Dear Mark,

Re: Eagle Gold HLF Phase 1A Construction Completion Report

Please find enclosed a final report summarizing the consulting services that BGC has provided to Strata Gold Corporation (SGC)[1] with respect to construction of Phase 1A of the Eagle Gold Heap Leach Facility (HLF). We appreciate the opportunity to work with you on this interesting project.

Yours sincerely,

BGC ENGINEERING INC.

1.0 INTRODUCTION

This report summarizes the quality assurance (QA) and engineering services provided by BGC Engineering Inc. (BGC) for construction of Phase 1A of the Heap Leach Facility (HLF) at StrataGold Corporation's (SGC) Eagle Gold Project located in Yukon Territory, Canada.

The HLF design and technical specifications are presented in the Eagle Gold Project Heap Leach Facility Detailed Design Report issued by BGC and dated January 8, 2018 (BGC, 2018). Construction activities were completed with the oversight of the project Engineering, Procurement, and Construction Manager (EPCM) JDS Energy and Mining (JDS). Earthworks were completed by Pelly Construction Ltd (Pelly), Cobalt Construction Inc (Cobalt), and Ewing Construction (Ewing). Steel piping installation was performed by Heavy North Construction Ltd (Heavy North), and Priority Steel Erectors Ltd (Priority Steel). Geosynthetic materials for the HLF and Event Pond liner systems were supplied by various vendors through JDS and installed by Layfield Group Ltd. (Layfield). Concrete cloth spillway lining was installed by Titan Environmental and supplied by Concrete Canvas Ltd. Surveying services were provided by Underhill Geomatics Ltd (Underhill) under the direction of JDS, and Eshemuta Construction Surveyors (Eshemuta) under the direction of Pelly. Drilling services were provided by Pelly through their subcontractor, Midnight Sun Drilling Inc. (Midnight Sun). The following components of the HLF were constructed under direct oversight by BGC between September 2017 and early July 2019:

- Confining Embankment
- In-Heap Pond
- Phase 1A Heap Leach Facility Pad (partial)
- HLF Underdrain System up to Phase 1A Pad limits and the Monitoring Vault battery limits
- In-Heap Pond Spillway
- Event Pond and Emergency Spillway.

BGC provided direct oversight, while Tetra Tech provided QA for liner installation between September 2018 and June 2019.

The following components were partially constructed during this period:

- Phase 1A Pad area was partially constructed. BGC's work scope included QA oversight for the placement of Pregnant Leach Solution (PLS) pipework and Overliner Drain Fill (ODF) on the In-Heap Pond area and the upper Phase 1A Pad. However, BGC's scope did not include QA oversight during PLS pipework and ODF placement on the Phase 1A Pad above the In-Heap pond area (generally above elevation 938m).
- HLF Monitoring instrumentation was partially installed. The HLF In-Heap Pond and Event Pond Leak Detection and Recovery System (LDRS) piezometers were installed. Standpipes were installed in the confining embankment under BGC direction; however, responsibility for installing the piezometers in the confining embankment standpipes, as well as the Pad piezometers and data relay system, was with SGC personnel.

2.0 OBJECTIVE AND SCOPE OF WORK

BGC performed QA and on-site engineering during construction of Phase 1A of the HLF at the Eagle Gold Project within the limits described herein. These services were performed between September 2017 and early July 2019. Off-site engineering support was also performed by BGC intermittently throughout this time period. The scope of work included:

- Acting as on-site engineering representative for BGC and SGC
- Attending regular construction and safety meetings with contractors and the JDS construction management team, as well as other meetings requested by JDS or SGC
- Performing on-site inspections to evaluate field conditions, making recommendations to JDS, documenting construction progress and preparing related field reports
- Overseeing the QA monitoring program, which includes monitoring QC processes, testing, and data to ensure that deficiencies were identified and addressed.
- Completing foundation approvals (inspection and approval) prior to placement of fill
- Directing QA monitoring of earthworks operations, borrow material record testing, and in-place materials testing, to the extent required by the Specifications
- Reviewing QA and QC test data and observed field conditions with the JDS construction managers to make recommendations regarding work deficiencies and possible remedial actions
- Reporting to the JDS construction managers, and logging in daily report summaries of observations from visual inspections, laboratory results, and other observations reported by field personnel
- Reporting deviations from the construction documents to the JDS construction managers
- Providing input to responses for Request for Information (RFI), shop/working drawings, and other Contractor submittals when requested by the JDS construction manager.
- Assisting with design of additional related engineering work requested by JDS
- Helping resolve discrepancies in the contract documents noted by JDS or SGC
- Communicating with JDS field construction managers and QC monitoring personnel in accordance with the provisions of the Technical Specifications
- Reviewing and approving changes to the Technical Specifications
- Proactively recommending construction or design improvements to the JDS construction managers to enhance the design constructability and performance within project budget constraints

3.0 GENERAL PROJECT DESCRIPTION

3.1. Main Project Features

A general project description is presented in the following sections. Major construction areas are shown in Figure 1.

Figure 1: HLF Construction Areas.

3.1.1. Underdrain System

The HLF underdrain system provides for the collection and conveyance of subsurface water flows beneath the lined HLF Pad and Confining Embankment to limit upward pressure on the liner system and prevent the buildup of phreatic levels in the embankment fills. The HLF underdrain system consists of a network of lateral drains below the Phase 1A Pad area, finger drains below

the In-Heap Pond and Confining Embankment, and an underdrain header pipe trench that extends from the toe of the Confining Embankment to the upper limit of the Phase 1A Pad. Flows in the underdrain system are conveyed to collector pipes that discharge to a monitoring vault at the downstream toe of the Confining Embankment. The vault is configured to allow for sampling of seepage flows for water quantity and is equipped with a system that can either pump return flows to the HLF for use as make up water or allow seepage to flow to the environment if discharge criteria are met. The battery limits for QA oversight for the HLF underdrain system by BGC started several meters upstream of the monitoring vault at a containment berm and extended to the upstream limit of the Phase 1A Pad. The monitoring vault and connections to the underdrain pipes were the responsibility of JDS.

The underdrain system installed at the Event Pond consists of a loop drain system located directly below the Event Pond floor's perimeter. Finger drains were also installed along the north cut slope and connected to the loop drain to manage seepage water along the slope. The Event Pond underdrain system discharges to the ground surface via a solid HDPE pipe adjacent to and north of the Dublin Gulch access road.

3.1.2. Confining Embankment

The Confining Embankment was designed to provide heap stability and containment of process solutions in the In-Heap Pond. The Confining Embankment was constructed as an earthfill/rockfill structure with a double-lined upstream face. The tallest section of the final embankment measured 40 m from the natural ground elevation at the downstream toe to the crest.

3.1.3. In-Heap Pond

The In-Heap Pond is the double-lined impoundment area directly upstream of the confining embankment below elevation 940m. The In-Heap Pond will provide storage and an extraction point for PLS. The In-Heap Pond was constructed with three zones:1) the PLS zone which provides the collection point for PLS, 2) the Leak Detection and Recovery Sump (LDRS) to monitor and collect fluids that have accumulated in the liner system's leak detection layer, and 3) the closure sump which contains the inlet for the pipe that will transport fluids from the In-Heap pond by gravity at the time of closure. The design includes the ODF and the PLS recovery piping system over the liner within the In-Heap Pond.

3.1.4. Phase 1A Pad

The Phase 1A Pad area was constructed for ore storage and leaching between elevations 940m and 990m above the In-Heap Pond. The design includes a single composite liner system comprised of a geomembrane over geosynthetic clay liner (GCL), ODF and PLS recovery piping. The overall HLF design allows for future expansion of the Pad up the Ann Gulch drainage basin. The next planned expansion (Phase 1B) would be constructed between the upper limit of Phase 1A at elevation 990m and the Interceptor Ditch (approximate elevation 1050m).

3.1.5. Interceptor Ditch

The Interceptor Ditch was constructed at approximate elevation 1050m to divert surface water flows in the upper Ann Gulch basin around the Phase 1 Pad, and In-Heap Pond areas. The Interceptor Ditch consists of a geotextile and rip-rap lined channel that would convey any intercepted flows from east to west and into the environment west of the Phase 1 Heap Leach area.

3.1.6. In-Heap Pond Spillway

The In-Heap Pond spillway was constructed to safely convey flows from the In-Heap Pond to the Event Pond. The design included a concrete box culvert and spillway lined with Fabri-Form grout-filled revetment. The design was modified during construction to include HDPE culverts and concrete cloth revetment. Section 5.7 provides additional details.

3.1.7. Event Pond and Emergency Spillway

The double-lined Event Pond was designed to contain excess fluid during HLF operations. A LDRS inclined riser pipe was constructed on the western end of the Event Pond to monitor and recover leakage from the liner system's leak detection layer. A concrete cloth-lined Emergency Spillway was constructed to allow discharge from the Event Pond to environment. The design included Fabri-Form revetment which was modified during construction to incorporate concrete cloth revetment. Section 5.8 provides additional details.

3.1.8. HLF Liner System

The HLF liner system was designed to contain PLS for recovery and to prevent the release of process solutions to the environment. The liner system constructed in the Event Pond and In-Heap pond consists of a double liner system with a geocomposite leak detection layer between two textured Linear Low Density Polyethylene (LLDPE) liners. The double liner system was placed over a GCL as an additional layer of protection and cushioning. The HLF single composite liner system within the Phase 1A footprint (above Elevation 940m) was constructed with GCL overlain by textured LLDPE liner.

3.2. Site Conditions

Site conditions are discussed in the following subsections. Additional detail is in the Design Report and its appendices (BGC, 2018).

3.2.1. Topography

The HLF site topography is described as moderate to high relief, with ground elevation varying from approximately 880 to 1400 masl. The HLF is situated in the Ann Gulch drainage which is a first-order tributary to Dublin Gulch.

3.2.2. Climate and Hydrology

The property lies within the Mayo Lake–Ross River Eco-region in central Yukon. The area is characterized by a “continental” type climate, with moderate annual precipitation and a large temperature range. Summers are short and can be hot, while winters are long and cold with moderate snowfall. Rainstorms can occur frequently during the summer and may contribute 30% to 40% of the annual precipitation. Higher elevations are generally snow-free by mid-June. Freezing temperatures may occur at any time during the year, including summer or fall.

The mean annual temperature for the area is approximately -3°C, with an annual range of 63.5°C for the period of record. The estimated mean annual precipitation at the Eagle Gold site ranges from 350 mm to over 600 mm, depending on elevation. This climate description has been summarized from Stantec (2012b), Knight Piesold (2013) and Lorax (2017).

The hydrology of the region is generally characterized by large snowmelt runoff during the spring freshet, which quickly tapers off to low summer stream flows interspersed with periodic increases in flow associated with intense rainfall events (Stantec 2012).

3.2.3. Geology

Geologic conditions in the Dublin Gulch area have been strongly influenced by the geotectonic forces that produced the Eagle Zone deposit. The folding, faulting and plutonic activities have resulted in relatively weak rock mass with relatively poor mechanical properties. Further, with frost fracturing and permafrost common at the latitude of the project site, shallow subsurface processes and rock/soil characteristics are more complex.

Overburden soils encountered on the sloping ground at the HLF site typically consist of a veneer of organic soils overlying a blanket of colluvium, which overlies weathered bedrock. Placer tailings (fill remainders of previous dredge mining operations) cover most of the valley bottom of Dublin Gulch, which is outside the footprint of the HLF.

The bedrock encountered in the area is generally classified as metamorphosed sedimentary rock, with a variably deep weathering profile (BGC 2018). The intact rock strength of the encountered rock types is highly variable, ranging between R0 class (i.e., corresponding to < 1 MPa Unconfined Compressive Strength, UCS) and R4 (50-100 MPa UCS). The average intact strength is estimated to be approximately R2 (5-25 MPa UCS) in the metasedimentary rock, depending upon the degree of weathering, but with significant variability across the site.

4.0 CONSTRUCTION MANAGEMENT

BGC performed QA oversight, inspections and documentation, review of technical submittals, and responded to technical queries from the contractors. BGC participated in progress meetings, schedule meetings and safety meetings.

JDS provided EPCM services for the project and directly managed all construction contractors, which included:

- Pelly: Construction contractor for large earthworks including the HLF foundation preparation, underdrains, borrow and quarry development, and major fills (Confining Embankment and Event Pond construction). Surveying and record drawing production was performed by Eshemuta as a direct subcontractor to Pelly. Drilling services were provided by Midnight Sun Drilling, Ltd. for Pelly.
- Layfield: Liner installation contractor and liner QC.
- Titan Environmental: Concrete Canvas revetment supplier and installer.
- Heavy North: Steel LDRS and PLS piping.
- Priority Steel: Steel LDRS and PLS piping.
- Cobalt: Heavy earthwork support, specifically excavation of unsuitable material from Phase 1A heap Pad and spillway invert areas.
- Ewing: Heavy earthwork support, specifically excavation of unsuitable material from the Phase 1A heap Pad and labor support for Layfield's liner installation.
- Nuway Crushing: Aggregate production.
- Underhill: Surveying for JDS performed on works completed by Heavy North and Layfield. Periodic site aerial photography and site topographic surveys.
- Tetra Tech (EBA): HLF earthworks QC and QA for liner installation.

The BGC Resident Engineers did not direct, supervise, or monitor contractor or sub-contractor daily activities (other than those related to immediate construction QA issues); however, BGC did offer suggestions or input related to construction methods or scheduling, and collaborated with the JDS construction managers about ideas for efficient and safe construction.

4.1. Organization Structure and Responsibilities

An organizational chart maintained by JDS is included as Figure 2.

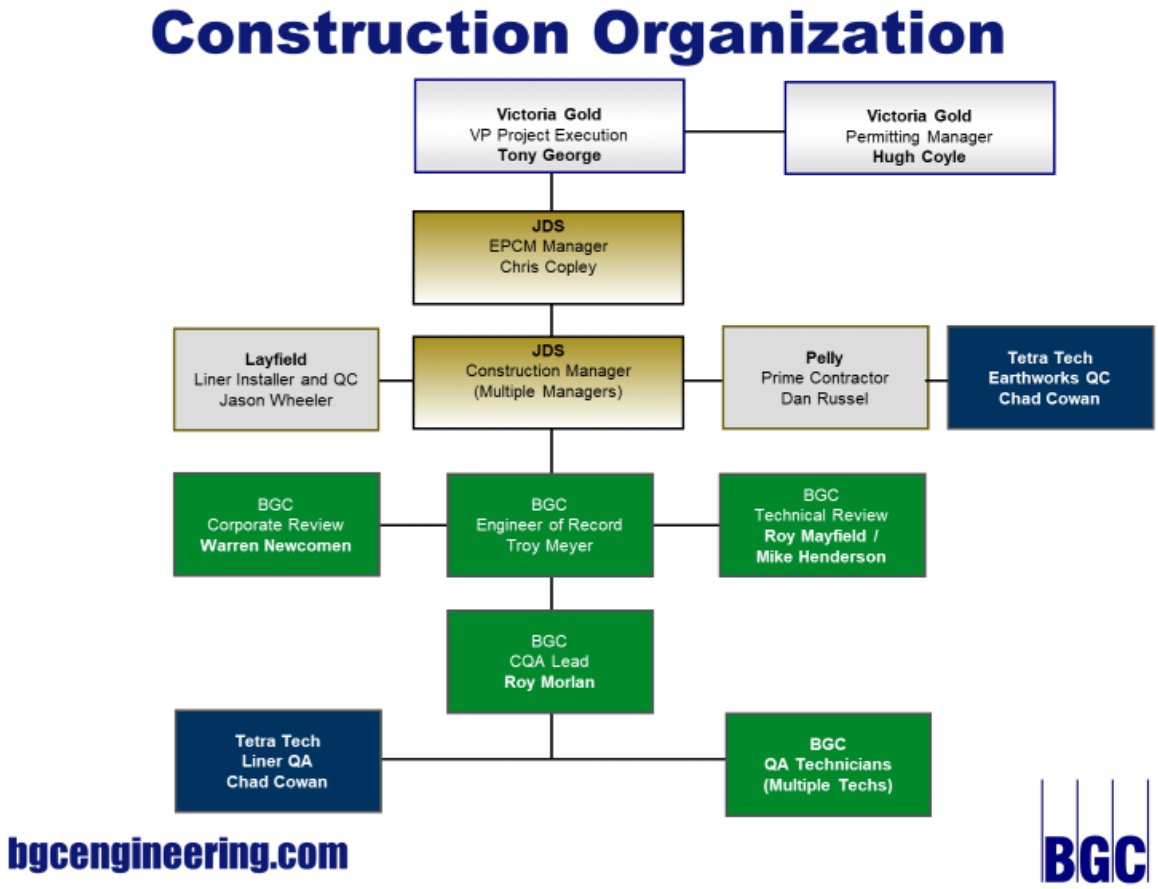

Figure 2: Construction organization chart.

5.0 CONSTRUCTION OBSERVATIONS, CHANGES, AND QA/QC TEST RESULTS

HLF design details and technical specifications were included in the design report (BGC 2018). Construction performed during the BGC oversight period (between September 2017 and early July 2019) was generally completed in conformance with the design technical specifications. Construction observations and instances where designs were modified to accommodate field conditions or construction limitations are discussed in this section. Construction Work Plans (CWPs) developed for the construction are included in Appendix 1. Requests for Information (RFI's) are included in Appendix 2. Technical memorandums developed by BGC for the construction are included in Appendix 3. Material QC testing results are included in Appendix 4. QA approvals and documentation are included in Appendix 5. BGC, Tetra Tech, and Pelly daily reports are included in Appendix 6. Tetra Tech's Liner QA Report is included in Appendix 7. Drawings issued for construction (IFC), including those modified after construction began, are included in Appendix 8. Record drawings are included in Appendix 9. Appendix 10 provides a summary of construction quantities provided by JDS.

Construction criteria and specifications discussed in this section are outlined in detail in the HLF Detailed Design Report, the RFI responses, and the applicable Technical Memorandums.

5.1. Material Production and Borrow Areas

5.1.1. Borrows

Six Borrow Areas were developed, two for rock fill material (Eagle Pit and ADR Quarries), two as part of construct and fill activities (Confining Embankment Event Pond Excavations), and two for construction fill material (Dublin Gulch and Kilometer 41 Borrows). The stockpile management plan developed for material produced at these borrows was updated regularly. A copy of the plan and its updates are included in Appendix 1. All Material 4 – ODF and Material 5 – Select Drain Fill was produced by Nuway's mobile crushing plant up to June 30, 2019. ODF produced after June 30 was generated by the mine's permanent ore crushing system. A figure showing the borrow areas is included below.

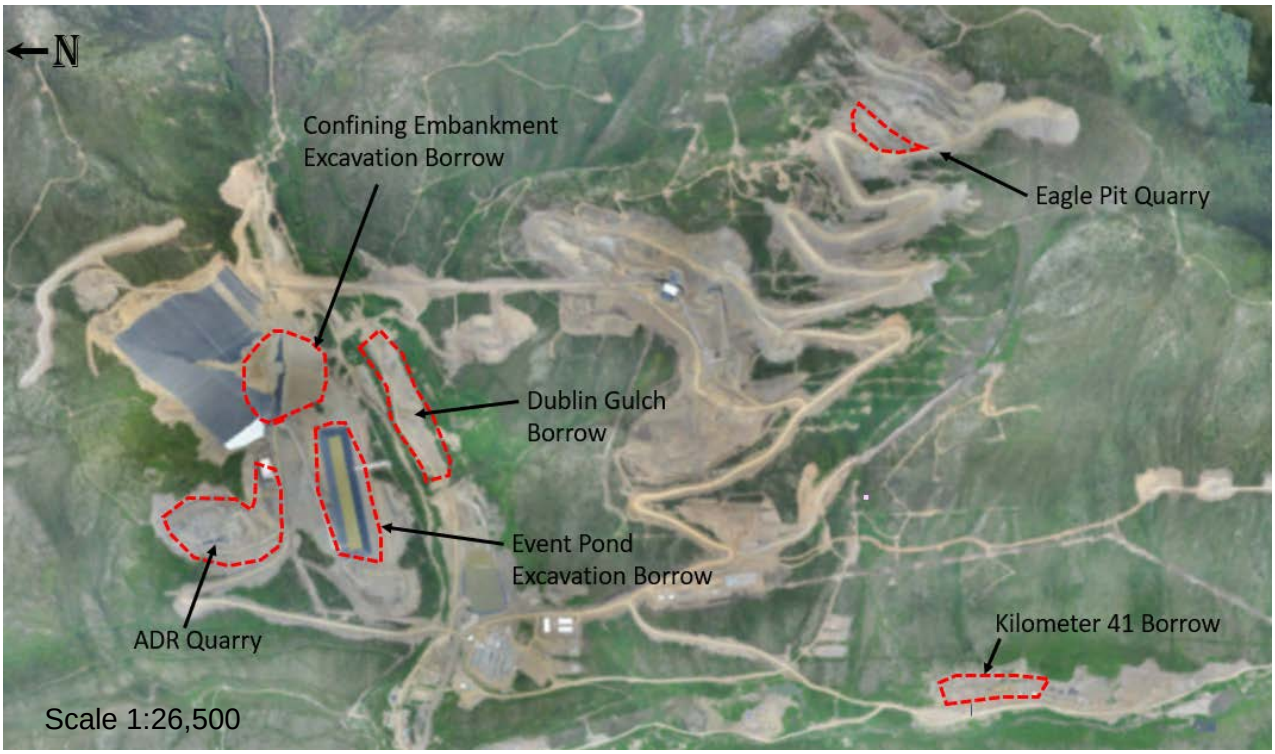

Figure 3: Borrow Locations.

5.1.1.1. Kilometer 41 Borrow

The Kilometer 41 borrow contained primarily placer tailings and alluvium and was located near the entrance to the mine at Kilometer 41. The material consisted of sand, gravel, cobbles and boulders excavated from historicplacer tailings deposits in the Haggart Creek valley. Borrowed material was a mixture of well-rounded granite/grano-diorite, quartzite, and meta-sedimentary rocks. Rock particles from this source were generally hard and strong.

Material excavated from this quarry was used to produce Material 4 –ODF, Material 5 – Select Drain Fill and Material 2 – Select Fill for the HLF construction.

5.1.1.2. Dublin Gulch Borrow

The Dublin Gulch borrow was located just south of the HLF footprint in the Dublin Gulch valley and consisted mostly of historic placer tailings with some in-situ alluvial material. The material consisted of sand, gravel, and boulders and was a mixture of well-rounded granite/grano-diorite, quartzite, and meta-sedimentary rocks and sand. Rock particles from this source were generally hard and strong.

Material excavated from this borrow area was used to produce Material 5 – Select Drain Fill, Material 2 – Select Fill, and Material 4 – ODF.

5.1.1.3. Event Pond Borrow

The Event Pond Borrow was located within the footprint of the required Event Pond excavation. After topsoil, frozen material, and highly-weathered / decomposed bedrock was removed the remaining material from the Event Pond excavation was hauled directly to the Confining Embankment for construction. Material used for construction generated form the Event Pond borrow consisted of organic free colluvium (gravelly sand and cobbles) or weathered quartzite bedrock with some phyllite lenses. Some ripping was needed while bedrock was excavated but no blasting was required at the Event Pond Borrow.

Material excavated from the Event Pond Borrow was used as either Material 3 – Structural Fill or Material 7 – Rockfill, depending on the observed particle size ranges of the material.

Some ice rich and/or wet material from this borrow was considered unsuitable as embankment fill and was wasted. The waste pile for this material was designed and managed by JDS and is located directly west of the Event Pond construction.

5.1.1.4. ADR Borrow

The ADR Borrow was a quarry located within the footprint of the required adsorption, desorption, and refining (ADR) plant excavation limits and included the adjacent hillside just west of the ADR area. The quarried material consisted of moderately weathered to relatively competent quartzite interbedded with some phyllite. The material was generally strong and hard. Ripping with large dozers and blasting was required to excavate material from the ADR Borrow.

Material excavated from the ADR Quarry was used as Material 3 – Structural Fill or Material 7 – Rockfill.

5.1.1.5. Eagle Pit Borrow

The Eagle Pit Borrow was a quarry located at mining Block 1285-01 of the Eagle Pit. The material consisted mostly of weathered to highly weathered quartzite and meta-sediments. Material 4 – ODF and Material 2 – Select Fill was produced from this quarry, which was transported to the HLF via the mine's conveyor system. Material produced from this quarry was generally weaker than the other sources used to produce ODF. ODF produced from this source met requirements of the Technical Specifications; however, more waste product (rejected fines) was produced in the processing at the crushing/screening plant.

Prior to June 30, 2019, ODF produced from the Eagle Pit Borrow was crushed by Nuway at their mobile plant. ODF produced after June 30 was processed by the mine's permanent crushing system. After June 30, 2019, SGC had direct oversight and management for the production, transportation, placement, QA, and QC of this material on the Phase 1A Pad.

5.1.1.6. Confining Embankment Excavation Borrow

Excavated material within the footprint of the Confining Embankment was originally intended to be used as Material 3 – Structural Fill for the embankment construction. However, the material

was generally near or slightly over optimum moisture content upon excavation and the generated stockpile froze over the 2017-2018 winter construction hiatus. Therefore, the stockpiled material was disposed in a waste stockpile and the entire fill volume for the HLF Confining Embankment and Event Pond embankments was generated from the Event Pond and ADR borrows. The waste material stockpile was designed and managed by JDS and is located downslope of the mine's primary and secondary crusher, directly east of the Eagle Pup Road.

5.1.2. Material Production

5.1.2.1. Material 1 – Site Grading Fill

Material 1 – Site Grading Fill was originally intended to establish design grades in specific portions of the Phase 1A heap Pad. Material requirements for site grading fill were changed during construction to allow Material 3 – Structural Fill and Material 7 - Rockfill to be used at the Engineer's discretion. This change was made to accommodate the availability of material during construction. Therefore, Material 1 was not produced or used.

It should be noted that the quantities table in Appendix 10 denotes the main spillway fill as Material 3/7. and the QC test data in Appendix 4 denotes the gradation tests as Material 1, which is an error. The correct designation of the material placed in the main spillway is Material 3/7.

5.1.2.2. Material 2 – Select Fill

Material 2 – Select Fill was used as bedding for liner systems. Material 2 was also used as transition material between geotextiles and other fills when additional protection of the geotextile was needed (such as placement of coarse fill over geotextile). Material 2 was produced by Nuway as a byproduct (fines reject) of the crushing/screening production of Material 5 – Select Drain Fill and Material 6 – ODF. The term used for this material on-site was 'reject sand' as the material consisted of well-graded sand. Material 2 was produced predominantly from the Kilometer 41 Borrow and the Dublin Gulch Borrow with a minor portion being produced from the Eagle Pit Borrow.

<u>Material Criteria</u>

The gradation allowed for Material 2 per the Technical Specifications was 35 to 100% passing #200 mesh, 60 to 100% passing sieve No. 4, and a maximum size of 75mm. The material was to be placed within +/- 2% of the optimal moisture which was measured as 95% per standard Proctor testing (ASTM D-698). Compaction criteria were modified from the Technical Specifications based on a test fill documented in Field Memorandum CTFM-01. See Section 5.2 for compaction control details.

<u>Minor Modification to Material Criteria</u>

Although gradation of reject sand fell partially outside the material requirements of the technical specification, specifically having less than 35% passing #200 mesh size and 60% material passing the No. 4 sieve size, it was approved for use as liner bedding and underdrain pipe trench

backfill. The modification was approved because it met the design intent of providing a densely compacted material that is free of oversize material (which could pose a risk of puncturing the liner system). The material produced was generally less than 12.5 mm in size and was graded. The requirement for QC testing for Atterberg Limits and permeability testing were removed since gradations showed the material to be a well-graded sand and field inspections noted that the material was non-plastic.

QA/QC During Production

The QC requirements for Material 2 production are included in Table 1 below.

Test	Required Test Frequency	Actual Test Frequency
Gradation (ASTM D-422)	Minimum 1 per soil type or 1 per 3,000 m^3, whichever is more frequent	1 per every 854 m^3

Table 1: Material 2 QC Testing Frequency

The testing frequency table in Section 3.9 of the specification document (BGC 2018) indicates laboratory permeability for Material 2. However, the actual material criteria in Section 3.6 of that document did not require this testing. The BGC design engineer confirmed the testing was not required.

A total of 17 gradation tests were completed. Samples were typically collected at the crushing facility. Gradation results are presented in Figure 4.

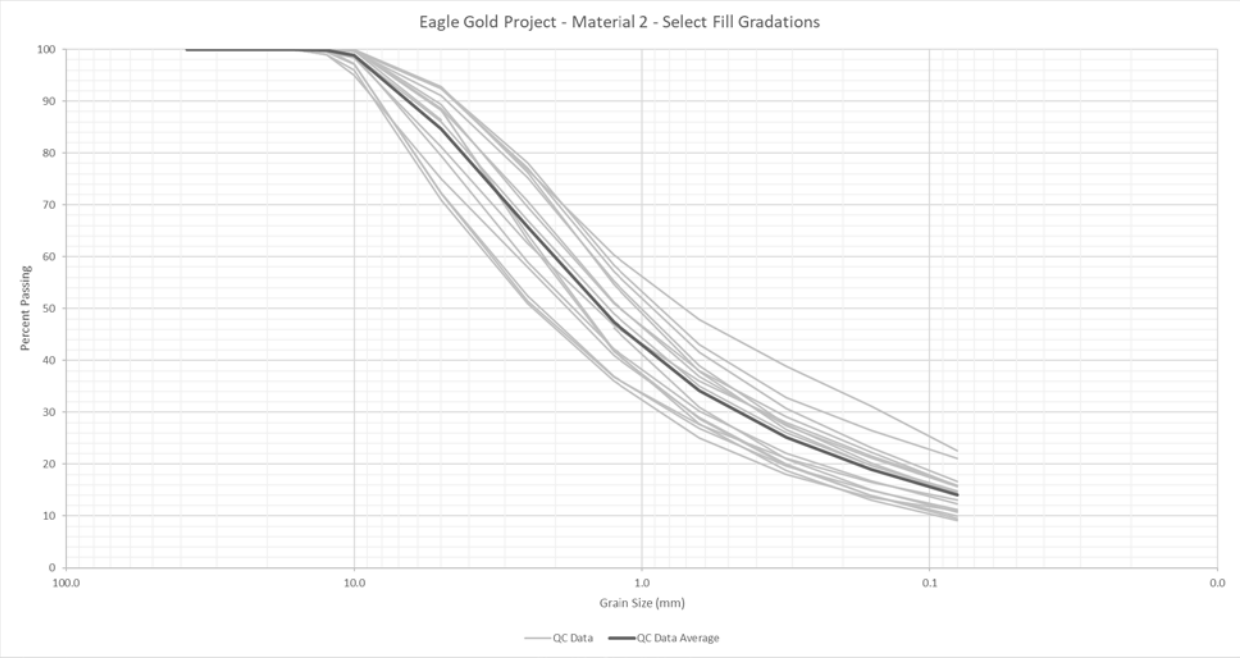

Figure 4: Material 2 – Select Fill Gradation Testing Results.

5.1.2.3. Material 3 – Structural Fill

Material 3 – Structural Fill was used to construct portions of the Confining Embankment. Structural Fill was sourced predominately from the ADR Borrow and the Event Pond Borrow.

Material Criteria

General requirements for Material 3 included a minimum of 10% material passing #200 mesh with less than 30% material larger than 19 mm and a maximum particle size of 150 mm. Gradation testing of the structural and rock fill was not required. The CQA Engineer visually inspected the structural fill in conjunction with measurement of the size of select stones and determined its compliance with the gradation requirements.

Minor Modification to Material Criteria

The maximum size for Material 3 was increased from 150 mm to 200 mm as discussed in EPCM-RFI-002. Material 3 was used in the Confining Embankment between elevation 891.25m and 940m (crest elevation). Material 3 was replaced with Material 7 – Rockfill in the Event Pond berm construction.

QA/QC During Production

Material 3 was produced directly from the excavation at the Event Pond Borrow and from blasted material at the ADR quarry. No processing was performed.

Daily observations made by BGC related to the quality of Material 3 borrowed are included in BGC's daily reports. Material 3 borrowed met the requirements in the Technical Specifications. The material visually appeared well graded, generally consisting of sandy gravel with an upper size ranging to approximately 150mm to 200mm, which BGC approved.

Compaction control during construction was achieved based on method specifications developed by the test fills (see Section 5.3).

5.1.2.4. Material 4 – Overliner Drain Fill (ODF)

Material 4 – ODF was used as drainage material over the liner system in the In-Heap Pond and the Phase 1A area. ODF material was produced from the Kilometer 41 Borrow, the Dublin Gulch Borrow, and the ADR Borrow. ODF production QA was performed by BGC on-site until June 25. After June 25 QA for production of ODF was performed by SGC. Production of ODF material until June 25 was exclusively performed by Nuway and QC testing was exclusively performed by Tetra Tech. The following section discusses QA during production performed by BGC.

Material Criteria

Material 4 production requirements included a 38-mm maximum particle size, less than 5% material finer than No. 200 sieve size, and an operating (loaded) permeability of no less than $2x10^{-4}$ m/s.

No modifications were made to the technical specification requirements for ODF.

QA/QC During Production

Gradation analysis was required to produce Material 4 at a minimum frequency of 1 test per 5,000 m^3 produced. The frequency of testing used exceeded this requirement. As of June 31, 2019, a total of 156 gradation tests were performed on 81,000 m^3 of ODF produced resulting in about 1 test per 520 m^3 produced. The higher frequency allowed for better control of the ODF production.

Test	Required Test Frequency	Actual Test Frequency
Gradation (ASTM D-422)	Minimum 1 per 5,000 m^3	1 per 520 m^3

Table 2: Material 4 QC Testing Frequency

ODF gradations generally met the requirements in the Technical Specifications with an average of 3.2% material passing No.200 sieve size and 99.9% material smaller than 38mm. A total of 17 gradation tests reported over 5% of the material passing the No.200 sieve size. On average these tests reported 6.6% material passing the No. 200 sieve size. In each of these cases adjustments were made in production and the material tested again after production resumed. The subsequent tests reported less than 5% material passing the No. 200 sieve. Due to the low volume of material produced the material with greater than 5% material passing No. 200 sieve was not removed but instead was combined with material that passed the criteria. The exception to this were tests SA 107, SA 108, SA 109, and SA 110 analyzed in September 2018. The results for these tests reported between 5.1% and 8.4% material passing the No. 200 sieve size. This material was reprocessed and subsequently fell within the design specifications.

