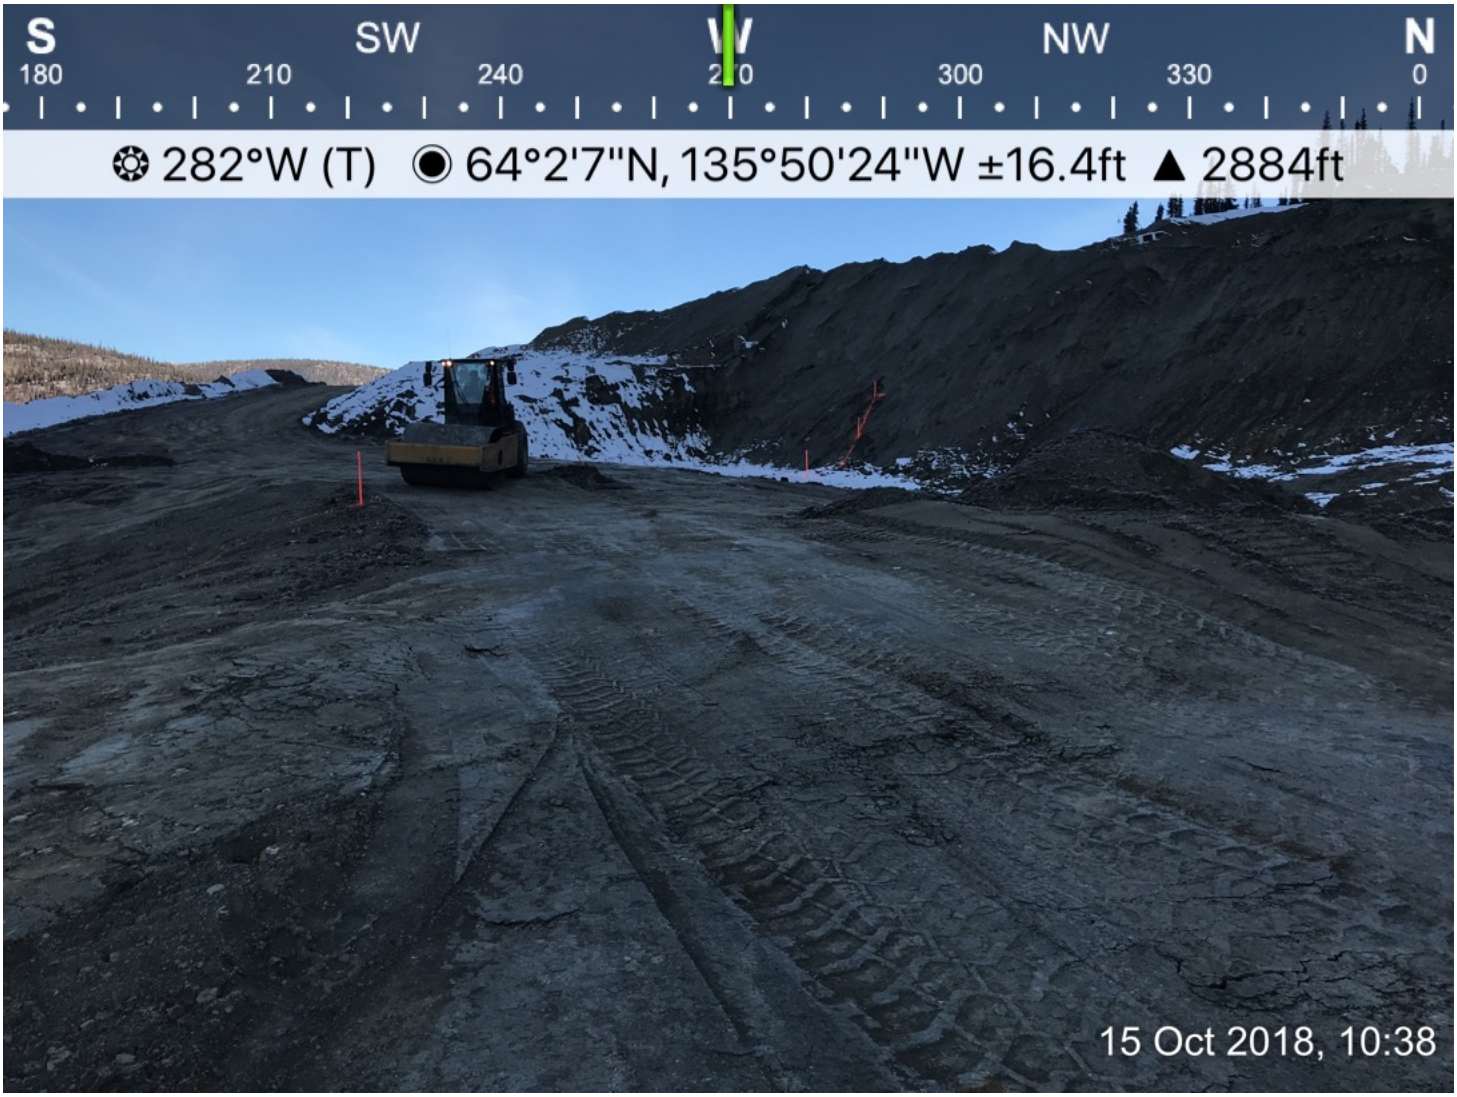

Photo 4: Pelly compacting foundation approved upstream before material placement.

Photo 5: Pelly continued placing and compacting material for preparation of spillway area.

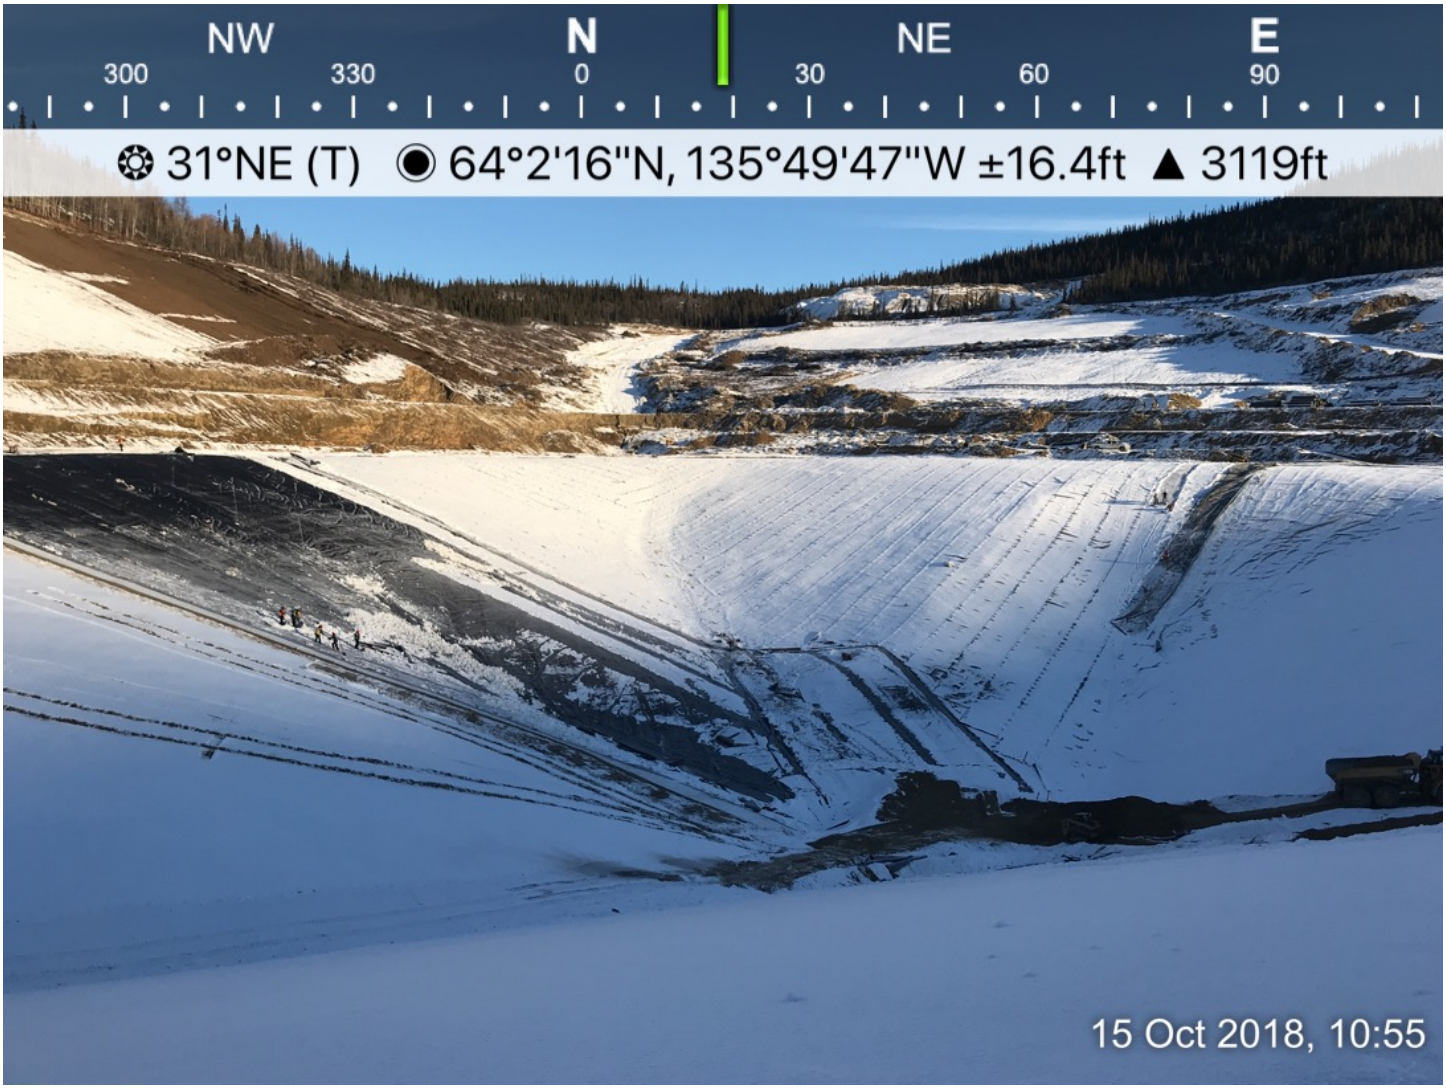

Photo 6: Snow from over 24 hours ago continues to affect work areas for Heavy North and Layfield, both teams continue to clean snow to proceed with liner installation and ODF placement.

Photo 7: During Event Pond foundation approval, BGC asked Pelly to remove frost susceptible phyllite, seen in this picture melting (having oozing effect during the thaw/freeze process). Foundation was approved with stakes, going under this area that needs removal.

Photo 8: Event pond East side was approved, Pelly had reached bedrock and surfaces not susceptible to ice, areas of clear quartzite were observed during inspection with Pelly and marked for survey pick up.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 16, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Troy Meyer	**Weather:**	Sunny/cloudy 3°C to 11°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Dan Granda left site. Roy Morlan arrived on site.
  - Pelly continues to work in the event pond. For most of the day quartzite rich fill was used. However, at the end of the day Phyllite rich material was placed on the lift. Pelly was informed that phyllite material can only be used if mixed on part phyllite to 2 parts quartzite. (***Photos 1).***
  - Pelly compacted an approved area of the event pond subgrade.
  - Snow was removed from the in-heap pond area that is pending liner placement. Snow was removed using an excavator and an I beam (***Photo 2)***. This resulted in gouging of the subgrade surface. Liner bedding material will have to be spread over this surface prior to placement of liner.
  - One of Heavy North's skid steers attempted a turn and drove off the ODF material and partially on the embankment liner. BGC inspected the liner for damage. No damage was found. (***Photo 3***)
  - Frozen soils were observed from approximately 0+080 to 0+065 along the foundation for the event pond berm. (***Photo 4***). Pelly began removing the frozen soils.
  - Pelly continues cleaning and hauling waste material on event pond.
  - Pelly continued construction of an access road to the ADR west borrow area. JDS/Pelly continue planning to continue borrowing the ADR West with the use of blasting.
  - The Event Pond work area is currently a maze of roads and stockpiles. JDS/Pelly should update the stockpile management plan and label all piles in the field to prevent borrow and placement of unsuitable material.

- Observations and Recommendations (Open/Ongoing):
  - During snow storms, it is recommended to run packers on event pond to provide compaction and kinetic energy on lift to help maintain density and moisture content.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter. Saturation of the event pond berms can cause damage due to frost which may result in removal of significant portions of already completed construction early next season. BGC would like to provide input to the plan and would like to review the completed plan.
  - BGC asked JDS/Heavy North to provide survey data of placement of steel plates and pipe work via RFI. No response has been received to date. The surveyed location of this plate is critical for closure to function properly. This item should be resolved quickly before closure sump is buried too deep.
  - As temperatures drop and construction shifts from the massive embankment fill to the smaller event pond berm fills moisture content and the use of frost susceptible soils will become more critical. QA and QC will monitor moisture and fines content of placed materials to determine if the material is suitable. BGC communicated to JDS and Pelly that both BGC and Tetra Tech need to know 24 hours in advance of all sources of material for the event pond to develop compaction and moisture criteria for lifts, RFI sent to help achieve this. BGC may reject lifts if the material placed is frost susceptible, RFIs to help plan have been sent out.
  - Due to frost susceptibility, material used in the Event Pond must not have more than 33% phyllite and phyllite must be blended in the delivered material.
  - A testfill should be completed once borrow from the ADR West resumes in order to determine lift sizes, compactor passes and necessary protocol/procedures for lift placement.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech's nuclear density gauge was not functioning properly and no density or moisture tests were performed on the day shift. The issue was resolved, and testing continued on the night shift.
  - Tetra Tech provided QC Daily Reports for liner installation on October 16.
  - Tetra Tech provided QC Daily Reports for event pond on October 16.

- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Communications (no follow up required):

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Troy Meyer	**Weather:**	Sunny/cloudy -2°C to 9°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Construction of the Event Pond berms continued. Material sources included fill that meets the criteria for Material 1 sourced from the northwest pond slope cut and fill that meets the criteria for Material 2 sourced from rock being excavated from the eastern portion of the event pond. (***Photos 1).***
  - An area of frozen, ice rich soils was excavated from the event pond. After removal this area was approved for construction. (***Photo 2***).
  - Pelly continues hauling waste material out of the event pond.
  - Pelly continued construction of an access road to the ADR west borrow area. JDS/Pelly continue planning to continue borrowing the ADR West with the use of blasting.
  - The ODF material placed on the upstream dam face as access for Heavy North failed. The mechanism for the failure appears to have been triggered by undercutting the toe and exasperated by frost accumulation between the geotextile rub sheet and liner. (***Photos 3 through 5***). Heavy North will remove all ODF material from this area to allow BGC and Tetra Tech to inspect the liner. BGC is in the process of redesigning the piping configuration to reduce the risk of future failures.
  - Liner placement continued below the 940m bench. (***Photo 6***)
  - BGC received the survey data for the steel closure drill plate. The closure pipe in the closure sump was not surveyed but can be estimated. With this information BGC-RFI-020 will be closed.
  - BGC is developing a memorandum with procedures for placement of material during cold weather as guidance for the Constructor and EPCM.
  - Snow is expected on Friday, October 19. As with precipitation events we experienced during the embankment construction it will be critical to tightly coordinate dumping material, spreading, and compacting it. Pelly should be prepared to remove layers of snow and/or ice that may accumulate on the surface of lifts prior to placement of new lifts. Pelly should be prepared to remove pooled water from melted snow if it has the potential for saturating a lift and causing frost jacking. Pelly should be prepared to scrape portions of frozen lifts off and/or scarify lift surfaces if needed and under the direction of BGC. It would be better to place courser material (ie Material 2) during events like this instead of finer material (ie Material 1) as Material 2 will be less susceptible (although not immune) to frost.

- Observations and Recommendations (Open/Ongoing):
  - Cold weather material placement will be a normal part of construction moving forward. BGC has provided the following recommendations to ensure quality standards are met during cold weather placement of material. The technical specifications should be consulted for guidance on cold weather placement. BGC is also developing a guidance memorandum to help with construction.
    - During snow storms, it is recommended to run packers on the completed lifts to help maintain density and moisture content.
    - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade.
    - QA and QC will monitor moisture and fines content of placed materials to determine if the material is frost suitable.
    - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
    - Due to frost susceptibility, material used in the Event Pond must not have more than 33% phyllite and phyllite must be blended in the delivered material.
  - A testfill should be completed once borrow from the ADR West resumes in order to determine lift sizes, compactor passes and necessary protocol/procedures for lift placement.
  - Liner bedding material will have to be spread over the west in-heap pond surface prior to liner placement. The surface was gouged during snow removal.

- The Event Pond work area is currently a maze of roads and stockpiles. JDS/Pelly should update the stockpile management plan and label all piles in the field to prevent borrow and placement of unsuitable material. (***Photo 7)***

- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift.
  - Tetra Tech provided QC Daily Reports for liner installation on October 17.
  - Tetra Tech provided QC Daily Reports for event pond on October 17.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 18, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Troy Meyer	**Weather:**	Sunny/cloudy -6°C to 6°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Troy Meyer left site.
  - Construction of the Event Pond berms continued. (***Photos 1).***
  - Pelly continues hauling waste material out of the event pond.
  - Pelly continued construction of an access road to the ADR west borrow area. JDS/Pelly continue planning to continue borrowing the ADR West with the use of blasting.
  - Heavy north removed their front end loader involved with the ODF material slide from the area. Heavy North plans to uncover the area affected tomorrow so the liner can be inspected for damage.
  - Liner placement continued below the 940m bench. (***Photo 2***)
  - BGC received a response to close BGC-RFI-18, BGC-RFI-19, and BGC-RFI-22.
  - Snow is expected on Friday, October 19. As with precipitation events we experienced during fill placement it will be critical to tightly coordinate dumping material, spreading, and compacting it. Pelly should be prepared to remove layers of snow and/or ice that may accumulate on the surface of lifts prior to placement of new lifts. Pelly should be prepared to remove pooled water from melted snow if it has the potential for saturating a lift and causing frost jacking. Pelly should be prepared to scrape portions of frozen lifts off and/or scarify lift surfaces if needed and under the direction of BGC. It would be better to place courser material (ie Material 2) during events like this instead of finer material (ie Material 1) as Material 2 will be less susceptible (although not immune) to frost.
  - Test pits were dug on the western portion of Phase 1 heap leach pad footprint. (***Photo 3***)
  - Thermistors were ordered. These thermistors will be used to monitor frost and ice accumulation in various part of the construction (placed fill, drains, ODF, ect) over the winter.

- Observations and Recommendations (Open/Ongoing):
  - Cold weather material placement will be a normal part of construction moving forward. BGC has provided the following recommendations to ensure quality standards are met during cold weather placement of material. The technical specifications should be consulted for guidance on cold weather placement. BGC is also developing a guidance memorandum to help with construction.
    - During snow storms, it is recommended to run packers on the completed lifts to help maintain density and moisture content.
    - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade.
    - QA and QC will monitor moisture and fines content of placed materials to determine if the material is frost suitable.
    - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
    - Due to frost susceptibility, material used in the Event Pond must not have more than 33% phyllite and phyllite must be blended in the delivered material.
  - A testfill should be completed once borrow from the ADR West resumes in order to determine lift sizes, compactor passes and necessary protocol/procedures for lift placement.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 19, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Snow -4°C to 6°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Construction of the Event Pond berms continued. It snowed today. Pelly had a very efficient method for removing, dumping, spreading, and compacting material in the snow. Lifts placed had increased moisture (approximately 7%). However, the material achieved good density and Pelly ensured that frost did not set in on the wetter lift by constantly rolling and scarifying before placement of drier lifts on the night shift. (***Photos 1).***
  - Pelly continues hauling waste material out of the event pond.
  - Pelly continued construction of an access road to the ADR west borrow area. JDS/Pelly continue planning to continue borrowing the ADR West with the use of blasting.
  - Pelly is working to shape the Phase 1 HL pad area and extend the underdrain.
  - No work was performed by Heavy North at the embankment due to heavy snow.
  - No liner was placed today due to heavy snow. (***Photo 2***)

- Observations and Recommendations (Open/Ongoing):
  - Cold weather material placement will be a normal part of construction moving forward. BGC has provided the following recommendations to ensure quality standards are met during cold weather placement of material. The technical specifications should be consulted for guidance on cold weather placement. BGC is also developing a guidance memorandum to help with construction.
    - During snow storms, it is recommended to run packers on the completed lifts to help maintain density and moisture content.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 20, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Light snow -3°C to 7°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Construction of the Event Pond berms continued. No issues. (***Photos 1).***
  - Pelly continues hauling waste material out of the event pond.
  - Pelly continued construction of an access road to the ADR west borrow area. JDS/Pelly continue planning to continue borrowing the ADR West with the use of blasting. Blasting is scheduled to begin October 21.
  - Pelly is working to shape the Phase 1 HL pad area and extend the underdrain. The area in the center valley where the underdrain header trench is being dug is frozen. (***Photo 2***)
  - Heavy north worked on removing the ODF from the in-heap area. (***Photo 3***)
  - Layfield cleared snow for liner placement at the in-heap pond. (***Photo 4***)
  - BGC dug additional test pits to delineate ice rich, thaw unstable soils in the Phase 1 area. Ice rich, thaw unstable soils were originally identified in the center valley near the underdrain header trench during the July 2018 test pitting. Today three test pits were excavated by Ewing. Additional test pits will be dug tomorrow. Frost unstable soils were observed in the test pit dug near the center of the valley (***Photo 5 through 7***). Test pits dug on the slope above the drain trench did not have ice. A preliminary figure showing ice impacted soils based on the July 2018 and October 2018 test pits is included is ***Figure 1***. An updated test pit memorandum with an updated figure will be completed once test pit has finished.

- Observations and Recommendations (Open/Ongoing):
  - Cold weather material placement will be a normal part of construction moving forward. BGC has provided the following recommendations to ensure quality standards are met during cold weather placement of material. The technical specifications should be consulted for guidance on cold weather placement. BGC is also developing a guidance memorandum to help with construction.
    - During snow storms, it is recommended to run packers on the completed lifts to help maintain density and moisture content.
    - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt.
    - QA and QC will monitor moisture and fines content of placed materials to determine if the material is frost suitable.
    - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
    - Due to frost susceptibility, material used in the Event Pond must not have more than 33% phyllite and phyllite must be blended in the delivered material.
  - A testfill should be completed once borrow from the ADR West resumes in order to determine lift sizes, compactor passes and necessary protocol/procedures for lift placement.
  - Liner bedding material will have to be spread over the west in-heap pond surface prior to liner placement. The surface was gouged during snow removal.
  - The Event Pond work area is currently a maze of roads and stockpiles. JDS/Pelly should update the stockpile management plan and label all piles in the field to prevent borrow and placement of unsuitable material and to prevent wasting material that can be used during construction.
- Engineering:

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 21, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy some rain at night -4°C to 8°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Construction of the Event Pond berms continued. No issues. Another area of subgrade was approved. There are a number of piles of uncontrolled fill on sections of the subgrade. This fill was either stockpiled for future/disposal or used to construct the network of roads and safety berms throughout the event pond. The approved subgrade is the natural in place colluvium and rock and not the uncontrolled fill. This was made clear to Pelly at the time of the approval. Uncontrolled fill should be excavated and the event pond fill should be placed on approved subgrade. Most of the uncontrolled fill observed was suitable for use in construction at the event pond. Approval of the subgrade constitutes that no further excavation of the natural in place ground is needed. However, subgrade should be proof rolled and compacted prior placement of lifts and BGC (or Tetra Tech on the night shift) should have the opportunity to inspect the foundation once more before lifts are placed. (***Photos 1 and 2).***
  - Pelly continues hauling waste material out of the event pond.
  - Pelly continued construction of an access road to the ADR west borrow area. JDS/Pelly continue planning to continue borrowing the ADR West with the use of blasting. Blasting is scheduled to begin October 21.
  - Pelly is working to shape the Phase 1 HL pad area and extend the underdrain. The area in the center valley where the underdrain header trench is being dug is frozen.
  - Heavy north worked on removing the ODF from the in-heap area. (***Photo 3***)
  - Ewing cleared snow for liner placement at the in-heap pond. (***Photo 4***)
  - GCL was placed on a section of the in-heap pond. (***Photo 5***)
  - Ewing was busy removing snow for Layfield and helping with liner installation. No test pits were dug today. Test pit to delineate ice rich material in the Phase 1 HL area will resume tomorrow.
  - A meeting was held between JDS, Heavy North, Ewing, BGC, and Tetra Tech to discuss the path forward in the area where the slide took place. In summary the area will be uncovered to allow inspection of the liner and welds and to install the closure plates.
  - The first blast in the ADR West borrow took place at 6:30pm.

- Observations and Recommendations (Open/Ongoing):
  - Cold weather material placement will be a normal part of construction moving forward. BGC has provided the following recommendations to ensure quality standards are met during cold weather placement of material. The technical specifications should be consulted for guidance on cold weather placement. BGC is also developing a guidance memorandum to help with construction.
    - During snow storms, it is recommended to run packers on the completed lifts to help maintain density and moisture content.
    - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt.
    - QA and QC will monitor moisture and fines content of placed materials to determine if the material is frost suitable.
    - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
    - Due to frost susceptibility, material used in the Event Pond must not have more than 33% phyllite and phyllite must be blended in the delivered material.
  - The Event Pond work area is currently a maze of roads and stockpiles. JDS/Pelly should update the stockpile management plan and label all piles in the field to prevent borrow and placement of unsuitable material and to prevent wasting material that can be used during construction.

Client:	Victoria Gold	**Date and Shift:**	October 22, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy 2ºC to 4ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Construction of the Event Pond berms continued. No issues. (***Photos 1).***
  - Pelly continues hauling waste material out of the event pond.
  - Pelly continued construction of an access road to the ADR west borrow area. A second blast to produce material for the Event Pond is scheduled for October 24.
  - Pelly is working to shape the Phase 1 HL pad area and extend the underdrain. The area in the center valley where the underdrain header trench is being dug is frozen.
  - Heavy north worked on removing the ODF from the in-heap area. Rain from the previous night resulted in water accumulation in the in-heap pond, which needed to be pumped out. (***Photo 2***)
  - Ewing cleared snow for liner placement at the in-heap pond.
  - No liner was placed today.
  - Ewing was busy removing snow for Layfield and helping with liner installation. No test pits were dug today. Test pit to delineate ice rich material in the Phase 1 HL area will resume tomorrow.
  - JDS provided a plugging report for a well casing found within the Event Pond footprint. The well is not located under any lined areas. Once the foundation it cut to final grade a final inspection will be performed.

- Observations and Recommendations (Open/Ongoing):
  - Cold weather material placement will be a normal part of construction moving forward. BGC has provided the following recommendations to ensure quality standards are met during cold weather placement of material. The technical specifications should be consulted for guidance on cold weather placement. BGC is also developing a guidance memorandum to help with construction.
    - Methods to ensure lifts do not freeze or do not have frost when placed should include; during snow storms, it is recommended to run packers on the completed lifts to help prevent frost buildup; if stockpiles surfaces freeze the crust should be removed and wasted; loose lifts should not be allowed to sit for too long and tight borrow, haul, dumping, spreading, and compacting sequence should be maintained; overly wet lifts (>4% moisture) may need removal based on outside and material temperatures.
    - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt.
    - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
    - Due to frost susceptibility, material used in the Event Pond must not have more than 33% phyllite and phyllite must be blended in the delivered material.
  - There are a number of piles of uncontrolled fill on sections of approved subgrade (berms, roads, ect). The approved subgrade is the natural in place colluvium and rock and not the uncontrolled fill. Uncontrolled fill should be excavated and the event pond fill should be placed on approved subgrade. Approved subgrade should be proof rolled, compacted, and keyed into prior placement of lifts and BGC (or Tetra Tech on the night shift) should have the opportunity to inspect the foundation once more before lifts are placed.
- Engineering:
  - None

QA/QC Results

- QA/QC:

- Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift.
- Tetra Tech provided QC Daily Reports for liner installation on October 22.
- Tetra Tech provided QA Daily Reports for event pond on October 22.

- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Communications (no follow up required):

Photo 2: Heavy North removed ODF.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 23, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Rain 2ºC to 9ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Construction of the Event Pond berms continued. Rain caused access issues. (***Photos 1).***
  - Pelly continues hauling waste material out of the event pond.
  - Pelly continued construction of an access road to the ADR west borrow area. A second blast to produce material for the Event Pond is scheduled for October 24.
  - Heavy north worked on removing the ODF from the in-heap area. Rain today added more water to in-heap pond bottom, which was being pumped out. (***Photo 2***)
  - Ewing cleared snow for liner placement at the in-heap pond.
  - No liner was placed today.
  - Test pits in the Phase 1 HL area continued. Five test pits were excavated to delineate ice rich frozen ground in the HL area. Ice rich ground was observed in the center valley. The approximate extent of ice rich soils is included in ***Figure 1***. A memorandum showing the ice rich region that will likely require additional excavation will be completed by BGC.
  - Wheel packing with the haul trucks was used on the night shift for a part of one lift. Tetra Tech monitored this. Wheel packing with haul trucks should not be used until a method to compact and track it has been developed.

- Observations and Recommendations (Open/Ongoing):
  - Cold weather material placement will be a normal part of construction moving forward. BGC has provided the following recommendations to ensure quality standards are met during cold weather placement of material. The technical specifications should be consulted for guidance on cold weather placement. BGC is also developing a guidance memorandum to help with construction.
    - Methods to ensure lifts do not freeze or do not have frost when placed should include; during snow storms, it is recommended to run packers on the completed lifts to help prevent frost buildup; if stockpiles surfaces freeze the crust should be removed and wasted; loose lifts should not be allowed to sit for too long and tight borrow, haul, dumping, spreading, and compacting sequence should be maintained; overly wet lifts (>4% moisture) may need removal based on outside and material temperatures.
    - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt.
    - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
    - Due to frost susceptibility, material used in the Event Pond must not have more than 33% phyllite and phyllite must be blended in the delivered material.
  - There are a number of piles of uncontrolled fill on sections of approved subgrade (berms, roads, ect). The approved subgrade is the natural in place colluvium and rock and not the uncontrolled fill. Uncontrolled fill should be excavated and the event pond fill should be placed on approved subgrade. Approved subgrade should be proof rolled, compacted, and keyed into prior placement of lifts and BGC (or Tetra Tech on the night shift) should have the opportunity to inspect the foundation once more before lifts are placed.
- Engineering:
  - None

QA/QC Results

- QA/QC:

- Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift.
- Tetra Tech provided QC Daily Reports for liner installation on October 23.
- Tetra Tech provided QA Daily Reports for event pond on October 23.

- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Client:	Victoria Gold	**Date and Shift:**	October 24, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 1°C to 10°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Construction of the Event Pond berms continued. (***Photos 1).***
  - Pelly continues hauling waste material out of the event pond.
  - Pelly continued construction of an access road to the ADR west borrow area. The second blast to produce material for the Event Pond has moved to October 26.
  - Heavy north worked on placing ODF in the in-heap area. (***Photo 2***)
  - The Event Pond liner near the slide was inspected. One damaged section was found and repaired. Additionally, water has made its way under the liner creating a bubble. Layfield drained it by making a hole in the liner to allow water to be pushed out. Details are included in Tetra Tech's Daily QA report for October 24.
  - Liner was placed today on the upstream face of the embankment (***Photo 2***).

- Observations and Recommendations (Open/Ongoing):
  - Cold weather material placement will be a normal part of construction moving forward. BGC has provided the following recommendations to ensure quality standards are met during cold weather placement of material. The technical specifications should be consulted for guidance on cold weather placement. BGC is also developing a guidance memorandum to help with construction.
    - Methods to ensure lifts do not freeze or do not have frost when placed should include; during snow storms, it is recommended to run packers on the completed lifts to help prevent frost buildup; if stockpiles surfaces freeze the crust should be removed and wasted; loose lifts should not be allowed to sit for too long and tight borrow, haul, dumping, spreading, and compacting sequence should be maintained; overly wet lifts (>4% moisture) may need removal based on outside and material temperatures.
    - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt.
    - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.

Observations and Recommendations

- Observations and Recommendations (Today):
  - Construction of the Event Pond berms continued. (***Photos 1).***
  - Pelly continues hauling waste material out of the event pond.
  - Pelly blasted the ADR west today.
  - Heavy north worked on constructing the LDRS pipe network. (***Photo 2***).
  - Liner was placed today on the west side of the in-heap pond.
  - BGC delivered memorandum FM18-020 Winter Condition Earthfill Placement to JDS.

- Observations and Recommendations (Open/Ongoing):
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pell. Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt. Pelly has verbally stated that this is the plan.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
- Engineering:
  - None

QA/QC Results

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 29, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear -2ºC to -11ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Placement of the Event Pond berm was suspended. Material generated from the Event Pond cut contained some ice, moisture of about 7%, and soil temperatures were 0C or less at the borrow. Some ice had been noted in this borrow before but when temperatures were warmer this ice usually melted in the borrow, haul, spreading, compaction process. Due to a 24 hour cycle of sub-zero temperatures and sub-zero soil temperatures at the borrow ice could not melt and, therefore, densities in compacted lifts were very low. Additionally, due to high moisture and low temperatures frost penetrated through most of the 30cm lift caused frost jacking, further lowering density. Measured density in the lifts were between 89 and 92% of the maximum density observed in the proctor test. Lifts placed early morning on the 28th were partially removed in an unsuccessful attempt to compact them further. The remaining 20cm will be left in place until placement resumes to help insulate lower lifts. Immediately prior to resuming lift placement this remaining 20cm should be removed. (***Photo 1 and 2***)
  - Two test fills were performed at the event pond (***Photo 3***).
    - The first test fill used material produced from the Event Pond borrow. Soil temperatures were measured between 0 and -0.5C. Some visible ice was present. Moisture was measured between 6 and 7%. Test fill lift thickness was 0.45m. Multiples attempts were tried to compact the material using a 6ton and 9ton compacter, with up to 10 passes from each. Measured density after compaction ranged from 88% to 93%.
    - The second test fill used fill produced from the ADR West. Soil temperatures were measured 0 to 0.5C (slightly above freezing). No visible ice. Moisture was measured at 4.4%. Lift thickness was 0.45m. Multiples attempts were tried to compact the material using a 6ton and 9ton compacter. Compaction was successful using 10 passes with a minimum 6 ton compactor. Final measure density ranged from approximately 95.5% to 98%.
  - The plan move forward is to build access roads to the ADR West blast material using the Event Pond borrow material and begin providing material to Event Pond berm on October 30 or 31.
  - Additional test fills will be needed depending on the moisture, gradation, densities, and soil temperatures observed in the ADR West blast rock.
  - Pelly continues hauling waste material out of the event pond. Mostly topsoil heavy in organics.
  - Heavy North installed the closure drill pipe. (***Photo 4***)
  - Heavy North continued backfilling the LDRS sump with ODF. (***Photo 5***).
  - Pelly worked on shaping the Phase 1 HL area. (***Photo 6***)
  - Liner was placed today on the west side of the in-heap pond. (***Photo 7***)
  - BGC and JDS agreed to close BGC-RFI-024 because all piles have been removed from the Event Pond so this RFI has become obsolete.

- Observations and Recommendations (Open/Ongoing):
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pell. Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt. Pelly has verbally stated that this is the plan.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
- Engineering:
  - None

QA/QC Results
• QA/QC: o Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift. o Tetra Tech provided QC Daily Reports for liner installation on October 29. o Tetra Tech provided QA Daily Reports for event pond on October 29. • BGC Recommendations: o Moisture will be monitored by BGC and adjustments made as needed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 30, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Snow -2°C to -7°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - No material was placed at the event pond berm. Pelly expects to resume filling last this week or early next week.
  - Pelly blasted the ADR West to produce material for event pond berm fill.
  - Pelly continues hauling waste material out of the event pond. Mostly topsoil heavy in organics.
  - A combination of temperature between -5C and -15C for 24 hour and the presence of water in the LDRS caused the ODF material to freeze. Heavy North covered the pipe today and began warming it to thaw the ODF material. (***Photo 1***)
  - Some liner was placed today. Snow throughout the day impeded progress.
  - The flight from Whitehorse to Mayo was canceled. Troy Meyer is now scheduled to arrive on site October 31.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond berm was suspended due to the inability to achieve required compacted density. Placement will continue once the ADR source with lower moisture is ready. A test fill will be needed to determine compaction requirements and lift thickness for this material. The exposed lift at the event pond berm will likely have to be removed immediately prior to resuming lift placement. This is because the moisture in this placed lift is high (6 to 7%) and the lift has been exposed for over 24 hours. This likely has resulted in frost jacking of the lift. Testing will be performed prior to placement to determine if removal is necessary.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pell. Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt. Pelly has verbally stated that this is the plan.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift.
  - Tetra Tech provided QC Daily Reports for liner installation on October 30.
  - Tetra Tech provided QA Daily Reports for event pond on October 30.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	October 31, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Troy Meyer	**Weather:**	Snow -5°C to -19°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - No material was placed at the event pond berm. Pelly expects to resume filling last this week or early next week.
  - Pelly worked on access to the ADR West blast material.
  - Pelly continues hauling waste material out of the event pond. Mostly topsoil heavy in organics.
  - Heavy North thawed ODF material using tarps and heaters. Some ODF placement was resumed today. (***Photo 1***)
  - No liner was placed today. Activities included snow removal and liner detail work. (***Photo 2***)
  - Topsoil is being hauled to and pushed off the embankment crest. This has created a platform at the crest. The platform may be unstable and BGC recommends that no vehicles use this platform.
  - Troy Meyer arrived on site.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond berm was suspended due to the inability to achieve required compacted density. Placement will continue once the ADR source with lower moisture is ready. A test fill will be needed to determine compaction requirements and lift thickness for this material. The exposed lift at the event pond berm will likely have to be removed immediately prior to resuming lift placement. This is because the moisture in this placed lift is high (6 to 7%) and the lift has been exposed for over 24 hours. This likely has resulted in frost jacking of the lift. Testing will be performed prior to placement to determine if removal is necessary.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pell. Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt. Pelly has verbally stated that this is the plan.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift.
  - Tetra Tech provided QC Daily Reports for liner installation on October 31.
  - Tetra Tech provided QA Daily Reports for event pond on October 31.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Troy Meyer	**Weather:**	Snow -10°C to -18°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - No material was placed at the event pond berm. Pelly expects to resume filling last this week or early next week. A blast at the ADR West is planned for November 2.
  - Pelly worked on access to the ADR West blast material. (***Photo 1***)
  - Pelly continues hauling waste material out of the event pond. Mostly topsoil heavy in organics. Pelly is using some of the material that would be hauled as waste to build the road to the ADR West.
  - Heavy North thawed ODF material using tarps and heaters. The second connection from the BBQ grill and hammer heads was completed. Some ODF backfill was completed. ODF material should not be allowed to freeze to prevent loss of permeability once the HLF is in use. (***Photo 2 and 3***)
  - Liner was placed today. (***Photo 4***).
  - Topsoil is being hauled to and pushed off the embankment crest. The topsoil was also partially spread across the embankment face today. BGC recommends that vehicles use care when traveling over the material platform created for this work as it is steep and has not been compacted and can potentially fail.
  - Excavation of unsuitable material continued in the Phase 1 HL area.
  - BGC sent BGC-RFI-027 for clarification of ODF sources. The RFI was received by JDS and closed the same day.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond berm was suspended due to the inability to achieve required compacted density. Placement will continue once the ADR source with lower moisture is ready. A test fill will be needed to determine compaction requirements and lift thickness for this material. The exposed lift at the event pond berm will likely have to be removed immediately prior to resuming lift placement. This is because the moisture in this placed lift is high (6 to 7%) and the lift has been exposed for over 24 hours. This likely has resulted in frost jacking of the lift. Testing will be performed prior to placement to determine if removal is necessary.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pell. Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt. Pelly has verbally stated that this is the plan.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift.
  - Tetra Tech provided QC Daily Reports for liner installation on November 1.
  - Tetra Tech provided QA Daily Reports for event pond on November 1.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	November 2, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Troy Meyer	**Weather:**	Snow -12°C to -25°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - No material was placed at the event pond berm. The ADR West was blasted today.
  - Pelly worked on access to the ADR West blast material.
  - Pelly continues hauling waste material out of the event pond. Pelly is using some of the material that would be hauled as waste to build the road to the ADR West.
  - Ampworks continued to work on the connections from the BBQ grill to the LDRS pump casings. The crew is waiting for delivery of some flange screws before they can finish he installation and start backfilling. (***Photo 1***)
  - Heavy North thawed ODF material using tarps and heaters. The tarp system is not large enough to cover the entire ODF area. This may result in sections of frozen ODF remaining. Additionally, water in the LDRS sump under the ODF is likely contributing to the rapid freezing of the material. (***Photo 2***)
  - Liner was placed today. (***Photo 3***).
  - Topsoil is being hauled to and pushed off the embankment crest. The topsoil was also partially spread across the embankment face today. BGC recommends that vehicles use care when traveling over the material platform created for this work as it is steep and has not been compacted and can potentially fail.
  - Excavation of unsuitable material continued in the Phase 1 HL area.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond berm was suspended due to the inability to achieve required compacted density. Placement will continue once the ADR source with lower moisture is ready. A test fill will be needed to determine compaction requirements and lift thickness for this material. The exposed lift at the event pond berm will likely have to be removed immediately prior to resuming lift placement. This is because the moisture in this placed lift is high (6 to 7%) and the lift has been exposed for over 24 hours. This likely has resulted in frost jacking of the lift. Testing will be performed prior to placement to determine if removal is necessary.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pell. Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt. Pelly has verbally stated that this is the plan.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift. Tetra Tech provided QA Daily Reports for event pond on November 2.
  - Tetra Tech did not provided QC Daily Reports for liner installation on November 2. Due to issues with the plane to Mayo Tetra Tech did not have liner QA present for most of the day November 2. It is expected that the Tetra Tech liner QA will arrive the afternoon of November 3. BGC will assist with QA in the interim.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	November 3, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan / Troy Meyer	**Weather:**	Snow -15°C to -23°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - No material was placed at the event pond berm.
  - Work continued on the ADR West.
  - Pelly continues hauling waste material out of the event pond. Pelly is using some of the material that would be hauled as waste to build the road to the ADR West.
  - Ampworks continued to work on the connections from the BBQ grill to the LDRS pump casings. The angle of the that the pump casing pipes connect to the BBQ grill was off and Heavy North had to modify some of the BBQ grill sections to connect. (***Photo 1 and 2***). Additionally, not all of the of the bolts needed to fasten the flanges arrived in the the shipment today. BGC approved the connections between steel and corrugated pipes, which are going to be staggered (for a total of 6 bolts per flange) due to the lack of bolts. It was reported that all steel to steel flange connection will get the 12 bolts needed for those connections. (***Photo 3 and 4***). Some bolts appeared to be hand tightened and could be easily unscrewed by hand. It was reported to BGC that all bolts will be properly tightened before being buried.
  - Heavy North thawed ODF material using tarps and heaters. The tarp system is not large enough to cover the entire ODF area. This may result in sections of frozen ODF remaining. Additionally, water in the LDRS sump under the ODF is likely contributing to the rapid freezing of the material.
  - Liner was placed today. (***Photo 5***).
  - Topsoil is being hauled to and pushed off the embankment crest. The topsoil was also partially spread across the embankment face today. BGC recommends that vehicles use care when traveling over the material platform created for this work as it is steep and has not been compacted and can potentially fail.
  - Excavation of unsuitable material continued in the Phase 1 HL area.
  - Due to mobilization issues Tetra Tech's liner QA was not on site during work today. Due to the critical nature of the liner placement BGC recommends some overlap between (minimum 24 hours overlap) to ensure that QC testing and QA tracking is being performed and tracked properly and without gaps.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond berm was suspended due to the inability to achieve required compacted density. Placement will continue once the ADR source with lower moisture is ready. A test fill will be needed to determine compaction requirements and lift thickness for this material. The exposed lift at the event pond berm will likely have to be removed immediately prior to resuming lift placement. This is because the moisture in this placed lift is high (6 to 7%) and the lift has been exposed for over 24 hours. This likely has resulted in frost jacking of the lift. Testing will be performed prior to placement to determine if removal is necessary.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pell. Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt. Pelly has verbally stated that this is the plan.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
- Engineering:
  - None

QA/QC Results

- QA/QC:

- Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift. Tetra Tech provided QA Daily Reports for event pond on November 3.
- Tetra Tech did not provided QC Daily Reports for liner installation on November 3. Due to issues mobilizing to site Tetra Tech liner QA did not arrive until the evening of November 3. BGC observed liner placement in the interim and Layfield stated that they would not perform QC shear tests until Tetra Tech arrived.

- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

Observations and Recommendations

- Observations and Recommendations (Today):
  - No material was placed at the event pond berm.
  - Work continued on the ADR West.
  - Pelly continues hauling waste material out of the event pond. Pelly is using some of the material that would be hauled as waste to build the road to the ADR West.
  - ODF backfill continued in the LDRS sump. (***Photo 1***)
  - Heavy North thawed ODF material using tarps and heaters. The tarp system is not large enough to cover the entire ODF area. This may result in sections of frozen ODF remaining. Additionally, water in the LDRS sump under the ODF is likely contributing to the rapid freezing of the material.
  - Liner was placed today.
  - Topsoil is being hauled to and pushed off the embankment crest. The topsoil was also partially spread across the embankment face today. BGC recommends that vehicles use care when traveling over the material platform created for this work as it is steep and has not been compacted and can potentially fail.
  - Excavation of unsuitable material continued in the Phase 1 HL area.
  - Tetra Tech's liner QA arrived on site yesterday evening. Tetra Tech performed QA on the liner installation today.
  - BGC installed thermistor LDRS-T-01 in the ODF at the LDRS sump.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond berm was suspended due to the inability to achieve required compacted density. Placement will continue once the ADR source with lower moisture is ready. A test fill will be needed to determine compaction requirements and lift thickness for this material. The exposed lift at the event pond berm will likely have to be removed immediately prior to resuming lift placement. This is because the moisture in this placed lift is high (6 to 7%) and the lift has been exposed for over 24 hours. This likely has resulted in frost jacking of the lift. Testing will be performed prior to placement to determine if removal is necessary.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pell. Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt. Pelly has verbally stated that this is the plan.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift. Tetra Tech provided QA Daily Reports for event pond on November 4.
  - Tetra Tech did not provide a QA report for November 4 today.
- BGC Recommendations:
  - Moisture will be monitored by BGC and adjustments made as needed.