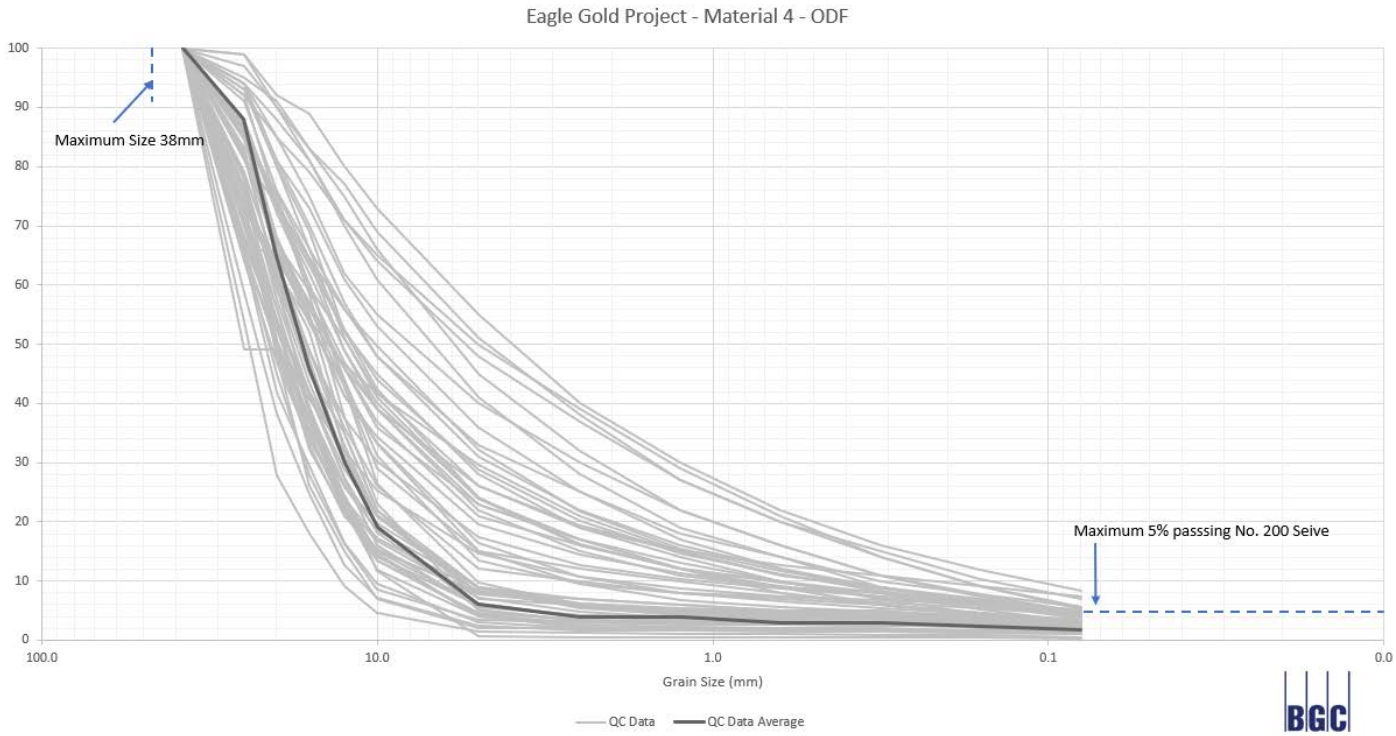

Figure 5: Material 5 – ODF Gradations

Laboratory analysis for permeability of the ODF was conducted in September 2017 by loaded, rigid wall constant head testing. Two samples were analyzed (Comp 1 and Comp 2). The results for Comp 1 reported a permeability of $1.2x10^{-2}$ m/s at a pressure loading of 100 psi and $3.4x10^{-3}$ m/s at a pressure loading of 400 psi. The results for Comp 2 reported a permeability of $1.7x10^{-1}$ m/s at a pressure loading of 100 psi and $6.4x10^{-2}$ m/s at 400 psi.

Although not required by the Technical Specifications, durability testing was performed on the ODF when visual field screening performed by BGC indicated a change in material strength. A total of four samples were analyzed for durability per ASTM 131 (LA Abrasion) and ASTM D4644 (Slake Durability). Two of the samples were analyzed from material produced in 2017 at the Kilometer 41 Borrow (Comp 1 and Comp 2) and two samples were analyzed in 2018 from material collected from the Eagle Pit Borrow (ODF 1 and ODF 2).

Comp 1 and Comp 2 reported material losses of 31.6% and 35.7%, respectively. ODF 1 and ODF 2 reported losses of 17% and 20%, respectively. Results less than 40% are typically considered durable (USBR 2014). All samples reported a second cycle slake durability index greater than 98% indicating virtually no change to the specimen.

ODF produced before June 30, 2019 was processed by Nuway at their mobile crushing and screening facility. Tetra Tech provided QC testing for the material and BGC provided QA and confirmation that the material met the requirements of the Technical Specifications. It is BGC's understanding that all ODF produced after June 30 was processed by SGC at their mine crushing

facility and that QC was also performed by SGC. BGC's scope did not include being present on-site after June 30 and so therefore BGC did not provide QA or confirmation of the material produced or placed at the HLF (generally above elevation 938m on the Phase 1A Pad). QA was conducted by others under SGC's direction.

5.1.2.5. Material 5 – Select Drain Fill

Material 5 – Select Drain Fill was placed in underdrain and seepage collection trenches as a medium for flow. Material 5 – Select Drain Fill was produced by Nuway from the Kilometer 41 Borrow.

Material Criteria

The select drain fill is required to have an operational permeability of greater than $1x10^{-4}$ m/s. The gradation specification for Select Drain fill called for a 12.5 mm maximum particle size and a maximum of 3% material smaller than the #200 mesh.

Minor Modifications to Material Criteria

The maximum material smaller than #200 mesh was increased from 3% to 5%. A maximum particle size of 25 mm was also approved. These changes were justified by permeability testing (see Appendix 4 for test results) and the requirement of placement of a cushion layer of Material 2 over the drain trenches to cushion the liner system.

QA/QC During Production

QC requirements for Material 5 – Select Drain fill consisted of at least 1 sample collected for gradation testing every 5,000 m^3 produced. A total of 53 gradation tests were performed on 8,000 m^3 of Material 5 produced. Samples were typically collected at the crushing facility. Material 5 gradations met the requirements of the modified criteria with an average of 2.0% material below No.200 sieve size and 100% material smaller than 25mm.

Two tests reported greater than 5% material passing sieve No. 200. SA37 collected the morning of October 12, 2018 reported 5.2% passing sieve No. 200. A subsequent test (SA38) was performed the afternoon of the same day and reported 2.2% passing sieve No. 200. SA46 collected the morning of May 19, 2018 reported 7.8% passing sieve No. 200. A subsequent test (SA47) collected the afternoon of the same day reported 1.7% passing sieve No. 200. In both cases the material was inspected by the Engineer and it was determined that the higher fines results were likely caused by sampling technique.

It should be noted that the final gradation requirements for Material 5 – Select Drain Fill were the same as some of the concrete aggregate produced on-site for construction unrelated to the HLF. Because of this, in many cases Tetra Tech erroneously used the header 'Concrete Aggregate' or 'Concrete Mix Gradation' in some of the grain size analysis reports.

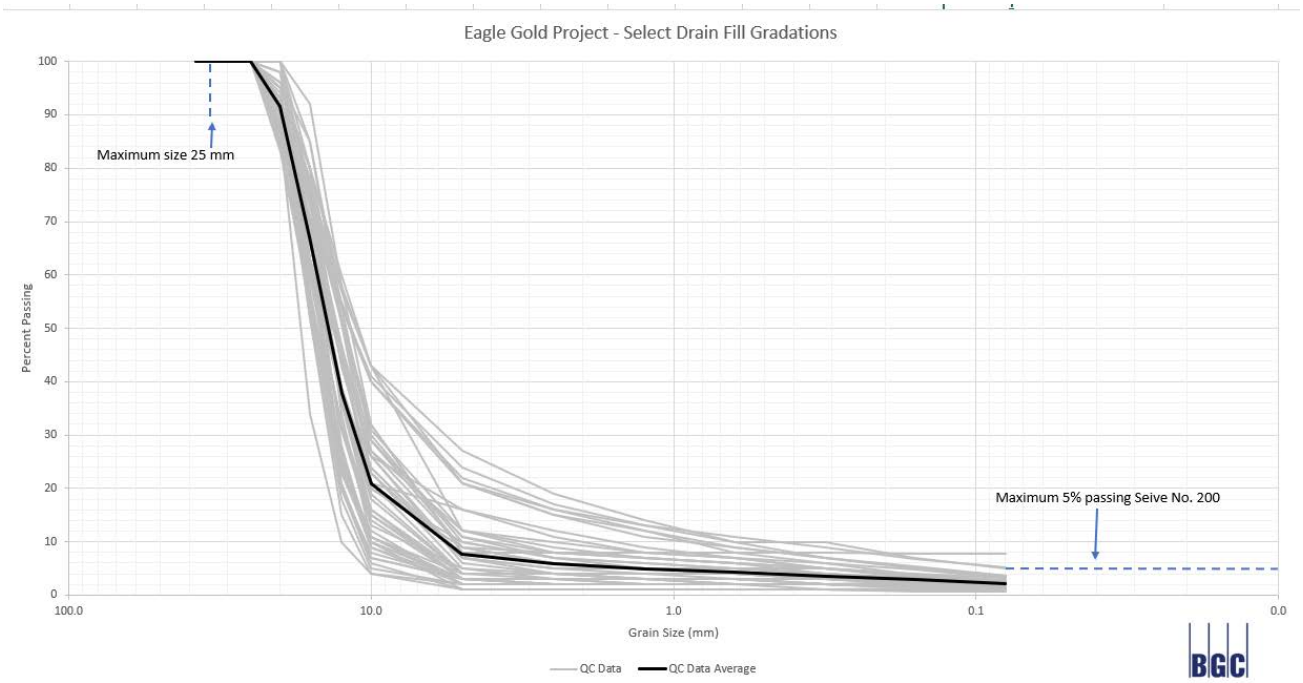

Figure 6: Material 5 – Select Drain Fill QC Gradation Results.

Field permeability testing was performed on a representative sample of the Select Drain Fill. The results of the test reported a permeability greater than $1x10^{-2}$ m/s.

5.1.2.6. Material 6 – Pipe Trench Backfill

Material 6 – Pipe Trench Backfill was initially included in the design as backfill over the underdrain header pipe trench. This material was replaced with Material 5 and, therefore, was not produced.

5.1.2.7. Material 7– Compacted Rockfill

Material 7 – Rockfill was used in the construction of the Confining Embankment below elevation 918.25m and the Event Pond embankments. Rockfill was blasted, excavated, and hauled directly from the borrow sources. No further processing was performed.

Material Criteria

Specifications for Material 7 included a maximum particle size of 300 mm and more than 30% particles larger than 19 mm.

Minor Modifications to Material Criteria

Gradation criteria for Material 7 were modified after completion of test fills discussed in Field Memorandum CTFM-02. The maximum particle size was increased to 0.75 m.

QA/QC During Production

Visual QC inspections of the quarried and placed material were performed daily by Pelly and Tetra Tech and included in their daily reports. QA observations were also made by BGC and included in the BGC daily reports, when applicable. Laboratory gradation were not required due to the material's maximum particle size.

QA/QC observations reported that the material generally conformed with requirements in the Technical Specifications. On occasions where material appeared gap-graded or contained a high content of softer rock such as phyllite it was temporarily stockpiled and mixed with harder quartzite rock. Compaction control during construction was achieved based on method specifications developed by the test fills (see Section 5.3 and Field Memorandum CTFM-02).

5.1.2.8. Material 8 – Anchor Trench Backfill

Material 3 and finer fraction Material 7 was used as anchor trench backfill and, therefore, Material 8 was not produced.

5.1.2.9. Material 9 – Road Wearing Coarse

Material 9 – Road Wearing Coarse was not used or produced.

5.1.2.10. Material 10 – Rip Rap

Material 10 – Rip Rap was sourced from the Dublin Gulch Borrow. No processing was necessary.

Material Criteria

Maximum particle size should not exceed the maximum lift thickness for this material. No material smaller than No. 200 sieve size should be present as determined by visual inspection.

Modifications to Material Criteria

No modifications were made to the material criteria.

QA/QC During Production

BGC's field engineer performed visual inspection of the Rip Rap material to confirm its suitability. These inspections are included in the BGC daily reports.

5.2. Underdrain System

5.2.1. Construction Criteria

Typical underdrain construction consisted of the following components:

- Perforated, corrugated, N-12 polyurethane (PE) piping with bell style joints secured with wire ties. Lateral drains and the Event Pond underdrains were designed and installed with these drain pipes. Finger drains installed to collect and convey groundwater seepage

during construction were either constructed with these corrugated pipes or as a gravel "French" drain, as determined by BGC in the field.

- Material 5 – Select Drain Fill was used as granular drain rock medium. No compaction was required for placement.
- Material 2 – Select Fill was used as cover over the underdrain Select Drain Fill and geotextile to provide a separation between upper fills or a cushion below the liner system.
- 12 oz non-woven geotextile was used between the Select Drain Fill and the natural ground and/or backfill material.
- Solid walled HDPE SDR 17 pipe was used from Station 0+000 to 0+158 m and solid walled HDPE SDR 11 was used from the Station 0+158 to 0+790 m. Solid walled pipe was joined using a butt fusing or electrofusion method.

5.2.2. QA/QC Requirements and Observations

BGC provided visual inspection and approval for the majority of the underdrain construction. This included verification that the specified geotextile, drain pipes, and aggregate were used and that the drainage network was properly spaced to capture visible seeps and to meet the requirements of the design. Construction for portions of the Lateral Drains and the Event Pond underdrains were performed when BGC was not on-site. These construction activities were reported by Pelly in their daily reports between December 17, 2018 and March 2, 2019. Underdrains construction performed when BGC was not on-site was reported by Pelly and JDS as being constructed in accordance to the design and Technical Specifications.

5.2.2.1. Fill Materials

Material 2 – Select Fill and Material 5 – Select Drain Fill were used in the construction of the underdrains. No compaction was required for the placement of Material 5.

A test fill was performed on June 30, 2018 to determine the best compaction method and to replace the QC testing requirements for Material 2. The results from the test fill are discussed in Field Memorandum CTFM-01. A Standard Proctor test was also performed on the Material 2 to determine the optimum moisture and density. Additionally, in-situ field moisture and density measurements were taken during the test fill using a nuclear density gauge. The results of the test fill indicated that >9% maximum dry Proctor density was achieved at >6% moisture and a minimum of 3 passes with 6,000 kg vibratory compactor. This method was used and tracked for placement of Material 2 throughout the construction of the HLF and replaced the field density testing requirements.

Four field density readings were also collected in the central underdrain pipe trench as verification of method developed to compact Material 2. Results from the testing all reported >99% compaction.

5.2.2.2. Solid Walled HDPE Pipe Installation QC Testing

All solid-walled HDPE pipe used in the underdrain header pipe trench, including the HLF closure pipe, was joined by butt-fusing per ASTM F2620 or electro-welding per ASTM F1055.

Electrofusion was not used for the closure pipe which was required to undergo pressure testing. All other underdrain header pipes will have gravity flow conditions and are not designed for pressure flow. All welding QC was performed and documented by Pelly. This included destruction of some welds to perform visual inspection. All welding documentation and testing performed by Pelly is included in Appendix 4.

A pressure test was performed on the HDPE closure pipe. The pipe was visually inspected by BGC during the test and no leaks or significant changes in pressure were observed during the testing. The leak testing was discussed in the Field Memorandum FM-04 HDPE Pipe Leak Test delivered to JDS on June 21.

5.2.2.3. Underdrain Construction Approvals and Tracking

All underdrain construction was reviewed and approved by BGC. Records of this approval were maintained by Pelly and are included in Appendix 5. As-built survey electronic data is available through JDS.

5.2.3. Construction Completed

Underdrain construction began in May 2018 and advanced to March 2019. Underdrain construction was typically completed after subgrade or foundation preparation for any given area of the HLF. As construction progressed the underdrain system was expanded to include additional fingers in response to observed seepage. Construction was typically performed by Pelly using Link Belt and CAT excavators, Volvo articulated trucks as well as a CAT D10 dozer when cutting the header drain trench. As-built drawings for the Underdrain system constructed at the HLF are included in Appendix 9.

5.2.3.1. HLF Underdrain Header Pipe Trench and Finger Drains

The HLF Underdrain Header Pipe Trench was constructed below the Phase 1A Pad area starting at elevation 990 m and ending downstream of the embankment toe at the Monitoring Vault. Twenty-one finger drains were extended from the HLF Underdrain Header Pipe Trench between Station 0+0.000m to 0+475 to capture seepage observed during construction. Finger drains typically consisted of an excavated trench lined with 12-oz non-woven geotextile and filled with Material 5 – Select Drain Fill. All finger drains sloped towards and were connected to the header drain trench.

5.2.3.2. Artesian Source Drain

In 2017 an artesian groundwater source was identified in the HLF Confining Embankment footprint. It was reported to BGC that the source was the result of an exploratory drill hole completed in 2015. In 2018 Pelly's drilling subcontractor, Midnight Sun, attempted to plug the boring. The attempt consisted of drilling several holes at and around artesian spring and filling the borings with grout. The attempts were unsuccessful. BGC designed a piped finger drain to direct

water from the artesian spring to the underdrain header pipes. The design of the finger drain was discussed in the Field Memorandum FM-06.

5.2.3.3. Embankment East Underdrain

A separate underdrain was installed on the east side of the embankment to capture seepage observed during construction. The drain was constructed per the typical underdrain design and included a corrugated, perforated pipe. This drain does not connect to the main HLF underdrain system and terminates downstream of the embankment toe. The discharge for this drain initially measured 0.25 L/min during construction. As of March 30, 2019, no discharge has been observed from this underdrain.

5.2.3.4. Lateral Drain Construction

Ten lateral drains extend from the HLF Underdrain Header Pipe Trench above Elevation 940 m and extend throughout the remaining footprint of the HLF Phase 1A Pad. Piping from the underdrains is connected to the HLF underdrain header pipes.

5.2.3.5. Monitoring Vault Connection

The connection between the underdrain system and monitoring vault was completed on June 25, 2019 by JDS. The underdrain transition to the monitoring vault connection consists of a lined containment berm with gravel fill. The underdrain HDPE header pipes are booted through the liner at the berm and are insulated and heat traced between the berm and the vault. Water collecting just upstream of the containment berm in the drain rock placed around the underdrain headers flows into a perforated pipe which runs into the monitoring vault in a separate solid HDPE pipe. All of the header pipes also discharge into the monitoring vault where they can be sampled and tested. From the monitoring vault all streams are either routed to a tank and pumping system which sends the water to the Event Pond or ADR, or they are discharged through one HDPE drain line that exits at Dublin Gulch. The outfall was covered with coarse rock for protection.

5.2.3.6. Event Pond Underdrain System Construction

An underdrain loop was installed along the bottom perimeter of the Event Pond. Finger drains running along the north slope of the Event Pond excavation were installed to capture seepage observed during construction. These finger drains connect to the underdrain loop. The Event Pond Underdrain discharges uphill from the Dublin Gulch access road via a solid walled 150-mm HDPE pipe buried under the Event Pond south berms.

5.2.3.7. In-heap Pond Spillway Underdrain Construction

Seepage observed during construction of the In-heap Pond Spillway was collected in an underdrain installed running parallel to the spillway between the channel and the cut slope to the north. The drain discharges west of the Event Pond and spillway.

5.2.4. Approved Minor Modifications, Rationale and Clarifications to the Design

The following minor modifications approved by the Engineer of Record were made to the design during construction activities.

- At JDS's request BGC modified the design of the Event Pond underdrain discharge pipe. The modifications eliminated the non-woven geotextile and allowed for either a 150-mm or a 200-mm HDPE pipe. These modifications are discussed in BGC-RFI-014 and BGC-RFI-017.
- At JDS's request the closure drain pipe was modified from 300-mm SDR 9 HDPE to 150-mm SDR 11 HDPE. This was discussed in CC204-RFI-007.
- Electrofusion welding was approved for use on the underdrain head and closure pipes. This was discussed in CC204-RFI-008. Pelly used both electrofusion and standard butt-welding techniques in construction of the underdrain header pipes.
- Horizontal seams were allowed for the 12-oz geotextile used in underdrain construction. No horizontal seems were allowed within 2 m of the Confining Embankment toe. This was discussed in CC204-RFI-10.
- The use of split couplings was approved for use in the underdrains. This is discussed in CC204-RFI-015. However, during 2018 construction no split couplers were used. Corrugated drain pipes were connected using bell joints and bailing wire, per the Technical Specifications.
- Finger drains were built in response to groundwater seeps observed from the Confining Embankment and In-Heap Pond subgrade. Final finger drain locations and designs were developed by BGC's field personnel. Finger drains typically consisted of a trench excavated to depths between 0.5 m and 1.5 m into the subgrade, wrapped with 12-oz geotextile, filled with a 0.3-m to 1-m thick layer of Material 5 – Select Drain Fill, sloped towards and connected to the underdrain header trench. The requirements for finger drains are discussed in CC204-RFI-036 and CC204-RFI-037. Technical memorandum FM-03 Seeps and Finger Drains was also delivered to JDS on June 13, 2018 and discusses finger drain criteria.
- The portion of the HLF underdrain from Station 0+000 to 0+020 was modified to accommodate field conditions encountered. Specifically, there was a steep dip in bedrock that did not allow this portion to be founded on Type 3 bedrock and an accumulation of runoff that saturated the subgrade, requiring the saturated portions of the subgrade to be removed. This area was over-excavated and backfilled with zoned material ranging from Material 7 -Rip Rap to Material 3 – Structural Fill to stabilize the subgrade. The header drain between Stations 0+000 and 0+020 was completed over this stabilized area. These revisions are discussed in CC204-RFI-017.
- Modifications to the connection between the HLF underdrains and the Monitoring Vault were completed on April 20, 2019. The modifications included a lined berm and perforated pipe to allow water from the underdrain gravel to collect and drain into the monitoring vault through a perforated pipe. These minor modifications are detailed in BGC-RFI-036 and are reflected in revised IFC drawing XD-05-06.

- Event Pond Underdrain Discharge Winterization: Winterization was added to the Event Pond discharge and over the western portion of the Event Pond ring drain. These modifications are discussed in BGC-RFI-033.
- Spillway Underdrain: An underdrain was added directly north of the In-Heap Pond Spillway. The drain was added to deal with seepage into the spillway excavation from the slope directly north. This modification was discussed in CC204-RFI-048.
- Field fitting was needed to accommodate subsurface conditions encountered during construction. None of the field fitting performed affected the design intent of the underdrains. Examples of field fitting not represented in the RFIs included re-aligning the header drain trench approximately 4 m to the west to ensure it was in the valley low point, and modifications were made to the length and width of finger drains.
- Addition of finger drains from the 990-m bench to the lateral drain on the west side of the Phase 1A Heap Pad was added. This addition was discussed in BGC-RFI-034.

5.3. Confining Embankment

5.3.1. Construction Criteria

The HLF confining embankment and Phase 1A heap Pad consisted of the following components:

- The confining embankment foundation required removal of loose soils, highly weathered rock, and organic material. Foundation within the footprint of the confining embankment was to be excavated to Type 3 bedrock or better. Type 3 bedrock is defined in the Technical Specifications as weathered rock that has a confined compressive strength of between 1 MPa and 5 MPa. Type 3 bedrock would require a moderate effort to excavate with a heavy excavator.
- An earthfill/rockfill confining embankment constructed of Material 3 – Structural Fill and Material 7 – Compacted Rockfill. Material placement requirements included:
    - Material 3 – Structural Fill: Compaction criteria were developed based on test fills discussed in field memorandums CTFM-03 and CTFM-04. Final compaction requirements were a minimum 3 pass cycles (each consisting of one forward and one backward pass) using a 9,000 kg or 2 pass cycles using a 13,000 kg vibratory compactor in lifts up to 0.5m thick, a moisture content between 3% and 8%. QC requirements included meeting 95% of the measured proctor result of 2,270 kg/m^3.
    - Material 7 – Rockfill: Compaction criteria were developed based on test fills discussed in field memoranda CTFM-02 and CTFM-05. Final compaction requirements were a minimum of 4 pass cycles of a minimum 9,000 kg vibratory compactor in lifts up to 0.9 m thick.
    - Fill lifts were required to be kept free of excess snow and moisture.

5.3.2. QA/QC Requirements

5.3.2.1. Foundation Inspections and Approvals

BGC provided visual inspection and approval for all foundations within the footprint of the embankment. BGC also provided QA review of the QC data collected by Tetra Tech and

approvals of each lift during construction of the embankment. Approvals were tracked by Pelly and are included in Appendix 5.

Type 3 bedrock foundation approvals were provided by BGC within the footprint of the embankment. These foundation approvals consisted of surveying the bounds of the approved area, visually inspecting the cleared foundation, using a rock hammer to determine hardness, taking photos of the approved areas, and creating a photographic log of the approved areas.

5.3.2.2. Material 3 – Structural Fill and Material 7 – Rockfill.

Both Material 3 – Structural Fill and Material 7 – Rockfill were approved for use in construction of the confining embankment. Testing frequencies for these materials were not provided in the Technical Specifications and instead test fills were developed to provide a method specification for use of the materials. The methods for placing and compacting Materials 3 and 7 are discussed in memorandums CTFM-02, CTFM-03, CTFM-04, and CTFM-05. The memoranda provide the requirement for moisture conditioning and compaction efforts for use of these materials. Additionally, protocols and limitations for placing material in extreme cold were developed in Field Memorandum FM-08 to accommodate fill placement in the winter months. These memorandums are included in Appendix 3. Material 7 – Rockfill was used in construction of the confining embankment below elevation 918.25m and Material 3 – Structural Fill was used from elevation 918.25m to the crest (940m).

Laboratory testing for grain size analysis and moisture/density relationship was not required or practical for Materials 3 and 7 due to the large fraction material present. However, Tetra Tech provided the following field information on a daily basis:

- Visual confirmation that the material gradation and moisture met the requirements set forth in the applicable test fill.
- Visual confirmation and tracking that the compaction requirements set forth in the applicable test fill were being performed by the Tetra Tech.
- Daily field density and moisture readings from placed and compacted lifts using a nuclear density gauge. Larger fraction material can create inaccurate density and moisture results with a nuclear density gauge and, therefore, this testing was performed as field screening tool. The target density was >95% of the reference density determined during the Material 3 and Material 7 test fills (CTFM-02 through CTFM-05). If a density measurement was below 95% the reference density this area was recompacted and tested again until density was achieved. In-situ density results are included in Appendix 4.

5.3.3. Construction Completed

Construction of the HLF Embankment (from foundation preparation to fill completion) began in March 2017 and was completed in October 2018. Construction consisted of excavation and removal of unsuitable foundation material and placement and compaction of embankment fill.

5.3.3.1. Foundation Preparation

The embankment foundation was prepared by excavating to Type 3 bedrock. Pelly used a combination of D10 dozers, CAT and Hitachi excavators, and articulated haul trucks to accomplish this. As-built drawings for the Confining Embankment are included in Appendix 9. Digital as-built survey information is available through JDS.

5.3.3.2. Confining Embankment Fill

Placement Confining Embankment fill began in April 2018 and advanced to October 2018. The embankment was completed to a crest elevation of 940 m. Construction was performed in lifts ranging from 0.3 m to 0.9 m depending on the construction fill, equipment, and method used. Construction was performed by Pelly using Link Belt and CAT excavators and CAT D10 dozers for foundation preparation; Volvo articulated trucks and CAT 777 haul trucks were used to deliver and haul away material; CAT D10 dozers were used to spread material; and Volvo SD100F, CAT CS68D, CAT CS58D, or a loaded CAT 777 haul truck were used for compaction depending on the weight requirements for a specific lift. As-built drawings of the final embankment are included in Appendix 9.

Four borings were completed in the embankment crest for instrumentation. Standpipe piezometers were installed in three of the borings (VWP-01, VWP-02, and VWP-03). Vibrating wire piezometers are planned to be installed in the standpipes. As of BGC's demobilization on June 30 the vibrating wire piezometers had not been installed. An inclinometer instrument casing was installed in the fourth boring.

5.3.4. Minor Modifiations and Clarifications to the Design

The following minor modifications were made to the Confining Embankment design during the 2018 construction activities:

- BGC developed modifications to the alignment of the very eastern portion of the dam at the request of JDS. The dam crest alignment was shifted slightly north near the left abutment to allow a permanent access road to be maintained from Dublin Gulch to the dam crest and Lime Silo area. This change was discussed in BGC-RFI-010.
- BGC provided a re-alignment of the west HLF perimeter road to allow for a larger safety setback from the ADR plant cut which was excavated steeper than originally planned west of the HLF Pad. This revision was included in BGC-RFI-011.
- Central portion of the embankment crest was widened at JDS's request to accommodate construction equipment needed for LDRS and PLS piping installation. This change was discussed in BGC-RFI-012.
- The use of Material 7 – Rockfill was approved for embankment construction. This material replaced Material 3 in some embankment lifts. The zones of Material 3 and Material 7 were discussed in CC204-RFI-022 and EPCM-RFI-040. Construction criteria for Material 7 were developed based on the results of test fills done on the material. The test fills and criteria are discussed in technical memorandums CTFM-02 and CTFM-05.

- The connection between the subgrade and embankment at the toe and groins was redesigned to accommodate the field conditions, specifically the lack of Type 3 bedrock at the western toe of the embankment. This was discussed in EPCM-RFI-012.
- Minor modifications to the location of the vibrating wire piezometers were realized to accommodate field construction activities. One additional vibrating wire piezometer was added to the design to monitor pore pressures within the eastern portion of the embankment.

5.4. In-Heap Pond

5.4.1. Construction Criteria

Construction of the in-heap pond area consisted of preparing the subgrade, constructing the lined closure sump, constructing the lined LDRS sump, constructing the lined PLS sump, and installing the PLS recovery piping and ODF layer. Discussion of the liner installation is included in Section 5.10. The criteria for the remaining portions of the In-Heap Pond are included below.

- The In-Heap Pond was shaped to meet the volume and piping installation requirements of the HLF and sloping requirements for liner installation.
- The In-Heap Pond foundation was excavated down to Type 3 bedrock and included removal of all organic, ice rich, and soft or yielding soils. Areas were delineated for removal and backfilled with Material 3 or Material 7.
- In preparation for liner placement the liner subgrade was made smooth and free of jagged rocky surfaces. Where needed Material 2 – Site Grading Fill was used to create a smooth surface.
- The Closure Sump construction included the lined sump with a booted 150-mm HDPE SDR 11 closure drain pipe. The closure drain pipe criteria was to withstand a minimum of 100 psi of pressure, which was confirmed by testing. Both butt-fusion and electro-fusion was approved for joining the sections of the closure pipe. The closure sump was filled with ODF material and covered and sealed with the bottom layer of the LDRS liner.
- The LDRS sump was sealed with 60-mil (1.5-mm) LLDPE and 80-mil (2.0-mm) LLDPE liners. The leak detection layer of the liner system drained into the LDRS sump. The LDRS sump was filled with ODF material. A grid of corrugated, perforated 250-mm N-12 pipes were constructed to collect and direct seepage towards the LDRS pump casings. The LDRS pump casings consisted of steel 600-mm pipes which ended in a perforated hammer head configuration. The LDRS pump casings were designed by Hatch Ltd.
- The PLS sump was constructed above the LDRS sump. The PLS sump was filled with ODF material to elevation 917 m. A grid of corrugated, perforated, 450-mm N-12 PE pipe was constructed in the sump at elevation 915.6m. The 450mm solid walled SDR 11 HDPE PLS header pipes drained into this grid.
- A herring bone configuration of 100-mm and 250-mm corrugated, perforated N-12 PE collector pipes was placed within the In-Heap Pond starting at elevation 917 m.

5.4.2. QA/QC Requirements

The following quality control tracking was performed during construction of the in-heap pond area.

- BGC performed daily inspections of the subgrade for general conformance with the requirements of the technical specifications. Subgrade suitability was assessed by observing deflection during subgrade compaction with either a six-ton or nine-ton vibratory compactor. Subgrade approvals are included in Appendix 5.
- In isolated areas where Material 3 and Material 7 fill was used to achieve design grade and where Material 2 was used as bedding, placement and compaction was monitored by and documented by Pelly and/or Tetra Tech as required in Field Memorandums CTFM-01 through CTFM-05. These inspections were documented in Pelly and Tetra Tech's daily reports.
- BGC performed daily inspections of piping materials used, placement, spacing, and connections. Approvals for piping placement are included in Appendix 5.
- QA of liner placement within the In-Heap Pond was performed by Tetra Tech. Tetra Tech performed QA testing per the project technical specifications and reviewed all QC testing performed by Layfield. A Tetra Tech technician was present during all liner work. Tetra Tech provided daily reports that included test results, observations, and recommendations. Tetra Tech's Liner QA daily reports are included in Appendix 7. Issues reported by Tetra Tech in 2018 were addressed by Layfield. These included instances where weld tests failed or areas needed rewelding or patching. Liner QA is discussed in Section 5.10.

5.4.3. Construction Completed

The following In-Heap pond components were completed:

- Preparation of the subgrade for liner placement. This included excavation of finger drains, where needed, excavation to approved grade and shape, and placement of Material 2 – Bedding Sand where needed.
- Placement of the liner system along the In-Heap Pond and upstream embankment face. Liner installation is discussed in Section 5.10.
- Construction of the Closure Sump was completed by Pelly.
- Construction of the LDRS sump. Pelly completed the installation of all corrugated PE pipes and the placement of ODF. Layfield completed the liner system installation. The steel piping portions of the LDRS sump were completed by Heavy North.
- Construction of the PLS sump. Pelly completed the installation of all corrugated PE pipes and the placement of ODF. Layfield completed the liner system installation. Steel piping in PLS sump was completed by Heavy North and Priority Steel.
- Leak testing of the In-Heap Pond liner system was conducted on April 27, 2019. Holes in the liner system were identified and repaired during the leak test. The testing and repairs are discussed and documented in Field Memorandum FM-13. Liner QA is discussed in Section 5.10.
- Installation of a vibrating wire piezometer in the LDRS Sump instrument casing by Tetra Tech in July 2019.

Final Record Drawings for the In-Heap pond are being prepared by Pelly and JDS and were not available for this report.

5.4.4. Minor Modifications and Clarifications to the Design

The following minor modifications were made to the In-Heap Pond design during the 2018 construction activities.