BGC Personnel:	Roy Morlan / Troy Meyer	**Weather:**	Clear -19°C to -26°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - No material was placed at the event pond berm.
  - Work continued on the ADR West. A test fill was performed on the produced blast rock was from the upper quarry for suitability as fill for the Event Pond embankment.
  - Pelly continues hauling waste material out of the event pond. Pelly is using some of the material that would be hauled as waste to build the road to the ADR West. A test fill was performed on this material for suitability as fill for the Event Pond embankment.
  - Liner was placed today at the HLF.
  - Topsoil is being hauled to and pushed off the embankment crest for spreading as part of reclamation.
  - Excavation of unsuitable material continued in the Phase 1 HL area.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond berm was suspended due to the inability to achieve required compacted density. Two test fills were initiated today for material generated from blasting at the ADR West borrow and from the north and east walls of the Event Pond Cut. Placement will continue once suitability is confirmed and a method specification is developed.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pell. Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt. Pelly has verbally stated that this is the plan.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Clear -20°C to -27°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - No material was placed at the event pond berm, but the crest was being stripped of frozen material in preparation for placement of fill during night shift. About 30cm of frozen material as removed (**Photo 1**).
  - Blasting at the ADR west borrow continued to produce rockfill for the Event Pond embankment.
  - Pelly continues hauling waste material out of the event pond. The material is coming from the north wall of the excavation and is fine grained weather rock and colluvium with some frozen material (**Photo 2**).
  - Material from the eastern portion of the Event Pond cut has been approved as rockfill for Event Pond embankment construction (**Photo 3**).
  - Liner was placed today at the HLF.
  - Topsoil is being hauled to and pushed off the embankment crest for spreading as part of reclamation.
  - Excavation of unsuitable material continued in the Phase 1 HLF area.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendation from the test fill documented in CTFM-05.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pelly (FM18-020). Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt. Photo 3: Rockfill produced from required excavation at eastern Event Pond.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	November 7, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Clear -20°C to -27°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - No material was placed at the event pond berm, but the crest was being stripped of frozen material in preparation for placement of fill during night shift. About 30cm of frozen material as removed (**Photo 1**).
  - Blasting at the ADR west borrow continued to produce rockfill for the Event Pond embankment.
  - Pelly continues hauling waste material out of the event pond. The material is coming from the north wall of the excavation and is fine grained weather rock and colluvium with some frozen material (**Photo 2**).
  - Material from the eastern portion of the Event Pond cut has been approved as rockfill for Event Pond embankment construction (**Photo 3**).
  - The materials were delivered to the Event Pond embankment and dumped in separate areas (**Photo 4**). The soil temperature of the delivered material was measured as -9 deg C with the surface of the piles measured as -15 deg C.
  - Liner was placed today at the HLF.
  - Topsoil is being hauled to and pushed off the embankment crest for spreading as part of reclamation.
  - Excavation of unsuitable material continued in the Phase 1 HLF area.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a “checker-board” pattern. This will result in a more homogeneous fill overall.
  - The fill operation at Event Pond should be as tight as practical in terms of dump/spread/compact sequencing. Once the dumped material is spread on the fill, it should be compacted as soon as possible to prevent further freezing.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pelly (FM18-020). Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt. Pelly has verbally stated that this is the plan.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift. Tetra Tech provided QA Daily Reports for event pond on November 7.
  - Tetra Tech provided QA report for the HLF liner for November 7.
- BGC Recommendations:
  - QA/QC will continue for the liner and Event Pond construction.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	November 8, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Cloudy -13°C to -26°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond Embankment (**Photo 1**).
  - Pelly continues hauling waste material out of the event pond. The material is coming from the north wall of the excavation and is fine grained weather rock and colluvium with some frozen material.
  - Material from the eastern portion of the Event Pond cut has been approved as rockfill for Event Pond embankment construction.
  - The southeastern corner of the Event Pond was being stripped and prepared for foundation of the embankment (**Photo 2**). Some small ice lenses were noted in the upper 0.5m of colluvium (**Photo 3**). This material was removed down to competent, thaw-stable material.
  - Liner was placed today at the HLF in the sump area (**Photo 4**).

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a "checker-board" pattern. This will result in a more homogeneous fill overall.
  - The fill operation at Event Pond should be as tight as practical in terms of dump/spread/compact sequencing. Once the dumped material is spread on the fill, it should be compacted as soon as possible to prevent further freezing.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pelly (FM18-020). Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt. Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Light Snow -9°C to -18°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond main embankment (**Photo 1**). The fill material source is blast rock from the ADR borrow area.
  - Material was placed at the Event Pond east embankment (**Photo 2**). The fill material is from the eastern portion of the Event Pond cut which has been approved as rockfill to be placed at 0.9 m maximum lifts. The material delivered to the southeast corner of the embankment was finer weathered quartzite today with less rock over 19mm size than previous days. This material must be placed in maximum 0.45m lifts and compacted with 3 passes of a minimum 9 tonne vibratory compactor or 1 pass with a loaded 777 haul truck. The material may also be mixed with ADR Blast Rock at a volume ratio of 2:1 (Blast Rock to Pond Cut). This material is not phyllitic but can be expected to be somewhat moisture/frost susceptible due to the fines content. BGC will evaluate the material from the event pond cut and make further recommendations, as appropriate.
  - The area of the Event Pond foundation between the main embankment and the east embankment was being stripped and prepared for foundation (**Photo 3**). A small area of ice rich material was encountered just below the root zone. The material is frozen colluvium and must be removed down to thaw-stable material.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a “checker-board” pattern. This will result in a more homogeneous fill overall.
  - The fill operation at Event Pond should be as tight as practical in terms of dump/spread/compact sequencing. Once the dumped material is spread on the fill, it should be compacted as soon as possible to prevent further freezing.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pelly (FM18-020). Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring. One major goal for the plan should be to prevent water and ice from collecting in the Event Pond over the winter, which could result in major repairs to the unlined Event Pond berms and exposed subgrade. BGC has suggested installing the event pond underdrains then protecting them with sacrificial gravel (such as ODF) to allow a place for water drain during melt. Pelly has verbally stated that this is the plan.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift. Tetra Tech provided QA Daily Reports for event pond on November 8.
  - Tetra Tech provided QA report for the HLF liner for November 8.
- BGC Recommendations:
  - QA/QC will continue for the liner and Event Pond construction.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Light Snow -13°C to -20°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond main embankment. The fill material source was blast rock from the ADR borrow area blended at the fill with Event Pond Cut material.
  - The ADR borrow was inspected. Two excavators are loaded the blasted rock (**Photo 1**). There is a 2m wide zone of Phyllite rock (**Photo 2**) in the face. This material is fairly competent and may produce acceptable quality rockfill. There is also a pile of stripped overburden (**Photo 3**) at the eastern edge of the quarry. This material is gravelly with significant fines and should be avoided. Otherwise the quarry face is good quality quartzite rock.
  - The area of the Event Pond foundation between the main embankment and the east embankment was being stripped and prepared for foundation (**Photo 4**). A small area of ice rich material was encountered just below the root zone and was ripped with a dozer and removed.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a “checker-board” pattern. This will result in a more homogeneous fill overall.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Light Snow -7°C to -10°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond embankment (**Photo 1**). The fill material source was blast rock from the ADR borrow area blended at the fill with Event Pond Cut material.
  - A portion of the HLF Spillway foundation above the eastern portion of the Event Pond was inspected (**Photo 2**). The area requires about 3 meters of fill to construct the spillway upper ramp between the HLF and Event Pond. A lens of ice (**Photo 3**) was found extending along about 12 meters on the excavated bench. This area received runoff water which apparently became trapped, buried and frozen. The excavator could not dig through the ice and it was suggested that a dozer was needed to rip the area to remove all ice and frozen material prior to fill placement. Test pits will be excavated east of this area to confirm the extent of the ice.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a “checker-board” pattern. This will result in a more homogeneous fill overall.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Light Snow -3°C to -9°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond embankment. The fill source was primarily Event Pond Cut material. The ADR quarry was being prepared for blasting for tonight.
  - Snow removal was performed on the completed lifts prior to placement of new lifts. A portion of the foundation along the Event Pond embankment northern edge is covered with snow and some loose material. An old partially filled test pit is also obscured by snow (**Photo 1**). The test pit should be cleaned out and filled with compacted fill and about 30m of foundation on either side of the test pit should be cleaned and inspected by BGC / Tetra Tech prior to placement of fill against the slope.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a “checker-board” pattern. This will result in a more homogeneous fill overall.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Light Snow -9°C to -13°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond embankment. The fill source was primarily Event Pond Cut material at the main embankment and ADR Blast Rock material for the smaller east corner of the embankment. Snow was removed on the lift and the surface of the fill was roughed up using dozers (**Photo 1**) to scarify.
  - A portion of the foundation between the main and eastern embankments required additional preparation to remove apparent organic layer (**Photo 2**). The material was removed with a dozer to competent foundation prior to fill placement (**Photo 3**).

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a "checker-board" pattern. This will result in a more homogeneous fill overall.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	November 16, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Clear -19°C to -31°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond embankment. The fill source was the ADR Blast Rock material.
  - The northeastern portion of the Event Pond was being shaped with a dozer (**Photo 1**). The cut material has a high fraction of frozen soil (**Photo 2**) and Pelly agreed it should be wasted.
  - The ADR Blast Rock source was inspected. The eastern 50 to 100m of the quarry is now in a more weathered zone and producing rockfill with a higher fines content. Direction to Pelly was to avoid the upper 2 to 3m of this weathered zone to ensure suitable rockfill is delivered to the Event Pond Embankment.
  - Shaping of the HLF was performed above the 940m bench (**Photo 3**).
  - Liner placement continued in the HLF sump.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a "checker-board" pattern. This will result in a more homogeneous fill overall.
  - The fill operation at Event Pond should be as tight as practical in terms of dump/spread/compact sequencing. Once the dumped material is spread on the fill, it should be compacted as soon as possible to prevent further freezing.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pelly (FM18-020). Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift. Tetra Tech provided QA Daily Reports for event pond on November 16.
  - Tetra Tech provided QA report for the HLF liner for November 16.
- BGC Recommendations:
  - QA/QC will continue for the HLF liner and Event Pond construction.

Client:	Victoria Gold	**Date and Shift:**	November 17, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Snow Flurries -12°C to -21°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond embankment (**Photo 1**). The fill source was the ADR Blast Rock material. The fill was composed of quartzite rock material with no significant amount of phyllitic rock materials present. No significant amount of ice-rice frozen soil was observed. Compaction was achieved with minimum 3 passes of a 11-tonne vibrating roller-compactor.
  - The northeastern portion of the Event Pond was being shaped with a dozer. The cut material has a high fraction of frozen soil and was sent to waste.
  - A thermistor was installed on lift 100 (elevation 882.45m) and the end of the wire was marked with a blue stake and surveyed.
  - Shaping of the HLF was performed above the 940m bench.
  - Liner placement continued in the HLF sump.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a “checker-board” pattern. This will result in a more homogeneous fill overall.
  - The fill operation at Event Pond should be as tight as practical in terms of dump/spread/compact sequencing. Once the dumped material is spread on the fill, it should be compacted as soon as possible to prevent further freezing.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pelly (FM18-020). Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Cloudy -12°C to -21°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond embankment (**Photo 1**). The fill source was primarily the ADR Blast Rock material.
  - Material was being bulked on the pond floor from required excavations of the pond walls. A portion of this material located in the eastern end of the pond (**Photo 2**) is suitable as rockfill and can be placed in the Event Pond Embankment lift. The remaining piles (**Photo 3**) contain fine material with some frozen soils and must be wasted.
  - The approved fill was composed of quartzite rock material with no significant amount of phyllitic rock materials present. No significant amount of ice-rice frozen soil was observed. Compaction was achieved with minimum 3 passes of a 11-tonne vibrating roller-compactor.
  - Foundation was prepared with an excavator for the eastern Event Pond embankment (**Photo 4**). The foundation in this area is weather quartzite bedrock below dense colluvium/till. The overburden soil does not contain excess ice.
  - Shaping of the HLF was performed above the 940m bench.
  - Liner placement continued in the HLF sump.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a “checker-board” pattern. This will result in a more homogeneous fill overall.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 4ºC to -5ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Roy Morlan arrived on site.
  - Material was placed at the Event Pond embankment. The fill source was a mix of the ADR Blast Rock material and the Event Pond cut. BGC has asked that 3 parts blast rock to 1 part event pond cut be used because the event pond cut material is composed of much weaker rock. Material is blended by laying piles on the lift and dozing them across each other. Because this does not result in a true blending BGC has asked that the event pond cut material be used in the center of downstream side of the berm and not the upstream side of the berm where liner will be placed. (***Photo 1***)
  - Fill placement at the Event Pond berm was being completed quickly with little time between loading, hauling, spreading, and compacting. This tight sequence will help in reducing post construction settlement.
  - The ADR Blast Rock delivered to site was composed of competent, rocky material with material sizes up to 0.5m long. Moisture content appeared low.
  - Shaping of the HLF was performed above the 940m bench (**Photo 2**).
  - Liner placement continued in the HLF sump. (***Photo 3***)
  - Placement of ODF material in the in-heap pond continued. (***Photo 4***)

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	November 29, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Fog, Light Snow -5°C to -7°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond embankment. Berm elevation at the end of the night shift was 891.45m.
  - Shaping the event pond continues.
  - The ADR Blast Rock delivered to site was composed of competent, rocky material with material sizes up to 0.5m long. Moisture content appeared low.
  - Shaping of the HLF was performed above the 940m bench (***Photo 1***).
  - Liner placement continued in the HLF sump. (***Photo 2***)
  - Heavy North placed the LDRS and closure drill casing pipes using a crane. Extensions for the hammerheads were aligned. The extension for the closure drill casing was placed but will be aligned on November 30. The pipes will be welded on December 1. (***Photo 3 and 4***)
  - Heavy North used the excavator to clear snow off the liner. This resulted in 2 punctures of the liner. Prior to placement of more ODF the entire exposed liner should be inspected by Tetra Tech and BGC for punctures and repaired as necessary. This inspection should be documented by QA. The excavator should no longer be used to clear snow from the liner. BGC and Tetra Tech will develop a protocol for the inspection for JDS. It will likely entail uncovering this area again by hand to allow for a detailed inspection. (***Photo 5***)

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a “checker-board” pattern. This will result in a more homogeneous fill overall.
  - The fill operation at Event Pond should be as tight as practical in terms of dump/spread/compact sequencing. Once the dumped material is spread on the fill, it should be compacted as soon as possible to prevent further freezing.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Snow -5°C to -8°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond embankment. Berm elevation at the end of the night shift was 892.35m. (***Photo 1***)
  - Shaping the event pond continues.
  - The ADR Blast Rock delivered to site was composed of competent, rocky material with material sizes up to 0.5m long. Moisture content appeared low. (***Photo 2***)
  - Shaping of the HLF was performed above the 940m bench (***Photo 3***).
  - Liner placement continued in the HLF sump. (***Photo 4***)
  - Heavy North used the excavator bucket to clear now off a portion of the liner the previous day. In doing so they punctured the liner in 3 placed. (***Photo 5***) BGC and Tetra Tech had Heavy North clear all the snow from the liner in the area affected by hand so it could be inspected. The inspection was documented by Tetra Tech. After inspection the three punctures were patched by Layfield. After patching ODF was placed on top of the liner to make snow removal easier in the future. (***Photo 6***).
  - Snow removal using heavy steel equipment close to the liner has never been permitted. However, BGC developed the following protocols as guidance for work around the liner: 1.) Snow should only be removed from over the liner with hand digging. Snow <1" thick can be left and ODF placed over it. Snow >1" thick must be removed. 2.) If excavation of placed ODF is needed over the liner then a machine can be used but excavation must stop a minimum 20cm away from the liner. The last 20cm must be hand excavated. If material is frozen it may need to be heated before excavation to prevent damage to the liner.
  - ODF material in the sump is frozen but not icy. It breaks apart when dug with an excavator. The frozen zone appears to be about 0.5m deep. BGC would like for the frozen ODF to be scarified to 0.5m deep immediately before placement of more ODF. New ODF should not be placed on un-scarified frozen material. (***Photo 7***)

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a "checker-board" pattern. This will result in a more homogeneous fill overall.
  - The fill operation at Event Pond should be as tight as practical in terms of dump/spread/compact sequencing. Once the dumped material is spread on the fill, it should be compacted as soon as possible to prevent further freezing.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pelly (FM18-020). Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift.
  - Tetra Tech provided QA report for the HLF liner.
- BGC Recommendations:
  - QA/QC will continue for the HLF liner and Event Pond construction.

Photo 4: Liner placement.

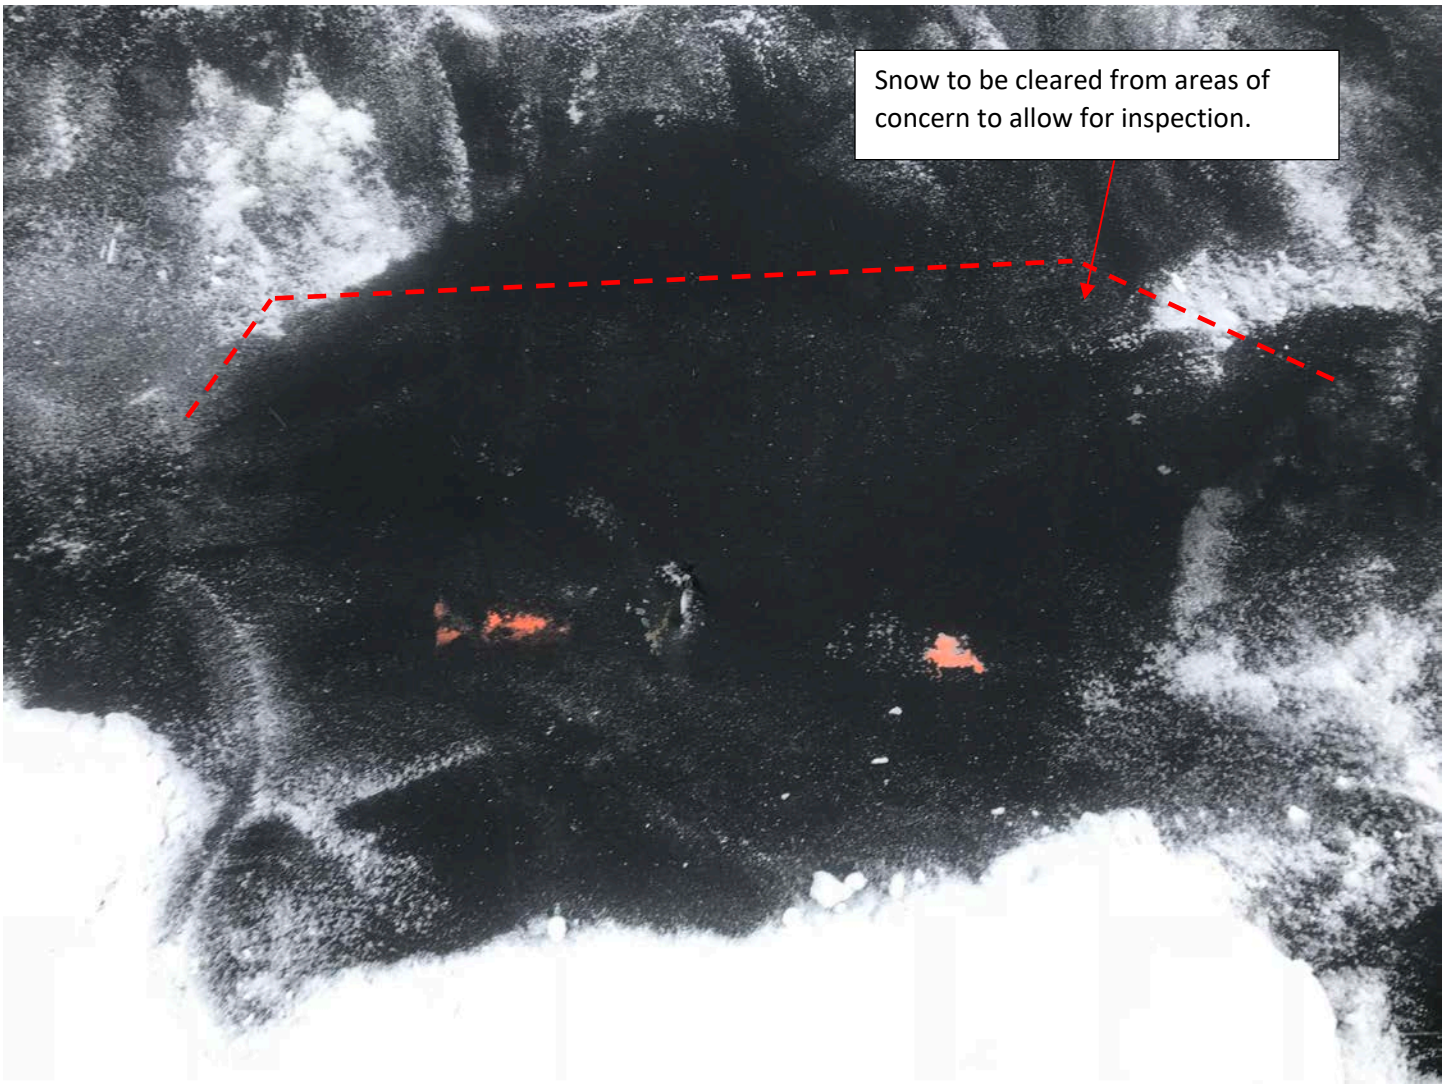

Photo 5: Punctured liner.

Photo 6: ODF being placed on approved sections of liner.

Photo 7: Frozen ODF at the in-heap pond.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	December 1, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Light snow -8°C to -11°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond embankment. Berm elevation at the end of the night shift was 894.15m. (***Photo 1***)
  - Shaping the event pond continues.
  - The ADR Blast Rock delivered to site was composed of competent, rocky material with material sizes up to 0.5m long. Moisture content appeared low. Some finer material was being generated from a portion of the quarry. BGC will monitor to determine if the material becomes too fine to place in 0.9m lifts.
  - Shaping of the HLF was performed above the 940m bench (***Photo 2***).
  - Liner placement continued in the HLF sump. (***Photo 3***)
  - Heavy North scarified the ODF material already placed. An approximately 0.3m to 0.5m layer of the ODF had frozen due to exposure. Material below this frozen layer was loose. (***Photo 4***)
  - Heavy North placed more ODF along the in-heap pond side slopes. (***Photo 5***)
  - Extensions to the LDRS and closure drill pipe were welded into place. Liner was protected by a layer of ODF material. Very little slag was generated during welding. As an extra precaution welding mats were also placed under the welding area as well. (***Photo 6***)

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a "checker-board" pattern. This will result in a more homogeneous fill overall.
  - The fill operation at Event Pond should be as tight as practical in terms of dump/spread/compact sequencing. Once the dumped material is spread on the fill, it should be compacted as soon as possible to prevent further freezing.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pelly (FM18-020). Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
  - Snow should only be removed from over the liner with hand digging. Snow <1" thick can be left and ODF placed over it. Snow >1" thick must be removed. If excavation of placed ODF is needed over the liner then a machine can be used but excavation must stop a minimum 20cm away from the liner. The last 20cm must be hand excavated. If material is frozen it may need to be heated before excavation to prevent damage to the liner.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift.
  - Tetra Tech provided QA report for the HLF liner.
- BGC Recommendations:
  - QA/QC will continue for the HLF liner and Event Pond construction.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	December 2, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Light snow -17°C to -23°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond embankment. Berm elevation at the end of the night shift was 894.15m. (***Photo 1***)
  - Shaping the event pond continues.
  - The ADR Blast Rock delivered to site was composed of competent, rocky material with material sizes up to 0.5m long. Moisture content appeared low. Some finer material was being generated from a portion of the quarry. BGC will monitor to determine if the material becomes too fine to place in 0.9m lifts.
  - Shaping of the HLF was performed above the 940m bench (***Photo 2***).
  - Liner placement continued in the HLF sump. (***Photo 3***)
  - Heavy North continued to place ODF material. (***Photo 4***) Haul trucks are dumping near the center of the sump and the loaders are spreading it. This method should continue. Haul trucks should not back and dump material near over the liner where ODF is less than 2m thick and there is no rub sheet.