- Modifications to the configuration of the LDRS and PLS pump casings were presented in BGC-RFI-028.
- The use of an off-the-shelf split coupler on the 100-mm and 250-mm collector pipes was reviewed and approved in CC204-RFI-031.
- A clarification to drawings EGHLF-XD-05-05 was issued in BGC-RFI-015. The clarification provided for one closure drain pipe outlet form the closure sump.
- The use of flanges to connect the corrugated, perforated PLS sump piping to the primary PLS drain pipes was allowed with the assumption that a minimum of 0.5 m of ODF be placed between the flange and the liner. This was discussed in CC204-RFI-045.
- The use of MarMac brand couplers to reinforce the coupler joints from corrugated header collector pipes to the solid-walled header pipes was approved with stipulations on how the coupler is affixed to the pipes. This is discussed in CC204-RFI-046.
- BGC approved the use of prefabricated 450-mm HDPE SDR 11 to 250-mm HDPE SDR 11 for the connection between the header pipes and the collector pipes. This replaced the 450-mm to 300-mm to 250-mm reducer in the IFC drawings. This is discussed in CC204-RFI-046.
- BGC approved the use of a pup-piece between the PLS manifold and the PLS pump header pipes. This is discussed in CC206-RFI-017

5.5. Phase 1A Heap Pad

5.5.1. Construction Criteria

The Phase 1A Heap Pad consisted of the lined area of the HLF between elevations 940 m and 990 m. It included perimeter berms along the eastern and western edges of the Phase 1A Heap Pad. Construction criteria included:

- The In-Heap Pond was shaped to meet the sloping requirements for liner installation.
- As with the In-Heap Pond, the Phase 1A Heap Pad subgrade foundation was excavated down to Type 3 bedrock and included removal of all organic, ice rich, and soft or yielding soils. Areas were delineated for removal and backfilled with Material 3 or Material 7. Subgrade was inspected by BGC and approved prior to liner installation. Subgrade approvals are included in Appendix 5.
- In isolated areas Material 3 and Material 7 fill was used to achieve design grade.
- In isolated areas Material 2 was used as liner bedding.
- A herring bone configuration of 100-mm and 250-mm corrugated, perforated N-12 PE collector pipes were included above the liner system in the Phase 1A Heap Pad area.

- Perimeter berms were required on the west and east side of the Phase 1A Heap Pad area. These structures were constructed with Material 3 – Structural fill or Material 7 – Rockfill.
- Requirements for placement of ODF within the Phase 1A Heap Pad and In-Heap Pond were developed during a test fill conducted on August 18 and 19, 2019. The recommendations from this test fill include placing 2 layers of geotextile between the geomembrane layers and the ODF. ODF thickness recommended was a minimum of 1.5 m thick in areas of heavy traffic and where traffic crosses pipework. In all other areas a minimum of 0.6 m was and still s recommended. It is also still recommended that haul truck speeds, braking, and turning must be done at slow speeds and controlled to prevent damage to the liner. The test fill is discussed in Field Memorandum FM-07 included in Appendix 3.

5.5.2. QA/QC Requirements

- BGC performed daily inspections of the subgrade for general conformance with the requirements of the technical specifications. Subgrade suitability was assessed by observing deflection during subgrade compaction with either a six-ton or nine-ton vibratory compactor. Subgrade approvals are included in Appendix 5.
- In isolated areas where Material 3 and Material 7 fill was used to achieve design grade and where Material 2 was used as bedding, placement and compaction was monitored by and documented by Pelly and/or Tetra Tech as required in Field Memorandums CTFM-01 through CTFM-05. These inspections were documented in Pelly and Tetra Tech's daily reports.
- Pelly provided spotters as QC during ODF placement to ensure that lift thickness and haul truck traffic were meeting the construction criteria. ODF placement was documented in Pelly's daily reports. Additionally, Pelly collected survey data to ensure that the minimum ODF cover over the liner was being met. BGC provided QA inspection of the construction activities daily and included any issues in the BGC daily reports.
- QA of liner placement was performed by Tetra Tech reporting to BGC. Tetra Tech performed QA testing per the project technical specifications and reviewed all QC testing performed by Layfield. A Tetra Tech technician was present during all liner work. Tetra Tech provided daily reports that included test results, observations, and recommendations. Tetra Tech's Liner QA daily reports are included in Appendix 7. Any issues reported by Tatra Tech in 2018 were addressed by Layfield. This included instances where weld tests failed or areas needed rewelding or patching.

5.5.3. Construction Completed

The following Phase 1A Heap Pad components were completed:

- Preparation of the subgrade for liner placement. This included excavation of finger drains, where needed, excavation to approved grade and shape, and placement of Material 2 – Select Fill (bedding sand) where needed.
- Placement of the liner system along the Phase 1A Heap Pad. Liner installation is discussed in Section 10.

The following components of the Phase 1A Heap Pad had not been completed when BGC demobilized from the site on June 30, 2019:

- ODF production and placement was only completed in the in-heap pond area and was pending above Elevation 918 m on the Phase 1A Pad.
- Installation of the Pad cell piezometers per Drawing XD-09-02 was not completed.

It is BGC's understanding that after June 30, 2019, SGC will produce and place ODF and will provide QC for this work. SGC will also provide confirmation and acceptance that the material produced meets the requirements of the Technical Specifications and that placement meets the design requirements and is performed in a manner that protects the HLF liner system. BGC has provided recommendations of a minimum amount of ODF cover over the exposed Phase 1A liner before winter months. This includes ODF cover of the center of Ann Gulch Valley and cover up to elevation 960 m. This cover was not completed prior to BGC's demobilization.

5.5.4. Minor Modifications and Clarifications to the Design

The following minor modifications were made to the design during the construction activities:

- BGC provided a re-alignment of the west HLF perimeter road to allow for a larger safety setback from the ADR plant cut which was excavated steeper than originally planned west of the HLF Pad. This revision was included in BGC-RFI-011 and is reflected in the revised IFC drawings (Appendix 9).

5.6. Interceptor Ditch

5.6.1. Construction Criteria

The Interceptor Ditch was constructed at elevation 1050 m between the proposed locations for the Phase 1B and Phase 2 Heap Pads. The purpose of the Interceptor Ditch is to safely collect and convey surface water run-off from above elevation 1050 m and divert flows above the Phase 1 Pad before the construction of Phase 2 is completed. General criteria for the Interceptor Ditch include:

- The ditch was sized to convey flows from the 100-yr 24-hr storm. The ditch is graded towards the west of the HLF into the environment west of the Heap pads. The outfall and discharge from the ditch were designed by others and are not included in this report.
- The Interceptor Ditch was designed with a minimum 1% slope from east to west.
- The Interceptor Ditch was lined with one layer of 12-oz non-woven geotextile then a 300-mm layer of riprap with D_{50}=150 mm.
- A 5-m wide access road was designed for the south (downhill) side of the Interceptor Ditch.

5.6.2. QA/QC Requirements and Observations

BGC was not present during the construction of the Interceptor Ditch. QC reporting for placement of the geotextile and riprap was provided by Pelly in their daily reports. QA for the riprap included visual inspection by BGC prior to its placement in the ditch.

5.6.3. Construction Completed

The Interceptor Ditch was constructed in early 2019.

5.6.4. Minor Modifications and Clarifications to the Design

A minor modification was made to the alignment of the interceptor ditch to optimize the cut and fill balance.

5.7. In-Heap Pond Spillway

5.7.1. Construction Criteria

The spillway design was revised in 2019 prior to construction. These changes and the related hydraulic calculations are disused in Field Memorandum FM-017 included in Appendix 3.

The spillway invert design, channel sizing, and channel alignment were revised on March 27, 2019 to account for an invert elevation of 937.5 m and the replacement of Fabri-Form concrete filled channel lining with Concrete Canvas brand concrete cloth liner. The primary reason for the material change was the lack of a concrete batch plant on-site at the time of installation. Five dual-walled 1200-mm, corrugated HDPE culverts were included to direct flow from the pond into the spillway. As with the previous iteration of the design the culverts were booted to the liner system and liner was extended from the top of the culverts to the crest elevation of 940 m.

The spillway liner system was revised to concrete cloth for the entire spillway. Spillway capacity criteria remain unchanged. Hydraulic calculations for the spillway are provided in FM-017 and revised IFC drawings relevant to the spillway are provided in Appendix 8.

Foundation requirements remained unchanged and the spillway was built on sections of bedrock or dense colluvium.

5.7.2. QA/QC Requirements

Subgrade preparation followed the requirements outlined in the design and Technical Specifications. Loose material was removed and the surface was excavated to dense colluvium or bedrock with Material 2 – Select Fill placed over the graded channel to provide a suitable subgrade and cushion for the Concrete Canvas revetment. QA inspection of the subgrade was performed by BGC and documented in the subgrade approval forms included in Appendix 5.

Representative samples of the concrete cloth were collected by Titan Environmental and sent to Concrete Canvas for destructive testing. The results from this testing are included in Appendix 4.

5.7.3. Construction Completed

The spillway excavation was completed by Pelly. The installation of the HDPE culverts was completed by Ewing on April 3, 2019. Titan Environmental completed the installation of the concrete cloth at the In-Heap Pond Spillway on May 18, 2019.

5.7.4. Minor Modifications and Clarifications to the Design

The following minor modifications were made to the design during construction as discussed in Field Memorandum FM-17.

- The alignment of the In-Heap Pond spillway was revised to optimize cut and fill once subsurface conditions were apparent.
- The use of Concrete Canvas (concrete impregnated liner cloth) was approved for use in the In-Heap Pond spillway.
- At JDS's request, the configuration of the spillway invert culverts were re-evaluated. The original design included concrete box culverts which were replaced with HDPE, corrugated 1200-mm culverts. No changes were made to the spillway capacity criteria.

Additionally, an underdrain was added adjacent to the north side of the spillway to collect seepage observed during construction that could affect the concrete cloth installation. The addition of the underdrain is discussed in CC204-RFI-048 included in Appendix 2.

5.8. Event Pond and Emergency Spillway

5.8.1. Construction Criteria

The Event Pond Emergency Spillway design was revised in 2019 prior to construction. As with the In-Heap Pond Spillway, these changes and the related hydraulic calculations are disused in Field Memorandum FM-017 included in Appendix 3.

The spillway channel sizing, channel alignment, and outlet were revised to account for the replacement of Fabri-Form concrete filled channel lining with Concrete Canvas brand concrete cloth liner. Hydraulic calculations for the spillway are provided in FM-017 and revised IFC drawings relevant to the spillway are provided in Appendix 8.

Foundation requirements remained unchanged and the spillway was built on sections of bedrock or dense colluvium.

5.8.2. QA/QC Requirements

Subgrade inspections and approvals were completed by BGC. The foundation was inspected by BGC to confirm that dense subgrade was achieved.

Representative samples of the concrete cloth were collected by Titan Environmental and sent to Concrete Canvas for destructive testing. The results from this testing are included in Appendix 4.

5.8.2.1. Material 7 – Rockfill.

Material 7 – Rockfill was approved for use in construction of the Event Pond berms. Testing frequencies for these materials were not provided in the Technical Specifications and instead test fills were developed to provide a method specification for use of the materials. The methods for placing and compacting Material 7 are discussed in memorandums CTFM-02 and CTFM-05. The memoranda provide the requirement for moisture conditioning and compaction efforts for use of

these materials. Additionally, protocols and limitations for placing material in extreme cold were developed in Field Memorandum FM-08 to accommodate fill placement in the winter months. These memorandums are included in Appendix 3

Laboratory testing for grain size analysis and moisture/density relationship was not required or practical for Material 7 due to the large fraction material present. However, Tetra Tech provided the following field information on a daily basis:

- Visual confirmation that the material gradation and moisture met the requirements set forth in the applicable test fill.
- Visual confirmation and tracking that the compaction requirements set forth in the applicable test fill were being performed by the Tetra Tech.

5.8.3. Construction Completed

The spillway excavation was completed by Pelly. Titan Environmental completed the installation of the concrete cloth at the Emergency Spillway on May 25, 2019.

5.8.4. Minor Modifications and Clarifications to the Design

The following minor modifications were made to the design during the construction activities.

- The use of Concrete Canvas brand, concrete impregnated liner cloth, was approved for use in the in-heap pond spillway.

5.9. Investigations Completed

Test pits were excavated to identify and delineate the areas of the subgrade with ice rich or frost-susceptible soils as required in the Foundation Improvement Plan. Ice rich and frost susceptible soils were identified and removed from within the Phase 1A Heap Pad area. These areas were confined to the central Ann Gulch drainage. The areas identified as having ice rich or frost susceptible soils were delineated by Pelly's survey crew and excavated by Pelly.

5.10. Liner System

QC for installation of the liner system was performed by Layfield. QA was performed by Tetra Tech. Installation of the In-Heap Pond and Event Pond liner system are summarized in Tetra Tech's QA report included in Appendix 7. The following primary changes to the design criteria were made:

- Conductive backed liner (to allow electrical leak survey) was not used. JDS asked to use normal liner due to the lack of available supply of conductive backed liner for the project. The leak testing was changed to hydro-testing for the In-Heap Pond and Event Pond. This is discussed in EPCM-RFI-022.
- Seaming liner at temperatures below 0°C was allowed if Layfield could show through prequalifying test that seams comply with project specifications. Minus 10°C is the lowest temperatures that geomembrane is allowed to be unrolled. These changes are discussed in BGC-RFI-016.

- BGC reviewed and approved the liner to pipe boot installation method proposed by Layfield. This is discussed in CC204-RFI-013.

Other variations to the design are discussed in Section 3.10 of Appendix 7.

6.0 RECORD DRAWINGS

Record drawings are included in Appendix 9 and are based on as-built survey data provided by JDS. Electronic files of the record drawings are available upon request from BGC and files of raw survey data are available through JDS.

Survey control for all earthworks was performed by Pelly's geomatics contractor, Eshemuta. Pelly completed record drawings for all major earthworks, including the following:

- Confining Embankment foundation preparation
- HLF subgrade preparation below elevation 940 m
- HLF subgrade preparation above elevation 940 m
- HLF underdrain system below 940 m
- HLF underdrain system above 940 m
- HLF ODF placement below 928 m
- In Heap Pond Spillway construction
- In-Heap Pond Construction and Emergency Spillway
- PLS piping layout below 940 m
- PLS piping layout above 940 m

Survey control for all work performed by Heavy North and Layfield was performed by JDS via their subcontractor Underhill. Record drawings provided by JDS or their contractors included:

- Steel LDRS Piping
- Steel PLS Piping
- Liner installation

7.0 REQUESTS FOR INFORMATION AND RESPONSES

A list of RFIs responded to and/or created by BGC during the 2018 and 2019 construction is included below. It should be noted that only RFI's developed for and answered by BGC are included.

RFI	From	Date Closed	Description
BGC-RFI-001	BGC	08/02/18	Request for plan to protect construction from surface water erosion.
BGC-RFI-002	BGC	06/01/18	Request for underdrain construction plan.
BGC-RFI-003	BGC	06/27/18	Request for materials management plan.
BGC-RFI-004	BGC	06/18/18	Request for testing of underdrain header pipes and closure pipe.
BGC-RFI-006	BGC	06/26/18	Request for a Phase 2 Water Management Plan
BGC-RFI-007	BGC	Obsolete	Request for a Material 2 reserve plan. RFI became obsolete once the use of Material 2 was no longer needed.
BGC-RFI-008	BGC	07/02/18	Request for embankment construction work plan.
BGC-RFI-009	BGC	Obsolete	Request for an embankment material zoning plan. This RFI became obsolete once BGC provided a material type recommendation.
BGC-RFI-010	BGC	NA	BGC provided a redesign of the embankment east crest and access road. This redesign was provided at the request of JDS. BGC provided the response as an RFI requesting acknowledgement. JDS verbally acknowledged the design change and directed Pelly to construct it. However, no official response was provided to formally close this RFI.
BGC-RFI-011	BGC	NA	BGC provided a redesign of the embankment west crest and access road. This redesign was provided at the request of JDS. BGC provided the response as an RFI requesting acknowledgement. JDS verbally acknowledged the design change and directed Pelly to construct it. However, no official response was provided to formally close this RFI.

BGC-RFI-012	BGC	NA	BGC provided a redesign of the central portion of the embankment crest to accommodate construction equipment. This redesign was provided at the request of JDS. BGC provided the response as an RFI requesting acknowledgement. JDS verbally acknowledged the design change and directed Pelly to construct it. However, no official response was provided to formally close this RFI.
BGC-RFI-013	BGC	NA	Summary of construction method for installation of the PLS and LDRS piping. This method was developed jointly by BGC, JDS, and Heavy North. The construction method was implemented, however, this RFI receipt was not formally acknowledged and, therefore, it was not formally closed.
BGC-RFI-014	BGC	NA	Clarification to EGHLF-XD-05-03 (Event Pond Underdrain) at JDS's request. The clarifications were informally acknowledged by JDS. The RFI receipt was not formally acknowledged and, therefore, it was not formally closed.
BGC-RFI-015	BGC	NA	Clarification to EGHLF-XD-05-05 (Closure Sump Piping) at JDS's request. The clarifications were informally acknowledged by JDS. The RFI receipt was not formally acknowledged and, therefore, it was not formally closed.
BGC-RFI-016	BGC	NA	Clarification to Section 4.1.7.2 of the Technical Specifications (placement of liner in cold weather) at JDS's request. The clarifications were informally acknowledged by JDS. The RFI receipt was not formally acknowledged and, therefore, it was not formally closed.
BGC-RFI-017	BGC	NA	Clarification to EGHLF-XD-03-03 (event pond underdrains) at JDS's request. The clarifications were informally acknowledged by JDS. The RFI receipt was not formally acknowledged and, therefore, it was not formally closed.
BGC-RFI-018	BGC	10/18/18	Clarification to requirements for permafrost removal at the Event Pond at JDS's request.

BGC-RFI-019	BGC	10/18/18	Clarification to EGHLF-XD-05-04 and 05 at JDS's request.
BGC-RFI-020	BGC	10/17/18	BGC request for survey as-built drawings for closure sump steel plate.
BGC-RFI-021	BGC	Obsolete	Request for a water management plan for the Event Pond construction. This RFI was made obsolete by BGC-RFI-022.
BGC-RFI-022	BGC	10/18/18	BGC requested a water management plan for the Event Pond Construction.
BGC-RFI-023	BGC	10/21/18	BGC requested the source for material to be used as fill for construction of the Event Pond.
BGC-RFI-024	BGC	10/21/18	BGC requested a stockpile management plan for the material planned for construction of the Event Pond.
BGC-RFI-025	BGC	10/21/18	BGC requested a winterization plan for the Event Pond construction.
BGC-RFI-026	BGC	NA	ID not used due to RFI mis-numbering.
BGC-RFI-027	BGC	NA	At JDS's request BGC reviewed the suitability of ROM road material and substation ballast as ODF.
BGC-RFI-028	BGC	NA	Summary of a construction method developed by BGC, JDS, and Heavy North to place ODF and install PLS sump piping. The RFI receipt was not formally acknowledged and, therefore, it was not formally closed.
BGC-RFI-029	BGC	01/17/19	BGC requested the final spillway invert elevation required by Victoria Gold in order to finalize the spillway invert re-design.
BGC-RFI-030	BGC	01/29/19	BGC provided recommendations based on gradation and field permeability tests on an ODF produced from a source located within the ADR quarry that was not previously used.
BGC-RFI-031	BGC	02/04/19	Revision to the primary collector pipe spacing and the use of ODF sourced from the 1285-01 bench.
BGC-RFI-032	BGC	01/31/19	Rejection of the use of Coletenche liner for use as liner in the spillways until further information is provided.

BGC-RFI-033	BGC	04/07/19	Designs for winterizing the Event Pond underdrains. Includes winterization that reduced the size of the Event Pond LDRS sump.
BGC-RFI-034	BGC	04/17/19	Addition of a finger drain from the 990-m bench to the lateral drain on the west side of the Phase 1A heap Pad footprint.
BGC-RFI-035	BGC	04/18/19	Approval to use HDPE pipe for the inclined riser pipes at the Event Pond.
BGC-RFI-036	BGC	04/20/19	Design for the header trench transition to the monitoring vault at the HLF Confining Embankment.
CC204-RFI-006	Pelly	05/10/18	The use of blast rock for Material 3 or Material 7 in the Embankment and Event Pond fills.
CC204-RFI-007	Pelly	05/10/18	Clarification of closure drain pipe specifications.
CC204-RFI-008	Pelly	05/23/18	The use of electrofusion for underdrain pipes.
CC204-RFI-009	Pelly	05/17/18	Request for material quantities take-off.
CC204-RFI-010	Pelly	05/15/18	Clarification to horizontal seams in geotextile used in the underdrains.
CC204-RFI-012	Pelly	05/19/18	LDRS piping clarifications.
CC204-RFI-013	Pelly	05/17/18	Review of alternative designs for the liner to piping boots.
CC204-RFI-014	Pelly	05/17/18	Clarification related to the geotextile in the underdrains.
CC204-RFI-015	Pelly	05/25/18	Clarification to the underdrain piping.
CC204-RFI-017	Pelly	05/31/18	Redesign of embankment toe drain.
CC204-RFI-018	Pelly	05/26/18	BGC provided a map of boreholes within the footprint of the HLF.
CC204-RFI-020	Pelly	05/31/18	Clarification to the closure sump.
CC204-RFI-021	Pelly	06/03/18	Clarification to the In-Heap Pond subgrade.
CC204-RFI-022	Pelly	06/16/18	DWG created and provided for material zoning in the embankment.
CC204-RFI-030	Pelly	06/15/18	Clarification to LDRS piping.
CC204-RFI-031	Pelly	06/03/18	Request to review off the shelf alternative to split couplers used on collector pipes.

CC204-RFI-032	Pelly	06/01/18	BGC provided guidance on plugging monitoring wells within the footprint of the HLF.
CC204-RFI-033	Pelly	06/11/18	Clarification to LDRS piping.
CC204-RFI-034	Pelly	06/17/18	Clarification to the closure sump plate and rejection of the bolting plates together.
CC204-RFI-036	Pelly	06/14/18	Clarification on criteria for adding additional finger drains under the embankment.
CC204-RFI-037	Pelly	06/25/18	Clarification and flexibility on unplanned underdrain finger design. Review of construction methods and minor design revisions presented by Pelly.
CC204-RFI-044	Pelly	10/9/18	Clarification on rub sheets.
CC204-RFI-045	Pelly	12/01/18	Review of flanges proposed by Pelly for the PLS piping.
CC204-RFI-046	Pelly	12/07/18	Review of alternative materials proposed by Pelly for use in the collector piping.
CC204-RFI-047	Pelly	03/01/19	Approval to use CAT 745C haul trucks to place ODF.
CC204-RFI-048	Pelly	04/07/19	Finger drain design on the northern slope of the Event Pond.
CC204-RFI-049	Pelly	04/06/19	Approval of a 2:1 slope directly north of the In-Heap Pond Spillway near the spillway outlet.
CC206-RFI-017	Heavy North	12/14/18	Review of solution to improperly fabricated flanges for the PLS piping.
EPCM-RFI-012	JDS	05/11/18	Redesign of how the embankment toe and groin can be keyed in given the absence of bedrock foundation.
EPCM-RFI-022	JDS	07/11/18	Review of changes to the liner system proposed by JDS.
EPCM-RFI-040	JDS	08/01/18	BGC reviewed embankment zoning proposed by JDS and Pelly.

8.0 TECHNICAL MEMORANDUMS

A total of 12 technical memorandums were provided to JDS by BGC in 2018. A list of Technical Memorandums developed in 2018 is included below. Technical Memorandums are included as Appendix 3.

Memorandum	Date Issued	Description
CTFM-01	06/30/18	Material 2 test fill discussion.
CTFM-02		Material 7 test fill discussion.
CTFM-03	08/20/18	Material 3 test fill discussion.
CTFM-04	08/21/18	Material 3 test fill discussion.
CTFM-05		Material 7 test fill discussion. Included use of a loaded 777 haul truck for compaction and compaction during cold weather.
FM-01	9/12/17	Memo requested by JDS providing a description and photos of acceptable Type 3 bedrock foundation for the embankment.
FM-03	06/13/18	Discussion of the need for finger drains beyond the initial design in response to groundwater seeps observed throughout the HLF footprint
FM-04	06/21/18	Pipe leak test results and discussion.
FM-06	7/26/18	Design of the figure drain use to control the artesian groundwater seep.
FM-07	08/19/18	Procedure to conduct a test fill to determine how to use heavy equipment over the liner.
FM-08	10/27/18	Criteria for placement of material during extreme cold temperatures.
FM-09	10/01/18	2018 Instrumentation equipment and materials discussion.
FM-010	12/07/18	Revetment Criteria Memorandum
FM-011	12/14/18	BGC 2018 demobilisation discussion.
FM-012	04/12/19	Observation of Switchback 5 material for use as ODF
FM-013	04/27/19	In-Heap Pond Leak Test
FM-014	05/05/19	Field screening procedures for ODF sources
FM-015	05/02/19	Event Pond Leak Test

FM-016	05/18/19	Summary of the In-Heap and Event Pond leak tests.
FM-017	05/26/19	Revision to the in-heap pond spillway alignment.

9.0 CONSTRUCTION WORK PLANS

The following CWPs related to the Underdrain System Construction were developed by Pelly and reviewed by BGC and JDS.

- CC204 CWP Embankment Underdrain Leak Test: Work plan detailing how leak testing was to be performed and documented on the underdrain header pipes and closure sump pipe.
- CC204 CWP Underdrain Installation Water Management: A work plan detailing measures to control surface water erosion of completed and ongoing drain construction.
- CC204 CWP HLF Embankment Underdrain Installation: A work plan detailing how underdrain construction was to be performed, approved, and documented.
- CC204-CWP HLF Water Management: Work plan detailing water management during construction foundation preparation at the Confining Embankment.
- CC204-CWP Unsuitable Material Removal: Work plan detailing excavation of unsuitable material within the Confining Embankment footprint.
- CC204-CWP Embankment Phase 2 Water Management: Work plan detailing water control planning once embankment fill placement begins.
- CC204-CWP Embankment: Work plan detailing methods for construction of the HLF Confining Embankment.
- CC204-CWP Embankment Phase 2 Water Management: Work plan detailing water control planning once embankment fill placement begins. Also included water management after subgrade preparation at the in-heap pond.

10.0 DAILY REPORTING AND PHOTOGRAPHS

Daily reports, including daily construction photographs generated by BGC for QA and on-site engineering; Tetra Tech for earthworks QC services; and JDS's EPCM daily reports are included in Appendix 6.

Daily reports generated by Tetra Tech for liner installation QA are included in Appendix 7.

APPENDIX 1
Construction Work Plans

PELLY WORK PLANS

Work Plan:	HLF Embankment	**Revision:** 03
Location:	HLF Embankment approx. 1.5km Dublin Road	**Date:** 2018-05-09

OBJECTIVE

The objective of this CWP is to outline the scope of work pertaining to the HLF Embankment while highlighting methods to minimize environmental impact and safety hazards.

SUMMARY

The scope of work includes:

Item No.	Description
0.00	Water management including installation of sediment control fences and direction of drainage to downstream sump where appropriate and practical
4110.1.01	Clearing and grubbing of all trees, brush and surface debris to the embankment limits provided by the client
4110.1.02	Stripping of all topsoil within the HLF embankment footprint to be stockpiled for movement to the designated topsoil stockpile
2220.5.01	Supply and install culvert for Dublin Creek temporary crossing - Completed
4110.1.07	Construction of heap leach area sediment basin at base of HLF embankment - Completed
4110.1.03	Excavate HLF embankment footprint to type 3 rock
4110.1.04	Handle, place and compact embankment fill, including stockpiling as required
4110.1.05	Excavation from within Heap Leach to embankment (other)
4110.1.06	If unsuitable, premium cost to haul to waste
4110.5.01 4110.5.02 4110.5.03	Supply and install heap leach under drain system pipes including trenching, geotextile, bedding and backfill

Work Plan:	HLF Embankment	**Revision:** 03
Location:	HLF Embankment approx. 1.5km Dublin Road	**Date:** 2018-05-09

SAFETY

Potential Hazard	Precautions and Actions
Heavy Equipment	JHA's/SOP's, Radios, PPE
Workplace Congestion	Maintain radio communication, limit foot traffic in area
Steep Slopes	Stay within operator's abilities, operate on slopes in dry conditions when possible and must travel facing down the slope.

ENVIRONMENT

Critical Items	Precautions and Actions
Water Management Plan	Sediment control fences will be placed on boundaries of work areas in proximity to waterways; direction of water to downstream sump where appropriate and practical
Spill Containment	Equipment spill kits, preshift inspections before operating, work area spill kit

HOLD POINTS

Hold Point	Description	Responsible	Initial
1	Survey to flag out clearing limits for embankment footprint	Pelly	
2	Starting survey asbuilt of stripped embankment footprint to be agreed upon by Pelly and JDS before excavation	Pelly/JDS	
3	Approval of ITP-001 for HLF embankment excavation	Pelly/JDS	
4	Inspection of type 3 rock within embankment excavation following procedures outlined in ITP-001(continuous)	BGC	
5	Final survey asbuilt of approved excavation section outlined in ITP-001 to be agreed upon by Pelly and JDS	Pelly/JDS	
6	Installation of C-3 culvert Dublin Creek temporary crossing to gain access to Topsoil B Stockpile	Pelly	
7	Approval of ITP-TBD for HLF embankment fill	Pelly/JDS	
8	Compaction testing of embankment fill following procedures outlined in ITP-TBD (continuous)	Tetra Tech	
9	Approval of ITP-002 for HLF underdrain system	Client Rep	
10	~~Required testing of piping installation following procedures as outlined in ITP-TBD~~ Approval of ITP-003 for verification of closure and underdrain system installation.	Client Rep	

SCOPE OF WORK

Item No.	Description	Responsible	Hold Point
	Construction Strategy 1. Water management – sediment fence installation, sediment pond construction and drainage control 2. Clearing and grubbing of all trees, brush and surface debris 3. Stripping of topsoil to be loaded and hauled to topsoil stockpile 4. Placement of C-3 culvert for temporary Dublin Creek crossing and		

Item No.	Description	Responsible	Hold Point
	culvert in Eagle Pup Creek to gain access to topsoil B stockpile 5. Excavate HLF embankment footprint to type 3 rock 6. Excavate underdrain trench (coincident with point 5), place bedding, pipes, geotextile, and backfill 7. Handle place and compact excavated material as embankment fill 8. Excavate, handle, place and compact heap leach sump area cut to embankment fill		
0.00 4110.1.07	1. <u>Water Management</u> 1.1. Small excavator will assist in installing sediment control fences on boundaries of work areas following specifications of Water Management Plan drawing G1.03 1.2. Excavate sediment pond at base of embankment 1.3. Excavate a diversion ditch above the working area 1.4. Water will be managed by Installation of pipes, ditches, and pumping when necessary 1.5. Direct drainage from within work areas to downstream sump where appropriate and practical	Pelly	
4110.1.01	2. <u>Clearing and Grubbing</u> 2.1. Survey to layout clearing limits for embankment provided by Client 2.2. D10 dozer to push trees, brush and surface debris to stockpile at base of slope; D6 dozer may be used in event that slope is too soft for D10 2.3. Grubbing piles will be windrowed along the base of the slope and levelled in place	Pelly	1
4110.1.02	3. <u>Stripping of topsoil and haul to stockpile</u> 3.1. D10/D6 dozer to strip topsoil down to rock and stockpile at base of slope; stockpiles to be staged along slope where excessive dozer push is required 3.2. Excavator to load topsoil into haul truck and transport to topsoil B (or other) stockpile approved by Client	Pelly	
2220.5.01	4. <u>Placement of C-3 culvert and culvert extension</u> 4.1. Dozer work required on north and south approach crossings to make suitable for haul traffic 4.2. Load and haul culvert bedding material from Pelly Laydown borrow to culvert placement area 4.3. C-3 Culvert to be placed within Dublin Creek at approx. 1.75km off of Dublin Road; culvert placement to follow specifications in Water Management Plan drawing C1.07 4.4. 800mm culvert will be placed within Eagle Pup creek extending current crossing to allow for haul truck access to topsoil B stockpile	Pelly	6

Item No.	Description	Responsible	Hold Point
4110.1.03 4110.1.06	5. Excavate HLF embankment to type 3 rock (approx. 138,000 m^3) 5.1. Starting survey asbuilt of stripped footprint within embankment clearing limits before excavation 5.2. Creation and approval of ITP-001 for HLF embankment excavation 5.3. Dozer to push embankment material down to type 3 rock and stockpile; excavator will be used where slopes exceed dozer capability and within areas deemed more suitable 5.4. Excavator to load haul trucks with excavated material and transport to suitable stockpile within embankment footprint 5.5. Excavated material deemed unsuitable by BGC Engineer will be loaded, hauled and placed to unsuitable stockpile outside of the embankment footprint. 5.6. Inspection, testing, and documentation to follow procedure outlined in ITP-001 5.7. Final survey asbuilt of excavated embankment footprint		2 3 4 5
4110.5.01 4110.5.02 4110.5.03	6. Installation of underdrain system 6.1. Coincident with point 5 in areas where underdrain system travels through the embankment 6.2. Creation and approval of ITP-002/003 for HLF underdrain system 6.3. Excavate underdrain trench to be field fit following existing geology and procedures out lined in ITP-002 6.4. Lay geotextile along pipe trench in parallel sections 6.5. Place select drain fill pipe base material 6.6. Fuse and place pipe into bedding following specifications outlined in IFC drawings 6.7. Placement of select drain fill around pipes 6.8. Close off geotextile envelope with minimum 0.5m overlap 6.9. Inspection, testing, and documentation to follow procedure outlined in ITP-003		9 10
4110.1.04	7. Handle, place and compact embankment fill (approx. 725,000 m^3) 7.1. Creation and approval of ITP-TBD for HLF embankment fill 7.2. Excavator to load haul trucks with excavated/stockpiled material to haul to placement position 7.2.1 Estimated Rockfill requirement– 407,000m^3 7.2.2 Estimated Structural fill requirement – 318,000m^3 7.3. The Rockfill section will be constructed in 0.9m thick lifts (subject to test fill results) with maximum particle size no greater than 2/3 the loose lift fill thickness 7.4. Test fills may be conducted to determine if a greater Rockfill lift thickness is permissible 7.5. The Structural fill section will be constructed in 0.3m thick lifts		7 8

Item No.	Description	Responsible	Hold Point
	with maximum particle size no greater than 2/3 the loose lift fill thickness 7.6. The Rockfill will key into the Structural fill horizontally by 1.0m for every 0.9m incremental vertical lifts 7.7. Every compacted lift will be scarified prior to placement of the next lift 7.8. Smooth and Grid drum packers to pack lift material 7.9. Inspection, testing and documentation to follow procedure outlined in ITP-TBD		
4110.1.04 4110.1.05 4110.106	8. <u>Excavate, handle, place and compact heap leach sump area to embankment fill</u> 8.1. Sump area will be excavated to design grade and load the unsuitable material to a stockpile. 8.2. Excavator to load haul trucks with stockpiled material to haul to placement position 8.3. Dozer will be used to spread material in loose lift thickness specified in drawings 8.4. Excavated material deemed unsuitable by BGC Engineer will be loaded, hauled and placed to unsuitable stockpile outside of the embankment footprint 8.5. Inspection, testing and documentation to follow procedure outlined in ITP-TBD (coincident with point 7)		

Work Plan:	HLF Embankment Phase 2 Water Management and Construction Plan	**Revision:**	01
Location:	HLF Embankment approx. 1.5km Dublin Road	**Date:**	2018-06-26

OBJECTIVE

The objective of this CWP is to outline the water management and construction sequence of the Heap Leach Embankment.

SUMMARY

i) The scope of work includes:

1. Excavate 950-drainage ditch
2. Excavate Underdrain Header and Lateral pipe Trenches
3. Construct Temporary Containment Berms
4. Excavate Temporary Sumps
5. Install Underdrain Header Pipes
6. Install Underdrain Lateral Pipes
7. Install Riser Pipe
8. Well Decommissioning (Completed)

ii) Work Sequence

iii) Conceptual Drawing

SAFETY

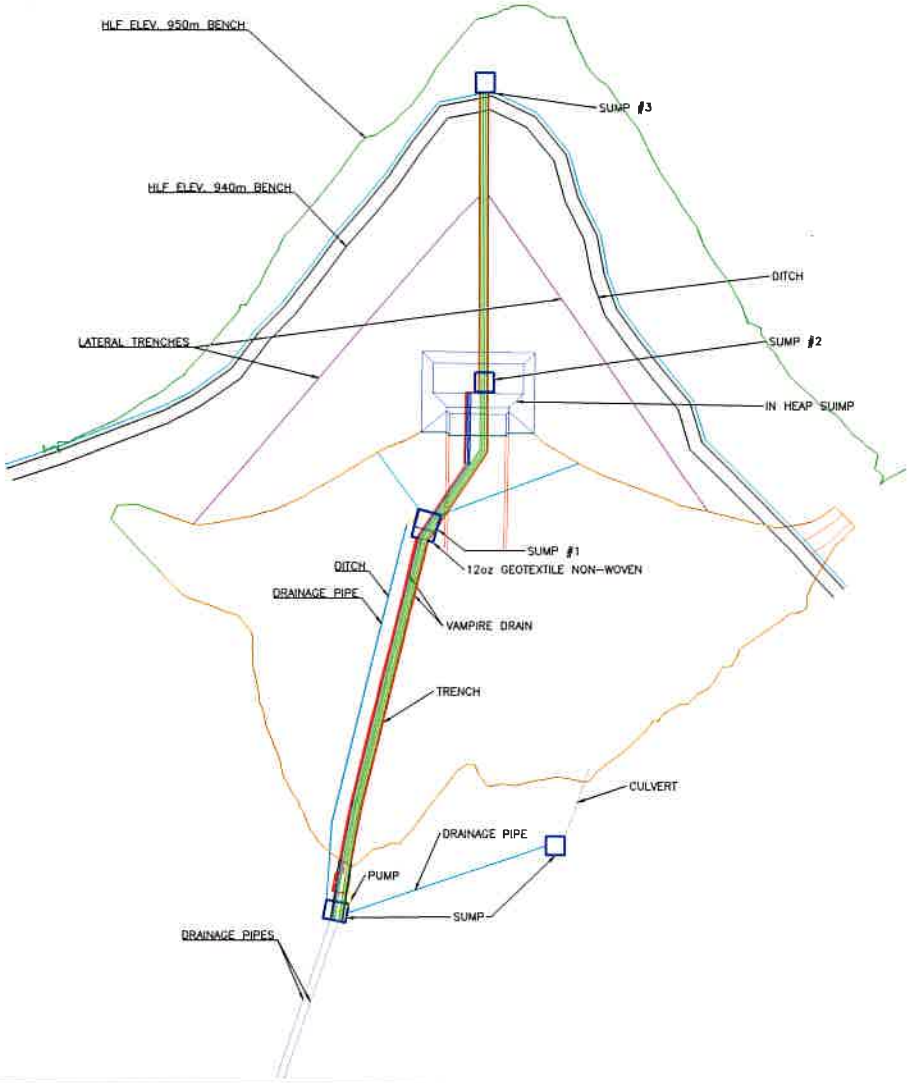
Potential Hazard	Precautions and Actions
Heavy Equipment	JHA's/SOP's, Radios, PPE
Workplace Congestion	Maintain radio communication
Steep Slopes	Stay within operator's abilities, operate on slopes in dry conditions when possible and must travel facing down the slope.

ENVIRONMENT

Critical Items	Precautions and Actions
Spill Containment	Equipment spill kits, preshift inspections before operating, work area large spill kit

SCOPE OF WORK

Description	Responsible
1. **Excavate the 950-drainage ditch** • Topsoil to be stripped and placed above the intended ditch area • Excavate a ditch to bedrock along the perimeter of the work area • The drainage ditch will provide a positive drainage toward the east side	Pelly
2. **Excavate Underdrain Header and Lateral pipe trenches** • Excavate Header pipe trenches to be contained within bedrock foundation • The header trench shall be excavated upstream to the 950m elevation • The trenches shall be excavated as per IFC drawing EGHLF-XD-03-04 • Excavate Lateral pipe trenches as per drawings from finish grade • All excavation prior to backfill to be approved by BGC	Pelly BGC
3. **Construct Temporary Containment Berms** • Construct within the Header trench as needed while progressing the construction from the bottom to the top • The upstream side of the berm shall be lined with a geomembrane liner • A back-up pump will be on standby ready to convey water safely away from construction activities in the HLF area when required • The temporary berm will be removed when it's no longer needed	Pelly



Description	Responsible
4. **Excavate Temporary Sumps** • Excavate temporary sump(s) as needed • Minimum dimensions: 5m x 5m x 1m deep (max. 2m deep) • Trenches will be excavated to direct all downslope water into the temporary sump • A back-up pump will be on standby ready to convey water safely away from construction activities in the HLF area when required • The temporary sump will be backfilled[1] when it's no longer needed	Pelly
5. **Install Underdrain Header Pipes** • The underdrain header pipes shall be installed as per IFC drawing EGHLF-XD-03-03 and 03-04	Pelly BGC
6. **Install Underdrain Lateral Pipes** • The underdrain lateral pipes shall be installed as per IFC drawing EGHLF-XD-03-03 and 03-04	Pelly BGC
7. **Install Riser pipe(s)** • Install geomembrane liner in the sump or dam • Connect the Riser pipe(s) to the underdrain pipe(s) • Place rip-rap or cobble stones in the sump area • Remove riser pipe when it's no longer required	Pelly
8. **Well Decommissioning (Completed)** • See attached completion reports	Pelly BGC

Notes:

1. Pelly has identified potential water problem that could affect the backfill compaction requirement of the structural/rock fill which will require input from BGC

WORK SEQUENCE

1. Establish the 950 drainage ditch
2. Install a temporary berm/sump at STN 1+90 (Sump 1)
3. Install five (5) – 150mm SDR 17 HDPE pipes from STN 0+29 to STN 1+80
4. Connect the Riser pipe to an underdrain header pipe
5. Excavate the header trench upstream beyond the Embankment footprint (STN 3+70)
6. Install a temporary berm/sump at STN 3+60 (Sump 2)
7. Install four (4) – 150mm SDR 11 HDPE pipes from STN 1+80 to STN 3+50
8. Install one (1) – 150mm SDR 11 HDPE pipe from STN 1+80 to STN 2+73
9. Install three (3) – 150mm SDR 11 HDPE pipes from STN 2+73 to STN 3+28
10. Disconnect the Riser pipe at STN 1+80 and reconnect at STN 3+50
11. Install a temporary berm/sump at STN 5+10 (Sump 3)
12. Excavate the header trench upstream to STN 5+00
13. Excavate the lateral trenches
14. Install four (4) – 150mm SDR 11 HDPE pipes from STN 3+50 to STN 5+00
15. Install two (2) - 100mm ADS N12 Perforated pipes to connect to the header drain pipes
16. Disconnect the Riser pipe at STN 3+50 and reconnect at STN 5+00

3. **HLF Embankment Toe Redesign ITP approval** • Signed BGC approval of the HLF Embankment Toe Redesign ITP	Pelly BGC
4. **Material list** • Select Drain Fill • Non-woven Geotextiles • SDR11 HDPE pipes • SDR17 HDPE pipes	Pelly
5. **Equipment list** • 49t Excavator – Load Select Drain Fill • 40t ADT – Haul Select Drain Fill • 25t Excavator – Placement Select Drain Fill	Pelly

Description	Responsible
6. Haul Route • The 40t ADT will haul from Nuway stockpile to the trench via Dublin Gulch then exit via Eagle-Pub road back to the Nuway stockpile	Pelly
7. Work Sequence • Pelly will work from the bottom to the top • Surveyors will layout station numbers every 10m • Geotextiles will be installed with the seams running parallel to the trench • Each geotextile overlay must maintain a 0.5m overlap • Select Drain Fill shall be directly hauled from the Nuway Stockpile to the trench to minimize dilution • Select Drain fill to be used as a ballast • Minimum 0.1m of Select Drain fill material to be placed on top of the geotextiles • Install five (5) – 150mm SDR17 HDPE pipes from STA 0+29 to STA 1+80 • Install four (4) – 150mm SDR 11 HDPE pipes from STA 1+180 to STA 3+93 • Install one (1) – 150mm SDR 11 HPDE pipe from STA 1+180 to STA 2+73 • Install three (3) – 150mm SDR 11 HDPE pipes from STA 2+73 to STA 3+28 • Minimum 0.5m of Select Drain fill material to be placed on top of the HDPE pipes • Finish wrapping the Select Drain Fill with the geotextiles • Backfill 1.0m of compacted Structural Fill on top of wrapped geotextiles	Pelly

Work Plan:	HLF Embankment Underdrain installation Water Management Plan	**Revision:**	03
Location:	HLF Embankment approx. 1.5km Dublin Road	**Date:**	2018-06-01

OBJECTIVE

The objective of this CWP is to outline the water management during the installation of the Underdrain pipes at the Heap Leach Embankment.

SUMMARY

The scope of work includes:

1. Excavate a drainage ditch at the 940m elevation around the HLF perimeter
2. Excavate a sump outside the Embankment area
3. Create temporary sumps as needed within the Embankment area
4. Develop a vampire drain
5. Install Raiser pipe(s)

SAFETY

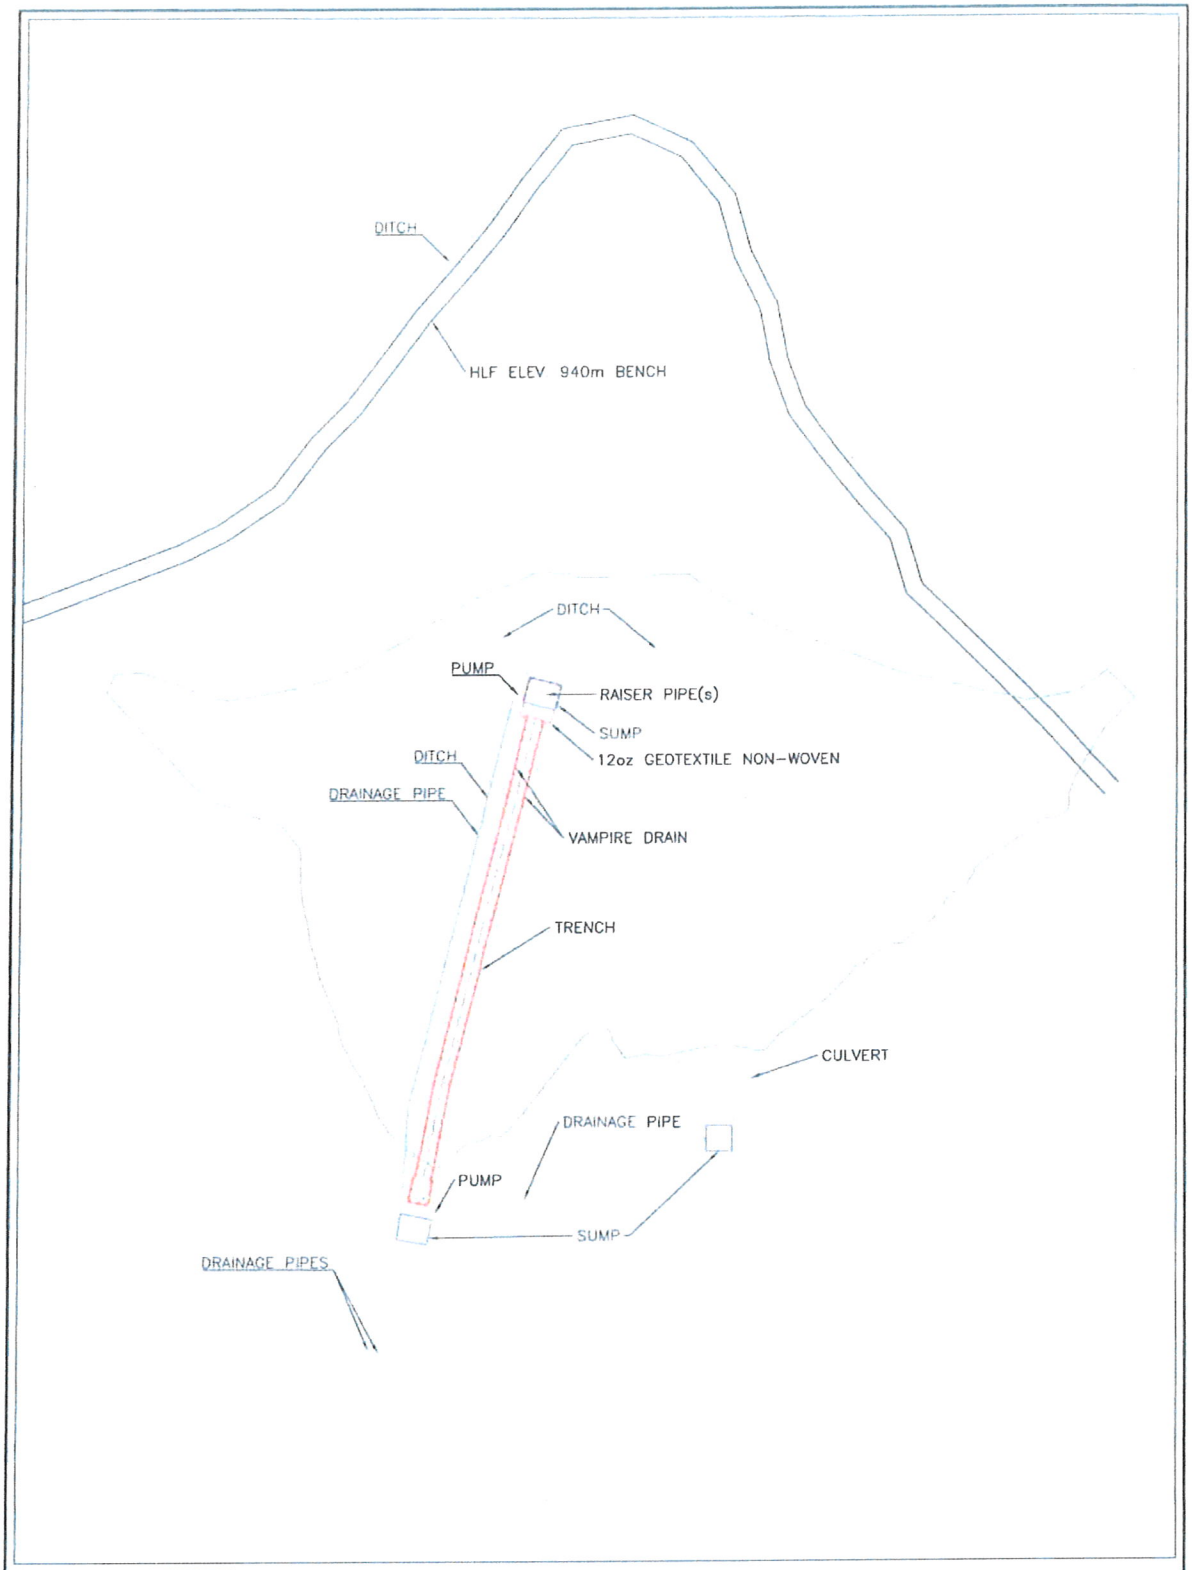
Potential Hazard	Precautions and Actions
Heavy Equipment	JHA's/SOP's, Radios, PPE
Workplace Congestion	Maintain radio communication, limit foot traffic in area

Work Plan:	HLF Embankment Underdrain installation Water Management Plan	**Revision:**	03
Location:	HLF Embankment approx. 1.5km Dublin Road	**Date:**	2018-06-01

Potential Hazard	Precautions and Actions
Steep Slopes	Stay within operator's abilities, operate on slopes in dry conditions when possible and must travel facing down the slope.

ENVIRONMENT

Critical Items	Precautions and Actions
Spill Containment	Equipment spill kits, preshift inspections before operating, work area large spill kit



SCOPE OF WORK

Description	Responsible
1. **Excavate the 940-elevation drainage ditch** • Excavator to strip the topsoil and place above the intended ditch area • Excavator to excavate a 1m deep ditch along the perimeter of the HLF area starting at the 940m elevation • The drainage ditch will provide a positive drainage (min. 2%) toward the east side • The 940m ditch will tie-in with the existing 1010m ditch at the east side of the embankment	Pelly
2. **Excavate a sump outside the Embankment area** • Excavate a sump at the south side of the Embankment toe area • Extend the existing 6" pipe (west side of the underdrain trench) to the new sump • Install an 8" pipe along the western side outside the embankment toe to capture surface water • A submersible pump will be use to pump the water from the new sump to the existing 12" pipes (to the Exfiltration sump)	Pelly
3. **Create Temporary sumps within the Embankment area** • Excavate temporary sump(s) into the Type 3 material within the Embankment area as needed • The location of the sump(s) must be approved by BGC • Minimum dimensions: 10m x 10m x 1m deep (max. 2m deep) • Two trenches will be excavated to direct all downslope water into the temporary sump • A pump will be on standby ready to relocate the water directly into the two 12" pipes (Exfiltration sump) when necessary • The temporary sump will be backfilled[1] using structural fill when it's no	Pelly

Description	Responsible
longer required	
4. <u>Develop a vampire drain</u> • Excavate a 30cm x 30cm deep vampire drain on both sides of the underdrain trench • The vampire drain will be backfilled using Select Drain Fill when it's no longer required	Pelly
5. <u>Install Riser pipe(s)</u> • Excavate a trench between the temporary sump and the underdrain pipe • Install geotextile in the sump • Connect the Riser pipe(s) to the underdrain pipe(s) • Backfill the trench after connecting the Riser pipe(s) to the underdrain pipe(s)	Pelly

Notes:

1. Pelly has identified potential water problem that could affect the backfill compaction requirement of the structural fill that will require input from BGC

Work Plan:	HLF Embankment Underdrain Pipe Leak Test	**Revision:**	0
Location:	HLF Embankment approx. 1.5km Dublin Road	**Date:**	2018-06-20

OBJECTIVE

The objective of this CWP is to outline the procedure and provide results of a leak test to be completed on the underdrain pipe(s) to be installed within the HLF Embankment in Response to BGC RFI-004.

SUMMARY

The scope of work includes:

1. Test pipe for leaks following guidelines outlined in ASTM F2164-13
2. Monitor and record test results
3. Approval of tested pipe

SAFETY

Potential Hazard	Precautions and Actions
Outlined in attached JHA	Job Hazard assessment completed for work to be done

SCOPE OF WORK

Description	
1. **Test pipe for leaks** **Test Pipe:** The test pipe will consist of approx. 150m length of HDPE SDR 17 pipe to be used as the closure pipe between station 0+29.3 (upstream vault contact) and 1+81.4 SDR 17 to SDR 11 connection as per drawing EGHLF-XD-03-05. • Pipe leak test will be completed guided by procedures and safety precautions included in ASTM F2164-13 (attached). Most recently fused pipe will be selected as a spot test to prove quality of welds and free of any leaks. In the event that the selected pipe fails the procedure, all pipes will then have to be tested as quality assurance. **Procedure:** • Flanges will be fused onto the selected pipe consisting of a cap and gasket to seal pressure at one end and introduce water and pressure into the other end. • The pipe will be placed into a confining ditch where all welds in question are visible. Pipe will be placed in a constant graded position to minimize undulations and air pockets. • The pipe will be filled with water to capacity. • Pneumatic pressure will be introduced into the pipe in stages of 20 – 30 psi up 100 psi agreed upon by BGC representative. Each stage must sustain constant pressure for 15 minutes while remaining free of any leaks. • The pipe will be required to sustain 100 psi of constant pressure and be	

Work Plan:	HLF Embankment Underdrain Pipe Leak Test	**Revision:** 0
Location:	HLF Embankment approx. 1.5km Dublin Road	**Date:** 2018-06-20

Description	
free of any leaks for a period of 4 hours. • Pressure will be reduced to a constant pressure of 90 psi for 1 hour while remaining free of any leaks. • Pipe to be drained of water and marked as the tested pipe to be used as the closure pipe during construction.	
2. **Monitor and record test results:** • Pressure was introduced into pipe in stages up 100 psi remaining free of any leaks • Pipe sustained 100 psi of constant pressure for 4 hours while remaining free of any leaks • Pressure was reduced and pipe sustained 90 psi of constant pressure for 1 hour while remaining free of any leaks	Pelly BGC D.S. RM D.S. RM D.S. RM
3. **Approval of tested pipe:** • Approved tested pipe has been flagged to be used as the closure pipe during HLF Embankment Underdrain Construction **Signatures of Approval:** Roy Morlan Senior Engineering Geologist/Geotechnical Engineer BGC	**Date** June 21, 2018 **Signature**

Work Plan:	HLF Embankment Unsuitable Material Removal	**Revision:**	01
Location:	HLF Embankment approx. 1.5km Dublin Road	**Date:**	2018-06-29

OBJECTIVE

The objective of this CWP is to outline the scope of work pertaining to the removal and dumping of unsuitable material from the HLF Embankment while highlighting methods to minimize environmental impact and safety hazards.

SUMMARY

The scope of work includes:

1. Environmental Bird Survey
2. Install Silt Fencing
3. Clear Dump Area
4. Construct Dump
5. Placement of Unsuitable Material

SAFETY

Potential Hazard	Precautions and Actions
Heavy Equipment	JHA's/SOP's, Radios, PPE
Workplace Congestion	Maintain radio communication, limit foot traffic in area
Steep Slopes	Stay within operator's abilities, operate on slopes in dry conditions when possible and must travel facing down the slope.

Work Plan:	HLF Embankment Unsuitable Material Removal	**Revision:**	01
Location:	HLF Embankment approx. 1.5km Dublin Road	**Date:**	2018-06-29

ENVIRONMENT

Critical Items	Precautions and Actions
Water Management Plan	Sediment fence installation, effective drainage and sediment collection to avoid damage or clogging of drains and installed infrastructure per design and a monitoring plan to repair and maintain water management plan throughout construction.
Spill Containment	Equipment spill kits, preshift inspections before operating, work area large spill kit

SCOPE OF WORK

1. Environmental Bird Survey • Environmental personnel to perform a bird survey within the dump limits	**Victoria Gold**
2. Install Silt Fencing • Install silt fencing between the dump limit and the ditch at the 1,000m elevation	**Pelly**
3. Clear Dump Area • Dozer to strip all organic materials within the dump area • Trees and grubbing material to be windrowed and placed along the lower perimeter of the dump limit to aid with drainage and sediment/erosion control	**Pelly**
4. Construct Dump • Construct a containment berm utilizing rock pushed up from the floor of the dump area • Berm must be a minimum 4m high and 2m wide at the top • Widen the culvert crossing at the ditch 1,000m elevation to permit safe travel for ADT's	**Pelly**
5. Placement of Unsuitable Material • Excavator to load out the unsuitable material within the HLF area • 40t ADT's to haul material to the dump location • Dozer to pad the unsuitable material at the dump	**Pelly**

OBJECTIVE

The objective of this CWP is to coordinate the installation and operation of the heap leach embankment water management pipeline and pump.

SUMMARY

The scope of work includes:

1. Excavate exfiltration sumps
2. Temporarily install 6" Pump & 500 meters of 6" HDPE
3. Fuse 2 12" HDPE pipes 500 meters in length
4. Excavate discharge point for 2 12" HDPE lines at HLF exfiltration sump
5. Install 12 meter rig mat over the Dublin to support the 2 12" HDPE lines
6. Cut bench along the south side of the Dublin for 12" HDPE lines
7. Install 500 meter sections of 12" HDPE
8. Relocate 6" Pump to the Eagle exfiltration sump
9. Discharge water as required

Clint Abel Construction Superintendent JDS Energy & Mining Inc.		March 30, 2018
Roman Bilobrowka Site Manager JDS Energy & Mining Inc.		March 30/18

SAFETY

Potential Hazard	Precautions and Actions
Pipe Fusing	Review JHA, Radios, PPE
Slippery/icy conditions	Dress appropriately, 3 point contact climbing on and off equipment, Icy condition may also require sand placement
Working near water	Install berms or barricades around sumps, life ring and rope, and install warning signage
Walking on uneven surfaces	Take your time, be aware and careful. Avoid walking through work area unless necessary.
Heavy lifting	Lift with legs, use equipment if possible, stretch

ENVIRONMENT

Critical Items	Precautions and Actions
Fueling Pump	Ensure containment berm is used when fueling pump
Spill Containment	Vehicles will be equipped with spill kits. Work area will have spill kits and drip trays.
Housekeeping	Ensure pipe shavings and cut-offs are bagged and properly disposed of on a regular basis

SCOPE OF WORK

Description	Responsible
1. <u>Excavate exfiltration sumps</u>	
• EX1200 to excavate 10 m X10 m X 4 m deep exfiltration sump on the east side of the Eagle diversion ditch – slope all four sides to ensure no unstable crests – construct 500 mm high berm around sump	Pelly
• EX1200 to remove the ice from the HLF exfiltration sump – Excavator to excavate ice from around the perimeter	Pelly
• Ice will be hauled to the west side of Topsoil Stockpile B	Pelly
• Excavate any sedimentation from the HLF exfiltration sump to ensure correct functionality	Pelly
• Place barricade around sump & install life ring with rope	JDS
2. <u>Temporarily install 6" Pump & 500 meters of 6" HDPE</u>	
• Place 6" pump at the HLF exfiltration sump – pump must be placed in containment	JDS
• Install 500 meter HDPE pipe from the HLF sump to the Eagle diversion sump	JDS
• Install 6" intake with strainer into exfiltration sump; connect to pump intake	JDS
3. <u>Fuse 2) 12" HDPE pipes 500 meters in length</u>	JDS
• Refer to attached Fusion Machine JHA before starting work	
• Lift sections of pipe into jaws using mechanical means (zoom boom, loader, excavator)	
• Clamp pipe in jaws	
• Face pipe using rotating facing blade; check for fit	
• Remove facing blade; install heating plate	
• Heat soak pipe for minimum 3 min 22 sec. at 30 psi + drag pressure	
• Release pipe, remove heat plate – maximum 15 sec. between heat soak and fusing /cooling	
• Fuse/cool pipe at 383 psi for minimum 8 min. 14 sec.	

Description	Responsible
• Release jaws • Pull section of pipe through until end is in the jaws using mechanical means (zoom boom, loader, excavator) • Load next section of pipe into jaws using mechanical means (zoom boom, loader, excavator) • Install flanges every 162 meters; fuse 6) 162 meter sections of pipe	
4. **Excavate discharge point for 2) 12" HDPE lines at HLF exfiltration sump** • Excavate inlet 2 meters below the surface on the south side – bottom of excavation must be wide enough to ensure good compaction can be achieved around the pipes when installed • Excavation must be sloped back for crew to work safety when compacting backfill material • Continue excavating access down to the Dublin road through the old wash out • Ensure excavation has positive drainage	Pelly Pelly
5. **Install 12 meter rig mat over the Dublin to support the 2) 12" HDPE lines** • Prepare level pads on both side of the Dublin without disturbing the stream bed • Slide the rig mat into place with an excavator	Ewing Ewing
6. **Cut bench along the south side of the Dublin for 12" HDPE lines** • Survey to layout out grade to ensure 12" HDPE lines have positive drainage with no low points from the HLF to the Eagle diversion exfiltration sump • Utilize a dozer or excavator to cut a 5 meter wide bench	Underhill Ewing
7. **Install 500 meter sections of 12" HDPE** • Using mechanical means (excavator, loader) drag sections of pipe into position • Backfill 12" HDPE pipes in the HLF exfiltration sump with select fill – Backfill must be compacted in 300 mm lifts to ensure no breaching occurs – Compact back to original sump surface • Placed backfill material over the 12" HDPE line crossing the Dublin access road – Access road will be temporarily closed during HDPE line install • Bolt up 3) consecutive sections of 166.7 meter 12" HDPE pipe	JDS JDS JDS JDS
8. **Relocate 6" Pump to the Eagle exfiltration sump** • Place 6" trash pump in containment in case of a spill • Install 6" intake with strainer into exfiltration sump; connect to pump intake • Install 6" line from Eagle exfiltration sump to the Forebay • Pump is only to be utilized in the case of an event that water flows are too great for the exfiltration sump to handle	JDS JDS JDS JDS
9. **Discharge water as required** • Water will discharge by gravity whenever sump levels rise to within 2 meters of capacity • In case of an emergency the 6" pump will be utilized to pump water to the Forebay	JDS JDS

Job Hazard Assessment (JHA)

Job Description: Heap Leach Water Management – HDPE Pipe Fusion
Project Name: Eagle Gold Project
Company Name(s): JDS Energy & Mining
Job Supervisor:
Written By: Clint Abel
Date: March 30, 2018

Tools/Equipment Required	Permits Required	PPE Required
• Fusion Machine • Loader	• Fusion Certificate	• Mandatory site PPE is required • Gloves • Hearing protection

*Pre-Job Meeting / Review JHA at Job Site

#	Task Step	Hazard(s)	Risk	Controls	Risk
1	Inspect all equipment before staring operation	• No wheel chocks • Oil leaks • Equipment damage • Machine wasn't shutdown correctly	6	• Ensure wheel chocks are in place on tire equipment • Daily inspection will reduce possible spills • Ensure equipment has no damage that could cause personal injuries • Ensure all necessary safeties are in place before starting the machinery	3
2	Warm up equipment & Inspect work area	• Operating cold machines • Changes to work area between shifts • Damage fusion machine generator	8	• Allow machine to warm up to reduce unnecessary damage to engine & hydraulics • Inspect work area to identify any changes to work area • Fusion machine must be at maximum RPM before plugging heating plate in, not doing so will damage onboard generator	1
3	Moving fusion machine into place	• Congested work areas • Ground conditions	9	• Park fusion machine in an area that will reduce any possible congestion • Inspect ground conditions to ensure good stability for equipment and footing	2

Job Hazard Assessment (JHA)

4	Place pipe into the fusion machine clamps	• Hit by pipe during setup • Pinch points between pipe and fusion machine • Over lifting heavy pipe	10	• Stay out of the line of fire when equipment is moving HDPE pipe into place • Insure good communication between operators and personal on the ground • One person to direct operator when loading pipe into fusion machine • Lift with your legs not your back – equipment should be utilized if pipe is to heavy	3
5	Securing HDPE pipe into fusion machine	• Stored energy on installed HDPE pipe • Pinch points between pipe and clamp	10	• Ensure equipment operator has safely placed the HDPE pipe in the fusing machine and support stand • Never place hands between pipe and clamp – flip upper portion of clamp over pipe and secure	3
6	Facing the pipe	• Cutting hands on cutter blades • Loose clothing getting caught in the cutter	10	• Never place hands near rotating blades when facing the pipe – wear gloves • Do not wear loose clothing that could entangle in the machine and cause serious injuries	3
7	Heat soak	• Burns from heating plate • Cleaning heating plate before each fusion	6	• Wear glove and ensure you never touch heating plate surface (400-450 F) • Use manufacture handle when using heating plate – use paper towel to clean hot surfaces	1
8	Fusion force	• Pinch Point between pipe ends once heating plate is removed	10	• Never place hands in pinch point when applying fusion force	3
9	Cold down	• Pipe failure	6	• Ensure correct cooldown time is achieved before releasing and moving the pipe	1
10	Releasing Clamps	• Possible stored energy when releasing clamps	6	• Use caution when releasing clamps to ensure no stored energy on fused pipe	1

Job Hazard Assessment (JHA)

11	Moving pipe to next fusion joint	• Damage to fusion machine	9	• Ensure all clamps, cutter, and heating plate are open and clear of the HDPE pipe • Raise hydraulic rollers on both ends of the machine to ensure pipe is clear of the lower portions of the clamps • Pull HDPE pipe slowly with equipment to the next fusion joint under the direction of a spotter	2
12	Housekeeping	• Tripping hazards • Garbage in the environment	3	• Ensure any cord, garbage, and pipe fittings are cleaned up • Cuttings and paper must be cleaned and removed each day	1

Instructions

Job Hazard Assessment (JHA)

CONSEQUENCE TYPE	CONSEQUENCE DESCRIPTION				
	1 - Insignificant	2 - Minor	3 - Moderate	4 - Major	5 - Catastrophic
Injury	First aid case	Medical treatment case	Lost time injury	Permanent disability or single fatality	Numerous permanent disabilities or multiple fatalities
Environment	Lasting days or less; affecting small area (metres)	Lasting weeks; affecting limited area (hundreds of metres)	Lasting months; affected extended area (kilometres)	Lasting years; affecting area on sub-basin scale	Permanent impact; affecting area on a whole basin or regional scale
Property Damage	Less than $1,000	$1,000 to $10,000	$10,000 to $100,000	$100,000 to $1,000,000	More than $1,000,000
Production Loss	Less than 1 production shift loss	Less than 24 hours production loss	Production loss between 1 and 7 days	Production loss between 1 week and 1 month	Production loss for greater than 1 month

Identify the Job: Determine the job that will be assessed and the scope that will be covered by the JHA. If the job is too large or complex, it may need to be broken down into sections and multiple JHAs completed.

List Resources: Identify the tools/equipment, permits, and PPE required for the job.

List the Steps: Break the job down into the key tasks that are required to complete the job. The goal is to capture each of the steps and list them in the order that they are to be performed.