- Observations and Recommendations (Open/Ongoing):
  - Placement at the Event Pond embankment will continue based on recommendations from the test fill documented in CTFM-05. It is recommended that the materials from the two approved sources (Event Pond Cut and ADR Blast Rock) are placed in a manner to facilitate some blending during spreading. This can be done by alternating loads from the two sources dumped on the fill area in a “checker-board” pattern. This will result in a more homogeneous fill overall.
  - The fill operation at Event Pond should be as tight as practical in terms of dump/spread/compact sequencing. Once the dumped material is spread on the fill, it should be compacted as soon as possible to prevent further freezing.
  - Cold weather material placement will be a normal part of construction moving forward. A cold weather placement guidance document was provided to JDS and Pelly (FM18-020). Cold weather placement methods will be dynamic as temperatures drop and the Constructor and Engineer should maintain close and frequent communication to deal with issues and adapt as needed.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring.
  - BGC and Tetra Tech should be informed 24 hours in advance of all sources of material changes for the event pond to evaluate it suitability for use in cold temperatures and to develop compaction and moisture criteria.
  - Snow should only be removed from over the liner with hand digging. Snow <1” thick can be left and ODF placed over it. Snow >1” thick must be removed. If excavation of placed ODF is needed over the liner then a machine can be used but excavation must stop a minimum 20cm away from the liner. The last 20cm must be hand excavated. If material is frozen it may need to be heated before excavation to prevent damage to the liner.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift.
  - Tetra Tech provided QA report for the HLF liner.
- BGC Recommendations:
  - QA/QC will continue for the HLF liner and Event Pond construction.

Observations and Recommendations

- Observations and Recommendations (Today):
  - Material was placed at the Event Pond embankment. The final berm elevation was achieved. (***Photo 1***)
  - Shaping the event pond continues.
  - Shaping of the HLF was performed above the 940m bench (***Photo 2***). Pelly shared the new shaping surface with BGC. The surface removals the vast majority of ground ice observed in the test pits except for the area in the center valley in the north. (***Figure 1***)
  - Liner placement continued in the HLF sump. (***Photo 3***)
  - Heavy North continued to place ODF material. (***Photo 4***)

- Observations and Recommendations (Open/Ongoing):
  - Fill placement of rockfill within the Phase 1 footprint should follow the practices used at the Event Pond:
    - Placement should follow recommendations from the test fill documented in CTFM-05.
    - The fill operation should be as tight as practical in terms of dump/spread/compact sequencing.
    - The cold weather placement guidance document (FM18-020) should be followed.
    - BGC should be informed 24 hours in advance of all sources of material changes.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring.
  - Snow should only be removed from over the liner with hand digging. Snow <1" thick can be left and ODF placed over it. Snow >1" thick must be removed. If excavation of placed ODF is needed over the liner then a machine can be used but excavation must stop a minimum 20cm away from the liner. The last 20cm must be hand excavated. If material is frozen it may need to be heated before excavation to prevent damage to the liner.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	December 4, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy -15ºC to -25ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Shaping the event pond continues. (***Photo 1***)
  - Liner placement continued in the HLF sump. (***Photo 2***)
  - Heavy North continued to place ODF material. (***Photo 3***)
  - Heavy North excavated an area of the ODF to prepare for placing the PLS hammerheads. This area was frozen to approximately 1m bgs and required ripping to excavate. (***Photo 4***). This surface was ripped before placement of more ODF two days ago. It is likely this material has frozen over the past 2 days accelerated by heavy traffic during ODF placement. BGC assumes that large portions of the ODF between 914m and 912.5m has refroze. It is not possible to tell how far under the new ODF the frozen layer extends. Now that temperatures are consistently between -15 and -25 there is a higher probability that frozen zones will be buried in the ODF. BGC will install a thermistor in PLS portion of the ODF fill. However, this will only monitor a single point. The plan to thaw the ODF in 2019 is to pump heated air through the PLS piping system. Work to verify if frozen layers have thawed should also be completed in 2019.
  - Shaping continued above the 940m bench. (***Photo 5***)
  - JDS will arrange to have ODF produced from the ADR rockfill quarry. BGC has requested to be present when the sample is collected. BGC would like for two batches of ODF material be produced. One from the weaker phyletic material and one from the more common quartz rich material. These samples will be shipped to Tetra Tech for durability testing.
  - BGC received CC204-RFI-046.

- Observations and Recommendations (Open/Ongoing):
  - Fill placement of rockfill within the Phase 1 footprint should follow the practices used at the Event Pond:
    - Placement should follow recommendations from the test fill documented in CTFM-05.
    - The fill operation should be as tight as practical in terms of dump/spread/compact sequencing.
    - The cold weather placement guidance document (FM18-020) should be followed.
    - BGC should be informed 24 hours in advance of all sources of material changes.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring.
  - Snow should only be removed from over the liner with hand digging. Snow <1" thick can be left and ODF placed over it. Snow >1" thick must be removed. If excavation of placed ODF is needed over the liner then a machine can be used but excavation must stop a minimum 20cm away from the liner. The last 20cm must be hand excavated. If material is frozen it may need to be heated before excavation to prevent damage to the liner.
  - Shaping of the HLF was performed above the 940m bench. Pelly shared the new shaping surface with BGC. The surface removals the vast majority of ground ice observed in the test pits except for the area in the center valley in the north. (***Figure 1***)
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Tetra Tech provided QC monitoring and testing for construction of the Event Pond berms on both the day and night shift.

Client:	Victoria Gold	**Date and Shift:**	December 5, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy -16°C to -27°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Shaping the event pond continues. (***Photo 1***)
  - Heavy North made a hole in the liner while clearing snow. Heavy North had previously been instructed not to use heavy equipment or metal shovels to remove snow, however, this occurred early in the morning when a new operator with incorrect instructions began work with the excavator. The area cleared by the excavator was inspected and patched. JDS has reiterated to Heavy North that no snow removal can be performed by heavy equipment.
  - Heavy North completed shaping the ODF for PLS hammer head installation. Heavy North also began backfilling the shaped area up to grade using the screened ODF. (***Photo 2***)
  - Liner continued at the spillway invert bowl.
  - Shaping continued above the 940m bench. Frozen, ice rich material observed in the central/northern portion of the Phase 1 footprint during the test pit program was removed. (***Photo 3***) JDS/Pelly are deciding if they will backfill this area to achieve a grade that is easier to work on. BGC does not have an issue with backfilling this area, however, the area can also be kept at the current cut depth and shaped to meet the underdrain and collection system sloping and piping criteria if that is easier. If this area is backfilled, due to extremely cold temperatures, it can only be backfilled with rockfill and compacted using the method spec used at the event pond berm. Liner bedding material will have to be placed over the rockfill in 2019 prior to liner placement. As temperatures drop below -20 C consistently additional density testing (a stand alone test fill or drone survey density testing of a placed lift) will be required to determine if the current method being used is still appropriate.
  - This week JDS and BGC discussed having Pelly perform QC of the method spec used for rockfill placement as they construct. BGC has no issue with this. When rockfill placement resumes Pelly should begin reporting to BGC the following on a daily basis:
    - Number of passes performed by the roller.
    - Roller weight.
    - Lift thicknesses.
    - Rockfill material appears to meet strength requirements (very little weak rock, usually observed as grey weathered phyllite in this borrow source).
    - The absence of ice in the material.
    - Moisture content (visual estimate or lab sample).
    - Gradation (visual estimate that at least 20% of the material is greater than 12” and that the material is not gap graded).
    - Soil temperatures after placement but before compaction.
  - Over the past several weeks BGC has discussed with Pelly and JDS the subgrade approvals for the Phase 1 heap leach area. This area is being shaped to remove all ice rich material observed in the test pitting, as is required by the Foundation Improvement Plan. However, because this area has been stripped of topsoil the exposed subgrade has frozen, and to a significant depth in some places (between 0.5 to 1.0m bgs). Due to the temperatures construction is being performed in and the length of time the subgrade will be exposed to the elements any subgrade approvals done this season will have to be conditional. A final approval will be needed before liner is being placed. Final approval in 2019 will determine if the subgrade is dense (ie does not deflect much with proof rolls) and dry enough for liner placement. This should also be kept in mind when planning underdrain construction (ie main pipe trench and lateral drains). If underdrains are completed this season with piping and drain rock and subgrade in areas needs to be excavated deeper in 2019 this may require removal and reconstruction of some underdrains.
  - BGC and JDS discussed ballast options for the spillways. Both concrete impregnated fabric and bituminous geomebrane are being investigated.
  - Due to freezing ODF and the potential that it may not thaw in 2019, BGC and JDS decided to not cover the PLS BBQ grill with ODF this season. The piping will be anchored down (likely with piles of ODF or sandbags) and the area thawed with tarps and heaters in 2019 before placement resumes.

- Observations and Recommendations (Open/Ongoing):

- Fill placement of rockfill within the Phase 1 footprint should follow the practices used at the Event Pond:
    - Placement should follow recommendations from the test fill documented in CTFM-05.
    - The fill operation should be as tight as practical in terms of dump/spread/compact sequencing.
    - The cold weather placement guidance document (FM18-020) should be followed.
    - BGC should be informed 24 hours in advance of all sources of material changes.
- Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring.
- Snow should only be removed from over the liner with hand digging. Snow <1" thick can be left and ODF placed over it. Snow >1" thick must be removed. If excavation of placed ODF is needed over the liner then a machine can be used but excavation must stop a minimum 20cm away from the liner. The last 20cm must be hand excavated. If material is frozen it may need to be heated before excavation to prevent damage to the liner.
- BGC would like to be present when samples are collected from the ADR rock quarry for potential use as ODF material.

BGC Personnel:	Roy Morlan	**Weather:**	Clear -3°C to -19°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Shaping the event pond/ spillway continues. A number of active seeps were observed. Water from the seeps froze into ice sheets. BGC and Pelly plan on putting in gravel drains along the event pond slope walls to direct water to the underdrains. However, the extent of seeps will not be completely understood until temperatures regularly reach above freezing next year. (***Photo 1 and 2***)
  - Heavy North completed placing PLS hammerheads. (***Photo 3***)
  - Liner continued at the spillway invert bowl. (***Photo 4***)
  - Shaping continued above the 940m bench. (***Photo 5, 6 and 7***)
  - BGC responded to CC204-RFI-046.

- Observations and Recommendations (Open/Ongoing):
  - Fill placement of rockfill within the Phase 1 footprint should follow the practices used at the Event Pond:
    - Placement should follow recommendations from the test fill documented in CTFM-05.
    - The fill operation should be as tight as practical in terms of dump/spread/compact sequencing.
    - The cold weather placement guidance document (FM18-020) should be followed.
    - BGC should be informed 24 hours in advance of all sources of material changes.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring.
  - Snow should only be removed from over the liner with hand digging. Snow <1" thick can be left and ODF placed over it. Snow >1" thick must be removed. If excavation of placed ODF is needed over the liner then a machine can be used but excavation must stop a minimum 20cm away from the liner. The last 20cm must be hand excavated. If material is frozen it may need to be heated before excavation to prevent damage to the liner.
  - BGC would like to be present when samples are collected from the ADR rock quarry for potential use as ODF material.
  - JDS/Pelly may backfill areas of the Phase 1 HL footprint with rockfill this season. BGC does not have an issue with backfilling this area, however, the area can also be kept at the current cut depth and shaped to meet the underdrain and collection system sloping and piping criteria if that is easier or more cost effective. If this area is backfilled, due to extremely cold temperatures, it can only be backfilled with rockfill and compacted using the method spec used at the event pond berm. Liner bedding material will have to be placed over the rockfill in 2019 prior to liner placement. BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date and Shift:**	December 8, 2018 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy 2°C to -7°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Shaping the event pond/ spillway continues.
  - Heavy North completed placing PLS hammerheads and began installing the steel manifold. (***Photo 1***)
  - Liner continued at the spillway invert bowl. (***Photo 2***)
  - Shaping continued above the 940m bench. (***Photo 3***)

- Observations and Recommendations (Open/Ongoing):
  - Fill placement of rockfill within the Phase 1 footprint should follow the practices used at the Event Pond:
    - Placement should follow recommendations from the test fill documented in CTFM-05.
    - The fill operation should be as tight as practical in terms of dump/spread/compact sequencing.
    - The cold weather placement guidance document (FM18-020) should be followed.
    - BGC should be informed 24 hours in advance of all sources of material changes.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring.
  - Snow should only be removed from over the liner with hand digging. Snow <1" thick can be left and ODF placed over it. Snow >1" thick must be removed. If excavation of placed ODF is needed over the liner then a machine can be used but excavation must stop a minimum 20cm away from the liner. The last 20cm must be hand excavated. If material is frozen it may need to be heated before excavation to prevent damage to the liner.
  - BGC would like to be present when samples are collected from the ADR rock quarry for potential use as ODF material.
  - JDS/Pelly may backfill areas of the Phase 1 HL footprint with rockfill this season. BGC does not have an issue with backfilling this area, however, the area can also be kept at the current cut depth and shaped to meet the underdrain and collection system sloping and piping criteria if that is easier or more cost effective. If this area is backfilled, due to extremely cold temperatures, it can only be backfilled with rockfill and compacted using the method spec used at the event pond berm. Liner bedding material will have to be placed over the rockfill in 2019 prior to liner placement. As temperatures drop below -20 C consistently additional density testing (a stand alone test fill or drone survey density testing of a placed lift) will be required to determine if the current method being used is still appropriate.
  - This week JDS and BGC discussed having Pelly perform QC of the method spec used for rockfill placement as they construct. BGC has no issue with this. When rockfill placement resumes Pelly should begin reporting to BGC the following on a daily basis:
    - Number of passes performed by the roller.
    - Roller weight.
    - Lift thicknesses.
    - Rockfill material appears to meet strength requirements (very little weak rock, usually observed as grey weathered phyllite in this borrow source).
    - The absence of ice in the material.
    - Moisture content (visual estimate or lab sample).
    - Gradation (visual estimate that at least 20% of the material is greater than 12" and that the material is not gap graded).
    - Soil temperatures after placement but before compaction.
  - Over the past several weeks BGC has discussed with Pelly and JDS the subgrade approvals for the Phase 1 heap leach area. This area is being shaped to remove all ice rich material observed in the test pitting, as is required by the Foundation Improvement Plan. However, because this area has been stripped of topsoil the exposed subgrade has frozen, and to a significant depth in some places (between 0.5 to 1.0m bgs). Due to the temperatures construction is being performed in and the length of time the subgrade will be exposed to the elements any subgrade approvals done this season will have to be conditional. A final approval will be needed before liner is being placed. Final approval in 2019 will determine if the subgrade is dense (ie does not deflect much with proof rolls) and dry enough for liner placement. This should also be kept in mind when planning underdrain construction (ie main pipe trench and lateral drains). If underdrains are completed this season with piping and drain rock and

subgrade in areas needs to be excavated deeper in 2019 this may require removal and reconstruction of some underdrains.

Observations and Recommendations

- Observations and Recommendations (Today):
  - Shaping the event pond/ spillway continues.
  - Heavy North continued installing the steel manifold. There was an issue the manifolds fabrication. The angles for the flanges connecting the PLS header pipes are incorrect. JDS and Heavy north are planning options. It is likely that only the manifold will be installed in December and the angle will be corrected using a manufactured elbow next year. (***Photo 1***)
  - Liner continued at the spillway invert bowl. (***Photo 2***)
  - Shaping continued above the 940m bench. (***Photo 3***)

- Observations and Recommendations (Open/Ongoing):
  - Fill placement of rockfill within the Phase 1 footprint should follow the practices used at the Event Pond:
    - Placement should follow recommendations from the test fill documented in CTFM-05.
    - The fill operation should be as tight as practical in terms of dump/spread/compact sequencing.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Snow -9°C to -24°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Shaping the event pond/ spillway continues. (***Photo 1***) Pelly continued construction of the underdrains. (***Photo 2***)
  - Heavy North buried the manifold to hammer head connections with screened ODF and began demobing from site. (***Photo 3***)
  - Liner continued at the spillway invert bowl. (***Photo 4***)
  - Shaping continued above the 940m bench. (***Photo 5***)
  - BGC and JDS identified two areas in the ADR quarry to collect samples for ODF production. The first material (ADR-ODF-01) is phyllite rich, grey in color, and has weaker rock strength. The second sample (ADR-ODF-02) consists of strong quartzite rock with some phyllite (<30%) and is greyish brown. 5 truck loads of each were sockpiled near the Nueway crushers for processing into ODF on December 18. The samples will be sent to Tetra Tech in Whitehorse for durability analysis. If the sample is collected before December 20 Richard with Tetra Tech can drive the samples to the Whitehorse office. (***Photo 6 and 7***)

- Observations and Recommendations (Open/Ongoing):
  - Fill placement of rockfill within the Phase 1 footprint should follow the practices used at the Event Pond:
    - Placement should follow recommendations from the test fill documented in CTFM-05.
    - The fill operation should be as tight as practical in terms of dump/spread/compact sequencing.

Observations and Recommendations

- Observations and Recommendations (Today):
  - Shaping the event pond/ spillway continues. (***Photo 1***) Pelly also continued installing the underdrains for the Event Pond. (***Photo 2***) Portions of the completed drains were covered to grade with reject sand. Because this cover was placed in the extreme cold it will likely need to be recompacted next year prior to liner placement.
  - Shaping continued above the 940m bench. (***Photo 3***)
  - BGC responded to CC206-RFI-017.
  - BGC will demobe tomorrow, Saturday, December 15. BGC delivered a demobilization memo to JDS. The memo discusses outstanding items and recommendations for January and February construction.

- Observations and Recommendations (Open/Ongoing):
  - Fill placement of rockfill within the Phase 1 footprint should follow the practices used at the Event Pond:
    - Placement should follow recommendations from the test fill documented in CTFM-05.
    - The fill operation should be as tight as practical in terms of dump/spread/compact sequencing.
    - The cold weather placement guidance document (FM18-020) should be followed.
    - BGC should be informed 24 hours in advance of all sources of material changes.
  - Water Management Plan and Winterization Plan is needed to help maintain current event pond construction efforts, failure to do this may result in rework and repairs during Spring.
  - Snow should only be removed from over the liner with hand digging. Snow <1" thick can be left and ODF placed over it. Snow >1" thick must be removed. If excavation of placed ODF is needed over the liner then a machine can be used but excavation must stop a minimum 20cm away from the liner. The last 20cm must be hand excavated. If material is frozen it may need to be heated before excavation to prevent damage to the liner.
  - Over the past several weeks BGC has discussed with Pelly and JDS the subgrade approvals for the Phase 1 heap leach area. This area is being shaped to remove all ice rich material observed in the test pitting, as is required by the Foundation Improvement Plan. However, because this area has been stripped of topsoil the exposed subgrade has frozen, and to a significant depth in some places (between 0.5 to 1.0m bgs). Due to the temperatures construction is being performed in and the length of time the subgrade will be exposed to the elements any subgrade approvals done this season will have to be conditional. A final approval will be needed before liner is being placed. Final approval in 2019 will determine if the subgrade is dense (ie does not deflect much with proof rolls) and dry enough for liner placement. This should also be kept in mind when planning underdrain construction (ie main pipe trench and lateral drains). If underdrains are completed this season with piping and drain rock and subgrade in areas needs to be excavated deeper in 2019 this may require removal and reconstruction of some underdrains.

- Engineering:
  - None

QA/QC Results

- QA/QC:
  - No liner was placed today.
  - No fill was placed today at the HLF.
- BGC Recommendations:
  - None

Communications (no follow up required):

Client:	Victoria Gold	**Date and Shift:**	March 28, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 8ºC to -5ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - BGC arrived on site in the afternoon.
  - Pelly excavated portions of the frozen underdrain at the event pond and cleared frozen underdrain pipe using a steam machine. (***Photo 1***)
  - Pelly prepared for blasting at the ADR to be performed on March 29.
  - BGC reviewed the frozen underdrains at the vent pond. The drains likely froze after the underdrain outlet pipe froze and backed up water into the event pond underdrains. BGC will develop a method to prevent the underdrain outlet pipe from freezing.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 11°C to -5°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Void space from an apparent fault was observed while cleaning out the previous blanket drain at the event pond northern face. (***Photo 1***) Once this void space was exposed flow in the area of the blanket concentrated from this location. The void was excavated but concentrated flow continued at the fault contact. BGC recommends installing a single pipe drain in this location. (***Photo 2***)
  - Pelly continued prepping the event pond surface for liner (***Photo 3***).
  - Ewing began culvert placement. (***Photo 4***).
  - Pelly continued work shaping the Phase 1 heap pad area (***Photo 5***).
  - BGC and JDS discussed placing an additional 1m bench over the event pond underdrains to add additional insulation over the winter. Adding a ramp to the west side of the vent pond for the pump casing and to provide additional insulation for the underdrains was also discussed. BGC will develop a conceptual drawing for this work.

- Observations and Recommendations (Open/Ongoing):
  - BGC will develop a cover for the Event Pond underdrain outlet to reduce the change of the outlet freezing and backing up water into the underdrain system.
- Engineering:
  - None

Construction:	JDS Mining	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan		
Weather:	Clear 6ºC to -4ºC		

Summary and Observations

- Summary and Observations:
  - Pelly excavated and shaped the spillway and its underdrain. Material excavated from the underdrain is being used as grading fill at the HL Pad.
  - Layfield continued installing liner in the Event Pond. (***Photo 1***)
  - Pelly continued work shaping and placing sand at the Phase I heap pad area. (***Photo 2***). Rockfill was used in portions to fill areas.
  - Work installing the monitoring wells continued. A detailed daily report was provided by Robin Bruce (BGC) to Steven Wilbur (Victoria Gold).
  - Water was pumped from the PLS sump to the exfiltration sump at the toe of the embankment. The exfiltration sump was overwhelmed by the flow so pumping was stopped until tomorrow when a diversion from the sump could be completed.
  - Once water levels in the LDRS are below the PLS sump liner the leak test will begin. A technical summary and discussion of observations was provided to JDS.
- Recommendations:
  - None

1) QA/QC Results:

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Phase 1 heap pad areas in their daily report.
  - o Tetra Tech provided QA monitoring and reporting for construction of the liner in the event pond.
- BGC Recommendations:
  - None.

Safety Issues: None.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	April 1, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 13ºC to -5ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued installing drains at the event pond. (***Photo 1, 2, 3***).
  - Layfield began installing GCL. (***Photo 4***).
  - Ewing continued installation of culverts at the spillway invert. (***Photo 5***). Pipe spacing is close so only hand tamping compaction is possible between culverts. However, hand tamping is done properly and good compaction is being achieved. Culverts appear level per measurement with a spirt level. Connections between culverts appear to be tight. Ewing has stated that they will begin providing QC comments in their daily report starting April 2.
  - Pelly continued work shaping the Phase 1 heap pad area (***Photo 6***).
  - BGC visited the quarry that will produce ODF material near the Eagle Pit. The visit was conducted with Stuart Harris with Victoria Gold. The area delineated for ODF production form the surface appears to be predominantly weak and composed of either highly altered and weak granodiorite and metasediments, moderately weak silicified metasediments, with some stronger granodiorite that appears partially silicified. Producing clean ODF that meets the specifications or that doesn't produce a lot of waste may be difficult. BGC will develop a summary of the observations on April 2. (***Photo 7***)

- Observations and Recommendations (Open/Ongoing):
  - BGC will develop a cover for the Event Pond underdrain outlet to reduce the change of the outlet freezing and backing up water into the underdrain system.
  - BGC and JDS discussed placing an additional 1m bench over the event pond underdrains to add additional insulation over the winter. Adding a ramp to the west side of the vent pond for the pump casing and to provide additional insulation for the underdrains was also discussed. BGC will develop a conceptual drawing for this work
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly completed the additional drains in the Event Pond. (***Photo 1***).
  - Layfield continued installing liner. (***Photo 2***).
  - Ewing continued installation of culverts at the spillway invert. (***Photo 3***). Pipe spacing is close so only hand tamping compaction is possible between culverts. However, hand tamping is done properly and good compaction is being achieved. Culverts appear level per measurement with a spirt level. Connections between culverts appear to be tight. Ewing has stated that they will begin providing QC comments in their daily report starting April 2. However, BGC did not receive a daily report or QC observations.
  - Pelly continued work shaping the Phase 1 heap pad area (***Photo 4***).
  - BGC sent a summary of observations made during the visit to the potential ODF quarry near the Eagle Gold Pit to JDS and Victoria Gold's Geology department.
  - BGC provided a conceptual drawing and guidance on additional measures to protect the drains in the event pond.
  - BGC provided a revised instrumentation figure based on as-built construction.

- Observations and Recommendations (Open/Ongoing):
  - None
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy -5ºC to -11ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued placing sand at the Event Pond (***Photo 1***).
  - Layfield continued installing liner. (***Photo 2***). High winds slowed work today.
  - Ewing continued installation of culverts at the spillway invert. (***Photo 3, 4***). Material above the culverts was being compacted with a jumping jack. QC testing showed moisture at 0% and compaction at 85% proctor on the first 30cm lift. A second 30m had already been partially placed (about 75% complete). BGC allowed the second lift to be spread and tomorrow we will attempt to wet the material in place before attempting compaction again, if temperatures allow.
  - Pelly continued work shaping the Phase 1 heap pad area.
  - Victoria Gold Geology reported that an attempt to produce ODF from the source near the Eagle Gold pit will move forward. After the blast a test run will be produced.
  - Robin Bruce with BGC arrived on site to assist with piezometer and monitoring well installation. Midnight Sun drilling was delayed and is not expected to arrive at the site until tomorrow.
  - JDS explained that they plan to run two utility pipes (8" HDPE) across the spillway invert above the culverts in case the client needs a utility corridor in the future. The pipes would be booted to the liner. BGC asked that the utility pipes be caped when not in use and sealed when in use. Although these pipes are relatively small and located above the top of the culverts BGC is not sure if the addition of these pipes will be an issue with the regulator. (***Figure 1***)

BGC Personnel:	Roy Morlan	**Weather:**	Cloudy some snow 4°C to -5°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued placing sand at the Event Pond and constructing sump (***Photo 1***).
  - Layfield continued installing liner. (***Photo 2***).
  - Material at the spillway culverts was not compacting properly due to low moisture. Ewing will attempt to wet the material prior to compacting. Due to below freezing temperatures the material could not be wetted so work in this area was suspended until it warms.
  - Pelly continued work shaping the Phase 1 heap pad area. (***Photo 3***) BGC inspected the east side of the Phase 1 pad and will provide Pelly and JDS a short report discussing which areas require sand placement.
  - Midnight Sun completed VWP-3 and the boring for the inclinometer. (***Photo 4***)
  - Ewing caught up on all missing daily reports and QC tracking.
  - BGC delivered a summary of what will be required for subgrade prep in the eastern portion of the Phase 1 heap pad. (***Photos 5 and 6***). Reject sand is not likely needed over the entire surface, however, hard surfaces that can cause stress in or puncture the liner should be improved.
  - BGC delivered responses to CC204-RFI-048 and 49. BGC also provided BGC-RFI-033 which discusses the construction of the event pond underdrain winter protection.

- Observations and Recommendations (Open/Ongoing):
  - None
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.
  - Ewing is providing QC monitoring and reporting for construction of the spillway invert in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner in the event pond.
- BGC Recommendations:
  - None.

Communications (no follow up required):

Photo 5: Midnight Sun installing piezometer on the embankment

Photo 6: Midnight Sun installing piezometer on the embankment

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	April 8, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy 10°C to -1°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued placing sand at the Event Pond and constructing sump (***Photo 1***).
  - Layfield continued installing liner in the Event Pond.
  - Ewing resumed construction at the spillway culverts. Ewing achieved density by wetting the construction material to approximately 2% moisture, using 15cm lifts, and 4 passes (ie 4 passes forward and 4 passes backwards) with a plate tamper. This is the method that will be used construct the rest of the spillway. Ewing may try to reduce the number of passes by wetting the material more (optimal moisture is 6%). However, if this is done density would have to shown to be met via Tetra Tech's nuke gauge testing. (***Photo 2 and 3***)
  - Pelly continued work shaping the Phase 1 heap pad area. (***Photo 4***) BGC inspected the east side of the Phase 1 pad and will provide Pelly and JDS a short report discussing which areas require sand placement.
  - Midnight Sun completed the inclinometer. (***Photo 5***) Midnight Sun began the monitoring wells in Dublin Gulch. (***Photo 6***) Steve Wilber and Roy Morlan visited the drilling. By end of day approximately 10m had been drilled, 3m in over burden, approximately 3m-7m bgs in weathered bedrock, and approximately 7m -10m bgs in more competent bedrock. Since the drill uses water it is difficult to estimate where groundwater was first encountered. However, from oxidation levels, some core moisture, and lithology described in a 2010 boring drilled near this hole we estimate GW is at about 4m bgs. We pulled casing approximately 1m from the bottom of the hole to expose more of the formation and left the hole overnight to gauge recharge/drainage. Water levels measured in the hole at the end of day today were 6.2m bgs.

- Observations and Recommendations (Open/Ongoing):
  - None
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.
  - Ewing is providing QC monitoring and reporting for construction of the spillway invert in their daily report. No work performed yesterday so no reports received today.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner in the event pond.
- BGC Recommendations:
  - None.

Communications (no follow up required):

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy 9ºC to -2ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly excavated and shaped the spillway and its underdrain.
  - Layfield continued installing liner in the Event Pond.
  - Pelly continued work shaping and placing sand at the Phase I heap pad area. (***Photo 1***).
  - Work on the monitoring wells was put on hold until Midnight Sun delivers and RC rig to the site.
  - JDS began pumping water into the PLS sump for the hydrostatic head test.
  - The piezometers installed in the embankment were gauged today.
    - P-1 (Drilled 55m below crest into the bedrock foundation) measured water at 46.5m below top of crest. Contact between embankment fill and subgrade in this location is approximately 40m bgs.
    - P-2 (Drilled 35m below crest within the embankment fill) was dry.
    - P-3 (Drilled 25m below crest within the embankment fill) was dry.
  - Water was gauged in the LDRS instrument casing. Water in PLS pond was 915.8m. Water level in the LDRS casing was 916.6m.

- Observations and Recommendations (Open/Ongoing):
  - BGC has helped field fit the spillway underdrain outlet with Pelly so that it will drain away from the Event Pond and infiltrate into the ground. The outlet was angled to also drain away from the waste pile located directly west of the Event Pond. However, JDS should also confirm that the outlet and general drain design meets their requirements for drainage away from the waste pile to ensure water discharge does not affect the stability of that structure.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner in the event pond.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Sunny 11ºC to -3ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly excavated and shaped the spillway and its underdrain (***Photo 1***).
  - Layfield continued installing liner in the Event Pond. (***Photo 2***)
  - Pelly continued work shaping and placing sand at the Phase I heap pad area. (***Photo 3 and 4***). Rockfill was used in portions to fill areas. Rockfill was placed in lifts less than 0.9m thick and compaction met the method spec for the fill. Liner bedding sand was also spread around the center drainage which was also compacted per specifications.
  - Work on the monitoring wells resumed. Midnight sun will use a small RC rig to drill the deeper wells. Shallow and deep wells will be installed as separate completions about 6m apart from each other. Four shallow wells were drilled today.
  - JDS continued pumping water into the PLS sump for the hydrostatic liner test. (***Photo 5***)
  - Water was gauged in the LDRS instrument casing. Water levels in the PLS provided by JDS and LDRS measured by BGC are provided below.

Date	PLS Water Elevation (m)	LDRS Water Elevation (m)
4-10-19	915.9	916.6
4-11-19	916.6	916.9

- Observations and Recommendations (Open/Ongoing):
  - BGC has helped field fit the spillway underdrain outlet with Pelly so that it will drain away from the Event Pond and infiltrate into the ground. Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy 7°C to -4°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly excavated and shaped the spillway and its underdrain (***Photo 1***). Material excavated from the underdrain is being used as grading fill at the HL Pad. The material meets the Technical Specification requirements for grading fill. Pelly removed ice sheets that built up over the winter prior to hauling the material to the HL pad.
  - Layfield continued installing liner in the Event Pond. (***Photo 2***)
  - Pelly continued work shaping and placing sand at the Phase I heap pad area. (***Photo 3***). Rockfill was used in portions to fill areas. Rockfill was placed in lifts less than 0.9m thick and compaction met the method spec for the fill. Liner bedding sand was also spread around the center drainage which was also compacted per specifications.
  - Temperatures over the past several days have been warmer and areas near the center valley have appeared wetter as ice in the bedrock melts at the HL pad (***Photo 4***). Ice was delineated in this area in 2018. Thaw unstable ice rich soil was removed and thaw stable ice rick bedrock was left in place in this area per the Foundation Improvement Plan requirements. Seeps observed now are coming from upper, weathered bedrock layers and appear in the day when it is warm and stop at night. This is likely temporary flow due to ice melting and not groundwater. Pelly and BGC discussed how to deal with this area. Options included waiting until a couple days before liner is placed here, digging out soft material, then replacing it with dry material (rockfill, site grading fill, structural fill, or liner bedding material) to give a dense dry surface to place liner on. If JDS and Pelly would like to prep this area more in advance removing the affected area now then replacing it with drain rock and covering it with a dry fill material would also be acceptable. Details were discussed in the field.
  - Work installing the monitoring wells continued. Midnight Sun drilled two wells. A detailed daily report was provided by Robin Bruce (BGC) to Steve Wilbur (Victoria Gold).
  - Tetra Tech collected a sample of the ODF test runs produced from crushed granodiorite and metasediment rock. The samples will be run for moisture and gradation. The following preliminary observations were made at the test piles:
    - The material produced from granodiorite made a cleaner drain material. Material was hard. (***Photo 5***)
    - The material produced from the metasediments made a dirtier drain rock with more sand. Material was also hard. (***Photo 6***)
  - JDS completed pumping water into the PLS sump for the liner test. (***Photo 7***)
  - Water was gauged in the LDRS instrument casing. Water levels in the PLS provided by JDS and LDRS measured by BGC are provided below.

Date	PLS Water Elevation (m)	LDRS Water Elevation (m)
4-10-19	915.9	916.6
4-11-19	916.6	916.9
4-12-19	917.2	917.3
4-13-19	918.0 (per gauge lines in pond)	917.8

- Observations and Recommendations (Open/Ongoing):
  - BGC has helped field fit the spillway underdrain outlet with Pelly so that it will drain away from the Event Pond and infiltrate into the ground. The outlet was angled to also drain away from the waste pile located directly west of the Event Pond. However, JDS should also confirm that the outlet and general drain design meets their requirements for drainage away from the waste pile to ensure water discharge does not affect the stability of that structure.
- Engineering:
  - None

QA/QC Results

- QA/QC:

- Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.
- Tetra Tech provided QA monitoring and reporting for construction of the liner in the event pond.

- BGC Recommendations:
  - None.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	April 17, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Partly Cloudy 9ºC to -4ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly excavated and shaped the spillway and its underdrain. Material excavated from the underdrain is being used as grading fill at the HL Pad.
  - Layfield continued installing liner in the Event Pond.
  - Pelly continued work shaping and placing sand at the Phase I heap pad area. (***Photo 1***). Rockfill was used in portions to fill areas.
  - Work installing the monitoring wells is complete and the drill (Midnight Sun) demobilized. A detailed daily report was provided by Robin Bruce (BGC) to Steve Wilbur (Victoria Gold). Robin will air lift the installed wells over the next few days.
  - Snowmelt runoff is flowing onto the 990 bench in several places, most notably at Station 4+30. Pelly has a temporary sump for pumping the water to the underdrains. As the snowmelt will continue from the slope, BGC has recommended in RFI-BGC-034 that finger drain is extended to the nearest lateral to drain this water from the bench.
  - JDS continued dewatering the LDRS sump (***Photo 2***). Water was gauged in the LDRS instrument casing during pumping. Once water levels in the LDRS are below the PLS sump liner the leak test will begin. BGC recommended use of tracer dye as a possible method for leak location. JDS has ordered the dye (16 gallons red and 16 gallons green). BGC will develop a detailed procedure for dye testing. BGC has also talked to Leak Location Services (LLSI) about possible electrical methods for locating the leak under the ODF. LLSI will be providing a quote for a leak location survey for our consideration.

- Observations and Recommendations (Open/Ongoing):
  - BGC has helped field fit the spillway underdrain outlet with Pelly so that it will drain away from the Event Pond and infiltrate into the ground. The outlet was angled to also drain away from the waste pile located directly west of the Event Pond. However, JDS should also confirm that the outlet and general drain design meets their requirements for drainage away from the waste pile to ensure water discharge does not affect the stability of that structure.
  - Ice in bedrock that was delineated in the HL Phase I area in 2018 is melting and wetting the subgrade surface in some isolated, small areas. Pelly and JDS plan on deal with these areas before liner placement to ensure the liner is placed on a dense, dry surface.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Phase 1 heap pad areas in their daily report.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner in the event pond.
- BGC Recommendations:
  - None.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Overcast, Snow 7°C to -4°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly excavated and shaped the spillway and its underdrain. Material excavated from the underdrain is being used as grading fill at the HL Pad.
  - Layfield continued installing liner in the Event Pond (***Photo 1***).
  - Pelly suspended work shaping and placing sand at the Phase I heap pad area due to snow.
  - JDS started dewatering the LDRS sump with the PLS pond at 917m to test and isolating the apparent leak in the liner (***Photo 2***). A flow gage will be used to meter the flow and a level-logger transducer is installed in the LDRS pipe to measure changes in head levels.

- Observations and Recommendations (Open/Ongoing):
  - BGC has helped field fit the spillway underdrain outlet with Pelly so that it will drain away from the Event Pond and infiltrate into the ground. The outlet was angled to also drain away from the waste pile located directly west of the Event Pond. However, JDS should also confirm that the outlet and general drain design meets their requirements for drainage away from the waste pile to ensure water discharge does not affect the stability of that structure.
  - Ice in bedrock that was delineated in the HL Phase I area in 2018 is melting and wetting the subgrade surface in some isolated, small areas. Pelly and JDS plan on deal with these areas before liner placement to ensure the liner is placed on a dense, dry surface.

Photo 2: HLF in-heap pond.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	April 19, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Overcast, Snow 8ºC to -1ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued work shaping and placing sand at the Phase I heap pad area for liner preparation (***Photo 1***).
  - Pelly excavated and shaped the spillway and its underdrain. Material excavated from the underdrain is being used as grading fill at the HLF.
  - Layfield continued installing liner in the Event Pond (***Photo 2***).
  - JDS started pumping down the PLS pond from 917m to 915.5m to test and isolate the apparent leak in the liner. JDS found several holes and a cut in the liner at about 916.5m (***Photo 3***).
  - BGC provided guidance for path forward to complete the liner leak test. The general plan involves pumping the PLS pond down to top of ODF gravel (about 915.5m) to allow patching the holes and another visual inspection of the liner. The pond will then be raised back to 918m to re-test for liner leaks.

- Observations and Recommendations (Open/Ongoing):
  - BGC has helped field fit the spillway underdrain outlet with Pelly so that it will drain away from the Event Pond and infiltrate into the ground. The outlet was angled to also drain away from the waste pile located directly west of the Event Pond. However, JDS should also confirm that the outlet and general drain design meets their requirements for drainage away from the waste pile to ensure water discharge does not affect the stability of that structure.
  - Ice in bedrock that was delineated in the HL Phase I area in 2018 is melting and wetting the subgrade surface in some isolated, small areas. Pelly and JDS plan on deal with these areas before liner placement to ensure the liner is placed on a dense, dry surface.

- Engineering:
  - BGC prepared a revised design for the HLF underdrain transition to the monitoring vault (BGC-RFI-036).

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Phase 1 heap pad areas in their daily report.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner in the event pond.
- BGC Recommendations:
  - None.

Communications (no follow up required):

Client:	Victoria Gold	**Date and Shift:**	April 20, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Cloudy 4°C to -3°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly started placing gravel and inclined riser pipes in the Event Pond LDRS sump. (***Photo 1***).
  - Layfield continued installing liner in the Event Pond. (***Photo 2***).
  - Pelly continued installing the HLF spillway seep drain.
  - Pelly continued work shaping the Phase 1 heap pad area and preparing surface for liner installation.
  - JDS lowered the PLS pond level from 916.4m to 915.4m. Another hole was found (***Photo 3***) in the liner at about elevation 915.5m. The LDRS sump will now be pumped down again in preparation of a leak test. Layfield will be directed to patch the holes and perform detailed visual inspection and seam re-test (channel pressure) on seams in the lower in-heap pond. A final leak re-test will be performed at PLS pond elevation 918m once the holes are repaired.

- Observations and Recommendations (Open/Ongoing):
  - BGC is providing data reports and guidance related to the ongoing HLF in-heap pond liner leak test via emails to the team. A field memo will be prepared to document the leak test once complete.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
- BGC Recommendations:
  - None.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Mostly Sunny 5°C to -2°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued installing the HLF spillway seep drain (***Photo 1***).
  - Layfield continued installing liner in the Event Pond.
  - Pelly continued work shaping the Phase 1 heap pad area and preparing surface for liner installation.
  - JDS lowered the PLS pond level to 915.2m (***Photo 2***). The damaged liner at elevation 915.5m and 916.5 was patched by Layfield (***Photos 3 and 4***) in the liner at about elevation 915.5m. The LDRS sump head elevation was measured by transducer and was steady with the PLS pond level at 915.2m. The LDRS will be pumped down further in preparation for the liner leak test at PLS pond level 918.0m.
  - BGC discussed the emergency spillway re-design with Pelly. A field review revealed a few opportunities to optimize the installation of the lower portion of the spillway. BGC will work with Pelly to field fit the lower spillway while meeting the design intent.

- Observations and Recommendations (Open/Ongoing):
  - BGC is providing data reports and guidance related to the ongoing HLF PLS pond liner leak test via emails to the team. A field memo will be prepared to document the leak test once complete.
- Engineering:
  - None

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Cloudy 7°C to 1°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Layfield continued installing liner in the Event Pond.
  - Pelly continued work shaping the Phase 1 heap pad area and preparing surface for liner installation. Several small areas of ice rich material was removed from the subgrade (***Photos 1 and 2***).
  - JDS cleaned the installed liner surface in the PLS sump between elevations 915m and 918m to allow detailed inspection (***Photo 3***). No additional holes were found and a few deep scratches/dents were repaired. A leak test was performed by BGC at pond elevation 915m and passed. JDS started re-filling the PLS sump to 918m in preparation of the final liner leak test.

- Observations and Recommendations (Open/Ongoing):
  - BGC is providing data reports and guidance related to the ongoing HLF PLS pond liner leak test via emails to the team. A field memo will be prepared to document the leak test once complete.
  - BGC discussed the emergency spillway re-design with Pelly. A field review revealed a few opportunities to optimize the installation of the lower portion of the spillway. BGC will work with Pelly to field fit the lower spillway while meeting the design intent.

BGC Personnel:	Troy Meyer	**Weather:**	Snow 0ºC to -2ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Layfield suspended liner work in the Event Pond due to snow (***Photo 1***).
  - Pelly continued work shaping the Phase 1 heap pad area and preparing subgrade and surface for liner installation. Rock fill from the ADR borrow is being placed and compacted as grading fill.
  - Pelly continued excavation of the main spillway.
  - Pelly worked on preparations for excavation of the emergency spillway. Organic material at the base of the spillway outlet was removed (***Photo 2***).
  - JDS continued re-filling the PLS sump to 918m in preparation of the final liner leak test.

- Observations and Recommendations (Open/Ongoing):
  - BGC is providing data reports and guidance related to the ongoing HLF PLS pond liner leak test via emails to the team. A field memo will be prepared to document the leak test once complete.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Partly Cloudy 6°C to -5°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Layfield resumed liner work in the Event Pond (***Photo 1***). Water is being pumped from the sump to allow placement of the geocomposite and top liner in the sump and northwest corner of the pond.
  - Pelly suspended work shaping the Phase 1 heap pad area and preparing subgrade and surface for liner installation due to snow and wet conditions.
  - Pelly continued excavation of the main spillway (***Photo 2***).
  - JDS continued re-filling the PLS sump to 918m in preparation of the final liner leak test (***Photo 3***).

- Observations and Recommendations (Open/Ongoing):
  - BGC is providing data reports and guidance related to the ongoing HLF PLS pond liner leak test via emails to the team. A field memo will be prepared to document the leak test once complete.
  - BGC discussed the emergency spillway re-design with Pelly. A field review revealed a few opportunities to optimize the installation of the lower portion of the spillway. BGC will work with Pelly to field fit the lower spillway while meeting the design intent.

- Engineering:
  - BGC has been discussing the ODF sources with Victoria geologist Helena Kuikka. Several source areas with fairly competent rock conditions from the pre-production pit benches have been tested and approved. Given the variable geologic conditions, BGC is proposing a field testing procedure with correlation of field parameters (such as ISRM hardness) to lab results to allow pre-approval of source areas for ODF production without the need for specialized off-site lab testing. A field memo will be prepared to document the procedure.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Cloudy -2°C to -13°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Layfield continued liner work in the Event Pond (***Photo 1***). The inclined riser pipes were booted to the liner at the crest of the pond.
  - Pelly resumed work shaping the Phase 1 heap pad area and preparing subgrade and surface for liner installation.
  - Pelly continued excavation of the main spillway (**Photo 2**).
  - JDS continued re-filling the PLS sump to 918m in preparation of the final liner leak test. Pond elevation was 918.0 at 2:30pm. An initial reading for the leak test was taken by BGC.

- Observations and Recommendations (Open/Ongoing):
  - BGC is providing data reports and guidance related to the ongoing HLF PLS pond liner leak test via emails to the team. A field memo will be prepared to document the leak test once complete.
  - BGC discussed the emergency spillway re-design with Pelly. Pelly provided a proposed re-design of the lower portion of the spillway for BGC review.

- Engineering:
  - BGC has been discussing the ODF sources with Victoria geologist Helena Kuikka. Several source areas with fairly competent rock conditions from the pre-production pit benches have been tested and approved. Given the variable geologic conditions, BGC is proposing a field testing procedure with correlation of field parameters (such as ISRM hardness) to lab results to allow pre-approval of source areas for ODF production without the need for specialized off-site lab testing. A field memo will be prepared to document the procedure.
  - JDS, Pelly and BGC discussed the need for an ODF loadout pad at the southeastern corner of the HLF. A concept plan was developed to place ODF against the existing (eastern dam groin) to allow sufficient room for a working stockpile and loadout area. The PLS header pipe alignment would need to be slightly modified to accommodate this. JDS will develop a grading plan for BGC to review.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
- BGC Recommendations:
  - None.

BGC Personnel:	Troy Meyer	**Weather:**	Sunny 10°C to -2°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Layfield continued liner work in the Event Pond (***Photo 1***). The rub sheet was installed below the spillway.
  - Pelly continued work in the Phase 1 heap pad area preparing subgrade and surface for liner installation (***Photo 2***).
  - Pelly continued excavation of the main spillway (**Photo 3**).
  - A small wet area below the spillway on the slope between the spillway bench and the event pond was walked with Pelly to discuss repair options (***Photo 4***). Frozen material was not found and the depth of wet material was less than 0.5m. Pelly plans to excavate to firm ground and replace with compacted rock fill.
  - Growth medium material was being spread across the HLF embankment face with dozers (***Photo 5***).
  - The final liner leak test for the HLF in-heap pond elevation at pond elevation 918.0 was completed. The 24-hour test passed.
  - JDS began pumping water from the PLS pond to the Event pond to prepare for the leak test.

- Observations and Recommendations (Open/Ongoing):

- Engineering:
  - JDS, Pelly and BGC discussed the need for an ODF loadout pad at the southeastern corner of the HLF. A concept plan was developed to place ODF against the existing (eastern dam groin) to allow sufficient room for a working stockpile and loadout area. AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	May 2, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Sunny 8°C to -2°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued work in the Phase 1 heap pad area preparing subgrade and surface for liner installation.
  - Pelly continued excavation of the main spillway.
  - Pelly continued PLS pipework in the HLF sump.
  - Layfield continued liner work in the Phase 1 pad area.
  - Roy Morlan arrived on site.

- Observations and Recommendations (Open/Ongoing):

- Engineering:
  -

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
- BGC Recommendations:
  - None.

Communications (no follow up required):

Safety Issues: None this shift.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	May 3, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Sunny 5°C to -2°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued work in the Phase 1 heap pad area preparing subgrade and surface for liner installation. (***Photo 1***)
  - Pelly continued excavation of the main spillway and the Event Pond emergency spillway (***Photo 2***).
  - Pelly continued PLS pipework in the HLF sump. (***Photo 3***) Pelly also placed ODF in the sump. ODF was placed at a minimum 0.3m thickness using a small bobcat. Material was dumped from above by the bobcat and not pushed to ensure that the liner was not damaged. Pelly also used a spotter during placement. (***Photo 4***)
  - Layfield continued liner work in the Phase 1 pad area. (***Photo 5***)
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond. (***Photo 6***). Currently the discharge is not in a lined ditch, however, surface drainage appears to be away from the Event Pond fill and the waste pile and has minimal flow so it is not likely to cause issues in the short term. Since BGC did not design or oversee the waste pile construction JDS should verify that this discharge will not be an issue with the waste pile.

- Observations and Recommendations (Open/Ongoing):
  - None

- Engineering:
  - BGC is developing a field procedure memo for inspecting the ODF's durability.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
- BGC Recommendations:
  - None.

Communications (no follow up required):

Client:	Victoria Gold	**Date and Shift:**	May 4, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Sunny 8°C to -1°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued work in the Phase 1 heap pad area preparing subgrade and surface for liner installation. (***Photo 1***) Touchup is needed in two approved areas of subgrade where traffic has caused rutting and exposure of jagged surfaces. (***Photo 2***)
  - Pelly continued excavation of the main spillway and the Event Pond emergency spillway (***Photo 3***). BGC and Pelly discussed installing a drain along the heap leach spillway to deal with water accumulation. (***Photo 4***)
  - Pelly continued PLS pipework in the HLF sump. (***Photo 5***)
  - Layfield continued liner work in the Phase 1 pad area. (***Photo 5***)

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond. Currently the discharge is not in a lined ditch, however, surface drainage appears to be away from the Event Pond fill and the waste pile and has minimal flow so it is not likely to cause issues in the short term. Since BGC did not design or oversee the waste pile construction JDS should verify that this discharge will not be an issue with the waste pile.

- Engineering:
  - BGC is developing a field procedure memo for inspecting the ODF's durability.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
- BGC Recommendations:
  - None.

Client:	Victoria Gold	**Date and Shift:**	May 5, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Snow 8ºC to 0ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - No prepping of the Phase 1 heap pad subgrade was completed today due to snow.
  - The spillway drain was extended about 4m to capture a new seep. (***Photos 1 and 2***)
  - Pelly continued excavation of the emergency spillway (***Photo 3***).
  - Pelly continued PLS pipework in the HLF sump. (***Photo 4***)
  - No liner was placed today due to snow.
  - Excavation to uncover the embankment underdrains continued. (***Photo 5***)
  - Field memo FM-014 was delivered to JDS and discusses a field procedure to track durability ODF produced from the pit.
  - BGC and JDS discussed procuring additional 1" threaded PVC pipe to make installation of the Pad Cell piezometers easier.

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond. Currently the discharge is not in a lined ditch, however, surface drainage appears to be away from the Event Pond fill and the waste pile and has minimal flow so it is not likely to cause issues in the short term. Since BGC did not design or oversee the waste pile construction JDS should verify that this discharge will not be an issue with the waste pile.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad areas in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
- BGC Recommendations:
  - None.

Photo 5: Underdrain excavation at the toe of the embankment.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	May 6, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear, snow melt 14°C to 2°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - No prepping of the Phase 1 heap pad subgrade was completed today due to snow melt.
  - Pelly continued excavation of the emergency spillway.
  - Pelly continued PLS pipework in the HLF sump. (***Photo 1***). Pelly also pumped snow melt water from the PLS sump work area.
  - No liner was placed today due to snow melt.
  - Excavation to uncover the embankment underdrains and to prepare the monitoring vault subgrade continued. Underdrain pipe outlets were exposed. No water was flowing from the closure pipe. Water was flowing from the west most underdrain pipe (connected to the west lateral and some finger drains) and from the east most pipe (connected to artesian source under the embankment). (***Photo 3***)

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for construction of the Event Pond and Phase 1 heap pad fills in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
  - Tetra Tech will provide QC monitoring and reporting for the production of ODF, once that resumes.
- BGC Recommendations:
  - None.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	May 7, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear, snow melt 19°C to 1°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Prepping of the Phase 1 heap pad subgrade continued (***Photo 1***)
  - Pelly continued construction of the emergency spillway. (***Photo 2***)
  - Pelly continued PLS pipework in the HLF sump. (***Photo 3 and 4***).
  - Liner placement continued. (***Photo 5***) Areas where GCL was exposed and hydrated will covered with an additional layer of GCL. (***Photo 6***)
  - Work is progressing into an area of the Phase 1 heap pad on the east where subgrade is undulating. Undulating subgrade can cause void space under the liner if the liner is not buried before weather cools and the liner tightens. This can result in separation of seems or rips once a load is placed on the liner. The following suggestions have been made by BGC, Tetra Tech, and Layfield:
    - Undulations should be filled in create a flat surface to place liner on.
    - If liner is placed on undulating surfaces then it should be buried before weather cools and the liner tightens.
  - Excavation of for the monitoring vault foundation continued. (***Photo 7***) To densify the foundation for the vault JDS and Pelly plan to over excavate the subgrade, compact the subgrade using a min 6 ton compactor, then place about 1m of fill (either as a 1m lift or in 0.5m lifts depending on the compactor available).
- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for fill placement in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
  - Tetra Tech will provide QC monitoring and reporting for the production of ODF, once that resumes.
- BGC Recommendations:
  - None.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	May 8, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear, PM Rain 20ºC to 3ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Prepping of the Phase 1 heap pad subgrade continued.
  - Pelly continued construction of the emergency spillway.
  - Pelly continued PLS pipework in the HLF sump. (***Photo 1***).
  - Pelly began adding ODF to east impoundment groin. The material was pushed in 1.5m thick lifts. Eventually this built up area may be used to transport heavy traffic. (***Photo 2***)
  - Liner placement continued. (***Photo 1***) After discussions with Troy, areas previously identified as hydrated by snow melt should be tested to determine if the internal structure of the GCL is stable or the GCL should be removed. After discussions with JDS and Layfield it was determined that the GCL will be removed.
  - Pelly filled in some undulating surfaces on the east side. Pelly will continue filling in undulating surfaces tomorrow.
  - Excavation of for the monitoring vault foundation continued. To densify the foundation for the vault JDS and Pelly plan to over excavate the subgrade, compact the subgrade using a min 6 ton compactor, then place about 1m of fill (either as a 1m lift or in 0.5m lifts depending on the compactor available).
- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for fill placement in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
  - Tetra Tech will provide QC monitoring and reporting for the production of ODF, once that resumes.
- BGC Recommendations:

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear, AM Rain 17°C to 2°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Prepping of the Phase 1 heap pad subgrade continued.
  - Pelly completed PLS pipework in the HLF sump. (***Photo 1***). Backfill of pipework will begin tomorrow.
  - Pelly continued adding ODF to east impoundment groin. (***Photo 2***)
  - Liner placement continued. (***Photo 3***) A portion of GCL was left exposed to rain and had spotty areas of hydration. (***Photo 4***). Layfield removed the affected areas.
  - Excavation for the monitoring vault foundation continued. (***Photo 5***).
  - Pelly began excavating the anchor trench for the concrete cloth at the HL spillway (***Photo 6***)
- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for fill placement in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
  - Tetra Tech will provide QC monitoring and reporting for the production of ODF, once that resumes.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	May 10, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy, PM Rain 19°C to 7°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Prepping of the Phase 1 heap pad subgrade continued. BGC approved the entire east side of the Phase 1 heap pad. There are small areas of touchup needed near the top and bottom where heavy equipment has dug down into the slope and pulled up large rocks. (***Photo 1***)
  - Backfill the PLS sump and east groin with ODF and extension of the header pipe on the east side of the PLS continued (***Photos 2***).
  - Liner placement continued. (***Photo 1***).
  - An area of GCL in the center valley that was left exposed during snow and rain events was hydrated several days back. This area was removed today. The affected area was removed to dry GCL or GCL that was not fully hydrated. This work was observed by Tetra Tech and BGC to ensure all affected areas were removed. (***Photo 3 through 6***)
  - Excavation for the monitoring vault foundation continued.
  - Pelly continued excavating the anchor trench for the concrete cloth at the HL spillway
- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for fill placement in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
  - Tetra Tech will provide QC monitoring and reporting for the production of ODF, once that resumes.

Client:	Victoria Gold	**Date and Shift:**	May 14, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 20°C to 6°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Backfill of the PLS sump and east groin with ODF and extension of the header pipe on the east side of the PLS continued (***Photos 1***).
  - A small section of PLS was damaged during ODF placement. This section was excavated by Pelly and replaced. (***Photo 2***)
  - Liner placement continued. (***Photo 3***).
  - The HL east perimeter road extension began. QC on road compaction is being performed by Pelly is BGC observed that construction is being done per the developed method spec for rockfill placement.
  - Concrete cloth installation continued. (***Photo 4***).
  - A damaged area of the liner was observed in the Event Pond. This likely happened to the recent rains. The area was inspected and the damage marked. Layfield will repair the damage. Tetra Tech will provide an inspection summary. After repairs are complete BGC, JDS, Layfield, and Tetra Tech will perform a final inspection. JDS plans to install a larger berm below the slope to prevent further rockfill. (***Photo 5***)
- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for fill placement in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
  - Tetra Tech will provide QC monitoring and reporting for the production of ODF, once that resumes.
  - Titan Enviro is providing QC for concrete cloth placement in their daily reports.
- BGC Recommendations:
  - None.

Photo 5: Concrete cloth installation.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	May 15, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 19°C to 5°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Backfill of the PLS sump and east groin with ODF and extension of the header pipe on the east side of the PLS continued (***Photos 1***). Placement of some of 100mm pipes does not conform with the design. 100mm pipes should have 1m parallel run at a max of 0.5m distance from the 250mm pipes (***Figure 1***). Many pipes were placed today without that parallel. (***Photo 2***) The should be corrected before being buried. Buried pipes to date met the design criteria.
  - Liner placement continued. (***Photo 4***).
  - The HL east perimeter road continued. QC on road compaction is being performed by Pelly is BGC observed that construction is being done per the developed method spec for rockfill placement. (***Photo 5***)
  - Concrete cloth installation continued. (***Photo 6***).
  - Layfield repaired damaged liner in the Event Pond but did not test it. Layfield said testing would be completed tomorrow. JDS began filling the pond. BGC recommended in an email and verbally that filling stop to allow testing to be completed. The pond testing should be completed and a final walkthrough performed by BGC, Tetra Tech, and JDS for approval. If patches are not tested because they are underwater Tetra Tech and BGC cannot provide acceptance for the repairs. (***Photo 7***)
  - Other items:
    - We were planning on mounting the instrument transmitter and receiver boxes today, however, this did not happen. We should schedule a time to have this done soon to allow us to collect readings from the Event Pond LDRS VW.
    - We will eventually need mounting posts for the VWs at the crest and pad cell.
    - We will eventually need to modify the VW wire completion on the crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
    - The embankment crest road was widened using uncompacted fill. This will eventually need to be reshaped or completed as a more permanent solution.
    - Planning for water control above 990m (between the liner and the interceptor ditch) should be completed this year to get ahead of issues from freshet in 2020.
- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for fill placement in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
  - Tetra Tech is providing QC monitoring and reporting for the production of ODF.
  - Titan Enviro is providing QC for concrete cloth placement in their daily reports.
  - ODF production resumed. BGC and Tetra Tech visited the production. Source material was consistent with what was tested during the test run (silicified metasediments and intrusive). Results from BGC's durability QA testing is included in ***ODF QA Results 01*** (attached).
- BGC Recommendations:
  - None.

Communications (no follow up required):

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date:**	May 15, 2019
Construction:	JDS Mining	**Inspection Number:**	SA119
BGC Personnel:	Roy Morlan	**Typical for ODF:**	Yes

ODF Production QA Summary and Observations

Source Location

Blast	Centroid of Grade Block Sent for ODF			
	Easting	Northing	Elevation	Field Type
1285-01	460254.279	7099399.548	1290.288	4 oxidized meta sediments

Waste Reported by Crusher Supervisor
Approximately 40% waste.
Typical Waste from 2018 ODF Production: Approximately 40%

Description
Observations from processed ODF. Silicified granodiorite and meta sediments, hard, strong.

Weathering Index

	W1 – Fresh	W2 – Slightly Weathered	W3 – Moderately Weathered	W4 – Highly Weathered	W5 – Decomposed or Completely	W6 – Residual Soil
Typical From 2018 ODF Production	X	X				
SA119		X				

Strength Index

	R0 – Extremely Weak	R1 – Very Weak	R2 – Weak	R3 – Moderately Strong	R4 - Strong	R5 – Very Strong	R6 – Extremely Strong
Typical From 2018 ODF Production				X	X	X	
SA119					X		

Hardness Index

	H1 – Extremely Hard	H2 – Very Hard	H3 – Hard	H4 – Moderately Hard	H5 – Moderately Soft	H6 – Soft	H7 – Very Soft
Typical From 2018 ODF Production			X	X			
SA119			X				

Slaking Observations
A sample for preliminary slaking evaluation was collected and submerged in water for 48 hours. If breakdown is obvious or if the material properties change significantly (ie can be scratched much easier, can be broken much easier, ect) then results will be reported in a separate report and a true laboratory slake test may be requested.

Based on general observations (rock type and composition, bedding characteristics, weathering, and cementation) the material is not likely susceptible to slaking.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	May 16, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 18°C to 8°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Backfill of the PLS sump and east groin with ODF and extension of the header pipe on the east side of the PLS continued (***Photos 1***). Some piping still needs proper placement. (***Photo 2***)
  - Liner placement continued. (***Photo 3***).
  - The HL east perimeter road continued. QC on road compaction is being performed by Pelly is BGC observed that construction is being done per the developed method spec for rockfill placement.
  - Concrete cloth installation continued. (***Photo 4***).
  - Layfield testing Event Pond patches. All areas tested passed. Three patches at the bottom of the pond could not be tested because water pumped into the pond has covered them. These patches should be tested for Tetra Tech QA and BGC acceptance. Tetra Tech, Layfield, and BGC performed a walk through inspection of the liner after testing and after a protection berm was built on the north side of the event pond. No additional damage was observed. Tetra Tech will write a summary of the inspection. JDS continues filling the pond. (***Photo 5***)
  - Jagged rocks that have rolled into the Event Pond should be removed. This is most critical for any rocks that are on a the side slope (***Photo 6***)

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.
  - We were planning on mounting the instrument transmitter and receiver boxes today, however, this did not happen. We should schedule a time to have this done soon to allow us to collect readings from the Event Pond LDRS VW.
  - We will eventually need mounting posts for the VWs at the crest and pad cell.
  - We will eventually need to modify the VW wire completion on the crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for fill placement in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
  - Tetra Tech is providing QC monitoring and reporting for the production of ODF.
  - Titan Enviro is providing QC for concrete cloth placement in their daily reports.
  - BGC and Tetra Tech visited the production. Source material was consistent with what was tested during the test run (silicified metasediments and intrusive, ***Photo 7 through 9***). Tetra Tech reported 3.2% fines. Results from BGC's durability QA testing is included in ***ODF QA Results 01*** (attached).
- BGC Recommendations:
  - None.

Communications (no follow up required):

ODF Production QA Summary and Observations

Source Location

Blast	Centroid of Grade Block Sent for ODF			
	Easting	Northing	Elevation	Field Type
1285-01	460254.279	7099399.548	1290.288	4 oxidized meta sediments

Waste Reported by Crusher Supervisor
Approximately 40% waste.
Typical Waste from 2018 ODF Production: Approximately 40%

Description
Observations from processed ODF. Silicified granodiorite and meta sediments, hard, strong. Some softer metasediments present, likely due to the loader digging into the natural ground at the site. However, majority of material is from the blast source.

Weathering Index

	W1 – Fresh	W2 – Slightly Weathered	W3 – Moderately Weathered	W4 – Highly Weathered	W5 – Decomposed or Completely	W6 – Residual Soil
Typical From 2018 ODF Production	X	X				
SA119		X				

Strength Index

	R0 – Extremely Weak	R1 – Very Weak	R2 – Weak	R3 – Moderately Strong	R4 - Strong	R5 – Very Strong	R6 – Extremely Strong
Typical From 2018 ODF Production				X	X	X	
SA119				X	X		

Hardness Index

	H1 – Extremely Hard	H2 – Very Hard	H3 – Hard	H4 – Moderately Hard	H5 – Moderately Soft	H6 – Soft	H7 – Very Soft
Typical From 2018 ODF Production			X	X			
SA119			X				

Slaking Observations
A sample for preliminary slaking evaluation was collected and submerged in water for 48 hours. If breakdown is obvious or if the material properties change significantly (ie can be scratched much easier, can be broken much easier, ect) then results will be reported in a separate report and a true laboratory slake test may be requested.

Based on general observations (rock type and composition, bedding characteristics, weathering, and cementation) the material is not likely susceptible to slaking.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy 17°C to 12°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Backfill of the PLS sump ODF and extension of the header pipe on the east side of the PLS continued (***Photos 1)***. BGC, Pelly, and JDS discussed methods for the wiggle wagons to place material on slopes covered with 1m of ODF. Trucks should only move back or forwards on the slope. If they stop for any reason they should dump their load before moving again. If the tires spin they should stop and dump their load. They should only move parallel to the slope.
  - Liner placement continued. (***Photo 2***).
  - HL East perimeter road was inspected by BGC and Tetra Tech. The subgrade was mostly ready for liner placement with small patches to be addressed. Layfield was digging the anchor trench today. (***Photo 3***)
  - Concrete cloth installation continued. (***Photo 4***). The subgrade below the spillway was prepared for concrete cloth. (***Photo 5***)
  - Jagged rocks were removed from the Event Pond.

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.
  - We will eventually need to modify the VW wire completion on the crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Some patches on the Event Pond bottom were inundated with water before testing could be completed. These patches should be tested once water can be removed from the pond.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly provided QC monitoring and reporting for fill placement in their daily report.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
  - Tetra Tech is providing QC monitoring and reporting for the production of ODF.
  - Titan Enviro is providing QC for concrete cloth placement in their daily reports.
  - BGC and Tetra Tech visited the production. Source material was consistent with what was tested during the test run. Due to mechanical issues no ODF was produced. No QA or QC samples were collected.
- BGC Recommendations:
  - None.

Communications (no follow up required):

AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	May 18, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy, some rain 13°C to 5°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Backfill of ODF below 940m and extension of the header pipe continued (***Photos 1***).
  - Liner was placed on the east side of the Phase 1 pad at the perimeter road. (***Photo 2***). Work was slower than normal because of rain and because liner could not be rolled down from the perimeter road.
  - Concrete cloth installation continued. The concrete cloth was placed under the spillway culverts per the design. (***Photo 3***).
  - Titan stated that they would be collecting a destruct sample as part of their QC, which would be shipped to England for testing. To date no destruct sample collection or tracking has been presented. Titan should provide a schedule for QC testing or clarify if a destruct will be collected, when, and how it will be tracked so there are no QC gaps in the construction record.

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.
  - We will eventually need to modify the VW wire completion on the crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Some patches on the Event Pond bottom were inundated with water before testing could be completed. These patches should be tested once water can be removed from the pond.
  - BGC, Pelly, and JDS discussed methods for the wiggle wagons to place material on slopes covered with 1m of ODF. Trucks should only move back or forwards on the slope (***Photo 4***). If they stop for any reason they should dump their load before moving again. If the tires spin they should stop and dump their load. They should only move parallel to the slope (***Photo 4***). Pelly to date has been conforming with this and there have been no issues.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QC monitoring and reporting for construction of the liner installations.
  - Tetra Tech is providing QC monitoring and reporting for the production of ODF.
  - Titan Enviro is providing QC for concrete cloth placement in their daily reports.
  - BGC and Tetra Tech visited the production. Source material was consistent with what was tested during the test run.
- BGC Recommendations:
  - None.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 21°C to 6°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Backfill of ODF below 940m and extension of the header pipe continued. The crane was moved to the PLS sump to begin installing the LDRS and PLS pipe extensions. (***Photos 1)***. Small punctures were found by Pelly on the west side of the HL below 940. These were marked, repaired, and tested by Layfield. Details from testing are included in Tetra Tech's Daily Report.
  - Liner was placed on the east side of the Phase 1 pad at the perimeter road. (***Photo 2***).
  - Concrete cloth installation continued on the Emergency Spillway. (***Photo 3***).
  - A stand was installed for the Event Pond VW transmitter. (***Photo 4***)
  - The following outstanding items were discussed with JDS and are planned to be resolved in the coming weeks. No formal RFIs have been issued yet.
    - ODF placement plan between elevations 940m and 990m.
    - Updated stormwater management plan to address potential runoff and future freshet from the Phase 1b area.

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.
  - We will eventually need to modify the VW wire completion on the crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Some patches on the Event Pond bottom were inundated with water before testing could be completed. These patches should be tested once water can be removed from the pond.

Pelly to date has been conforming with this and there have been no issues.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is proving QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
  - Titan Enviro is providing QC for concrete cloth placement in their daily reports.
  - BGC and Tetra Tech visited the ODF production. Source material was consistent with what was tested during the test run. A field screening summary is included in FS-SA122. A gradation test performed on todays run reported 5% fines, which is the upper bound of the allowable fines. Gradation will be tested again tomorrow.
- BGC Recommendations:
  - None.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 24ºC to 8ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Backfill of ODF below 940m and extension of the header pipe continued. (***Photo 1***).
  - The LDRS pipes were extended up the embankment. (***Photo 2***) The welders dig about 0.3m into ODF to create an area to weld the pipe bottom. They then place welding mats under the work area.
  - Liner was placed on the east side of the Phase 1 pad at the perimeter road. (***Photo 3***).
  - Concrete cloth installation continued on the Emergency Spillway. (***Photo 4***).
  - ODF material at the bottom of the stockpiles were investigated. This material could not be recovered without mixing with high silt from the natural ground below. Pelly should leave a sacrificial layer of about 30cm at the bottom of the piles so ODF is not contaminated with the natural ground.
  - BGC and Pelly discussed completion of the berm at the end of the embankment underdrains. Work in this area is expected to begin at the end of the week. (***Photo 5***) Water running through the underdrain blanket mostly exfiltrates before reaching the outlet. However, once the subgrade is exposed we may have to field fit a means for the flow underneath the geomembrane to reach the exfiltration structure.
  - Sealant was left off a small section of the overlapping panels to allow this flow to seep into the spillway and pipe underneath the concrete cloth. The flow is very minor (<0.1 L/min) and not consistent. This area should be monitored. If flow is consistently observed we may consider extending the spillway underdrain to cover this area. (***Photo 6***)

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.
  - We will eventually need to modify the VW wire completion on the crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Some patches on the Event Pond bottom were inundated with water before testing could be completed. These patches should be tested once water can be removed from the pond.
  - The following outstanding items were discussed with JDS and are planned to be resolved in the coming weeks. No formal RFIs have been issued yet.
    - ODF placement plan between elevations 940m and 990m.
    - Updated stormwater management plan to address potential runoff and future freshet from the Phase 1b area.

- Engineering:
  - None.

QA/QC Results

Client:	Victoria Gold	**Date and Shift:**	May 25, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Clear 23°C to 13°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Backfill of ODF below 940m and extension of the header pipe was suspended due to lack of ODF.
  - The LDRS pipes were extended up the embankment and ODF placement over the pipes continued. (***Photos 1 and 2***)
  - Liner was placed on the west side of the Phase 1 pad above elevation 940m. (***Photo 3***).
  - Spillway concrete cloth installation is now complete (***Photos 4 and 5***).

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.
  - We will eventually need to modify the VW wire completion on the HLF crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Some patches on the Event Pond bottom were inundated with water before testing could be completed. These patches should be tested once water can be removed from the pond.
  - ODF placement and initial ore stacking plans were discussed with JDS and Pelly. JDS provided a spreadsheet with assumptions, production rates, equipment, and target date ranges. This will be used for planning purposes.
  - Stormwater management planning was discussed with JDS and Pelly to address potential runoff and future freshet from the Phase 1b area including protection of the underdrain headers. The plan presented by Pelly is reasonable and will be implemented with BGC providing guidance, as needed.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is proving QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
  - Titan Enviro is providing QC for concrete cloth placement in their daily reports.
  - Tetra Tech visited the ODF production. Source material was consistent with what was tested during the test run. A gradation test was completed and indicated less than 1% fines.
- BGC Recommendations:
  - None.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Clear 23°C to 13°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Backfill of ODF below 940m and extension of the header pipe was suspended due to lack of ODF.
  - The LDRS pipes were covered with ODF using tracked skid steers. (***Photo 1***)
  - Liner was placed on the west side of the Phase 1 pad above elevation 940m. (***Photos 2 and 3***).
  - An exfiltration sump was being constructed for the event pond underdrain outlet (***Photo 4***). The pipe will be covered for frost protection.

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.
  - We will eventually need to modify the vibrating wire piezometer installation on the HLF crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Some patches on the Event Pond bottom were inundated with water before testing could be completed. These patches should be tested once water can be removed from the pond.
  - ODF placement and initial ore stacking plans were discussed with JDS and Pelly. JDS provided a spreadsheet with assumptions, production rates, equipment, and target date ranges. This will be used for planning purposes.
  - Stormwater management planning was discussed with JDS and Pelly to address potential runoff and future freshet from the Phase 1b area including protection of the underdrain headers. The plan presented by Pelly is reasonable and will be implemented with BGC providing guidance, as needed.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is proving QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
  - BGC and Tetra Tech visited the ODF production. Source material was consistent with what was tested during the test run (see FS-SA125 durability field test report). A gradation test was completed and indicated less than 1% fines.
- BGC Recommendations:
  - None.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Clear 22°C to 14°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Backfill of ODF below 940m and extension of the header pipe was suspended due to lack of ODF.
  - The LDRS pipes were covered with ODF using tracked skid steers (***Photo 1***).
  - Concrete Jersey blocks were being place on the HLF embankment upstream crest (***Photo 2***).
  - Liner was placed on the east side of the Phase 1 pad above elevation 940m. (***Photo 3***).
  - ODF production was intermittent today with testing of the conveyor system for delivery to the HLF.

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.
  - We will eventually need to modify the vibrating wire piezometer installation on the HLF crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Some patches on the Event Pond bottom were inundated with water before testing could be completed. These patches should be tested once water can be removed from the pond.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Cloudy 16ºC to 8ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Backfill of ODF below 940m and extension of the header pipe was suspended due to lack of ODF.
  - The LDRS pipes were covered with ODF using tracked skid steers (***Photo 1***).
  - Liner was placed on the east side of the Phase 1 pad above elevation 940m. Liner subgrade preparation was underway on the west HLF (***Photo 2***).
  - The 30cm thick ODF cushion layer between the liner and the PLS header pipes was partially washed out from rainfall runoff (***Photo 3***). No damage to the liner was observed.
  - The connection of the solid HDPE PLS header pipes to the corrugated perforated pipes was proposed to be a coupler with screws and zip ties (***Photo 4***). The connection will also be wrapped with Mar Mac coupler with steel compression bands per discussions with Pelly and JDS.

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.
  - We will eventually need to modify the vibrating wire piezometer installation on the HLF crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Some patches on the Event Pond bottom were inundated with water before testing could be completed. These patches should be tested once water can be removed from the pond.
  - ODF placement and initial ore stacking plans were discussed with JDS and Pelly. JDS provided a spreadsheet with assumptions, production rates, equipment, and target date ranges. This will be used for planning purposes.
  - Stormwater management planning was discussed with JDS and Pelly to address potential runoff and future freshet from the Phase 1b area including protection of the underdrain headers. The plan presented by Pelly is reasonable and will be implemented with BGC providing guidance, as needed.

- Engineering:
  - None.

QA/QC Results

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	May 30, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Clear 14ºC to 7ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Backfill of ODF below 940m and extension of the header pipe was suspended due to lack of ODF.
  - The LDRS pipes are covered with ODF and nearly ready for top liner installation by Layfield (***Photo 1***).
  - Liner was placed on the west side of the Phase 1 pad above elevation 940m (***Photo 2***).
  - For safety reasons, BGC will now sample ODF source material at the ODF dump above the Neway crushing plant instead of the lower feed pile next to the crusher (***Photo 3***). Durability QA testing and control will be based on samples from the piles most recently delivered by the Mine to the ODF dump area.

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.
  - We will eventually need to modify the vibrating wire piezometer installation on the HLF crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Some patches on the Event Pond bottom were inundated with water before testing could be completed. These patches should be tested once water can be removed from the pond.
  - ODF placement and initial ore stacking plans were discussed with JDS and Pelly. JDS provided a spreadsheet with assumptions, production rates, equipment, and target date ranges. This will be used for planning purposes.
  - Stormwater management planning was discussed with JDS and Pelly to address potential runoff and future freshet from the Phase 1b area including protection of the underdrain headers. The plan presented by Pelly is reasonable and will be implemented with BGC providing guidance, as needed.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is providing QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
  - BGC sampled the ODF dump feed pile above Neway crusher. A summary report is provided as FS-SA127. The material being delivered by the mine is becoming more oxidized but is still considered acceptable in terms of durability.
  - A gradation test was completed and indicated about 4% fines.
- BGC Recommendations:
  - None.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Cloudy, Rain 10ºC to 6ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - Placement of ODF below 940m was suspended due to lack of ODF.
  - The LDRS pipes are covered with ODF and ready for top liner installation by Layfield.
  - Pelly continued extending the PLS header pipes (***Photo 1***). Headers are butt-fused and connected to corrugated collector pipe with split couplers and screws (***Photo 2***), then wrapped with Mar Mac coupler with steel compression bands (***Photo 3***).
  - Liner installation was suspended due to rain.
  - A sump was excavated south of the monitoring vault for construction of an exfiltration sump for the 12-inch outfall pipe (***Photo 4***). The excavation was in colluvium (sandy gravel with some cobbles) to 3 m depth where black clayey silt was encountered. The sump was filled with water to observe percolation rate.

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.
  - We will eventually need to modify the vibrating wire piezometer installation on the HLF crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Cloudy, Rain 16ºC to 6ºC

Observations and Recommendations

- Observations and Recommendations (Today):
  - The overland conveyor delivered ODF intermittently to the HLF. A loader was spreading the ODF to form the loadout pad.
  - Runoff from rain washed out a portion of the PLS header pipe ODF cushion layer (***Photo 1***) and water ponded in the PLS sump.
  - A pump was installed to pump ponded rainwater from the PLS sump to the Event Pond (***Photo 2***).
  - Liner installation was suspended due to rain.
  - Winterization of the upper limit of the HLF underdrain headers was started by Pelly (***Photo 3***). The header trench was shaped and any mud was cleaned out of the trench. BGC discussed the plan with Pelly. The pipes will be buried in a geotextile wrapped layer of gravel and backfill. A sediment control berm will be constructed upstream of the pipes and covered with geotextile and riprap.
  - One of the pipe boots at the Event Pond has separated from thermal expansion of the HDPE pipe (***Photo 4***). BGC has suggested the boots be secured with Mar Mac couplers.

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.
  - We will eventually need to modify the vibrating wire piezometer installation on the HLF crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Some patches on the Event Pond bottom were inundated with water before testing could be completed. These patches should be tested once water can be removed from the pond.
  - ODF placement and initial ore stacking plans were discussed with JDS and Pelly. JDS provided a spreadsheet with assumptions, production rates, equipment, and target date ranges. This will be used for planning purposes.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Cloudy 16°C to 6°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - The overland conveyor delivered ODF consistently to the HLF. A loader was spreading the ODF to form the loadout pad (***Photo 1***).
  - Liner installation resumed at west HLF (***Photo 2***).
  - Winterization of the upper limit of the HLF underdrain headers was completed by Pelly (***Photo 3***). A sediment berm was constructed upstream of the headers and the pipes were covered for frost and erosion protection. One header pipe was stubbed up with a 90 degree elbow to allow access for pumping water into. All pipes were capped.
  - The Geokon barometer was temporarily installed at the southwest corner of the Event Pond embankment. A permanent installation will be completed with assistance from JDS site services.
  - Piezometer readings from the Event Pond LDRS sump indicate the sump should be pumped out. This will need to be done periodically when the pond has water in it.

- Observations and Recommendations (Open/Ongoing):
  - Seepage at the Event Pond spillway is being diverted west, away from the Event Pond fills. This outlet should be completed as a lined ditch this year.
  - We will eventually need to modify the vibrating wire piezometer installation on the HLF crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Some patches on the Event Pond bottom were inundated with water before testing could be completed. These patches should be tested once water can be removed from the pond.
  - ODF placement and initial ore stacking plans were discussed with JDS and Pelly. JDS provided a spreadsheet with assumptions, production rates, equipment, and target date ranges. This will be used for planning purposes.

- Engineering:
  - None.

QA/QC Results

- QA/QC:

Photo 3: Upper limit of the HLF underdrain headers.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	June 3, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Troy Meyer	**Weather:**	Cloudy 18°C to 4°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - The overland conveyor did not deliver ODF to the HLF. An excavator was loading 40-ton trucks for the stockpile at end of conveyor for placement of ODF on the pad and spreading with dozer (***Photo 1***).
  - Liner installation detailing work continued at west HLF.
  - The HLF spillway seepage underdrain pipe was located and excavated to prepare for construction of a lined ditch to the ultimate outfall (***Photo 2***). The pipe and gravel drain are not currently flowing. Once the lined ditch is completed, the crest area should be shaped to grade toward the ditch in this area to promote surface water drainage.
  - The exfiltration sump near the monitoring vault was deepened past the silt layer into alluvial material in attempt to increase percolation (***Photo 3***). The hole was partially filled with water to observe the infiltration rate.
  - The event pond inclined riser pipe boots were secured with Mar Mac couplers (***Photo 4***).
  - A pump was installed in the event pond LDRS riser pipe to evacuate the sump (***Photo 5***).
  - The HLF east underdrain downstream outlet has been left uncovered to allow observation of flow through the spring (***Photo 6***). Little to no flow has been observed. It is recommended that the outlet be covered with drainage rock/gravel to protect from frost in case flow begins in future.

- Observations and Recommendations (Open/Ongoing):
  - We will eventually need to modify the vibrating wire piezometer installation on the HLF crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Some patches on the Event Pond bottom were inundated with water before testing could be completed. These patches should be tested once water can be removed from the pond.
  - ODF placement and initial ore stacking plans were discussed with JDS and Pelly. JDS provided a spreadsheet with assumptions, production rates, equipment, and target date ranges. This will be used for planning purposes.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is providing QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
  - The Neway crusher was running today, samples for durability and gradation were collected. Gradation test by Tetra Tech indicated about 6% fines which is above the specified 5%. JDS and Neway were notified.
- BGC Recommendations:
  - None.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	June 5, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan/Troy Meyer	**Weather:**	Cloudy 19°C to 5°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - BGC shift change. Troy Meyer left site. Roy Morlan arrived on site.
  - The overland conveyor did not deliver ODF to the HLF. No ODF was placed today.
  - Liner installation continued at the HLF.

- Observations and Recommendations (Open/Ongoing):
  - We will eventually need to modify the vibrating wire piezometer installation on the HLF crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - The east embankment underdrain outlet is currently exposed to observe seepage over the summer. It is recommended that it be covered with drainage rock/gravel to protect from frost before the winter.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is providing QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
  - The Neway crusher was running today, samples for durability and gradation were collected.
- BGC Recommendations:
  - None.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Rain 19°C to 10°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - The overland conveyor did not deliver ODF to the HLF. No ODF was placed today.
  - Liner installation continued at the HLF. Installation was intermittent due to rain. (***Photo 1***)
  - Water levels in the exfiltration sump were monitored by JDS. Seepage out of the sump was slower than needed. JDS has stated that the exfiltration sump will be backfilled in the near future. (***Photo 2***)

- Observations and Recommendations (Open/Ongoing):
  - We will eventually need to modify the vibrating wire piezometer installation on the HLF crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - The east embankment underdrain outlet is currently exposed to observe seepage over the summer. It is recommended that it be covered with drainage rock/gravel to protect from frost before the winter.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is providing QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
  - The Neway crusher was running today, samples for durability and gradation were collected. Material was being screened twice after a run of high fines was observed in QC testing yesterday. Reported fines were below 2%.
- BGC Recommendations:
  - None.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 20°C to 6°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - The overland conveyor deliver ODF to the HLF and Pelly resumed ODF placement (***Photo 1***)
  - Liner installation continued at the HLF. (***Photo 2***)
  - An area of the 940 anchor trench was saturated from rain and settled. Liner has been placed over this area but it has not been welded. The liner will be pulled up in this area and anchor trench refilled and recompacted. (***Photo 3***)

- Observations and Recommendations (Open/Ongoing):
  - We will eventually need to modify the vibrating wire piezometer installation on the HLF crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is providing QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
  - No ODF produced yesterday.
  - Samples results from a segregated pile of ODF that was suspected to be high in fines reported fines ranging between 8 and 10%. This material will be rescreened to remove the fines. The total material to be rescreened is approximately 500 m3.
- BGC Recommendations:
  - None.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	June 8, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 21°C to 9°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - The overland conveyor deliver ODF to the HLF and Pelly resumed ODF placement (***Photo 1***)
  - Liner installation continued at the HLF. (***Photo 2***)
  - The saturated anchor trench at the 940 was uncovered. Additional material was added to the anchor trench and the trench was recompacted. The liner was placed back over the anchor trench. (***Photo 3***)
  - A perimeter berm was constructed between the liner above 940 and the ADR pipe trench. It was constructed with structural fill and packed in approximately 10 to 15cm lifts. (***Photo 4***)
  - Settlement was observed in the PLS pipes changing their angle and the amount of ODF fill between the pipes and the upstream liner. A minimum of 1m of ODF will be placed along the upstream embankment slope. However, a trench will be cut into the upper ½ (approximately) of the ODF fill to sit the west most pipe. (***Photo 5***)
  - Silt has collected on the ODF surface in the PLS sump due to runoff from multiple rain events. BGC recommends that the surface of ODF be skimmed off and wasted prior to scarifying and placement of ODF. (***Photo 6***)
  - The anchor trench at the crest was backfilled by Ewing. The anchor trench was not compacted. JDS plans to compact this with a hand tamper.
  - JDS and Layfield reviewed how they will access the area around the spillway culverts to install the liner boots. They will provide a method for installing this boot to BGC and if it changes the portion of the invert already built we will review it to ensure it meets design intent.
  - JDS will construct the additional instrument transmitter mounting posts so BGC can complete setting up the instrument network.

- Observations and Recommendations (Open/Ongoing):
  - We will eventually need to modify the vibrating wire piezometer installation on the HLF crest. The current cap does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Samples results from a segregated pile of ODF that was suspected to be high in fines reported fines ranging between 8 and 10%. This material will be rescreened to remove the fines. The total material to be rescreened is approximately 500 m3. Tetra Tech will have to provide QC testing of the material to verify it meets design spec prior to its delivery to the HL.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is providing QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
  - No ODF produced yesterday.
- BGC Recommendations:
  - None.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 19°C to 8°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - ODF placement continued for part of the day. (***Photo 1***)
  - Liner installation continued at the HLF. Liner installation was suspended late in the day due to concerns of falling rocks from the perimeter berm construction. (***Photo 2***)
  - Construction of the west perimeter berm continued. (***Photo 2***)

- Observations and Recommendations (Open/Ongoing):
  - The current cap for the crest instruments does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Samples results from a segregated pile of ODF that was suspected to be high in fines reported fines ranging between 8 and 10%. This material will be rescreened to remove the fines. The total material to be rescreened is approximately 500 m3. Tetra Tech will have to provide QC testing of the material to verify it meets design spec prior to its delivery to the HL.
  - Silt has collected on the ODF surface in the PLS sump due to runoff and pulverization from heavy traffic. BGC recommends that the surface of ODF be skimmed off and wasted prior to scarifying and placement of ODF.
  - Anchor trenches should be compacted on the crest and along the 990 perimeters.
  - JDS will construct additional instrument transmitter mounting posts so BGC can complete setting up the instrument network.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is providing QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
  - ODF production resumed late in the day. Tetra Tech collected a sample of the material being produced.
- BGC Recommendations:
  - None.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	June 11, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 20°C to 6°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - ODF placement continued today. (***Photo 1***)
  - The crane was setup to place the steel PLS pipes. (***Photo 2***)
  - Layfield worked on prepping the liner boot for the spillway culverts. No liner was placed.
  - Construction of the west perimeter berm continued. (***Photo 3***)
  - After the event pond sump was evacuated the pump was allowed to continue running to gauge recharge. Readings collected today:
    - 0.38 L/sec @ 0915.
    - 0.32 L/sec @ 1435.

    Readings will continue tomorrow until the flow stabilizes.
  - Eshemuta provided settlement data for all the PLS pipes
    - Settlement projected at pipe bottom:
    - Drill Casing Δ Horizontal = 0.039m Δ Vertical = -0.241m Δ Angle = 0.1400˚
    - Pipe 1 (west-most) Δ Horizontal = 0.018m Δ Vertical = -0.132m Δ Angle = 0.6883˚
    - Pipe 2 Δ Horizontal = 0.018m Δ Vertical = -0.105m Δ Angle = 0.2875˚
    - Pipe #3 Δ Horizontal = 0.070m Δ Vertical = -0.328m Δ Angle = -0.4111˚
    - Pipe #4 Δ Horizontal = 0.077m Δ Vertical = -0.282m Δ Angle = -1.0235˚
    - Pipe 5 (east-most) Δ Horizontal = 0.053m Δ Vertical = -0.127m Δ Angle = 0.1188˚
  - A sample was collected on the PLS bottom ODF surface. The gradation results reported 15% fines at the surface and 4.3% fines at 15cm below the surface. 15cm of ODF in the PLS sump bottom should be scraped off and wasted prior to placement of ore.

- Observations and Recommendations (Open/Ongoing):
  - The current cap for the crest instruments does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Samples results from a segregated pile of ODF that was suspected to be high in fines reported fines ranging between 8 and 10%. This material will be rescreened to remove the fines. The total material to be rescreened is approximately 500 m3. Tetra Tech will have to provide QC testing of the material to verify it meets design spec prior to its delivery to the HL.
  - Silt has collected on the ODF surface in the PLS sump due to runoff and pulverization from heavy traffic. BGC recommends that the surface of ODF be skimmed off and wasted prior to scarifying and placement of ODF.
  - Anchor trenches should be compacted on the crest and along the 990 perimeters.
  - JDS will construct additional instrument transmitter mounting posts so BGC can complete setting up the instrument network.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is providing QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
  - BGC reviewed the material being produced by Nuway for strength characteristics.

AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	June 12, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Rain 20°C to 8°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Heavy Rains were experienced overnight. The PLS sump was pumped in the morning. (***Photo 1***)
  - Pelly tested driving a rubber tread skid steer on the liner with 2 layers of geotextile as rubsheets. They will use this method to extend the header pipes above 940m. The test was successful. No damage was observed on the liner after the test. (***Photo 2 and 3***)
  - ODF placement continued today. (***Photo 4***)
  - Pelly shaped the upstream embankment slope for PLS pipe placement. (***Photo 5***)
  - Layfield continued working on prepping and installing liner boots at the spillway. No liner was placed on the heap leach slopes.
  - Construction of the west perimeter berm was completed.
  - After the event pond sump was evacuated the pump was allowed to continue running to gauge recharge. Readings collected today:
    - 0.38 L/sec @ 0915.
    - 0.32 L/sec @ 1435.
    - 0.25 L/sec @ 0809
    - 0.06 L/sec @ 1411

    Recharge rate at 2:11pm was approximately 5,000 L/day, below the level 1 alert level.
  - Nuway crushed material for part of the day. They were down part of the day for repairs.

- Observations and Recommendations (Open/Ongoing):
  - The current cap for the crest instruments does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Samples results from a segregated pile of ODF that was suspected to be high in fines reported fines ranging between 8 and 10%. This material will be rescreened to remove the fines. BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	June 13, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Cloudy 22°C to 6°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Pelly continued extending the header pipes above 940m. (***Photo 1***)
  - ODF placement continued for part of the day today. Due to issues with the conveyor ODF placement was suspended the second half of the day and Pelly was moved off the HL construction to another part of the mine. (***Photo 2***)
  - Priority Steel welded the PLS pipe casings. (***Photo 3***)
  - Layfield completed the fabrication of a second boot. (***Photo 4***). Layfield also resumed placing liner. (***Photo 5***)
  - BGC, Tetra Tech, and Layfield inspected the lined area on the west side below the western perimeter berm construction. Several rocks were observed falling into this lined area during construction of the west perimeter berm. We marked several deep dents for repair. No holes were found. (***Photo 6***)
  - The anchor trench was dug at the west perimeter berm.
  - Layfield was concerned that the liner would not hold properly during installation without a well compacted anchor trench. A plate tamper should be made available to immediately fill and compact the anchor trenches per the technical specifications. If the anchoring is not sufficient at the new perimeter berm angle the anchoring may need to be modified. (***Photo 7***)

- Observations and Recommendations (Open/Ongoing):
  - The current cap for the crest instruments does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Samples results from a segregated pile of ODF that was suspected to be high in fines reported fines ranging between 8 and 10%. This material will be rescreened to remove the fines. The total material to be rescreened is approximately 500 m3. Tetra Tech will have to provide QC testing of the material to verify it meets design spec prior to its delivery to the HL.
  - Silt has collected on the ODF surface in the PLS sump due to runoff and pulverization from heavy traffic. BGC recommends that the surface of ODF be skimmed off and wasted prior to scarifying and placement of ODF.
  - Anchor trenches should be compacted on the crest and along the 990 perimeters.
  - JDS will construct additional instrument transmitter mounting posts so BGC can complete setting up the instrument network.

- Engineering:
  - None.

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is providing QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
  - BGC inspected the ODF being produced for durability.
- BGC Recommendations:
  - None.

Safety Issues: None this shift.

Photo 1: ODF placement.

Photo 2: PLS pipe installation.

Photo 3: Liner placed on the west side of the HLF.

Photo 4: 4th boot placed around the spillway culverts. Once all boots are in the they will be welded to the culverts.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	June 16, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Rain 18°C to 12°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Some ODF placement was performed today. However, consistent rains slowed work. (***Photo 1***)
  - Priority Steel welded the PLS pipe casings.
  - Due to rain no liner was placed today. Layfield will switch to night shift tomorrow to allow them to finish liner installation near the conveyor. Dust generated by the conveyor while it is running causes issues with the liner welding.
  - BGC, JDS, and Pelly discussed the transition between the underdrains and the monitoring vault. Pipes were fused for this connection and Pelly began working on the anchor trenches. (***Photo 2***)

- Observations and Recommendations (Open/Ongoing):
  - The current cap for the crest instruments does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Samples results from a segregated pile of ODF that was suspected to be high in fines reported fines ranging between 8 and 10%. This material will be rescreened to remove the fines. The total material to be rescreened is approximately 500 m3. Tetra Tech will have to provide QC testing of the material to verify it meets design spec prior to its delivery to the HL.
  - Silt has collected on the ODF surface in the PLS sump due to runoff and pulverization from heavy traffic. BGC recommends that the surface of ODF be skimmed off and wasted prior to scarifying and placement of ODF.
  - Anchor trenches should be compacted on the crest and along the 990 perimeters.
  - JDS will construct additional instrument transmitter mounting posts so BGC can complete setting up the instrument network.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is providing QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
- BGC Recommendations:
  - None.

Communications (no follow up required):

Client:	Victoria Gold	**Date and Shift:**	June 17, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Some rain in PM 21°C to 11°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - Some ODF placement was performed today. However, conveyor issues slowed work. (***Photo 1***).
  - Layfield switch to night shift. Liner was placed on the east gap of the Phase 1A area. (***Photo 2***) Layfield also completed the patches to the liner upstream of the spillway where falling rocks caused damage during the perimeter berm construction.
  - Priority Steel welded the PLS pipe casings. (***Photo 3***)
  - Pelly continued constructing the underdrain tie in to the monitoring vault.
  - There have been issues with data acquisition from the instruments installed at the HLF. After discussions with Underhill it is possible that the radio signals and/or electrical field from their transmitter mounted on the roof of the office with the HLF instrument supervisor may be disrupting the signal. JDS will disconnect the supervisor tomorrow and we will test a different location on the roof.

- Observations and Recommendations (Open/Ongoing):
  - The current cap for the crest instruments does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Samples results from a segregated pile of ODF that was suspected to be high in fines reported fines ranging between 8 and 10%. This material will be rescreened to remove the fines. The total material to be rescreened is approximately 500 m3. Tetra Tech will have to provide QC testing of the material to verify it meets design spec prior to its delivery to the HL.
  - Silt has collected on the ODF surface in the PLS sump due to runoff and pulverization from heavy traffic. BGC recommends that the surface of ODF be skimmed off and wasted prior to scarifying and placement of ODF.
  - Anchor trenches should be compacted on the crest and along the 990 perimeters.
  - JDS will construct additional instrument transmitter mounting posts so BGC can complete setting up the instrument network.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is providing QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
- BGC Recommendations:
  - None.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 22°C to 12°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - ODF was placed today. (***Photo 1***).
  - Layfield completed the liner across the Phase 1A area. The remaining work includes welding the culvert boots, completing the tie in to 940m on the west side, completing the Emergency Spillway invert flap, and lining the underdrain monitoring vault transition. There is also an area on the east side at the conveyor that needs liner but is buried. JDS has stated that this may be completed at a different time.
  - Priority Steel continued extending the PLS pipe casings. (***Photo 2***)
  - Pelly continued constructing the underdrain tie in to the monitoring vault. (***Photo 3, 4, 5***)

- Observations and Recommendations (Open/Ongoing):
  - The current cap for the crest instruments does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Samples results from a segregated pile of ODF that was suspected to be high in fines reported fines ranging between 8 and 10%. This material will be rescreened to remove the fines. The total material to be rescreened is approximately 500 m3. Tetra Tech will have to provide QC testing of the material to verify it meets design spec prior to its delivery to the HL.

BGC Personnel:	Roy Morlan/Troy Meyer/Terry Mandziak	**Weather:**	Clear 27°C to 13°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - ODF was placed today. (***Photo 1***)
  - Layfield completed the liner shingle on the Emergency Spillway. (***Photo 2***) Layfield also worked on miscellaneous wrap up items requested by BGC for the final walkthrough of the area above 940m. Specifically, marking patches and patching smaller damages and defects that had been missed.
  - Pelly worked on modifications to the containment berm at the crest.
  - Pelly continued constructing the underdrain tie in to the monitoring vault. (***Photo 3***)
  - Nuway rescreened the stockpiled ODF material that previously tested high in fines.
  - BGC witnessed one of the haul trucks slipping on an area of the in-heap pond that only had 1m of ODF cover. This area will need to be uncovered and inspected. We have made plans to uncover this area tomorrow. Pelly will also delineate the areas within the in-heap pond that have 1.5m of cover to provide guidance for the haul truck traffic.

- Observations and Recommendations (Open/Ongoing):
  - The current cap for the crest instruments does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Silt has collected on the ODF surface in the PLS sump due to runoff and pulverization from heavy traffic. BGC recommends that the surface of ODF be skimmed off and wasted prior to scarifying and placement of ODF.
  - Anchor trenches should be compacted on the crest and along the 990 perimeters.

BGC Personnel:	Roy Morlan/Troy Meyer/Terry Mandziak	**Weather:**	Clear 25°C to 14°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - ODF was placed today. (***Photo 1***) Pelly delineated the areas where haul trucks are allowed to turn using spray paint and cones.
  - Layfield continued working on miscellaneous wrap up items requested by BGC for the final walkthrough of the area above 940m. Specifically, marking patches and patching smaller damages and defects that had been missed.
  - Pelly worked on modifications to the containment berm at the crest.
  - Pelly continued constructing the underdrain tie in to the monitoring vault. (***Photo 2***)

- Observations and Recommendations (Open/Ongoing):
  - The current cap for the crest instruments does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Silt has collected on the ODF surface in the PLS sump due to runoff and pulverization from heavy traffic. BGC recommends that the surface of ODF be skimmed off and wasted and scarified.
  - All anchor trenches have been compacted with the exception of a small portion of the west perimeter berm near 940m.
  - JDS will construct additional instrument transmitter mounting posts so BGC can complete setting up the instrument network.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is providing QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF. One sample reported higher than normal fines (7%). Nuway was informed and corrected the problem.
- BGC Recommendations:
  - None.

Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan/Troy Meyer/Terry Mandziak	**Weather:**	Clear 26°C to 15°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - ODF was placed today.
  - JDS connected the piping from the ADR trench. (***Photo 1***)
  - Layfield continued working on miscellaneous wrap up items requested by BGC for the final walkthrough of the area above 940m. Specifically, marking patches and patching smaller damages and defects that had been missed. Layfield also placed liner at the embankment underdrain/ monitoring vault tie in. (***Photo 2***)
  - Pelly worked on modifications to the containment berm at the crest.
  - BGC (Troy and Terry) and Scott Dimitroff (Tetra Tech) began training one of Tetra Tech's jr. field techs on the oversight of the ODF placement.

- Observations and Recommendations (Open/Ongoing):
  - The current cap for the crest instruments does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Silt has collected on the ODF surface in the PLS sump due to runoff and pulverization from heavy traffic. BGC recommends that the surface of ODF be skimmed off and wasted and scarified.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	June 27, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan/Troy Meyer	**Weather:**	Clear 25°C to 10°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - ODF was placed today. (***Photo 1***)
  - Pelly covered the containment pad at the crest with ODF today (***Photo 2***).
  - Three additional test pits were excavated. A hydraulic hose broke on the Ewing excavator which leaked about 80L of hydraulic fluid onto the ground. A spill kit was immediately deployed by Ewing. JDS and Victoria Gold Environmental were notified. Victoria Gold Environmental visited the site and provided Ewing with instructions on how to clean up. After the machine was repaired later the same day Ewing used it to fill several super sacks with contaminated soil.
  - BGC completed the Phase 1B final design test pit program after 6 test pits. These test pits were excavated to confirm depth to bedrock, colluvium strata, and the presence of ice rich soil. These test pits will be used in conjunction with historic test pits excavated. No frozen ground or ice rick soil was encountered. BGC also mapped the road cuts at 990m, 1025m, and 1050m today. (***Photo 3***)
  - Troy Meyer sent an email to JDS discussing issues with and recomendations for the cracking along a road downstream of the Event Pond's south toe.
  - Troy Meyer left site.

- Observations and Recommendations (Open/Ongoing):
  - The current cap for the crest instruments does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Silt has collected on the ODF surface in the PLS sump due to runoff and pulverization from heavy traffic. BGC recommends that the surface of ODF be skimmed off and wasted and scarified.
  - JDS will construct additional instrument transmitter mounting posts so BGC can complete setting up the instrument network.

- Engineering:
  - None.

QA/QC Results

- QA/QC:
  - Pelly is providing QC monitoring and reporting for fill placement in their daily report when needed.
  - Tetra Tech provided QA monitoring and reporting for construction of the liner installations. Layfield is providing QC. Both are being reported by Tetra Tech in daily reports.
  - Tetra Tech is providing QC monitoring (gradation testing) and reporting for the production of ODF.
- BGC Recommendations:
  - None.

Communications (no follow up required):

Safety Issues: None this shift.

Photo 1: ODF placement below 940m.

Photo 2: Pelly covering the containment pad on the crest with ODF.

Photo 3: Test pit excavation in the wooded area near the center of the Phase 1B pad at approximate elevation 1025m.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	June 28, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 24°C to 15°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - ODF was placed today. (***Photo 1***)
  - BGC redeployed the instruments at the event pond. The instruments were initially deployed with the receiving supervisor node at the camp on the roof of the office. Interference from the various signals at camp created a lot of interference and in the end resulted in the connection being lost. The supervisor node was moved to the event pond. The barometer's node and event pond vibrating wire node were deployed and setup. The remaining vibrating wires at the pad cell and embankment crest cannot be setup until eartherworks to prep these areas is complete.

- Observations and Recommendations (Open/Ongoing):
  - The current cap for the crest instruments does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Silt has collected on the ODF surface in the PLS sump due to runoff and pulverization from heavy traffic. BGC recommends that the surface of ODF be skimmed off and wasted and scarified.
  - JDS will construct additional instrument transmitter mounting posts so BGC can complete setting up the instrument network.

- Engineering:
  - None.

QA/QC Results

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792023
Client:	Victoria Gold	**Date and Shift:**	June 29, 2019 Day Shift
Construction:	JDS Mining, Pelly	**Location:**	45km N of Mayo, Canada
BGC Personnel:	Roy Morlan	**Weather:**	Clear 28°C to 16°C

Observations and Recommendations

- Observations and Recommendations (Today):
  - BGC delivered a demobe memo to JDS and Victoria Gold. The memo details issues and recommendations for items that are pending and will be addressed while BGC is off-site. Specifically, installation of the remaining instruments, cracking and potential slope failure downstream of the event ponds south toe, marking underdrain outflows, erosion of the slope north of the event pond its potential impact on the in-heap pond spillway, scarification and removal of fines from the in-heap pond.
  - ODF was placed today. (***Photo 1***)
  - Pelly filled the conduit used for the high voltage line above the spillway culverts with spray foam. Pelly said a cap would be placed over the second conduit or a sheet of 80mil liner would wrapped around it and affixed with multiple compression rings. This was not complete before BGC demobed.
  - Stands to mount the instrument transmitter nodes were constructed but not put in place prior to BGC demobing. BGC discussed deployment instructions with Tetra Tech. The instruments will be deployed by Tetra Tech after the standpipe piezometer on the crest are extended, the pad cell is ready for instrument installation, and the node stands are in place.
  - Roy Morlan demobed from site.

- Observations and Recommendations (Open/Ongoing):
  - The current cap for the crest instruments does not allow for wiring to run from the hole to a post without water infiltration. There was discussion of extending the PVC to complete this as a stickup. This should happen before operation begins.
  - Silt has collected on the ODF surface in the PLS sump due to runoff and pulverization from heavy traffic. BGC recommends that the surface of ODF be skimmed off and wasted and scarified.
  - JDS will construct additional instrument transmitter mounting posts so BGC can complete setting up the instrument network.

- Engineering:
  - None.

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5” crush rock.
Oct 6, 2018	Additional dozer ripping and feeding at event pond slopes
Oct 11, 2018	All trucking activities shutdown due to icy road conditions, the grader was unable to work due to ADR road incident shutdown

Quality Control Observations and Procedures:

Event Pond spillway – Material 7 rockfill is being placed and compacted in the construction of the event pond spillway. The rockfill is being sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with a D6 dozer. The material is being spread immediately after being dumped to a survey controlled thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. There is little wait time incurred between placing and compaction due to the small surface area of the lift size. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry; temperature reading 0 to 1.6 deg C (photo 1)
- Loose dumped material temperature ranged from -3.6 to -4.5 deg C (photo 2)
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture
- Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

Pelly Construction Ltd.	**Pelly Construction Ltd.** **Eagle Gold Project** **Daily Report**	
Date: Feb 19, 2019	**Weather:** clear (-11°C, -13°C)	**Prepared By:** Dean Serelo

Production:

WBS	Unit Type	Loads	Material Type	From Location	Destination
9000.32	40t ADT	1	Waste	Event Pond	EP Waste
9000.41	40t ADT	9	Waste	ADR to Emb Road	ADR Waste
4110.5.04	40t ADT	8	Drain fill	Nuway	HLF
4110.5.04	40t ADT	5	Reject Sand	Nuway	HLF
4110.1.09	40t ADT	8	Rock Fill	ADR Quarry	HLF
24,000 Litre	CAT633		Water	Control Pond	Pelly Haul Roads

Open Technical Concerns:

Date	Technical Concerns and Delays

Pending LEM codes:

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5” crush rock.
Oct 6, 2018	Additional dozer ripping and feeding at event pond slopes
Oct 11, 2018	All trucking activities shutdown due to icy road conditions, the grader was unable to work due to ADR road incident shutdown

Quality Control Observations and Procedures:

HLF – Material 7 rockfill is being placed and compacted in the construction of the HLF header trench, lateral trenches and shaping. The rockfill is being sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry; Temperature at source 1.0 deg C (photo 1)
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture
- Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock
- Loose dumped material before placement temperature 0.6 deg C (photo 2)

Date: Feb 26, 2019	**Weather:** sunny (-7°C,-20°C)	**Prepared By:** Yuheng Fei

Production:

WBS	Unit Type	Loads	Material Type	From Location	Destination
TBD	40t ADT	32	Snow	HLF	Snow Dump
4110.5.04	40t ADT	8	Drain fill	Nuway	HLF
4110.5.04	40t ADT	10	Reject Sand	Nuway	HLF
4110.1.09	40t ADT	7	Rock Fill	ADR Quarry	HLF
24,000 Litre	CAT633		Water	Control Pond	Pelly Haul Roads

Open Technical Concerns:

Date	Technical Concerns and Delays

Pending LEM codes:

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5" crush rock.
Oct 6, 2018	Additional dozer ripping and feeding at event pond slopes
Oct 11, 2018	All trucking activities shutdown due to icy road conditions, the grader was unable to work due to ADR road incident shutdown

Quality Control Observations and Procedures:

HLF – Material 7 rockfill is being placed and compacted in the construction of the HLF header trench, lateral trenches and shaping. The rockfill is being sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry; Temperature at source: 1.9 – 2.6 ^{o}C (photo 1)
- Temperature of fill after placement: 3.6 – 4.8 ^{o}C (photo 2)
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture
- Material is well graded
- Visual estimate of minimum 20% of material >12"; very little to no weak phyllite rock

9000.28	40t ADT	43	Rock Fill	ADR Quarry	HLE South Switchback
24,000 Litre	CAT633		Water	Control Pond	Pelly Haul Roads

Open Technical Concerns:

Date	Technical Concerns and Delays

Pending LEM codes:

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5” crush rock.

Quality Control Observations and Procedures:

HLF – Material 7 rockfill is being placed and compacted in the construction of the HLF header trench, lateral trenches and shaping. The rockfill is being sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry; Temperature at source: 3.4 – 6.6 ^{o} C (photo 1)
- Temperature of fill after placement: 0.2 – 2.2 ^{o} C (photo 3)
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5” crush rock.
Mar 4, 2019	ADR Drill and Blast

Quality Control Observations and Procedures:

HLF – Material 7 rockfill is being placed and compacted in the construction of the HLF header trench, lateral trenches and shaping. The rockfill is being sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry; Temperature at source: 1.2 – 1.6 ^{o} C (photo 1)
- Temperature of fill after placement: 2.0 – 3.8 ^{o} C (photo 3)
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

Pending LEM codes:

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5” crush rock.

Quality Control Observations and Procedures:

HLF – Material 7 rockfill is being placed and compacted in the construction of the HLF header trench, lateral trenches and shaping. The rockfill is being sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator or dozer. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry; Temperature after placement: 2.2 – 2.6 ^{o} C (photo 1)
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

Equipment/Materials Delivery:

Date	Bid Item #	Description	Quantity

Production:

WBS	Unit Type	Loads	Material Type	From Location	Destination
2150.03/4110.1.08	40t ADT	28	Rock Fill	ADR Quarry	HLF
4110.1.09	40t ADT	83	Unsuitable	HLF	HLF Dump
9000.43	40t ADT	2	Drain Fill	Nuway	HLF Silt Barrier
4130.11	40t ADT	4	Drain Fill	Nuway	EP Finger Drain
4130.11	40t ADT	3	Rock Fill	ADR Quarry	EP Access Road
4130.11	40t ADT	2	Unsuitable	Event Pond	HLF Dump
24,000 Litre	CAT633		Water	Control Pond	Pelly Haul Roads

Open Technical Concerns:

Date	Technical Concerns and Delays
Mar 16, 2019	Water seeps into event pond; additional drain systems required
Mar 24, 2019	Event pond underdrain system is frozen and not conveying water

Pending LEM codes:

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5” crush rock.
Mar 18, 2019	Spreading topsoil on downstream face of embankment (TBD2)
Mar 23, 2019	Crusher access road ripping with D11 (TBD3)

Quality Control Observations and Procedures:

HLF – Material 7 rockfill is being placed and compacted in the construction of the HLF liner surface shaping. The rockfill is being sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator or dozer. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry; Temperature at source 2.0-2.2 ^{o} C (photo 1)
- Material 7 placed in HLF pad shaping; Temperature at placement 5.0 ^{o} C (photo 2)
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

The rockfill is being sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator or dozer. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry; Temperature at source
- Material 7 placed in HLF pad shaping; Temperature at placement
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry
- Material 7 placed in HLF pad shaping
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

Date: April 15, 2019	**Weather: Flurries/cloudy**(-8°C, +5 °C)	**Prepared By:** Zean Lang

Production:

WBS	Unit Type	Loads	Material Type	From Location	Destination
2150.06	40t ADT	10	Unsuitable	ADR	ADR Dump
9000.44/9000.48	40t ADT	36	Rock	ADR Quarry	HLF
4130.11	40t ADT	28	Unsuitable	EP Spillway	ADR Dump
4130.11/9000.44/9000.48	40t ADT	30	Rock	EP Spillway	HLF
4110.01.09	40t ADT	18	Unsuitable	HLF	ADR Dump
24,000 Litre	CAT633		Water	Control Pond	Pelly Haul Roads

Open Technical Concerns:

Date	Technical Concerns and Delays

Pending LEM codes:

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5” crush rock.

Quality Control Observations and Procedures:

HLF – Material 7 rockfill is being placed and compacted in the construction of the HLF liner surface shaping. The rockfill is being sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator or dozer. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry
- Material 7 placed in HLF pad shaping
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

Equipment/Materials Delivery:

Date	Bid Item #	Description	Quantity

Production:

WBS	Unit Type	Loads	Material Type	From Location	Destination
4110.6.01a	40t ADT	55	Rock	ADR Quarry	HLF
4110.1.09	40t ADT	52	Unsuitable	HLF	ADR Dump
4130.11	40t ADT	2	Crush	Eagle Pup	EP Spilllway
4110.6.01a	40t ADT	5	Sand	ADR Quarry	HLF
24,000 Litre	CAT633		Water	Control Pond	Pelly Haul Roads

Open Technical Concerns:

Date	Technical Concerns and Delays
April 17,2019	Seepage on the crest of HLF West Slope persists after days of pumping.

Pending LEM codes:

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5” crush rock.
April 20, 2019	After numerous changes regarding the ADR-HLF trench, the scope of the original contract may be no longer suitable for the effort and alternations involved.

Quality Control Observations and Procedures:

HLF – Material 7 rockfill is being placed and compacted in the construction of the HLF liner surface shaping. The rockfill is being sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator or dozer. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry
- Material 7 placed in HLF pad shaping
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

24,000 Litre	CAT633		Water	Control Pond	Pelly Haul Roads

Open Technical Concerns:

Date	Technical Concerns and Delays
April 24, 2019	There are piles of organics were in the way of construction for emergency spillway. There material will need to be moved to ADR Dump. In addition, this area can only be accessed by a one-way lane. Reversing for long distance is time-consuming. Concrete liner crew will be on site on May1st, there may not be enough time.

Pending LEM codes:

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5” crush rock.

Quality Control Observations and Procedures:

HLF – Material 7 rockfill is being placed and compacted in the construction of the HLF liner surface shaping and Event Pond spillway. The rockfill is being sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator or dozer. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry
- Material 7 placed in HLF pad shaping
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

24,000 Litre	CAT633		Water	Control Pond	Pelly Haul Roads

Open Technical Concerns:

Date	Technical Concerns and Delays
May 6th,2019	As snow thaws, stream coming downhill is washing away the survey paint. Crews had to wait for surveyors to mark the floor again before proceeding.

Pending LEM codes:

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5" crush rock.

Quality Control Observations and Procedures:

HLF – Material 7 rockfill is being placed and compacted in the construction of the HLF liner surface shaping and Event Pond spillway. The rockfill is being sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator or dozer. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry
- Material 7 placed in HLF pad shaping
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12"; very little to no weak phyllite rock

Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5” crush rock.

Quality Control Observations and Procedures:

HLF – Material 7 rockfill was placed and compacted in the construction of the HLF east access. The rockfill was sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry
- Material 7 placed in HLF east access road (photo 2)
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock