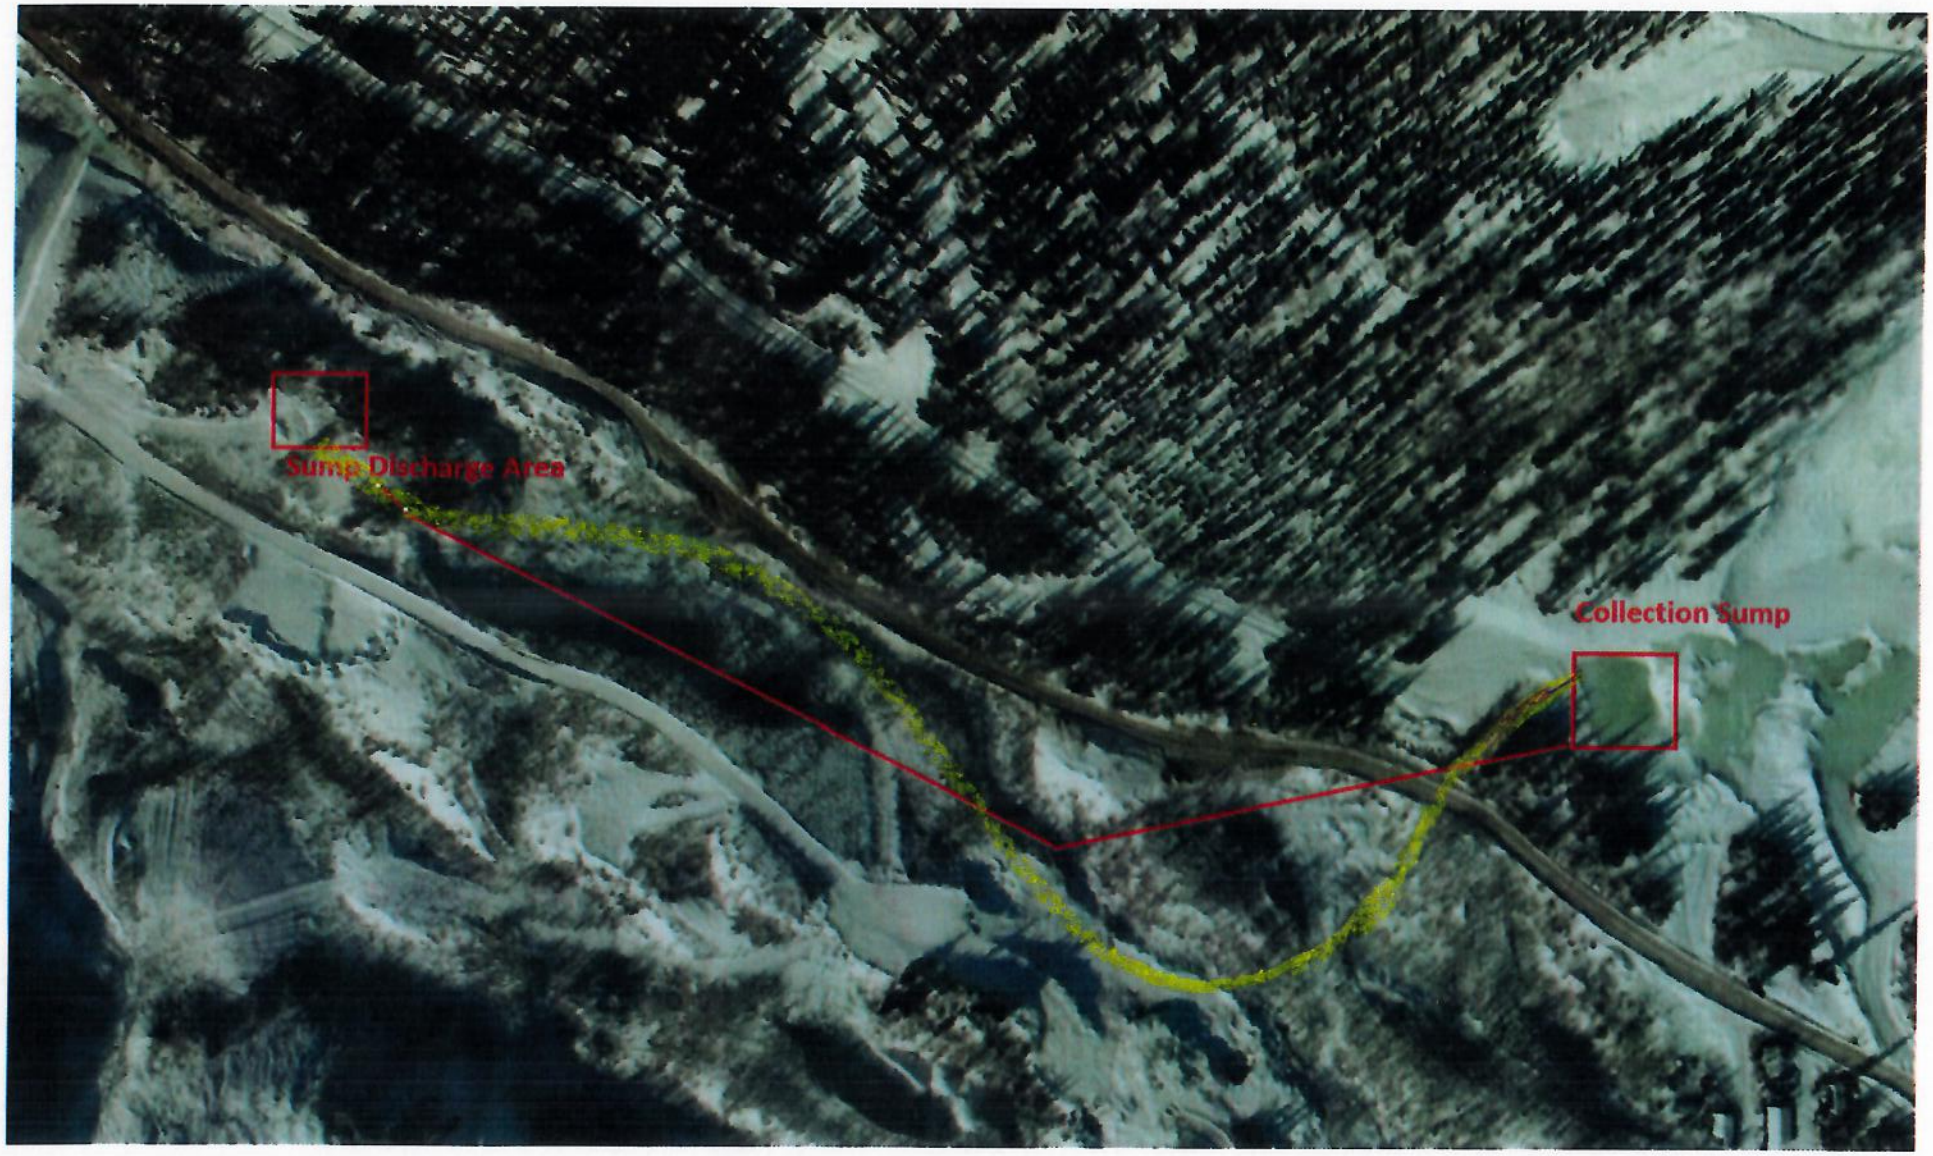
Identify the Hazards: For each step of the job, list all of the hazards associated with this step.

Rate the Risks: For each of the hazards, determine the **Likelihood** that the unwanted event will occur (e.g. Rare, Unlikely, Possible, Likely, Almost Certain). Then determine what the highest potential **Consequence** is (e.g. Insignificant, Minor, Moderate, High, Major). Assess both the Likelihood and Consequence on the Risk Matrix to determine the Risk Rating (1-25).

Identify the Controls: For each of the hazards, list the controls that are currently in place and any additional controls that will be added. Consider the Hierarchy of Controls (Elimination, Substitution, Engineering, Administration, PPE) and look for the most effective way(s) to control the hazard.

Rate the Residual Risks: Use the Risk Matrix to re-evaluate what the risk level will be after the controls are put in place.

Review and Approval: Depending on the level of residual risk (1-25), submit the JHA to the appropriate supervisors, managers, and HSE personnel for review and approval.



Pre-Job Meeting: Hold a meeting with all of the personnel and contractors who will be performing the job. Review the contents of the JHA and provide the opportunity for questions and comments. When the JHA has been reviewed, have all participants sign the JHA sign off sheet. If additional workers join the job, be sure to have them review and sign the JHA.

Monitor and Review: Supervise the work in order to make sure that the process is being followed. If the job is not going as planned in the JHA, stop and reassess the job. If changes are made to the JHA, make sure that the changes are reviewed with all participants.

USER GUIDE: JOINTING & FIXING

Concrete Canvas® is part of a revolutionary new class of construction materials called Geosynthetic Cementitious Composite Mats (GCCMs). It is a flexible, concrete filled geosynthetic, that hardens on hydration to form a thin, durable, water proof and fire resistant concrete layer. Essentially, it's concrete on a roll. The following guide provides useful information for installers, customers and specifiers of Concrete Canvas® GCCM (CC). It provides an overview of methods for jointing and fixing of CC material. The versatile nature of CC means that this document is not exhaustive and is intended for guidance purposes only.

1.0 Cutting Concrete Canvas® GCCM

1.1 Cutting Unset CC

A 'snap-off blade' utility knife can be used for cutting CC before it is hydrated or set. When cutting unset CC a 15-20mm allowance should be left from the cut edge due to potential loss of fill. For larger projects where numerous cuts are required it is recommended to use a powered disc-cutter, angle grinder or a self sharpening fabric cutter. If cutting with a disc cutter, it is recommended to wet the cut beforehand to minimise dust generation.

Cutting CC using a 'snap-off blade' utility knife

Cutting CC using a powered disc-cutter

1.2 Cutting Set CC

Set CC can be cut using the same tools used for cutting conventional concrete, such as disc cutters, angle grinders or good quality tile cutters. CC sheets can also be water-cut for applications where a high resolution is required such as for signage or sculptural works.

Cutting set CC using an angle grinder

Water-cut CC

2.0 Fixing Specification

2.1 To Soil

Anchor Trench: Burying the perimeter edges of CC in an anchor trench is essential for the majority of installations. This will help prevent undermining from surface water and provide a neat edge termination. Used in conjunction with pegs or when back-filled with concrete an anchor trench provides an effective means of securing CC to the substrate. Typically anchor trenches are used at the crest and toe of a slope and along the shoulders of a channel and leading and trailing edges to prevent wind and water ingress. **We would therefore recommend anchor trenching the entire perimeter edge of CC wherever possible.**

Pegs: Galvanised steel J-pegs are available from Concrete Canvas® Ltd in lengths of 250mm and 380mm. Pegs may be sourced from alternate suppliers but must have a sufficiently sharp point to penetrate the CC and a head design that will capture the surface of CC. Peg length and spacing should be selected based on soil conditions and application. Pegs should be applied at joints where possible to secure adjacent layers together.

Soil Nails / Ground Anchors: For high load applications or where ground conditions are poor, such as with slope protection, slope stabilisation or for high flow applications, it is recommended to use CC in conjunction with soil nails, ground anchors or earth percussion anchors. The anchor plate design should be circular where possible or have radiused corners to avoid stress concentrations. The soil nail and anchor plate specification should be approved by a qualified geotechnical engineer.

2.2 To Concrete

Mortar: A suitable mortar can be used to join and seal CC to existing concrete infrastructure such as head walls and slabs. Most off-the-shelf mortars will bond well to the fibrous surface of CC. We recommend applying the mortar to the CC immediately after hydration or wetting the CC surface if applying post-set.

Masonry fixings (bolts/ nails): A range of conventional masonry fixings, such as self tapping masonry bolts, wedge anchors and “Hilti” type nails, can be used to fix CC to other concrete surfaces. We recommend a minimum shank diameter of 3mm and a minimum washer/head diameter of 16mm or clamping plate to prevent pull-through.

2.3 To Rock

Rock Bolts: For use on hard or rocky substrates, the number and type of rock bolt should be selected based on the pull-out force requirement. A suitable head design should be selected to prevent stress concentrations. A minimum head diameter of 16mm is normally recommended and plates up to 150mm are often used.

Patent and Trademark information can be found here: http://www.concretecanvas.com/patent-and-trademark-info/

2.4 To Steel

Hog rings: Ideal for fixing CC to wire mesh, gabion baskets or fencing, hog-rings are available in a range of sizes and can be applied with a manual or powered hog-ringer. The hog rings should be applied to CC prior to hydration.

Tech-screws: Self-drilling screws such as tech-screws are suitable for fixing CC to sheet steel. A washer may be required to prevent pull-through.

2.5 To Wood

Screws / Staples / Nails / Adhesive: A range of conventional fixings can be used to fix CC to substrates such as wood. In its pre-hydrated form CC behaves like a thick geotextile and can be fastened with suitable screws, staples, nails or adhesives.

2.6 Other

The flexible nature of CC means that it can be jointed, sealed and fixed using a large selection of products available on the market. The 3 following listed joints (3.0) are suitable for the majority of applications and summarised in the table at the end of this document (5.0). Some other fixings which may be useful are also shown in the images below.

3.0 Jointing Specifications

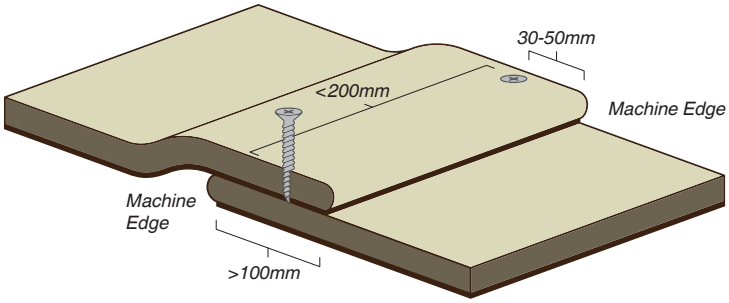

Fig 1. Standard Screwed Overlap Joint

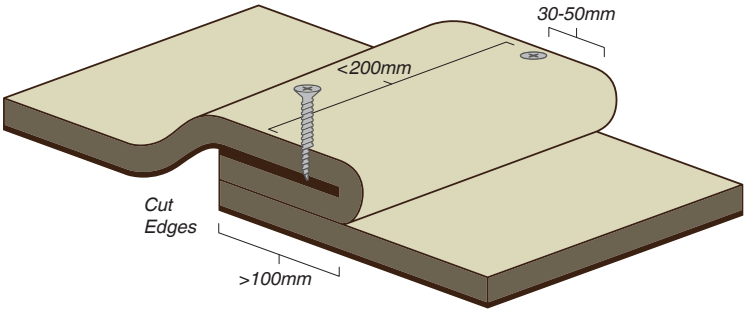

Fig 2. Screwed Knuckle Joint for Cut Edges of CC

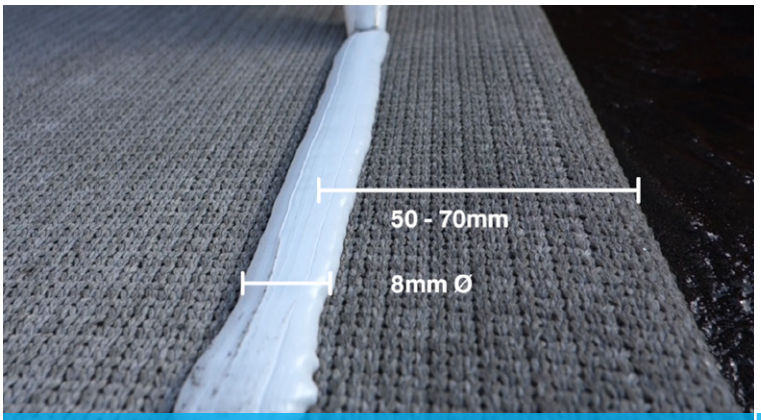
3.1 Overlapped Joint

This joint is suitable for the majority of CC applications and involves overlapping adjacent sheets of CC by a minimum of 100mm, (see Fig.1.) For erosion control applications, care should be taken to position the overlap in the direction of water flow (like shingled roof tiles). When jointing cut edges of CC, the material can be folded back on itself to form a knuckle joint, (see Fig.2.) which covers the cut edge and improves the seal between layers. We would recommend securing the overlap with one of the following methods **- please note, it is important to hydrate the material under the overlap before fixing.**

3.2 Screws

Suitable for the majority of applications this joint is fast and simple to apply, it provides good mechanical strength but has limited impermeability. The screws should be applied at 200mm spacing (50mm for bund lining) and 30-50mm from the edge of the CC. The screws should be applied prior to setting but immediately after hydration (CC has 1-2 hours working time in a UK climate), so the concrete within CC will then set around the thread of the screws. For this reason it is important that the screws have a fully threaded shank and a minimum length equal to the full thickness of the joint. Collated screws allow for the use of an auto-fed screwdriver which provides a rapid means of creating a screwed joint. Suitable collated stainless steel screws are available from Concrete Canvas Ltd.

Stainless steel collated screws



CC joint fixed using an autofed screwdriver

Patent and Trademark information can be found here: http://www.concretecanvas.com/patent-and-trademark-info/

3.3 Screws & Sealant

For applications where improved impermeability is required, CC can be jointed with a CC approved adhesive sealant using a caulking gun. This is applied as a single 8mm bead with the screws inserted through the sealant bead where possible to minimise leakage. An 8mm bead is equivalent to a coverage of 50g/m which is equivalent to 5.8m of joint for 290ml cartridge or 12m of joint from a 600ml cartridge. Suitable CC approved adhesive sealants are available from Concrete Canvas Ltd. 200mm screw spacing is suitable for most applications, 50mm is recommended for bund lining. It is important to hydrate under the overlap prior to applying the adhesive sealant in order to remove excess dust, ensuring contact with the fibrous top surface of the bottom CC layer and to provide moisture for curing. Surfaces may be damp during installation, but have no standing water.

Sealant applied to CC using caulking gun

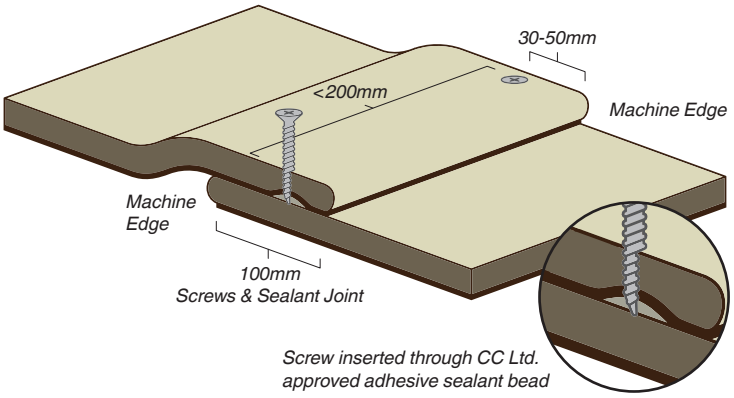

Diagram showing screw inserted through sealant bead

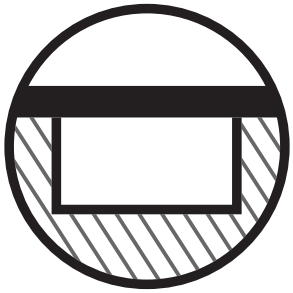
3.4 Hydration of the Overlap

In some circumstances for the above joints, it may not be possible to hydrate underneath the overlap prior to fixing. This is not generally advised, as the underlap material will only be partially hydrated, however it may be acceptable if certain conditions exist. For example, if the joint is going to be continually exposed to water due to the nature of the application, the underlap material will slowly hydrate through infiltration.

Please be aware, that in these instances, the joint strength may be compromised. For example a screwed joint relies on the CC setting around the thread of the screw to reach the strength values overleaf therefore the short-term strength will be significantly lower until full hydration is achieved. **Adhesive sealants also benefit from pre-hydration as this cleans the jointing surface of dry cement dust prior to the application of adhesive and helps to cure the adhesive during setting.** Joints will therefore typically achieve a long-term strength which is 30-40% lower than the published values if the underlap CC is not hydrated prior to jointing.

Automatic thermal welding machine

Handheld thermal welding machine



3.5 Thermal Bonding

Thermal Bonding can be used for applications where screws are not suitable, for example when applying CC onto a hard concrete substrate or geomembrane. The joint is formed using either a manual or automatic thermal welding machine to form a bond between the PVC backing of the CC and the polyester top surface.
Please refer to the *CC User Guide: Thermal Bonding* for more details.

4.0 Installation Principles

The unique material properties of Concrete Canvas (CC) mean that it can be used for a variety of applications. Following the Four Installation Principles below will help ensure a successful installation.

Avoid Voids

1. Avoid Voids

Prepare the substrate so it is well compacted, geotechnically stable and has a smooth and uniform surface.

- For soil substrates, remove any vegetation, sharp or protruding rocks and fill any large void spaces. Ensure the CC makes direct contact with the substrate to minimise soil bridging or potential soil migration under the layer.
- For concrete substrates, remove any loose or friable material, cut away any protruding exposed re-bar and fill any large cracks or voids.

2. Secure Canvas

Secure Canvas

It is important to ensure that the CC is **Jointed** at every overlap between layers and that those layers are **Fixed** to the substrate.

- **Jointing:** Overlapped CC layers should be securely jointed together, typically this is achieved using stainless steel screws applied with an auto-fed screw gun at regular intervals. Correct screw placement will help ensure intimate contact between CC layers, prevent washout of the substrate, and limit potential weed growth. An adhesive sealant can be applied between the layers to improve the joint impermeability.

  A non-penetrative method of jointing is to 'thermally bond' the CC layers together. This also improves joint impermeability. For more jointing options see above.

- **Fixing:** When fixing to a soil substrate, ground pegs (eg J-pegs) are typically used. On rock or concrete substrates, CC layers can be jointed together and fixed to the substrate using masonry bolts, percussion anchors or shot fired masonry nails. Stainless steel fixings with washers are recommended.

Prevent Ingress

3. Prevent Ingress

It is important to prevent water or wind ingress between the CC and the substrate, both around the perimeter of the installation and along the joints.

- For soil substrates, this is typically achieved by capturing the entire perimeter edge of the CC within an anchor trench.
- On rocky or concrete substrates, the perimeter edge should be sealed with a concrete fillet or an adhesive sealant.
- All overlapped CC layers should be lapped in the direction of water flow.

4. Hydrate Fully

Fully Hydrate

It is critical to properly hydrate CC, taking into account the quantity of material used and ambient temperature conditions.

- Always ensure hydration through the fibrous top surface.
- Ensure to hydrate any overlapped areas and anchor trenched material prior to backfilling.
- Spray the fibre surface with water until it feels wet to touch for several minutes after hydration (the 'Thumb Test').
- Follow the *CC User Guide: Hydration*.

1.0 Introduction

1.1 Background

Concrete Canvas® is part of a revolutionary new class of construction materials called Geosynthetic Cementitious Composite Mats (GCCMs).

It is a flexible, concrete impregnated fabric that hardens on hydration to form a thin, durable, water proof and fire resistant concrete layer.

Essentially, it can be described as 'concrete on a roll' and is used for a wide variety of applications including the rapid lining of drainage channels, providing slope protection, weed suppression, culvert repair and general concrete remediation.

1.2 Scope

- This document provides guidance procedures for the installation of CC as **channel lining** in a manner that maximises safety, efficiency, and the physical integrity of the material and channel.
- This document provides useful information for installers, customers and specifiers of Concrete Canvas® GCCM (CC) and provides an overview of installation techniques for the lining of channels.
- The versatile nature of CC means that this document is not exhaustive and is intended for guidance purposes only. Exceptions to this guideline may be required to address site-specific and/or product-specific conditions.
- The performance of the CC is wholly dependent on the quality of its installation. It is the installer's responsibility to adhere to these guidelines where applicable and to the project specification and drawings.

CC Channel Lining, Glyncorrwg Colliery, Wales, UK

© Concrete Canvas Ltd. 2019
+44 (0) 345 680 1908 info@concretecanvas.com www.concretecanvas.com

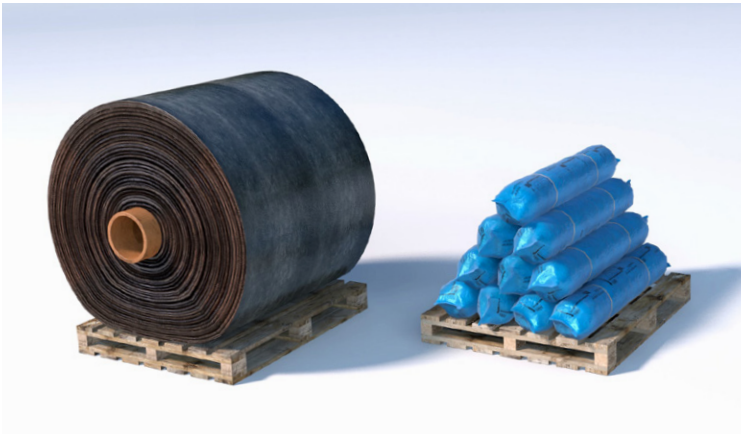
2.0 Specification and Installation Essentials

2.1 Specifying the correct CC Thickness

CC is available in 3 thicknesses, CC5™ (5mm), CC8™ (8mm) and CC13™ (13mm).



- CC5™ can be used to line channels with a solid substrate such as when relining an existing concrete channel or laying over a hard substrate such as rock. CC5™ may also be used for temporary works.
- CC8™ is the standard thickness specified for channel lining and is recommended unless either of the conditions above or below apply.
- CC13™ should be considered where a channel is to be trafficked, is exposed to high levels of debris, where water flow rates are above 8.6m/s or where the ground is particularly steep or unstable.

CC Type	Thickness (mm)	Roll Width (m)	Dry Weight (kg/sqm)	Batched Roll Coverage (sqm)	Batched Roll Length (m)	Bulk Roll Coverage (sqm)	Bulk Roll Length (m)
CC5™	5	1.0	7	10	10	200	200
CC8™	8	1.1	12	5	4.55	125	114
CC13™	13	1.1	19	N/A	N/A	80	73

2.2 Specifying the correct CC Roll Format

CC is available in **Bulk Rolls** or as smaller **Batched Rolls**.

- **Bulk Rolls** offer the quickest installation but must be deployed using heavy lifting equipment and a spreader beam. Bulk Rolls are generally more efficient to use than Batched Rolls, in terms of material use and transportation.
- For sites where this isn't suitable, man portable **Batched Rolls** can be installed without the need for plant and are well suited to smaller scale works in restricted access areas.
- CC is now also available in **Wide Rolls** of up to 4 times the standard roll width. Contact Concrete Canvas for further details.

CC Bulk Rolls and Batch Rolls

Wide Rolls of up to 4 times the standard roll width are now available

Manual lifting of CC Batch Rolls

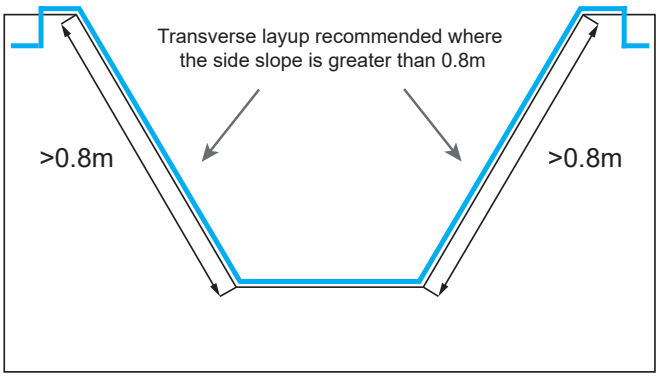
2.0 Specification and Installation Essentials

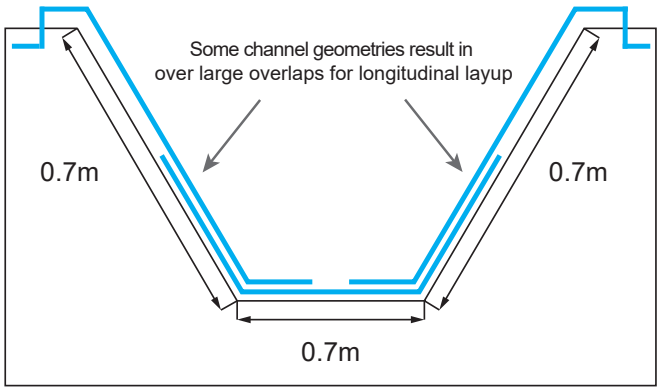
2.3 Specifying the correct CC Layup

CC can be laid along the length of the channel (longitudinal) or across the width (transverse).

Longitudinal Layup



Transverse Layup

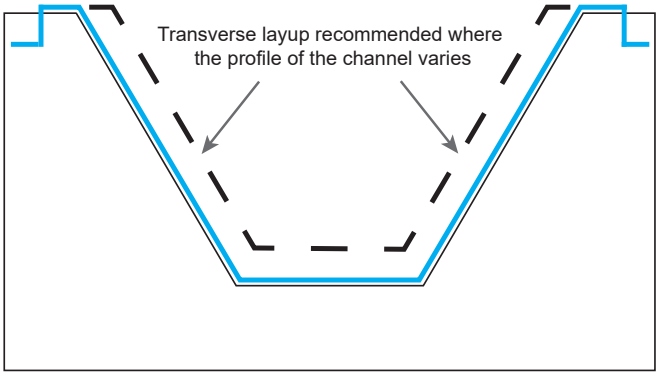


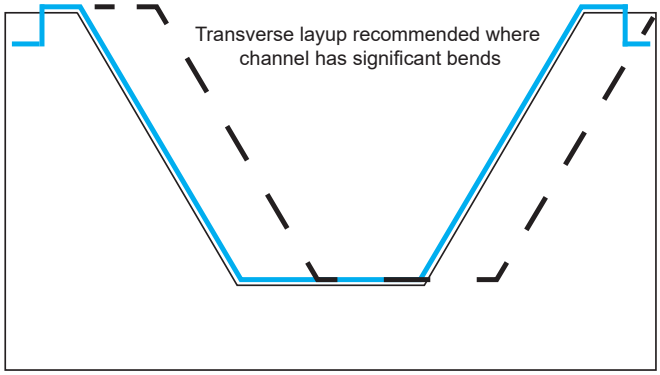
Laying longitudinally is typically faster than laying transversely. However a transverse layup may be preferable if:

- The channel side slope is greater than 0.8m as this makes securing the CC difficult when using a longitudinal layup.

or

- The channel geometry means that longitudinal layup is materially wasteful.





- The channel profile varies signifcantly along the channel length.

or

- The channel has significant and/or frequent sharp bends.

3.0 Four Key Installation Principles of CC

The unique material properties of Concrete Canvas (CC) mean that it can be used for a variety of applications. Following the Four Installation Principles below will help ensure a successful installation.

Avoid Voids

1. Avoid Voids

Prepare the substrate so it is well compacted, geotechnically stable and has a smooth and uniform surface.

- For soil substrates, remove any vegetation, sharp or protruding rocks and fill any large void spaces. Ensure the CC makes direct contact with the substrate to minimise soil bridging or potential soil migration under the layer.
- For concrete substrates, remove any loose or friable material, cut away any protruding exposed re-bar and fill any large cracks or voids.

Secure Canvas

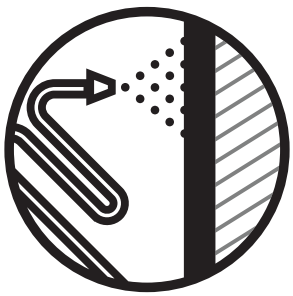
2. Secure Canvas

It is important to ensure that the CC is **Jointed** at every overlap between layers and that those layers are **Fixed** to the substrate.

- **Jointing:** Overlapped CC layers should be securely jointed together, typically this is achieved using stainless steel screws applied with an auto-fed screw gun at regular intervals. Correct screw placement will help ensure intimate contact between CC layers, prevent washout of the substrate, and limit potential weed growth. An adhesive sealant can be applied between the layers to improve the joint impermeability.

  A non-penetrative method of jointing is to 'thermally bond' the CC layers together. This also improves joint impermeability. For more jointing options see the *CC User Guide: Jointing and Fixing*.

- **Fixing:** When fixing to a soil substrate, ground pegs (eg J-pegs) are typically used. On rock or concrete substrates, CC layers can be jointed together and fixed to the substrate using masonry bolts, percussion anchors or shot fired masonry nails. Stainless steel fixings with washers are recommended.



Prevent Ingress

3. Prevent Ingress

It is important to prevent water or wind ingress between the CC and the substrate, both around the perimeter of the installation and along the joints.

- For soil substrates, this is typically achieved by capturing the entire perimeter edge of the CC within an anchor trench.
- On rocky or concrete substrates, the perimeter edge should be sealed with a concrete fillet or an adhesive sealant.
- All overlapped CC layers should be lapped in the direction of water flow.

Fully Hydrate

4. Hydrate Fully

It is critical to properly hydrate CC, taking into account the quantity of material used and ambient temperature conditions.

- Always ensure hydration through the fibrous top surface.
- Ensure to hydrate any overlapped areas and anchor trenched material prior to backfilling.
- Spray the fibre surface with water until it feels wet to touch for several minutes after hydration (the 'Thumb Test').
- Follow the *CC User Guide: Hydration*.

4.0 Installation Methodology

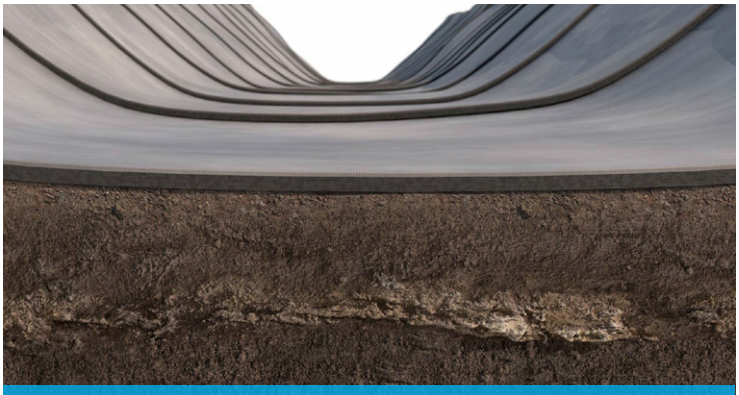
4.1 Equipment Required

- Sufficient CC to complete project
- Safety mask and gloves
- Cutting equipment, snap off knife or disc cutter
- Metal or plastic fixing pins
- Lump Hammer
- Screwdriver and stainless screws or alternative method to join the CC layers
- Water supply

See *CC Equipment List* for full details. Dust hazard. Wear appropriate PPE. Consult *CC SDS* document.

Equipment required

4.2 Site Preparation



- Divert water (if lining an existing watercourse)
- Remove vegetation and grade channel to a uniform profile. CC will conform closely to the underlying channel profile
- Remove sharp or protruding rocks >25mm and fill large voids
- Excavate anchor trench into the shoulders of the channel (min. 150mm)
- Excavate Leading and Trailing Edge termination trenches (min. 150mm) along invert and side slopes (if CC is not to be fixed into existing infrastructure)

Substrate preparation & anchor trench

4.3 Deployment

- Verify if longitudinal or transverse layup deployment of CC is specified
- Begin at downstream end of channel and work up gradient
- Remove packaging and unroll CC in channel profile to suit specified layup, ensuring the fibrous top surface faces upwards, with the PVC membrane in contact with the ground.
- Inspect CC to ensure intimate contact with substrate and adjust to remove any void space behind.
- For transverse layup installations, tuck the Edge of the CC into the anchor trench before cutting to length
- If cutting with a disc cutter, it is recommended to wet the cut beforehand to minimise dust generation
- Ensure the Edge of the **first layer** of CC is either :
  - Suitably terminated into existing infrastructure and fixed to prevent water ingress, e.g. a screwed and sealed knuckle joint– see the *CC User Guide: Jointing and Fixing* for methodology or;
  - Tucked into a termination trench which is backfilled to prevent scour beneath CC.

CC orientation and contact with substrate

CC tucked into anchor trench prior to cutting

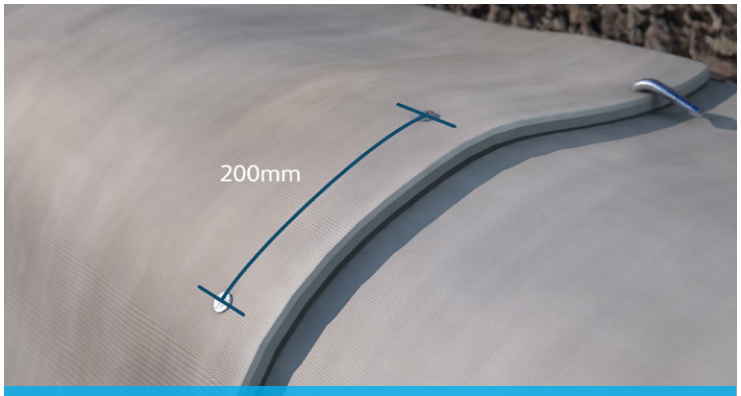
4.0 Installation Methodology contd...

4.4 Overlapping Layers

- When positioning subsequent layers ensure there is at least a 100mm overlap in the direction of water flow (shingled like roof tiles) and that the material is in intimate contact with the ground.

4.5 Jointing and Fixing



- Fix the material along the shoulder of the channel by inserting fixing pins through each overlap or at 2m intervals for longitudinal installations.
- Hydrate the material under the overlapped sections of the CC. Once hydrated, the material remains workable for 1 to 2 hours.
- Insert stainless screws at 200mm centres, at approximately 30–50mm from the edge of the CC. Ensure there is no rucking at the joint and both layers are in contact with each other
- Care shall be taken during installation to avoid damage occurring to the CC. Should the CC be damaged during installation and before hydration, the layer should be removed an replaced.
- It is essential that all exposed (i.e. unjointed) Edges of the CC should be secured during the installation to prevent water ingress underneath the CC which may cause wash-out of the substrate and subsequent undermining.
- Only install what can be fully installed and hydrated before the end of construction day to minimise any adverse effect on the installation and/or performance capabilities of the product.
- If installation continues the following working day, protect the Edge of the last layer of CC overnight with waterproof sheeting to enable jointing on return to work
- Ensure the Edge of the **last layer** of CC is either :
  - Suitably terminated into existing infrastructure and fixed to prevent water ingress, e.g. a screwed and sealed knuckle joint– see the *CC User Guide: Jointing and Fixing* for methodology or;
  - Tucked into a termination trench which is backfilled to prevent scour beneath CC.

Overlap CC Layers by a minimum of 100mm

Overlap in Direction of Water Flow

Hydration Under Joints Before Fixing

Fixing and Anchor Trench Pinning

4.0 Installation Methodology contd...

4.6 Hydration

- After fixing and jointing, spray the CC with water to hydrate.
- Spray the fibre surface multiple times until the CC is fully saturated. The wet CC will first darken and then become lighter as it absorbs the water.
- Do not spray high pressure water directly onto the CC as this may wash a channel in the material.
- CC can be hydrated using fresh water or salt water and will hydrate and set underwater.
- It is not possible to over hydrate CC.
- A minimum volume of water equal to 50% of the material weight is required. For example, CC8 requires 6 litres of water per square meter.
- To check proper hydration, the CC should feel wet to the touch several minutes after hydration.
- It is not recommended to rely on rainfall to provide hydration.
- To determine whether the CC has been sufficiently hydrated simply press your thumb into the CC and release. If water is present in the depression in the CC, it has been sufficiently hydrated. If no water is observed, then more water must be applied.
- For more information on hydration and for extreme temperature installations, please consult the *CC User Guide: Hydration.*

Hydration

Hydration Touch Test

4.7 Setting

- **There is a working time of 1-2 hours after hydration.**
- **Backfill anchor trenches to create a neat termination and encourage surface water runoff to flow over the anchor trench and in to the CC channel.**
- **CC hardens to 80% strength in 24 hours and is then ready for use.**

Ensure Adequate Hydration, Don't Rely on Rainfall

4.8 Maintenance and Repair

- CC lined channels require minimal maintenance, provide long term scour protection, reduced silt generation and effective weed suppression.
- If damage is found during a periodic inspection, a patch can be placed over the damaged area extending a minimum of 150mm in all directions beyond the damaged area and attached with mortar or an approved sealant.

Backfill Anchor Trench

Detailing Examples

Baffles can be formed by laying CC over fabricated wooden structures or sandbags

Sand bags can be used to compress joints during setting

A suitable mortar can be used to join and seal CC to existing infrastructure

Retrospective pipe penetration

CC can be easily manipulated to form ditch junctions and terminals

CC can be installed around existing infrastructure

11,125m² - CC8™ (Bulk Rolls)
August 2016

CONCRETE CANVAS®

DATA SHEET

Concrete Canvas® GCCM Physical Properties*

Product	Nominal Thickness (mm)	Batch Roll Size (m^2)	Bulk Roll Size (m^2)	Roll Width (m)
CC5™	5	10	200	1.0
CC8™	8	5	125	1.1
CC13™	13	N/A	80	1.1

Product	Mass (unset) (kg/m^2)	Density (unset) (g/cm^3)	Density (set) (kg/m^3)
	EN1849 (Mean)	EN1849 (Mean)	
CC5™	7	1.43 - 1.54	+30-35%
CC8™	12	1.43 - 1.54	+30-35%
CC13™	19	1.43 - 1.54	+30-35%

Pre-Set Concrete Canvas® GCCM Properties

Setting

Working Time

1-2 hours subject to ambient temperature

CC will achieve 80% strength at 24 hours after hydration.

Method of Hydration

Spray the fibre surface with water until it feels wet to touch for several minutes after spraying.

Re-spray the CC again after 1 hour if:

- Installing CC5™
- Installing on a steep or vertical surface

Notes:

- An excess of water is always recommended. CC will set underwater and in seawater.
- CC must be actively hydrated. For example do not rely on rainfall or snowmelt.
- Use a spray nozzle for the best results (see CC equipment list). Do not jet high pressure water directly onto the CC as this may wash a channel in the unset CC.
- CC has a working time of 1-2 hours after hydration. Do not move or traffic CC once it has begun to set.
- Working time will be reduced in hot climates and increased in very cold climates.
- CC will set hard in 24 hours but will continue to gain strength over time.
- If CC is not sufficiently wetted, or dries out in the first 5 hours, the set may be delayed and strength reduced. If the set is delayed avoid trafficking the material and re-wet with an excess of water.

Refer to the *Concrete Canvas Hydration Guide* for installation in low temperatures or drying conditions.

- Low Temperature Conditions occur the ground surface temperature is between 0 and 5°C and rising or is expected to fall below 0°C in the 8 hours following hydration.
- Drying Conditions occur when there is one or more of: high air temperature (>22°C), wind (> 12km/h), strong direct sunlight or low humidity (<70%).

Other Information

* Occasionally there will be a Beam Fault (fabric imperfection under 100mm wide running across the width) in a Bulk Roll. This fault is unavoidable due to the manufacturing process and the fault will be clearly marked with a white tag, there will be a maximum of (1) one Beam Fault in any Bulk Roll. A joint may need to be made on site where there is a Beam Fault as the material at a fault will not reach the performance specified in this Data Sheet. The maximum un-useable material due to any Beam Fault will be 100mm. There are no beam faults in standard batched rolls.

* Indicative values

** For containment applications it is recommended to use CC Hydro™

Post-Set Concrete Canvas® GCCM Properties

Hydrated by immersion in accordance with ASTM D8030
Water:GCCM ratio of 0.33

Mechanical Performance

Very high early strength is a fundamental characteristic of CC. Typical strengths and characteristics are as follows:

Compressive strength to BS EN 12390-3
Testing on cementitious mix at a water:powder ratio of 0.3 to correspond to GCCM hydration by immersion.

24 hour (MPa)	50
28 day (MPa)	80

Flexural strength to ASTM D8058 at **24 hours**.

Mean (M.D.)	Initial Break (MPa)	Final Break (MPa)
CC5™	4.0	>10.0
CC8™	4.0	>6.0
CC13™	4.0	>6.0

Differential Ground Movement▲

Strain prior to PVC failure (min 50mm per 1m width)	>5%

Environmental Durability (minimum 50 year expected life)

Freeze-Thaw testing (ASTM C1185) ±20°C	200 Cycles
Freeze-Thaw testing (BS EN 12467:2004) ±50°C	100 Cycles
Soak-Dry testing (BS EN 12467:2004)	50 Cycles
Heat-Rain testing (BS EN 12467:2004)	50 Cycles
Water impermeability (BS EN 12467:2004)	Passed**
Root Resistance (DD CEN/TS 14416:2005)	Passed
Chemical Resistance (BS EN 14414)	
- Acid (pH 1.0) (56 day immersion at 50°C)	Passed
- Alkaline (pH 13.0) (56 day immersion at 50°C)	Passed
- Hydrocarbon (56 day immersion at 50°C)	Passed
- Sulfate Resistance (28 day immersion at pH 7.2)	Passed

Hydraulic Performance

Permissible Shear & Velocity CC8™▲▲ (ASTM D-6460)	
- Shear (Pa)	575
- Velocity (m/s)	8.62
Abrasion Resistance (ASTM C-1353)	
Approx 7.5x greater than 17MPa OPC (mm/1000 cycles)	0.15
Manning's Value (ASTM D6460)	n = 0.011

Other

Impact Resistance of Pipeline Coatings	
ASTM G13 (CC13™ only)	Passed
Embodied CO_2 to ISO 14040 and EN 15804	55%
Saving based on CC8™ Vs conventional concrete (cradle to gate)	
Coefficient of Thermal Expansion	
α (mm/mk)	0.012-0.015
Reaction to Fire; Euroclass B certification:	
BS EN 13501-1:2007+A1:2009	B-s1, d0
Flame Resistance: MSHA ASTP-5011	
Vertical and Horizontal Certification	Passed

▲Refer to CC Differential Ground Movement document.

▲▲Product exceeded large scale testing capabilities and was not tested to failure. To achieve these permissible values, the CC material must be properly anchored with a system designed to meet or exceed these values.

APPENDIX 2
RFIs

REQUEST FOR INFORMATION

JDS RFI:	
Contractor RFI:	**BGC-RFI-001**
Site Location: EAGLE GOLD	
Date Submitted: May 21, 2018	

Subject: Heap Leach Facility – Water Control	**Project Zone/Area:** Heap Leach Facility
Contractor: BGC Engineering	**Station/Location:** Heap Leach Facility
Attention: Pelly Construction	**Discipline:** Civil

REQUEST

Related Drawings None	**Other Related Documents:**

Information Request/Description of Issue:

Information Request: BGC would like a better understanding of the water control plans to protect immediate construction and permanent constructions (such as embankment lifts, fills, liner installs, pond side slopes, ect) over this construction season and the winter season. For immediate construction, BGC would like to review water control plans prior to the placement of geotextile and drainrock in the pipe trench to ensure that a plan is in place to prevent siltation of these materials. Additionally, as is required in Section 2.3 of the Technical Specifications, the Owner should also be provided water control plans for review to ensure that they meet their permitting requirements.

REQUEST

Related Drawings None	**Other Related Documents:**

Information Request/Description of Issue:

Information Request: BGC would like a better understanding of the embankment underdrain construction procedures to construct the Embankment Underdrain section protected by the Phase 1 Water Management Plan. A construction plan is requested for review; this plan should reflect the requirements presented in the design drawings and specifications for construction. It should include a plan view drawing of the hauling route, stockpiling areas for materials (if used), should account for possible damage of geotextile, include a survey control plan, health and safety plan given the current topography and have necessary access roads without damaging embankment underdrain construction site. Consideration of weather, equipment, resources should be considered.

Work Plan:	HLF Embankment Underdrain pipe installation Plan	**Revision:**	0
Location:	HLF Embankment approx. 1.5km Dublin Road	**Date:**	2018-06-01

OBJECTIVE

The objective of this CWP is to outline the scope of work plan pertaining to the HLF Embankment Underdrain pipe installation.

SUMMARY

The scope includes:

1. HLF Embankment Underdrain Installation Water Management Plan Approval
2. HLF Embankment Type 3 Foundation ITP Approval
3. HLF Embankment Toe Redesign ITP Approval
4. Material List
5. Equipment List
6. Haul Route
7. Work Sequence
8. Plan-View Map

SIGNATURES:

Re: BGC-RFI-003: Construction Materials Management and Volume Reporting

1.0 INFORMATION REQUEST

BGC requests that JDS/Pelly provide a Materials Management Plan, which should include regular reporting. The purpose of this plan is to ensure that construction materials scheduled for use at the HLF construction are of sufficient volume, managed, protected, tested, and accounted for prior to use. As a component of the Materials Management Plan regular reporting of construction material status is also requested. At a minimum the information that BGC requires to perform QA and resident engineering services in regard to materials are:

- A plan view drawing including the locations of each stockpile and laydown yard where material is stored. The drawing should include labels of what material is being stored at each location. This drawing should be updated and redistributed if these locations change.
- A table and explanation of the volume of material stored, used, and/or moved. This should be updated at a minimum bi-weekly.
- Quality Control sampling results are reported to BGC by EBA. Frequency of testing is currently not reported. BGC requests that this EBA start correlating test results to material volumes and stockpile locations.
- Plans and description of methods to protect stockpiles from accidental use, contamination, instability, water and wind erosion, sun degradation, and general weather.
- A materials production/procurement schedule.

Re: Strata Gold – Eagle Gold Project
Contract No. YG403 – Heap Leach Facility
Subject: Stockpile Management Plan

Response to BGC-RFI-003

Response:

The produced Heap Leach Facility (HLF) fill materials are to be managed by the EPCM team while Pelly Construction will manage stockpiled materials excavated from the ADR Plant pad and HLF abutment.

EPCM Managed Materials

Attached drawing VICEAG05E-220-9900-0001 illustrates the produced stockpiles locations, material type, specification, total quantity produced, contractor responsible for placement, and engineering firm responsible for materials specification.

- HLF Materials
    1. Spec #6 – Pipe Bedding (SDF) Select Drain Fill
    2. Spec #7 – Overliner Drain Fill (ODF)

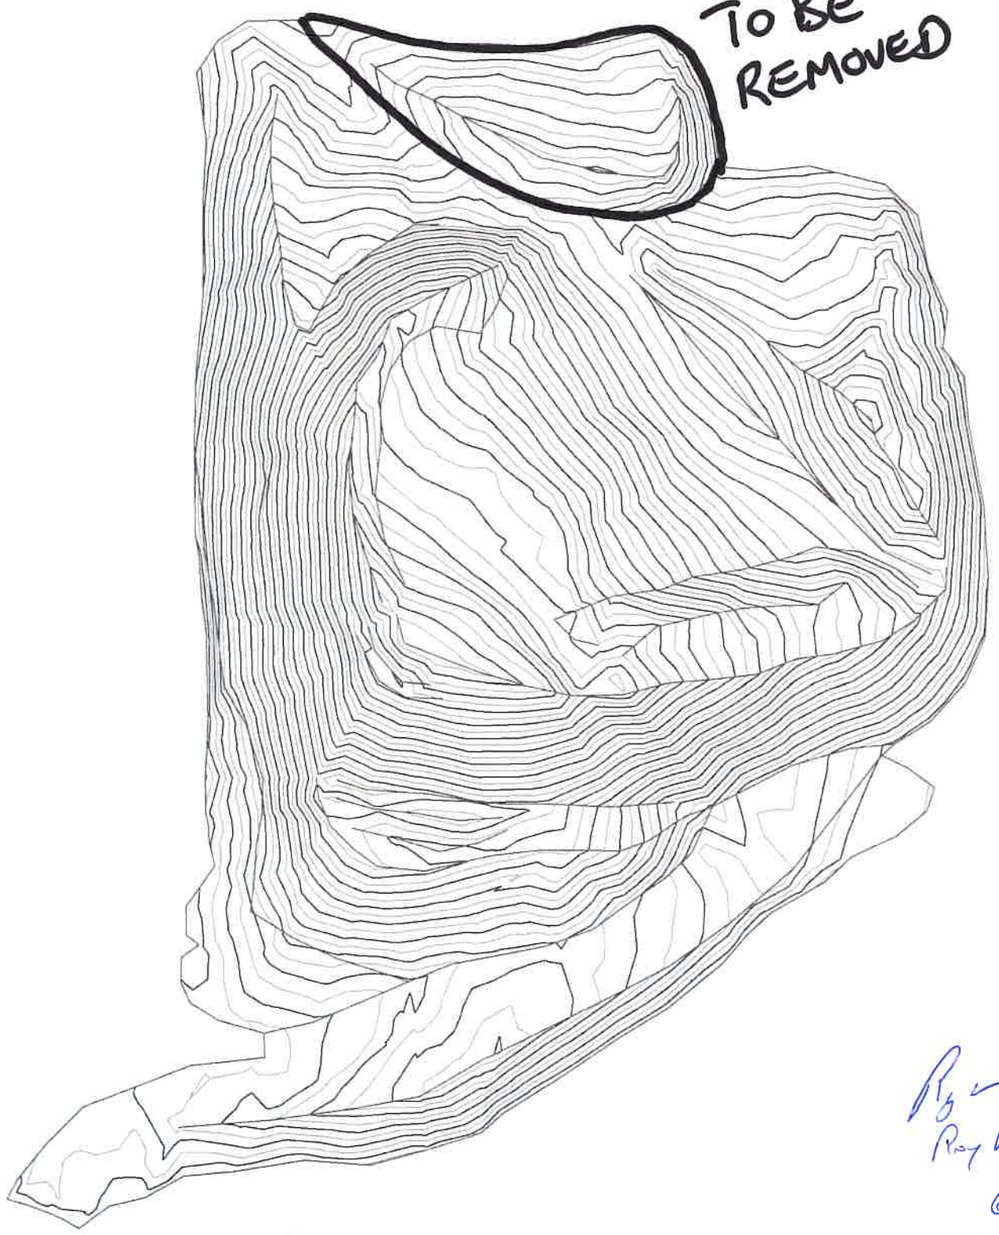
- Material Testing
    - Sieve analysis testing will continue to be performed by Tetra-tech.

- Quantity
    - Produced stockpiles will be surveyed weekly; updated quantities and newly produced stockpiles will be shown in an updated revision of drawing VICEAG05E-220-9900-0001 and distributed to the appropriate parties.

- Identification
    - Signs are to be placed at the toe of each stockpile identifying the material type and contractor responsible for placement.

- Tracking
    - Placed material quantities to be tracked by recording the number of loads by truck type.

Pelly Construction Managed Materials



Attached drawings EMB008-1 and EMB008-2 illustrates stockpiled locations, material type, and quantity.

- Structural Fill
  1. 82,181 m3 contained within the HLF Embankment footprint
  2. 55,912 m3 at the ADR Pad stockpile
  3. Estimated 34,300 m3 will be structural fill for the remainder of the unexcavated ADR Pad material

- Rockfill
  1. 89,995m3 at the ADR Pad stockpiles
  2. Estimated 68,700 m3 will be rockfill for the remainder of the unexcavated ADR Pad material

- Quantity
  - Produced stockpiles will be surveyed prior to excavation

- Tracking
  - Placed material quantities to be tracked by recording the number of loads by truck type.

Re: BGC-RFI-004: Leak Test for fused HDPE Pipes in Underdrain

1.0 INFORMATION REQUEST

BGC requests that JDS/Pelly provide a procedure to verify HDPE pipes are few of leaks due to debris found during the fusing stage (e.g. hydrostatic pressure test) to verify that the HDPE pipe fusing can withstand at a minimum 50 metres of hydraulic head without leaks. Conditions observed are attached as pictures below.

This test will verify seal quality for placement on drains.

Subject: RE: BGC-RFI-004

Hi D'Arcy,

Pelly will be following the test procedure guidelines outlined in ASTM F2164-13. As discussed with BGC site Engineer, we will be testing the pipe that has been most recently fused as a spot test for the remainder of the pipes. This pipe will be tested to a maximum pressure of 100 psi and will be flagged to be used as the closure pipe within the underdrain construction. A detailed procedure will follow along with the test results.

Dean Serelo, EIT

Field Engineer

PELLY CONSTRUCTION LTD.

Victoria Gold Project

Find attached RFI from BGC for your response. RFI is regarding testing of underdrain HDPE piping.

Thanks

D'Arcy

Subject: BGC-RFI-004

Gentlemen,

As you may already know, conditions at the site until very recently have been full of rain storms, mud, debris and variable temperatures.

We conducted an inspection of Pelly's pipe fusing station and have concern that the pipes that will be installed may not meet the design criteria due to mud, and conditions mentioned in the start of this email.

The specifications in section 4.1.2 provide guidelines that refer to ASTM standards. We suggest these documents be used and also conduct a field test to make sure the pipes have no leaks given that once buried, it will be costly to fix, replace, etc. We hope to work with Pelly as needed to develop a plan to verify the quality of the seals and verify that they will withstand the hydrostatic pressures of the design without leaks.

Let me know if you have any questions.

Thanks

Re: **BGC-RFI-006: Water Management Plan Phase 2**

1.0 INFORMATION REQUEST

BGC requests that JDS/Pelly provide a Water Management Phase 2 Plan for the embankment construction, protection from erosion of finer compacted material. The Phase 1 plan submitted and previously accepted only covers the construction of the underdrain trench. Intense rainfall and runoff could potentially cause erosion of finer compacted materials and oversaturate materials that could cause delays in construction. The Water Management Phase 2 should include a work plan and a plan view drawing of the construction footprint with proposed features to protect construction efforts.

Work Plan:	HLF Embankment Phase 2 Water Management and Construction Plan	**Revision:**	01
Location:	HLF Embankment approx. 1.5km Dublin Road	**Date:**	2018-06-26

OBJECTIVE

The objective of this CWP is to outline the water management and construction sequence of the Heap Leach Embankment.

SUMMARY

i) The scope of work includes:

1. Excavate 950-drainage ditch
2. Excavate Underdrain Header and Lateral pipe Trenches
3. Construct Temporary Containment Berms
4. Excavate Temporary Sumps
5. Install Underdrain Header Pipes
6. Install Underdrain Lateral Pipes
7. Install Riser Pipe
8. Well Decommissioning (Completed)

ii) Work Sequence

iii) Conceptual Drawing

SAFETY

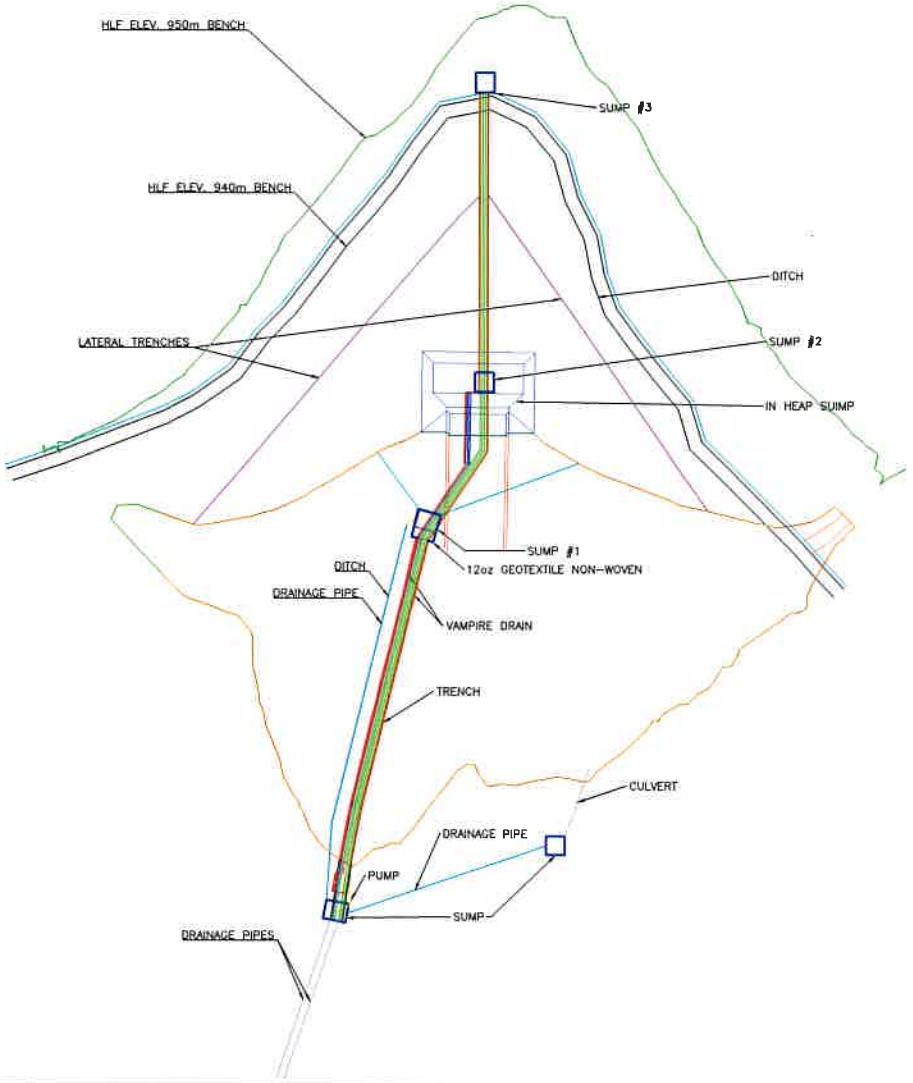
Potential Hazard	Precautions and Actions
Heavy Equipment	JHA's/SOP's, Radios, PPE
Workplace Congestion	Maintain radio communication
Steep Slopes	Stay within operator's abilities, operate on slopes in dry conditions when possible and must travel facing down the slope.

ENVIRONMENT

Critical Items	Precautions and Actions
Spill Containment	Equipment spill kits, preshift inspections before operating, work area large spill kit

SCOPE OF WORK

Description	Responsible
1. **Excavate the 950-drainage ditch** • Topsoil to be stripped and placed above the intended ditch area • Excavate a ditch to bedrock along the perimeter of the work area • The drainage ditch will provide a positive drainage toward the east side	Pelly
2. **Excavate Underdrain Header and Lateral pipe trenches** • Excavate Header pipe trenches to be contained within bedrock foundation • The header trench shall be excavated upstream to the 950m elevation • The trenches shall be excavated as per IFC drawing EGHLF-XD-03-04 • Excavate Lateral pipe trenches as per drawings from finish grade • All excavation prior to backfill to be approved by BGC	Pelly BGC
3. **Construct Temporary Containment Berms** • Construct within the Header trench as needed while progressing the construction from the bottom to the top • The upstream side of the berm shall be lined with a geomembrane liner • A back-up pump will be on standby ready to convey water safely away from construction activities in the HLF area when required • The temporary berm will be removed when it's no longer needed	Pelly



Description	Responsible
4. **Excavate Temporary Sumps** • Excavate temporary sump(s) as needed • Minimum dimensions: 5m x 5m x 1m deep (max. 2m deep) • Trenches will be excavated to direct all downslope water into the temporary sump • A back-up pump will be on standby ready to convey water safely away from construction activities in the HLF area when required • The temporary sump will be backfilled[1] when it's no longer needed	Pelly
5. **Install Underdrain Header Pipes** • The underdrain header pipes shall be installed as per IFC drawing EGHLF-XD-03-03 and 03-04	Pelly BGC
6. **Install Underdrain Lateral Pipes** • The underdrain lateral pipes shall be installed as per IFC drawing EGHLF-XD-03-03 and 03-04	Pelly BGC
7. **Install Riser pipe(s)** • Install geomembrane liner in the sump or dam • Connect the Riser pipe(s) to the underdrain pipe(s) • Place rip-rap or cobble stones in the sump area • Remove riser pipe when it's no longer required	Pelly
8. **Well Decommissioning (Completed)** • See attached completion reports	Pelly BGC

Notes:

1. Pelly has identified potential water problem that could affect the backfill compaction requirement of the structural/rock fill which will require input from BGC

WORK SEQUENCE

1. Establish the 950 drainage ditch
2. Install a temporary berm/sump at STN 1+90 (Sump 1)
3. Install five (5) – 150mm SDR 17 HDPE pipes from STN 0+29 to STN 1+80
4. Connect the Riser pipe to an underdrain header pipe
5. Excavate the header trench upstream beyond the Embankment footprint (STN 3+70)
6. Install a temporary berm/sump at STN 3+60 (Sump 2)
7. Install four (4) – 150mm SDR 11 HDPE pipes from STN 1+80 to STN 3+50
8. Install one (1) – 150mm SDR 11 HDPE pipe from STN 1+80 to STN 2+73
9. Install three (3) – 150mm SDR 11 HDPE pipes from STN 2+73 to STN 3+28
10. Disconnect the Riser pipe at STN 1+80 and reconnect at STN 3+50
11. Install a temporary berm/sump at STN 5+10 (Sump 3)
12. Excavate the header trench upstream to STN 5+00
13. Excavate the lateral trenches
14. Install four (4) – 150mm SDR 11 HDPE pipes from STN 3+50 to STN 5+00
15. Install two (2) - 100mm ADS N12 Perforated pipes to connect to the header drain pipes
16. Disconnect the Riser pipe at STN 3+50 and reconnect at STN 5+00

Re: BGC-RFI-007: Material Type 2 Production/Stockpile Reserve Plan

1.0 INFORMATION REQUEST

BGC requests that JDS/Pelly provide a Material Type 2 Reserve Plan.

Gathering sufficient and low moisture type 2 material proved to be difficult during the construction of the embankment toe (RFI-017). To avoid future delays and to plan for future needs of approved type 2 material, BGC requests a reserve plan with the following goals:

- Lowering the moisture content during favorable weather conditions by material spreading on dry surfaces.
- Creating multiple elevated stockpiles of drier type 2 materials.
- Grading surfaces to avoid water ponding near stockpiles and on stockpiles.
- Covering stockpiles with tarps or other materials until used.

The main purpose is to prepare, reserve, protect and have Material Type 2 ready for use during construction.

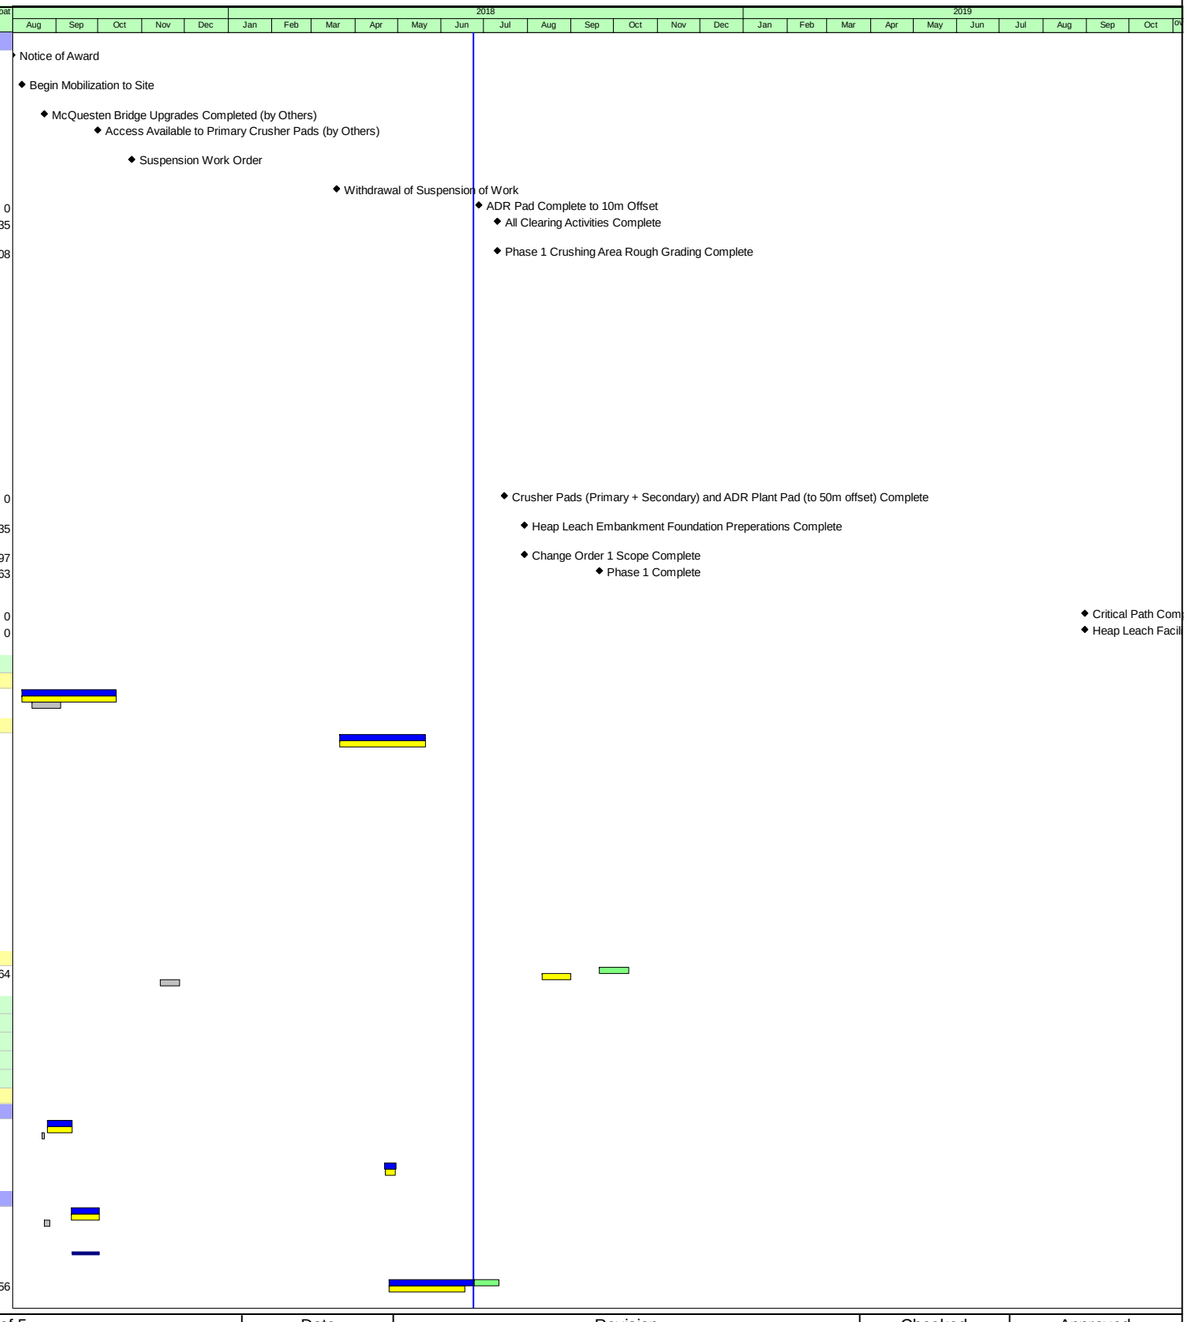
Re: **BGC-RFI-008: QC Plan and Schedule**

1.0 INFORMATION REQUEST



BGC requests Pelly provide a QC plan and schedule for the HLF construction. The plan should take into account the different phases of construction, including potential for 2 shifts working 24 hours per day. BGC would like to verify that adequate QC is planned for construction and testing. This will also help BGC plan the QA monitoring schedule. The QC plan and schedule should reference to the anticipated construction schedule.

EG-.4110.3 Heap Leach - Closure Sump								
EG-.4110.3.1 Supply and Install 300mm SDR9 HDPE (to Monitoring Vault)								
EG-3200	Pending	Supply 300mm SDR9 HDPE (to Monitoring Vault)	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2350	155
EG-2350	Pending	Install 300mm SDR9 HDPE (to Monitoring Vault)	6	17-May-19	22-May-19	EG-3200, EG-2380	EG-2360	26
EG-.4110.3.2 Supply and Install 300mm Perforated N-12 Header, incl all fittings								
EG-3190	Pending	Supply 300mm Perforated N-12 Header, incl all fittings	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2360	161
EG-2360	Pending	Install 300mm Perforated N-12 Header, incl all fittings	1	23-May-19	23-May-19	EG-2350, EG-3190	EG-2370	26
EG-.4110.3.3 Load, Haul, and Place 36mm Backfill								
EG-2370	Pending	Load, Haul, and Place 36mm Backfill	1	24-May-19	24-May-19	EG-2360	EG-2910	26
EG-.4110.3.4 Supply and Install steel protection/guide plates								
EG-3210	Pending	Supply steel protection/guide plates	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2380	154
EG-2380	Pending	Install steel protection/guide plates	1	16-May-19	16-May-19	EG-3210, EG-2900	EG-2350	26
EG-.4110.4 Heap Leach Leak Detection & Recovery System								
EG-.4110.4.1 Supply and Install LDRS piping loop - 250MM ADS N-12 PERF incl. all fittings & geotextile wrap								
EG-3220	Pending	Supply LDRS piping loop - 250MM ADS N-12 PERF incl. all fittings & geotextile wrap	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2390	187
EG-2390	Pending	Install LDRS piping loop - 250MM ADS N-12 PERF incl. all fittings & geotextile wrap	1	18-Jun-19	18-Jun-19	EG-2440, EG-3220	EG-2420	26
EG-.4110.4.2 Supply and Install LDRS pump/instrument casing - 600MM STD STEEL PIPE								
EG-3230	Pending	Supply LDRS pump/instrument casing - 600MM STD STEEL PIPE	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2400	177
EG-2400	Pending	Install LDRS pump/instrument casing - 600MM STD STEEL PIPE	7	08-Jun-19	14-Jun-19	EG-3230, EG-2430	EG-2440	26
EG-.4110.4.3 Supply and Install primary casing rub sheet - 16OZ GEOTEXTILE								
EG-3240	Pending	Supply primary casing rubbing sheet - 16OZ GEOTEXTILE	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2410	174

EG-.4110.6.3 Supply and Install Heap Leach In-Pond Liner System								
EG-.4110.6.3.1 Install In Heap Pond - Primary Geomembrane - 2 MM LLDPE								
EG-2550	Pending	Supply In Heap Pond - Primary Geomembrane - 2 MM LLDPE	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2500	176
EG-2500	Pending	Install In Heap Pond - Primary Geomembrane - 2 MM LLDPE	5	28-Jun-19	02-Jul-19	EG-2550, EG-2420	EG-2620	5
EG-.4110.6.3.2 Install In Heap Pond - LDS Liner - 8mm goecomp W/ geotextile both side								
EG-3060	Pending	Supply In Heap Pond - LDS Liner - 8mm goecomp W/ geotextile both side	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2510	147
EG-2510	Pending	Install In Heap Pond - LDS Liner - 8mm goecomp W/ geotextile both side	5	30-May-19	03-Jun-19	EG-3060, EG-3390	EG-2870	5
EG-3420	Pending	Install In Heap Pond - LDS Liner - 8mm goecomp W/ geotextile both side above PLS Sump	5	09-Aug-19	13-Aug-19	EG-2590	EG-2600	5
EG-.4110.6.3.3 Install In Heap Pond - Secondary Geomembrane - 1.5 MM LLDPE								
EG-3070	Pending	Supply In Heap Pond - Secondary Geomembrane - 1.5 MM LLDPE	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2520, EG-3390	108
EG-2520	Pending	Install In Heap Pond - Secondary Geomembrane - 1.5 MM LLDPE	5	27-Oct-18	31-Oct-18	EG-2530, EG-3070	EG-2540, EG-2480, EG-2490, EG-2380, EG-2900	0
EG-3390	Pending	Install In Heap Pond - Secondary Geomembrane - Above Closure Sump 1.5 MM LLDPE	2	30-May-19	31-May-19	EG-2910, EG-3070	EG-2510	5
EG-.4110.6.3.4 Install In Heap Pond - Base Liner - GCL								
EG-3080	Pending	Supply In Heap Pond - Base Liner - GCL	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2530	108
EG-2530	Pending	Install In Heap Pond - Base Liner - GCL	5	27-Oct-18	31-Oct-18	EG-2470, EG-3080, EG-1730	EG-2520, EG-2490	0
EG-.4110.6.3.5 Install Closure Sump Liner								
EG-3090	Pending	Supply 16oz Non-Woven Geotextile	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2900	128
EG-2900	Pending	Place 16oz Non-Woven Geotextile	5	11-May-19	15-May-19	EG-2540, EG-2480, EG-3090, EG-2520	EG-2380	5
EG-2910	Pending	Fold Over 16oz Non-Woven Geotextile	5	25-May-19	29-May-19	EG-2370	EG-3390	5
EG-.4110.6.4 Perform Heap Leach Pad Liner EEL Testing								
EG-2540	Pending	Perform Heap Leach Pad Liner EEL Testing	2	01-May-19	02-May-19	EG-2520	EG-2900	13
EG-.4110.7 Heap Leach Solution Collection System								
EG-.4110.7.1 Supply and Install HLP Solution Headers - 450MM SDR11 HDPE								
EG-2970	Pending	Supply HLP Solution Headers - 450MM SDR11 HDPE	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2560	224
EG-2890	Pending	Install HLP Solution Headers - 450MM SDR11 HDPE to Phase 1A Liner Anchor Bench (990m)	6	06-Jun-19	11-Jun-19	EG-3010, EG-3430	EG-2940	0
EG-2930	Pending	Install HLP Solution Headers - 450MM SDR11 HDPE to Phase 1 Interceptor Ditch	20	06-Jul-19	25-Jul-19	EG-2920	EG-2950	0
EG-2560	Pending	Install HLP Solution Headers - 450MM SDR11 HDPE to Liner Anchor Bench (940m)	3	15-Aug-19	17-Aug-19	EG-2970, EG-2600	EG-2570	5
EG-.4110.7.2 Supply and Install HLP Collection drains - 250MM ADS N-12 PERF								
EG-2980	Pending	Supply HLP Collection drains - 250MM ADS N-12 PERF	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2570	227
EG-2940	Pending	Install HLP Collection drains - 250MM ADS N-12 PERF to Phase 1A Liner Anchor Bench (990m)	4	12-Jun-19	15-Jun-19	EG-2890	EG-2920	0
EG-2950	Pending	Install HLP Collection drains - 250MM ADS N-12 PERF to Phase 1 Intercepl	6	26-Jul-19	31-Jul-19	EG-2930	EG-2960	0
EG-2570	Pending	Install HLP Collection drains - 250MM ADS N-12 PERF to Liner Anchor Bench (940m)	2	18-Aug-19	19-Aug-19	EG-2980, EG-2560	EG-2580	5
EG-.4110.7.3 Supply and Install HLP Secondary drains - 100MM ADS N-12 PERF								
EG-2990	Pending	Supply HLP Secondary drains - 100MM ADS N-12 PERF	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2580	229
EG-2920	Pending	Install HLP Secondary drains - 100MM ADS N-12 PERF to Phase 1A Liner Anchor Bench (990m)	20	16-Jun-19	05-Jul-19	EG-2940	EG-2930	0
EG-2960	Pending	Install HLP Secondary drains - 100MM ADS N-12 PERF to Phase 1 Interceptor Ditch	30	01-Aug-19	30-Aug-19	EG-2950	M15	0
EG-2580	Pending	Install HLP Secondary drains - 100MM ADS N-12 PERF to Liner Anchor Bench (940m)	6	20-Aug-19	25-Aug-19	EG-2570, EG-2990	M15	5
EG-.4110.7.4 Supply and Install Sump Solution Collection loops - 450MM ADS N-12 PERF								
EG-3000	Pending	Supply Sump Solution Collection loops - 450MM ADS N-12 PERF	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2590	207
EG-2590	Pending	Install Sump Solution Collection loops - 450MM ADS N-12 PERF	11	29-Jul-19	08-Aug-19	EG-3000, EG-2610	EG-3420	5
EG-.4110.7.5 Load, haul and place over liner material - 38MM								
EG-3430	Pending	Load, haul and place over liner material - 38MM - Liner Anchor Bench to Interceptor Ditch	26	11-May-19	05-Jun-19	EG-2480	EG-2890	0
EG-2600	Pending	Load, haul and place over liner material - 38MM - In-Pond	4	14-Aug-19	17-Aug-19	EG-3420	EG-2560	5
EG-.4110.7.6 Supply and Install solution pump casing & headers - 900MM STD steel pipe incl spigots								
EG-3010	Pending	Supply solution pump casing & headers - 900MM STD steel pipe incl spigots	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2610, EG-2890	149
EG-2610	Pending	Install solution pump casing & headers - 900MM STD steel pipe incl spigots	23	06-Jul-19	28-Jul-19	EG-3010, EG-2640	EG-2590	5
EG-.4110.7.7 Supply and Install primary casing rub sheet - 16OZ geotextile								
EG-3020	Pending	Supply primary casing rub sheet - 16OZ geotextile	0	11-Jul-18	11-Jul-18	EG-1800, M7	EG-2620	181
EG-2620	Pending	Install 16 oz non-woven geotextile above Primary LLDPE	1	03-Jul-19	03-Jul-19	EG-3020, EG-2500	EG-2630, EG-2650	5
EG-3410	Pending	Install primary casing rub sheet - 16OZ geotextile	1	03-Jul-19	03-Jul-19	EG-3030, EG-2630		180

An effective and/or acceptable ITP should provide the client with a high degree of confidence that the Work will be, or has been, completed in accordance with the applicable contract, IFC drawings, Standards, Procedures, etc. Therefore, a sufficient sampling of each (identified) Activity must be inspected by the Owner's Representative and/or General Contractor in order to ensure that conformance is, in fact, being achieved. ITPs help define the auditable documentation that will be produced by Layfield for each Activity. A sufficient number of Activities must be identified in order to accurately reflect the Scope of Work. ITPs that lack sufficient detail will not be Approved.

An effective and/or acceptable ITP should provide the client with a high degree of confidence that the Work will be, or has been, completed in accordance with the applicable contract, IFC drawings, Standards, Procedures, etc. Therefore, a sufficient sampling of each (identified) Activity must be inspected by the Owner's Representative and/or General Contractor in order to ensure that conformance is, in fact, being achieved. ITPs help define the auditable documentation that will be produced by Layfield for each Activity. A sufficient number of Activities must be identified in order to accurately reflect the Scope of Work. ITPs that lack sufficient detail will not be Approved.

1. Overview

1.1. This manual is a guide to the duties and responsibilities of the Layfield Project Manager, Layfield Project Supervisor, Layfield QA/QC Designate, and Layfield Technician on every project.

1.2. This document is not intended to be prescriptive for every possible application, project or material. Each practice, standard, and/or test method should be guided by (and applied with) good engineering principles and judgement, project specifications and the expertise of qualified Layfield personnel.

1.3. This document does not address any health, safety or environmental concerns related to practices, standards, test methods, regional regulations, or site specific rules.

3. Material Delivery

3.1. Overview

3.1.1. Layfield is usually responsible for geosynthetic material transport to the worksite. The Layfield Project Manager is responsible for ensuring that Layfield produced and procured materials are packaged and identified in a manner that complies with ASTM D4873 and/or ASTM D7865.

3.1.2. When Layfield is directly responsible for onsite geosynthetic material receiving, storage and handling, the Layfield Project Supervisor or QA/QC Designate will ensure that this done in a manner that complies with ASTM D4873 and/or ASTM D7865. However, Layfield often does not have direct control of these activities onsite and the Project Supervisor or QA/QC Designate is only able to give guidance, which may or may not be followed.

3.2. Procedure

3.2.1. The Project Supervisor or QA/QC Designate shall perform an inventory of all materials onsite for use in the scope of work.

3.2.2. All geomembrane, geotextile, geonet, geocomposite, etc roll or panel numbers shall be entered in the Inventory Log (Appendix B) and will be cross-referenced with bills of lading.

3.2.3. The Inventory Log must be returned to the Layfield office along with the remainder of the project QA/QC documentation at the end of the project for inclusion in the final QA/QC turnover package.

3.2.4. All damages must be noted on the Geomembrane Inventory Log. If damages are substantial, notify the Project Manager immediately so that the appropriate claim process may be started and/or PIR process initiated.

4. Subgrade Surface Inspection

4.1. Overview

4.1.1. All projects must have all Certificate(s) of Subgrade Surface Inspection (Appendix A) signed by the Owner's Representative prior to the deployment of any covering material.

4.1.2. It is important to note that there are cases where a total work area cannot or will not be turned over to Layfield. The Certificate of Subgrade Surface Inspection does make provision for partial areas being turned over to Layfield. The Project Supervisor or QA/QC Designate shall ensure that the extents of the inspected area are clearly expressed on the Certificate of Subgrade Surface Inspection. A separate certificate shall be generated for each partial area.

4.1.3. The Certificate of Subgrade Surface Inspection is generated in duplicate with a white (original) and yellow (copy). The white copy is kept with Layfield's QA/QC documentation and is turned over to the Layfield Project Manager at the Project Closeout Meeting. The yellow copy is turned over to the countersigning party (Contractor's QA, Owner's Representative, etc) immediately upon signature for their records.

4.2.Procedure

4.2.1. The General Contractor is responsible for preparing and maintaining the subgrade. The subgrade must be prepared and maintained per the individual project specifications.

4.2.2. The Project Supervisor or QA/QC Designate will be responsible for visually inspecting the subgrade surface.

4.2.2.1. If the subgrade is deemed unsuitable by the Project Supervisor or QA/QC Designate, they must alert the Owner's Representative and/or General Contractor as soon as possible. The Project Supervisor or QA/QC Designate shall communicate why the subgrade is unsuitable and may give some guidance for subgrade remedy.

4.2.2.2. Alternatively, the Owner's Representative may direct the Project Supervisor to begin deployment despite the unsuitable subgrade. The Project Supervisor will confer with the Project Manager prior to deployment.

4.2.3. When the subgrade has been inspected and deemed acceptable, the Project Supervisor or QA/QC Designate will complete and sign the Certificate of Subgrade Surface Inspection and submit to the Owner's Representative for countersignature.

4.2.3.1. The Certificate(s) of Subgrade Surface Inspection must be completed, signed and countersigned prior to beginning any deployment.

4.2.4. Prior to material installation, the Layfield Supervisor or QA/QC Designate should measure the area to be covered and compare it to the area included in the contract. Any differences must be communicated immediately to the Layfield Project Manager.

5. Deployment

5.1. Overview

5.1.1. Material shall be deployed under the direction of the Project Supervisor or QA/QC Designate.

5.1.2. Material shall be deployed in a logical sequence and in a manner that allows for efficient seaming.

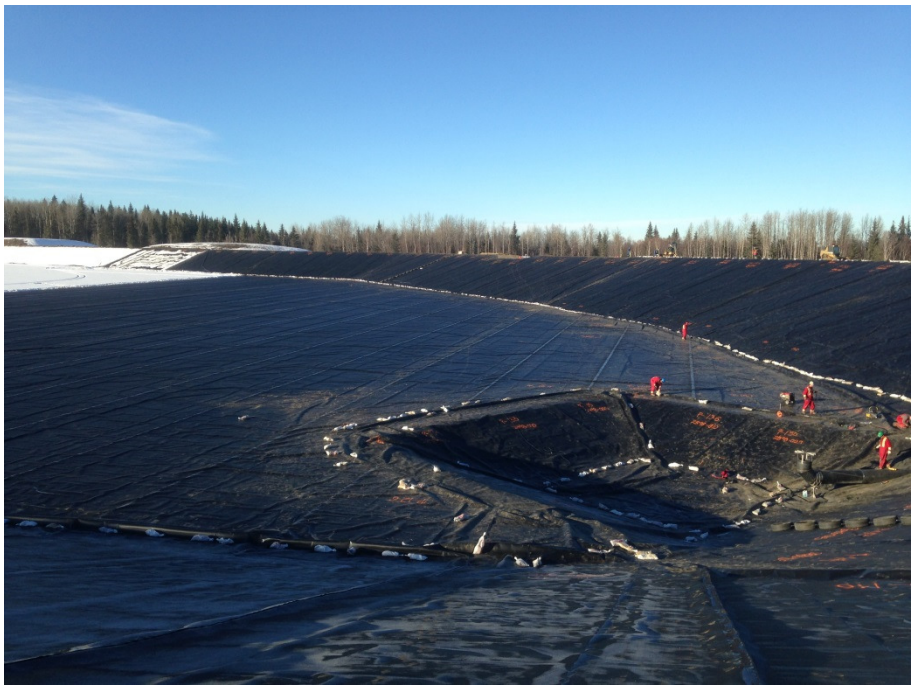
5.1.3. Equipment used to handle geomembrane panels or rolls shall not contact the material directly and shall not cause damage to material.

5.1.4. Adjacent rolls will be overlapped by an amount suitable for the material and the seaming method being used.

5.2. Procedure

5.2.1. Each prefabricated panel or roll stock length shall be assigned a unique Panel Number as detailed below.

5.2.1.1. It is essential that Layfield's identification system and the Owner's Representative are the same. Do not use different systems.



5.2.2. Panel numbers shall be written in large block letters in the center of each deployed panel. The roll number, date of deployment and length (gross) should be noted below the panel number. All noting should be made so that they are easily visible from a distance. On long panels this information should be written at both ends.

5.2.3. Panel Numbers shall be logged on the Geomembrane Deployment Log (Appendix C) along with the deployment date, roll number, length, width, and air temperature.

5.2.4. Deployment of geomembrane panels shall be performed in a manner that will comply with the following guidelines:

5.2.4.1. Unroll geomembrane using methods that will not damage geomembrane and will protect the underlying surface from damage.

5.2.4.2. To prevent wind uplift, place ballast that will not damage the geomembrane (usually sandbags).

5.2.4.3. Personnel walking on geomembrane shall not engage in activities or wear footwear that could damage the material. Smoking is not permitted on the geomembrane.

5.2.4.4. Do not allow heavy equipment or road vehicle traffic directly on geomembrane. Rubber tired/ tracked UTVs are acceptable if ground pressure is less than 8 psi.

5.2.4.5. If required, place a protective cover over the geomembrane in areas of heavy traffic. The type of cover will vary according to material and traffic types.

5.2.4.6. All tires/tracks shall be inspected for sharp edges, embedded rocks or other potentially damaging materials prior to driving on any geosynthetic layer.

5.2.4.7. All UTVs must drive as straight as possible while on any geosynthetic layer. No sharp turns, sudden stops or quick starts.

5.2.4.8. Areas where driving occurs shall be continuously and thoroughly inspected throughout the deployment process by the Layfield Project Supervisor or QA/QC Designate and the Owner's Representative.

6. Qualification Welds

6.1.Overview

6.1.1. Wedge and Extrusion Qualification Welds

6.1.1.1. When performing Wedge and/or Extrusion Qualification Welds, each welding apparatus will be assigned to a Layfield Technician.

6.1.1.2. Each welding apparatus along with its designated Layfield Technician must pass a qualification weld prior to use for production welds. This will occur prior to any production seaming and in 4.0 hour increments as a minimum.

6.1.1.2.1. In addition, qualifications must be performed whenever there is a power interruption, dramatic change in climate conditions, if equipment settings are modified or adjusted, or a technician (operator) change.

6.1.1.3. Wedge and Extrusion Qualification Welds must be destructively tested by a calibrated tensiometer. The tensiometer shall be calibrated by a certified third party calibration agency. The Project Manager shall ensure that the Project Supervisor or QA/QC Designate is in possession of a copy of the calibration certificate prior to mobilization to the worksite.

6.1.1.4. Wedge and Extrusion Qualification Welds shall be tested in accordance with ASTM D6392, ASTM D7177, ASTM D7408, GRI Standard GM6, GRI Standard GM13, GRI Standard GM17, GRI Standard GM19, or GRI Standard GM25; whichever is applicable to the material being welded.

6.1.2. Chemical Fusion Qualification Welds

6.1.2.1. Chemical Fusion is a versatile technique, but is only applicable to materials containing PVC.

6.1.2.2. Chemical Fusion does not provide the same peel strengths as thermo-fusion welding methods. For example, it is possible to create a wide chemical fusion bond that will develop the same shear strength as the material, but peel strengths will be lower than thermo-fusion welded samples.

6.1.2.3. Chemical Fusion welds typically require 8 to 24 hours curing time. As such, it is not usually practical to perform QA Chemical Fusion Qualification Welds in the field.

6.1.2.4. Chemical Fusion welds can be tested as a QC measure as part of Field Destructive Testing, which is covered below in this document.

6.1.3. Prepared Tape Seams

6.1.3.1. Prepared Tape seams are only used on materials such as vapor barrier and RPE type materials where Thermo-Fusion techniques cannot be used due to material properties.

6.1.3.2. Prepared Tape seams do not provide the same peel or shear strength values as thermo-fusion welding methods. The joint must be secured in some other fashion to create strength.

6.1.3.3. If Qualification Welds are required by the project specifications, Prepared Tape seams shall be tested in accordance with ASTM D7272.

6.2.Wedge and Extrusion Qualification Procedure

6.2.1. All welding equipment shall be allowed to warm up a minimum of 15 minutes before performing Qualification Welds.

6.2.2. The Project Supervisor, QA/QC Designate and/or Technician must verify:

6.2.2.1. The equipment used is functioning properly and is the correct style for the welding to be performed.

6.2.2.2. Welding personnel are competent, working in a professional manner and are attentive to their duties.

6.2.2.3. Welding will only be performed when conditions allow for the conclusion of successful welds which will meet the project specifications.

6.2.3. Wedge welds must be performed on samples at least 5’ long. Extrusion welds must be performed on samples at least 3’ long.

6.2.4. All Qualification Welds must be performed in the same conditions that exist on the worksite.

6.2.5. Use a 1” (25 mm) die cutter to cut ten (10) test specimens (or coupons) from the Qualification Weld samples. The Qualification Weld samples should be free of sand and

grit prior to cutting sample. Cut one sample at a time to avoid damaging the coupons and/or the die cutter.

6.2.6. When cutting coupons from the Qualification Weld samples, the inside and outside tracks on the coupon must be identified to assist in troubleshooting if the weld fails.

6.2.6.1. The outside track will be identified as the track which is closest to the edge of the top sheet. The inside track will be identified as the track closest to the edge of the bottom sheet.

6.2.7. Allow coupons to cool prior to testing.

6.2.8. Qualification Weld testing should occur at 21°C (+/- 4°C). Coupon temperatures greater than 21 degrees may result in artificially low strengths while colder temperatures lower may result in artificially high test values. If possible, allow the coupons to temperature stabilize to these conditions prior to testing.

6.2.9. Visually inspect the coupons for squeeze-out, footprint, pressure and general appearance.

6.2.10. Five (5) coupons will be tested in peel, and five (5) more coupons will be sampled in shear on the calibrated field tensiometer at a separation rate dictated by the applicable ASTM or GRI test method.

6.2.11. Criteria for passing Qualification Welds will be as follows:

6.2.11.1. Weld must exhibit film tear bond (FTB). Qualification Welds must have no more than 25% incursion into the weld in all samples.

6.2.11.2. Peel and shear values must meet or exceed the values that are applicable to the geosynthetic material. Peel and Shear values for the following typical materials can be found in:

6.2.11.2.1. HDPE, Smooth and Textured – GRI Standard GM 19

6.2.11.2.2. LLDPE, Smooth and Textured – GRI Standard GM 17

6.2.11.2.3. LLDPE, Reinforced – GRI Standard GM 25

6.2.11.2.4. EnviroLiner Series – GRI Standard GM17

6.2.11.2.5. Nonreinforced PVC – ASTM D7408

6.2.11.2.6. Flexible Polypropylene, Reinforced & Nonreinforced – GRI Standard GM18

6.2.11.3. Both tracks of Dual Track wedge welded samples must pass for the Qualification Weld to be considered acceptable. If any of the ten (10) coupons fail either peel or shear due to seam incursion (no FTB) or low strength values, the Qualification Weld must be re-done. Repeat the Qualification Weld process until passing values are obtained.

6.2.12. The Layfield Project Supervisor or QA/ QC Designate will give approval to proceed with welding after observing and recording all Qualification Weld results.

6.2.13. All qualification weld data shall be recorded on the following logs:

6.2.13.1. Wedge Qualification Weld data will be recorded in the Geomembrane Seam & Test Log (Appendix D).

6.2.13.2. Extrusion Qualification Weld data will be recorded in the Geomembrane Detail & Test Log (Appendix E)

7. Field Production Seaming

7.1. Overview

7.1.1. All seams shall be recorded.

7.1.2. Production wedge welds shall be recorded on the Geomembrane Seam & Test Log (Appendix D).

7.1.3. Extrusion welds are usually performed on details, defects or repairs and as such will be recorded on the Geomembrane Detail & Test Log (Appendix E).

7.1.4. Chemical Fusion welds shall be recorded on the Geomembrane Seam & Test Log if they are production welds. If they are performed as part of a detail or repair, they shall be recorded on the Geomembrane Detail & Test Log.

7.1.5. Prepared Tape welds shall be recorded on the Geomembrane Seam & Test Log if they are production welds. If they are performed as part of a detail or repair, they shall be recorded on the Geomembrane Detail & Test Log.

7.2. Wedge Welding Procedures

7.2.1. All wedge welding equipment must use the same settings that were used during the Qualification Weld process. If changes are made to any settings, the wedge welder must be re-qualified.

7.2.2. The seam shall be identified by the unique Panel Numbers on each side. These Panel Numbers and the seam lengths shall be recorded in the Geomembrane Seam & Test Log.

7.2.3. Welding Technicians will mark their initials, machine number, date and time at the start of every seam.

7.2.4. Welding should not be performed in ambient air temperatures or adverse weather conditions that would jeopardize the integrity of the liner installation.

7.2.4.1. Allowable welding temperatures and/or weather conditions shall be dictated by the project specifications, material specifications and/or the successful geomembrane Qualification Weld.

7.2.4.2. Welding may proceed in adverse conditions if sufficient precautionary measures have been implemented to protect the welding area and/or geomembrane.

7.2.5. The Layfield Technician shall verify the following as part of weld preparation:

7.2.5.1. Ensure that the seam is overlapped properly for Wedge welding.

7.2.5.2. Clean the seam area as required. The seaming area must be kept free of moisture, dust, dirt, sand or debris of any nature.

7.2.5.2.1. A slip sheet or geotextile working surface may be used to maintain a clean work area.

7.2.5.3. Align wrinkles on seams to minimize unmatched wrinkles or “fish mouths”.

7.2.6. Proceed with Wedge weld.

7.3. Extrusion Welding Procedures

7.3.1. All Extrusion welding equipment must use the same settings that were used during the Qualification Weld process.

7.3.2. The seam shall be identified by the unique Panel Numbers on each side. These Panel Numbers and the seam lengths shall be recorded in the Geomembrane Detail & Test Log.

7.3.3. Welding Technicians will mark their initials, machine number, date and time at the start of every seam or weld.

7.3.4. Welding should not be performed in ambient air temperatures or adverse weather conditions that would jeopardize the integrity of the liner installation.

7.3.4.1. Allowable welding temperatures and/or weather conditions shall be dictated by the project specifications, material specifications and/or the successful geomembrane Qualification Weld.

7.3.4.2. Welding may proceed in adverse conditions if sufficient precautionary measures have been implemented to protect the welding area and/or geomembrane.

7.3.5. The Layfield Technician shall verify the following as part of weld preparation:

7.3.5.1. Ensure that the seam or weld area is overlapped properly for Extrusion welding.

7.3.5.1.1. A slip sheet or geotextile working surface may be used to maintain a clean work area.

7.3.5.2. Clean the seam or weld area as required. The seam or weld area must be kept free of moisture, dust, dirt, sand or debris of any nature.

7.3.5.3. Tack the seam or weld in place by using a Hot Air welder.

7.3.5.4. Roughen the welding surface(s) by either grinding or abrasion

7.3.5.5. Purge the machine of heat degraded extrudate prior to use.

7.3.6. Proceed with Extrusion weld.

7.4.Chemical Fusion Welding Procedures

7.4.1. Chemical Fusion Welding requires the use of solvents or bodied solvents.

7.4.2. The seam shall be identified by the unique Panel Numbers on each side. These Panel Numbers and the seam lengths shall be recorded in the Geomembrane Seam & Test Log or Geomembrane Detail & Test Log, as applicable.

7.4.3. Welding Technicians will mark their initials, date and time at the start of every seam or weld.

7.4.4. Welding should not be performed in ambient air temperatures or adverse weather conditions that would jeopardize the integrity of the liner installation.

7.4.4.1. Allowable welding temperatures and/or weather conditions shall be dictated by the project specifications, Chemical Fusion manufacturer specifications, and/or material specifications.

7.4.4.2. Welding may proceed in adverse conditions if sufficient precautionary measures have been implemented to protect the welding area and/or geomembrane.

7.4.5. The Layfield Technician shall verify the following as part of weld preparation:

7.4.5.1. Ensure that the seam or weld area is overlapped properly for Chemical Fusion welding.

7.4.5.1.1. A slip sheet or geotextile working surface may be used to maintain a clean work area.

7.4.5.1.2. If the subgrade is not rigid enough, a rigid slip sheet can be used to help with compression during the seaming process.

7.4.5.2. Clean the seam area or weld area as required. The area must be kept free of moisture, dust, dirt, sand or debris of any nature.

7.4.6. Proceed with Chemical Fusion weld.

7.5.Prepared Tape Seaming Procedures

7.5.1. Prepared Tape Seaming requires the use of mastics, putties, asphalt, or butyl tapes.

7.5.2. The seam shall be identified by the unique Panel Numbers on each side. These Panel Numbers and the seam lengths shall be recorded in the Geomembrane Seam & Test Log or Geomembrane Detail & Test Log, as applicable.

7.5.3. Welding Technicians will mark their initials, date and time at the start of every seam.

7.5.4. Seaming should not be performed in ambient air temperatures or adverse weather conditions that would jeopardize the integrity of the liner installation.

7.5.4.1. Allowable seaming temperatures and/or weather conditions shall be dictated by the project specifications, Prepared Tape manufacturer specifications, and/or material specifications.

7.5.4.2. Seaming may proceed in adverse conditions if sufficient precautionary measures have been implemented to protect the welding area and/or geomembrane.

7.5.5. The Layfield Technician shall verify the following as part of seam preparation:

7.5.5.1. Ensure that the seam is overlapped properly for Prepared Tape seaming.

7.5.5.2. Clean the seam area as required. The seaming area must be kept free of moisture, dust, dirt, sand or debris of any nature.

7.5.6. Proceed with Prepared Tape seam.

8. Field Nondestructive Testing

8.1. Overview

8.1.1. Layfield shall nondestructively test the entire length of all seams and welds using the applicable nondestructive test method for the material as indicated by ASTM D7700. The table below can be used as a quick reference

Material	ASTM Test Method				
	D5641 Vacuum Chamber[1]	D4437 Air Lance	D4437 Point Stress	D5820 Pressurized Air Channel[3]	D6365 Spark Test
HDPE	X	X	X	X[2]	X
LLDPE & fPP	X	X	X	X[2]	X
Non-reinforced PVC	X	X	X		X
Reinforced PVC	X	X	X		X
fPP-R	X	X	X	X	
EnviroLiner series	X	X	X	X[2]	X

[1] Layfield will usually restrict use of ASTM D5641 (Vacuum Chamber) to Extrusion welds and other short weld lengths such as details and repairs.

[2] Layfield will usually perform Dual Track Wedge welds on this material if the thickness is above 40mil. Layfield will usually perform Solid Wedge welds if the material thickness is below 40mil.

[3] GRI Standard GM6 is also applicable to this test method.

8.2.Procedure

8.2.1. Vacuum Chamber

8.2.1.1. This method is used to inspect welds and seams for unbonded areas and/or pinholes. A Vacuum Chamber consists of a rectangular box with an open bottom, a soft rubber type gasket along the perimeter of the open bottom, a clear plastic viewing panel at the top, and a vacuum gauge.

8.2.1.2. Apply a soap solution (or other approved foaming agent) to the area to be tested.

8.2.1.3. Place Vacuum Chamber over the area to be tested.

8.2.1.3.1. This test method is performed in increments of approximately 18” with a 6” overlap of the previous length tested.

8.2.1.4. Apply a vacuum between 4 to 8” (122-244mm) of mercury (Hg) to the Vacuum Chamber.

8.2.1.5. Inspect the testing area through the clear plastic viewing panel for bubbles at unbonded areas or pinholes.

8.2.1.5.1. Bubbles near the edge of the vacuum chamber may be caused by an incomplete seal. If bubbles are detected near the edges of the vacuum chamber, move the vacuum chamber and retest to verify if the bubbles were caused by an actual defect or pinhole.

8.2.1.6. Mark all unbonded areas or pinholes for repair with a white paint marker.

8.2.1.7. Record results on the Geomembrane Seam & Test Log and/or Detail & Test Log, as appropriate.

8.2.2. Air Lance

8.2.2.1. This method is used to test welds and seams for unbonded areas by using an air nozzle directed on the upper edge and surface. Layfield typically uses this test method on Solid Wedge welds.

8.2.2.2. Use a minimum 50 psi (345 kPa) air supply directed through a 3/16" nozzle. Hold the nozzle approximately 2" away from the edge and surface.

8.2.2.3. While performing Air Lance testing, inspect testing areas for loose edges, riffles indicating unbonded areas, and other unacceptable conditions.

8.2.2.4. Mark all unbonded areas for repair with a white paint marker.

8.2.2.5. Record results on the Geomembrane Seam & Test Log and/or Detail & Test Log, as appropriate.

8.2.3. Point Stress

8.2.3.1. This method is used to manually inspect and test seam and weld edges with a rounded screwdriver (or similar device).

8.2.3.2. Layfield requires this to be done on all seams and welds in addition to other applicable testing methods.

8.2.3.3. Using a rounded screwdriver, manually test the edges of seams and welds.

8.2.3.3.1. Ensure that this procedure does not puncture or otherwise damage the sheet material, seams or welds.

8.2.3.4. While performing Point Stress testing, inspect for signs of unbonded areas.

8.2.3.5. Mark all unbonded areas for repair with a white paint marker.

8.2.3.6. Record results on the Geomembrane Seam & Test Log and/or Detail & Test Log, as appropriate.

8.2.4. Pressurized Air Channel

8.2.4.1. This method is used to test Dual Track Wedge welded seams. A Dual Track Wedge weld consists of parallel thermo-fusion welds separated by an unwelded air channel.

8.2.4.2. After a Dual Track Wedge weld has been completed and allowed to cool, perform the following:

8.2.4.2.1. Seal the two ends of the continuous air channel.

8.2.4.2.2. Connect the air pressure gauge assembly directly to the air channel.

8.2.4.2.3. Connect an air pump to the air pressure gauge assembly and pressurize the air channel to the appropriate pressure for the geomembrane material.

8.2.4.2.4. Disconnect the air pump from the air pressure gauge assembly.

8.2.4.2.5. Allow the air channel pressure to stabilize.

8.2.4.2.5.1. If required, increase or decrease the pressure to the specified starting value.

8.2.4.2.6. Record the test start time and pressure, and seam location.

8.2.4.2.7. Wait 5 minutes. During this period perform the following:

8.2.4.2.7.1. Visually inspect the air channel along its full length to ensure that pressure is present throughout the entire length of seam.

8.2.4.2.7.2. Listen for escaping air along the full length of the air channel.

8.2.4.2.8. After the 5 minute testing period, observe and record the test end time and pressure.

8.2.4.2.9. For a seam to pass, it must meet the following criteria:

8.2.4.2.9.1. Compare the recorded test results against the Maximum Pressure Drop testing values table for the material. If the pressure does not drop below the value listed, proceed to the next step.

8.2.4.2.9.2. Open the air channel at the opposite end from the pressure gauge. Pressurized air should escape and the pressure gauge should register an immediate drop in pressure. This indicates that the entire length of seam has been tested and the seam passes. If not, there is likely a blockage in the air channel.

8.2.4.2.9.2.1. If there is a blockage, the channel should be inflated up to the blockage. Cut the air channel on the gauge side of the blockage and

verify pressure loss. Repeat as necessary until the blockage is identified. Retest all sections and repair as required.

8.2.4.2.9.3. If the pressure drops below the allowable pressure value, Layfield personnel must trace and identify the defect by following these steps:

8.2.4.2.9.3.1. Check the seals at the ends of the air channel. Reseal and retest if the seal was defective.

8.2.4.2.9.3.2. Inspect the seam for deficiencies in the weld tracks (spinouts, wrinkles, fish mouths, etc).

8.2.4.2.9.3.3. Remove the overlap and apply a soap solution. Retest the seam in increments to identify the defect location. If the defect is found, effect localized repairs.

8.2.4.2.9.3.4. If the defect in the air channel cannot be identified, reconstruct the seam (or part of seam) by installing a Dual Track wedge welded cap strip and retest.

8.2.4.3. Record all test results on the Geomembrane Seam & Test Log (Appendix D).

8.2.5. Spark Test

8.2.5.1. This method is used to test an Extrusion weld that includes a conductive material inserted into or behind the weld.

8.2.5.2. Set the voltage source to the voltage needed for the expected distance.

8.2.5.3. The spark tester shall be held and operated approximately ½" to 1" away from the weld.

8.2.5.4. Sweep the spark tester over the welded materials along the weld length.

8.2.5.5. Spark arcing indicates a suspect area in the weld.

8.2.5.6. Mark all pinholes or unbonded areas for repair with a white paint marker.

8.2.5.7. Record all test results on the Geomembrane Seam & Test Log and/or Detail & Test Log, as appropriate.

9. Details, Defects & Repairs

9.1. Overview

9.1.1. All seam and non-seam areas of the geomembrane shall be inspected for damages and defects.

9.1.1.1. At minimum, all seams and welds shall be non-destructively tested. Where a seam is tested destructively, it shall be repaired and recorded as part of this process.

9.1.1.2. All non-seam areas shall be inspected throughout the work and as part of Final Inspection and Acceptance.

9.1.2. All details, defects and repairs shall be physically marked on the geomembrane and recorded on the Geomembrane Detail & Test Log (Appendix E) and their location recorded on the As-Built Drawing.

9.2. Identification

9.2.1. Details are identified in the Scope of Work, Construction Drawings, or other contract document. Examples are pipe or pile penetrations, rub sheets, etc.

9.2.2. Damages and defects are identified in one of two ways: an inspection, or as part of a destructive or non-destructive test. Examples are punctures in the sheet, defects in a seam, etc.

9.3. Details

9.3.1. Typical detail types include: grind & weld, boots, and skirts.

9.3.2. All details must be constructed using equipment that has been through the Qualification Weld process, and follow the applicable welding procedures.

9.3.3. Each detail shall be assigned a unique Detail Code.

9.3.4. The detail shall be constructed and tested non-destructively using an appropriate method for the detail type, geomembrane material type and project specifications.

9.3.5. The location, detail type, repair date & time, test date, and test type shall be recorded on the Geomembrane Detail & Test Log.

9.3.6. The location and unique Detail Code shall be recorded on the As-Built Drawing.

9.4.Repairs

9.4.1. Typical repair types include: grind & weld, patching, reconstructed seam, and capping.

9.4.2. All repairs must be performed using equipment that has been through the Qualification Weld process, and follow the applicable welding procedures.

9.4.3. Any damage or defect found in a seam or on sheet (pinholes, tears, punctures, etc) shall be marked on the geomembrane using a white paint marker, and designated for repair.

9.4.4. Each area designated for repair shall be assigned a unique Detail Code.

9.4.5. The repair shall be performed and tested nondestructively using an appropriate method for the damage or defect type, geomembrane material type, and project specifications.

9.4.6. The location, repair type, repair date & time, test date, and test type shall be recorded on the Geomembrane Detail & Test Log.

9.4.7. The location and unique Detail Code shall be recorded on the As-Built Drawing.

10. Field Destructive Testing

10.1. Overview

10.1.1. Destructive seam tests are performed to evaluate and confirm that production welds are conforming to the material and/or project specifications.

10.1.2. The sampling frequency of destructive testing shall be one (1) sample per 150 lineal meters of field welded seam, as guided by GRI Standard GM14 and GRI Standard GM29.

10.1.2.1. Project specifications and field considerations may modify this frequency.

10.2. Procedure

10.2.1. The Project Supervisor or QA/QC Designate shall identify the area from which the sample will be collected with a white paint marker.

10.2.1.1. Alternatively, project specifications may dictate that the Owner's Representative shall be responsible for identifying the area from which the sample will be collected.

10.2.2. Each destructive test sample will be assigned a unique Destruct Sample Number.

10.2.3. The sample size should be approximately 300mm (12") x 900mm (36"). This may vary based on project specification and sample distribution; however the typical distribution is as follows:

10.2.3.1. 300mm x 300mm sample for Layfield QA/QC Designate to be field tested.

10.2.3.2. 300mm x 300mm sample sent to Office for archiving or future testing if required.

10.2.3.3. 300mm x 300 mm sent to third party for independent testing, if required.

10.2.4. All samples shall be labeled with the unique Destruct Sample Number, seam location, machine number, Layfield project number, date welded, Technician, and geomembrane roll numbers.

10.2.5. The sample shall be tested using the same procedure as Qualification Welds for that welding apparatus.

10.2.5.1. Each geomembrane material has its own pass criteria. References are given in Section 6.2.11.2

10.2.5.2. The mechanical values of four out of five specimens must meet or exceed the specified values, and the fifth specimen must meet or exceed 80% of the value. In addition, the average value of each set of five specimens must meet GRI GM 19 specifications.

10.2.6. All destructive test data will be recorded on the Geomembrane Destruct Log (Appendix F).

10.2.7. If a destructive test sample fails, it is necessary to destructively sample and test the seam until a pass is found on both sides of the defect.

10.2.7.1. Cut additional samples 3 meters on each side of the defect and retest. These will be labeled A (after) & B (before). This procedure continues until a passing sample in each direction is achieved. The total length of defective seam between the two passing tests must be capped, or cut out and re-seamed.

10.2.7.2. After reconstructing the defective seam, the entire seam length must be non-destructively tested using the appropriate method for the repair type.

10.2.8. Destructive test samples should be repaired, but this may not be necessary depending on sample location (for example anchor trench or end of tie-in).

11. As-Built Drawing Requirements

11.1. As-built Drawings can be done on Layfield drafting paper, or overlay an Owner supplied construction/survey drawing. Drawings may be done in ink or pencil, but writing must be neat.

11.2. Scale must be indicated and consistent throughout the drawing.

11.3. Each As-Built Drawing must include a Legend, a North Arrow and overall dimensions.

11.4. Deployed geomembrane panels must be accurately located on the As-Built Drawing. The panels must be identified by the unique Panel Number that is physically written on the panel, and it must match the Geomembrane Deployment Log.

11.5. Details and Repairs must be accurately located on the As-Built Drawing. The details and repairs must be identified by the unique Detail Codes that are recorded in the Geomembrane Detail & Test Log.

12. Final Inspection and Acceptance

12.1. Overview

12.1.1. All projects must have all Certificate(s) of Final Inspection and Acceptance signed by, or on behalf of, both parties prior to the installation of any covering material.

12.1.2. It is important to note that there are cases where a total work area cannot or will not be completed and turned over to the Owner's Representative. The Certificate of Final Inspection and Acceptance does make provision for partial areas being completed and turned over to the Owner's Representative. The Layfield Site Supervisor shall ensure that the extents of the inspected area are clearly expressed on the Certificate of Final Inspection and Acceptance. A separate certificate shall be generated for each partial area.

12.1.3. The Certificate of Final Inspection and Acceptance is generated in duplicate with a white (original) and yellow (copy). The white copy is kept with Layfield's QA/QC documentation and is turned over to the Layfield Project Manager at the Project Closeout Meeting. The yellow copy is turned over to the countersigning party (Contractor's QA, Owner's Representative, etc) immediately upon signature for their records.

12.2. Procedure

12.2.1. The Project Supervisor or QA/QC Designate will arrange a final site inspection with Owner's Representative when the contracted Scope of Work has been completed.

12.2.2. The Project Supervisor or QA/QC Designate and Owner's Representative will inspect, measure, and validate all deliverables and components of the Scope of Work together.

12.2.2.1. If any deficiencies are found, they shall be remedied as soon as practical using the applicable procedures detailed above.

12.2.2.2. When the deficient item(s) have been remedied, the Project Supervisor or QA/QC Designate and Owner's Representative can re-inspect. Repeat this step as necessary.

12.2.3. When all deliverables and components have been inspected, measured and validated by the Owner's Representative, the Project Supervisor or QA/QC Designate will complete and sign the Certificate of Final Inspection and Acceptance and submit to the Owner's Representative for countersignature.

12.2.3.1. A Certificate of Final Inspection and Acceptance must be signed prior to Layfield demobilization.

Appendix A – Certificate of Subgrade Surface Inspection

CERTIFICATE OF SUBGRADE SURFACE INSPECTION
PROJECT NAME: _____
PROJECT NUMBER: _____
OWNER/CONTRACTOR: _____
LOCATION: _____

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the subgrade surface described below, and:

- ☐ *found it to be an Acceptable surface on which to install geomembrane; OR*
- ☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☐ Partial ☐ Complete)**:** _____
Dimensions of Subgrade Inspection:_____
Anchor Trench Dimensions:_____ ____
Comments:_____
_____

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:
Date: _____
Signature: _____
Name: _____
Title: _____

OWNERS REPRESENTATIVE:
I, the undersigned, a duly appointed representative of the Owner, hereby understand the subgrade surface inspection described above and authorize Layfield to proceed with deployment of Geosynthetics on the subgrade provided.

Appendix A – Certificate of Subgrade Surface Inspection 9

1. Overview

1.1. This manual is a guide to Layfield's site preparation expectations of the General Contractor, their Project Management staff and Site Supervision.

1.2. This document is not intended to be prescriptive for every possible application, project or material. Each practice, standard, and/or test method should be guided by (and applied with) good engineering principles and judgement, project specifications and the expertise of qualified Layfield personnel.

1.3. This document does not address any health, safety or environmental concerns related to practices, standards, test methods, regional regulations, or site specific rules.

2. Site Readiness (Anchor Trench, Ballast Sand, Access, Surface Water, etc)

2.1.Overview

2.1.1. Sandbags are required as ballast to reduce the risk of wind uplift which may result in material damage or personnel injury. Layfield's quote will specify the amount of sand to be supplied by the owner/contractor.

2.1.1.1. The number of sandbags required is typically 1 per 25 m2 of area, and 1 m3 of sand can typically fill 100 sandbags. This supplied sand must be usable in winter conditions (i.e. not frozen), and free of large rocks.

2.1.2. Layfield installation crews require a clean and clear access way approximately 4 to 5 meters wide on at least three sides of the installation area. This access way must be safe for a crew cab truck and trailer to traffic and clear of obstructions, debris or anchor trench spoil.

2.1.2.1. Then anchor trench should be dug prior to Layfield's arrival onsite. For larger projects, the Layfield Supervisor may coordinate the anchor trench excavation with onsite earthworks personnel to ensure that Layfield does not experience any productivity delays. Anchor trench spoil must be removed to allow adequate access for installation activities.

2.1.2.2. The above guideline may be waived if Layfield is made aware of site specific restrictions at time of bid. Onsite changes to as bid conditions may slow production, change deployment process or equipment required. These changes may also result in change orders.

2.1.3. Layfield installation crews are typically ill-equipped to handle water related project issues. Groundwater, surface water and/or snow removal are the responsibility of the General Contractor or Owner. If Layfield is required to perform activities relating to water and/or snow removal, this will be considered extra work and charged at force account rates.

2.1.4. Provision of onsite facilities such as sanitary toilets, lunch trailers and garbage bins are the responsibility of the General Contractor or Owner. Layfield installation crews are required to use and respect these facilities as instructed in the site orientation and by Layfield project management staff.

3. Material Delivery, Storage & Laydown Access

3.1. Overview

3.1.1. Prior to sending materials to a project site, any site specific loading/unloading requirements must be communicated to the Layfield Project Manager.

3.1.2. Prior to sending materials to a project site, mill certification reports are reviewed to ensure that the proposed materials meet project specifications.

3.1.3. Layfield is usually responsible for geosynthetic material transport to the worksite. The Layfield Project Manager is responsible for ensuring that Layfield produced and procured materials are packaged and identified in a manner that complies with ASTM D4873.

3.1.3.1. The Layfield Project Manager must be provided with access maps, site contacts, road restriction information and any other delivery requirements prior to material shipment.

3.1.4. The General Contractor is responsible for ensuring that geosynthetics are received, transported and stored in a manner that prevents damage and exposure to adverse environmental conditions.

3.1.5. The material laydown area should be in close proximity to the work area. If this is not possible, material delivery and spotting at the work area must be coordinated such that Layfield productivity is not impacted.

3.1.6. Typical equipment used for handling and transport are telehandlers with forks and/or front end loaders with forks. Excavators with suitable lifting points can also be used.

3.2.Procedure

3.2.1. Geosynthetic materials should be stored in a location that is close to the planned work area. That location should be flat, dry and self-draining with the materials placed on dunnage to prevent contact with the ground. This area must also be maintained by others to allow Layfield access throughout the project.

3.2.2. Rolls should be stacked no more than 3 rows high.

3.2.3. Geonet and geocomposite materials should arrive with a specific kind of zip tie. Please ensure that these are turned over to the Layfield Supervisor.

3.2.4. Materials that arrive with lifting straps should only be lifted or otherwise moved using the lifting straps. These lifting straps are not to be removed by anyone other than Layfield personnel.

3.2.5. Some materials may arrive packaged with a protective wrapping to prevent product degradation via sunlight (UV) or rain/moisture.

3.2.5.1. If present, the protective wrapping should not be removed until the material is ready to be deployed. If these materials are being stored outdoors for longer than a month, a tarp should be used as a cover to further prevent product degradation.

3.2.5.2. Geosynthetic Clay Liner (GCL) is shipped with a watertight sleeve. The integrity of the sleeve must be maintained to prevent premature bentonite clay activation. Layfield recommends that GCL be covered by a tarp in addition to the sleeve to prevent this from occurring.

3.2.6. Polyurea spray applied raw materials must be stored in a controlled environment. In the winter, raw materials must be kept in a covered and heated (+10^{o}C) environment. In the summer, raw materials must be protected from direct sunlight and temperatures above 20^{o}C.

3.2.6.1. Pre-sprayed rolls of polyurea membrane must remain in their protective wrapping and tarped to protect against moisture infiltration.

4. Subgrade Preparation

4.1.Overview

4.1.1. Geosynthetics can be installed in a wide variety of conditions and applications. The most common subgrades are some kind of prepared soil subgrade. The other most common subgrade is concrete. For other subgrade types, please speak directly to Layfield project personnel.

4.1.2. Prior to mobilization, the subgrade should be prepared for geosynthetic installation crews to begin installation activities.

4.2.Procedure

4.2.1. For soil subgrades:

4.2.1.1. All subgrade surfaces should be (at minimum) compacted to withstand geosynthetic installation activities, including vehicle and foot traffic. This is typically 95% SPMDD, but project specifications may require something different.

4.2.1.2. The surface should be cut to neat lines and smooth drum rolled to create a smooth surface. The surface should be free of standing water, rocks, sticks and vegetation. All angular or sharp rocks should be removed from the surface.

4.2.2. For concrete subgrades:

4.2.2.1. The surface must be swept for rocks, pebbles, sticks, rebar and anything else that might damage the geosynthetic material and all standing water should be removed.

4.2.2.2. Any cracks or holes in the concrete larger than ½" (12mm) should be repaired prior to beginning geosynthetic installation activities.

5. Subgrade Surface Inspection

5.1. Overview

5.1.1. All projects must have all Certificate(s) of Subgrade Surface Inspection (Appendix A) signed by the Owner's Representative prior to the deployment of any covering material.

5.1.2. It is important to note that there are cases where a total work area cannot or will not be turned over to Layfield. The Certificate of Subgrade Surface Inspection does make provision for partial areas being turned over to Layfield. The Project Supervisor or QA/QC Designate shall ensure that the extents of the inspected area are clearly expressed on the Certificate of Subgrade Surface Inspection. A separate certificate shall be generated for each partial area.

5.1.3. No subterranean inspections or tests will be performed by Layfield. Layfield will make no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield will accept no responsibility for conformance of the subgrade to any project specifications.

5.2. Procedure

5.2.1. The Layfield Project Supervisor or QA/QC Designate will be responsible for visually inspecting the subgrade surface.

5.2.1.1. If the subgrade is deemed unsuitable by the Project Supervisor or QA/QC Designate, they must alert the Owner's Representative and/or General Contractor as soon as possible. The Project Supervisor or QA/QC Designate shall communicate why the subgrade is unsuitable and may give some guidance for subgrade remedy.

5.2.1.2. Alternatively, the Owner's Representative may direct the Project Supervisor to begin deployment despite the unsuitable subgrade. The Project Supervisor will confer with the Project Manager and mark the Certificate of Subgrade Surface Inspection an unsuitable surface on which to

install geosynthetics prior to deployment. Proceeding on an unsuitable surface may void material and/or installation warranties.

5.2.1.3. The subgrade must be maintained by others throughout the project. If something occurs to the subgrade (weather, equipment traffic, etc) that causes it to become unsuitable, the Layfield Supervisor will notify the appropriate onsite personnel and repeat the subgrade inspection process.

5.2.2. When the subgrade has been inspected and deemed acceptable, the Project Supervisor or QA/QC Designate will complete and sign the Certificate of Subgrade Surface Inspection and submit to the Owner's Representative for countersignature.

5.2.2.1. The Certificate(s) of Subgrade Surface Inspection must be completed, signed and countersigned prior to beginning any deployment.

5.2.3. Prior to material installation, the Layfield Supervisor or QA/QC Designate should measure the area to be covered and compare it to the area included in the contract. Any differences must be communicated immediately to the Layfield Project Manager.

Acceptable Subgrade

Unacceptable Subgrade

Appendix A – Certificate of Subgrade Surface Inspection

CERTIFICATE OF SUBGRADE SURFACE INSPECTION
PROJECT NAME: _____
PROJECT NUMBER: _____
OWNER/CONTRACTOR: _____
LOCATION: _____

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the subgrade surface described below, and:

- ☐ *found it to be an Acceptable surface on which to install geomembrane; OR*
- ☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☐ Partial ☐ Complete)**:** _____
Dimensions of Subgrade Inspection:_____
Anchor Trench Dimensions:_____ ____
Comments:_____
_____

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:
Date: _____
Signature: _____
Name: _____
Title: _____

OWNERS REPRESENTATIVE:
I, the undersigned, a duly appointed representative of the Owner, hereby understand the subgrade surface inspection described above and authorize Layfield to proceed with deployment of Geosynthetics on the subgrade provided.
Date: _____
Signature: _____

MEMORANDUM

Date June 27, 2018
From: Arnie Toews
Attn: Mike Billowits

RE: Eagle Gold HLF – PLS Pump Casing

After familiarization with the project we have identified gaps in the design information relating to the PLS pump casing system proposed for installation at the Eagle Gold HLF. In order to generate a complete fabrication ITP, and to provide construction support, clarification on the intended design and installation of the pipe casing risers is required as follows:

With respect to piping inspection and testing:

In order to generate an inspection and testing plan for the steel casing pipe, acceptance criteria are required for each step in the fabrication process. Normally these acceptance criteria are dictated by a set of engineering specifications, owner requirements and/or design codes/regulations. Answers to the following questions are required in order for us to generate a complete ITP.

1. What is the scope boundary for the steel piping? Is the piping within the casing (pump discharge piping) included or just the casing alone. Does this include the LRDS piping?
2. The design drawings do not show any lifting appurtenances (i.e. lifting lugs). Are lifting lugs to be installed on the pipe, or is there a proposed installation procedure to allow for installation without lugs
    a. If lifting lugs are required, is a specification available (material, impact testing requirements (temperature), magnetic particle inspection of welds)
3. Is there a proposed design specification for the casing pipe joints (i.e. ASME B31.3 compliance, CSA W59 Structural Welding).
    a. What level of NDE is to be applied to casing pipe joints, if any (radiography, etc.)
4. Does the design include and pipe coatings or other corrosion mitigation features which must be addressed or applied during fabrication or installation?
5. Casing material appears to have previously been specified (on the publicly available detailed design report) as ASTM 139, A606 Type 4 HSLA steel. Is this still valid
    a. For the purposes of assigning responsibility for received material inspection and quality control, is material to be free issued to or procured by the fabricator

With respect to installation of the pipe riser system(s)

The design drawing package details the steel pipe risers and header as a single fabricated unit. In order to avoid welding directly on the liner system in place, this piping must be fabricated outside of the lined

area, and then installed in place. This cannot be accommodated based on the current design of the pipe casing.

Each of the Five (5) 900mm OD pipe risers (specified as 19mm wall thickness) has a weight exceeding 33,000 kg. All 5 of these risers are connected together at the bottom of the sump by a fully welded header. Given that the only suitable location for a crane is the crest of the confining embankment, a 110 ton crane will not have sufficient lifting capacity to position a single fabricated riser into place at the required reach.

Clarification is required regarding the installation of the casing pipe:

1. Does the design include break points to allow for in-situ assembly of pipe, which are not shown on the drawings (i.e. break flanges or other non-welded joints)?
2. Is a secondary crane location proposed to support the installation of the pipe?
3. Is there another proposed installation methodology that was intended when the design was developed?
4. Given that all fittings appear to be welded in the current design, is there a plan or specification which addresses the mitigation of heat-warping the pipe, and associated dimensional issues? This may be prevalent on the connections to the manifold end of the riser.

Yours truly,

Arnie Toews

Re: BGC-RFI-009: Embankment Zoning Plan

1.0 INFORMATION REQUEST

BGC requests Pelly provide an Embankment Zoning Plan. This RFI refers to BGC's response to CC204-RFI-022 where configurations of zones and construction considerations were presented.

This plan should take into considerations the BGC response to RFI-022 and volumes of material available to determine survey controls, construction sequencing and zone dimensions for Embankment construction. The plan should also consider how Pelly proposes to tie the two zones (Type 7 and Type 3) together, following RFI-022.

RFI-022 attached for reference.

Re: BGC-RFI-012: Crest Width Adjustment

1.0 DESIGN REVISION

BGC requests JDS provide acknowledgment of receipt of the following design revision:

- At JDS's request BGC evaluated extending the grade break at the crest to allow for additional width in the area where pipe works will be installed. The changes are included in the attached "Figure 9 – In-heap Pond Embankment – Crest Width Widening Revision" pdf and AutoCAD file. The figure shows the grade break beginning at 930.5m. However, the grade break can occur at a higher elevation if needed. Approximately 1m of crest width would be lost for each 1 meters higher the grade break occurs.

Re: BGC-RFI-013: PLS and LDRS Pipe Installation Approach

BGC requests JDS provide acknowledgment of receipt of the following design revision.

In discussions between BGC, JDS and Heavy North regarding the construction approach for PLS pipe risers installations, a preferred approach was jointly developed to better match the proposed equipment while protecting the installed pipes and geosynthetic liner system.

The approach will involve conventional equipment (dozer and excavator) traffic within the pipe corridor, as opposed to using a crane or side-boom. This approach requires a modification to the pipe and liner arrangement to ensure protection of the liner system and placed LDRS pipes.

Design drawings EGHLF XD-05-03, 05-04, and 05-05 should be referenced. Figure 1 presents the revised section through the pipe corridor (looking downstream) on the face of the HLF embankment. This section replaces Detail 28 on Drawing XD-05-03.

The LDRS pipe will be placed in the slot on the embankment face from access roads constructed with Overliner Drain Fill (ODF) between the pipes and buried with ODF gravel. The geocomposite and top liner would then be placed followed by 2 layers of geotextile and 2m thick layer of ODF for liner protection and to provide a traffic surface for PLS pipe installation. The ODF shall be placed starting from the toe of the slope in a single lift toward the top of the embankment. The pipes will then be placed and buried in sequence across the corridor. A layer of ODF must be place beneath any pipes to be field welded in order to protect the geomembrane. Welding protection blankets must also be used for all field welding activities within the pipeline corridor.

The outward shift of the PLS pipes will be accommodated at the bottom by adjusting the dimensions of the PE pipe network in the PLS sump. The concrete anchoring system at the top must be designed to support both the LDRS and PLS pipe terminations.

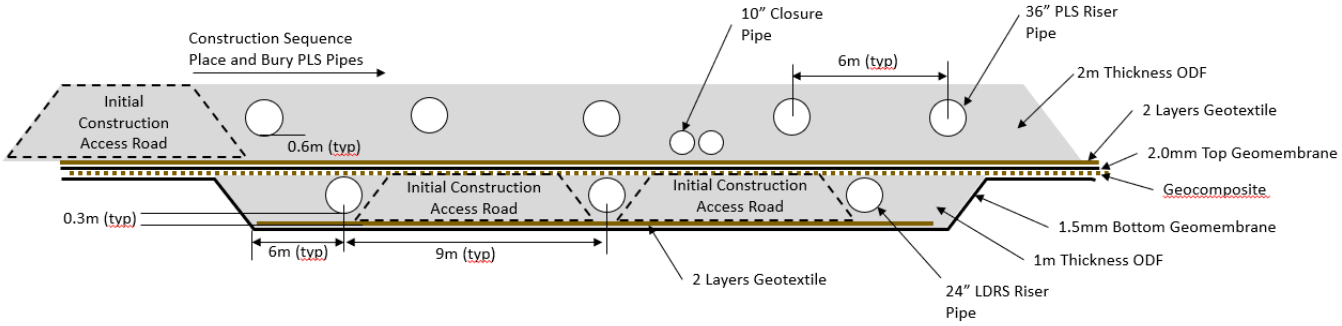

Figure 1: Revised Detail 28, Drawing EGHLF-XD-05-03.

A field test pad has been conducted (BGC Field Memo FM-007) to demonstrate the protection of the liner with ODF thickness from 0.6m to 1.5m and traffic from loaded 40T rock trucks, CAT 3250 trackhoe excavator and D6 dozer. The proposed equipment for pipe placement includes a CAT 349F and Linkbelt 490 excavator (data sheets attached). Based on our estimates of the maximum ground pressure exerted from this equipment, a minimum of 1m thickness ODF underlain by 2 non-woven geotextile layers to cushion the geomembrane liner will be required. Other equipment must be approved by BGC prior to use. Equipment movement must be slow and turning on the access roads built over the liner will not be allowed. BGC may require the contractor to excavate the ODF to demonstrate protection of the liner system during the installation process based on observation of the operation.

SPECIFICATIONS

Link-Belt EXCAVATORS

Performance, Productivity and Reliabilty Come Standard

Link-Belt X4 Series excavators are built to exceed your expectations. We redesigned the control spools and incorporated spool stroke control (SSC) functions into the hydraulic system to reduce pressure loss and distribute hydraulic oil more smoothly, increasing cycle times by 10%. Expect more power and fuel efficiency, thanks to an innovative Final Tier 4 engine that delivers up to 5% improved fuel consumption, **without a Diesel Particulate Filter (DPF) to maintain or replace!** Settle in to the roomiest, most accommodating cab in its class, with more legroom and a new high-back, heated seat for shift-long comfort. Daily maintenance is a snap, with ground-level access to all service points, easily opened by hand.

Innovation and Attention to Details at Every Level

- Three power modes (Speed Priority, Heavy and Applied Power) let you **choose the best blend of power, precision and fuel savings** for the work you're doing

- EPA Final Tier 4 engine is **fuel efficient without sacrificing power**

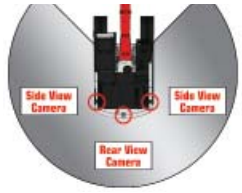
- **No DPF** to ever worry about!
- 2 - 3% DEF (Diesel Exhaust Fluid) consumption rate, combined with one of the largest DEF tank capacities lets you work long hours between refills

- Ground level access to routine service points lets you **cut daily maintenance down to just minutes**

- Quiet, pressurized cab offers **excellent visibility and comfortable, best-in-class seating**
- Enough floor space to **accommodate the largest of work boots**, with cup holders and roomy storage compartments for cell phones, snacks and other personal items

- Dual cab working lights are standard, or choose optional LEDs for **added visibility**

- Ergonomic joysticks **fit your hand perfectly**



- 7" high-definition LCD monitor **keeps you connected to your machine and work environment**

- RemoteCARE® telematics **keeps a watchful eye** on performance, maintenance intervals and theft deterrence

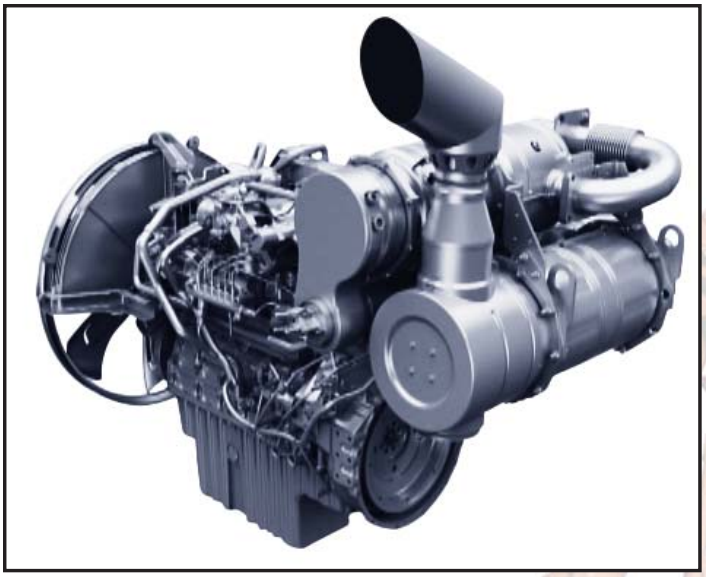
- Full-time, rear-view camera display is standard; add the WAVES™ option for a **seamless 270° view around the machine**

- Structural improvements to the boom and arm **reduce stress and provide greater durability**

- Robust undercarriage features **larger track rollers and thicker plating for longer life**
- Unique side-frame design **reduces dirt accumulation** and is **easier to clean**

**All improvements and percentage increases are in reference to Link-Belt X3 Series excavators, unless otherwise stated*

Quick and Responsive to Take On Tough Challenges



Greater digging power and increased lift capacities are the result of our innovative Spool Stroke Control (SSC) system, which reduces pressure loss and distributes hydraulic oil more smoothly. Pilot pressure sensors detect the type of work being done-such as digging or leveling-and then relays that data to proportional solenoid valves that quickly determine where optimal hydraulic pressures should be directed for that operation.

Two electronically-controlled Kawasaki variable-displacement axial-piston pumps and one Kawasaki gear pump assure that hydraulic power is delivered precisely when and where it's needed. At the same time, hydraulic flows in noncritical areas of the system are reduced.

The result is better breakout force, more lifting strength and faster machine response. You'll dig, swing and dump quicker than ever before... with 10% faster cycle times and improved fuel efficiency!

- Proprietary hydraulic system
- New control valve with larger ports; less restriction means improved hydraulic flow for increased performance
- Electronically-controlled pumps for improved cycle times, quicker response and more efficient machine operation
- Move more dirt per gallon of fuel

The X4 Series features innovative EPA-certified Final Tier 4 engines from Isuzu that strike the ultimate balance between power, productivity and fuel efficiency. You'll experience up to 5% improved fuel efficiency, without having to worry about costly diesel particulate filters (DPF) to maintain or replace. Three engine modes provide reliable power and control for any machine application. Choose Speed Priority (SP mode) to get jobs done quickly, Heavy (H mode) for the best blend of power and fuel savings or Applied Power (A mode), with 13 different RPM settings for precise control of heavy lifting, fine grading or leveling work.

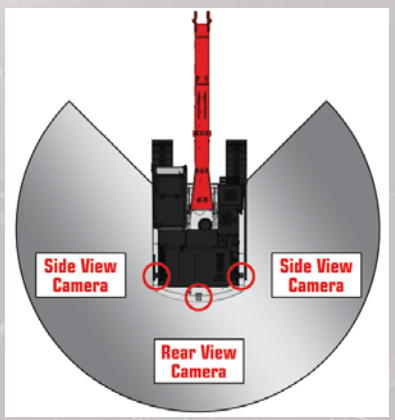
- EPA-certified Tier 4 Final
- No DPF to maintain
- Up to 5% improved fuel economy
- 500-hr. fuel filters service intervals
- 8 diesel tank refills per 1 diesel exhaust fluid (DEF) refill
- 2 - 3% DEF consumption rate
- Two-stage DEF anti-freeze system for protection in harsh operating conditions
- 30 hrs. between SCR regenerations, only takes 5-10 minutes to complete!
- VGT (Variable Geometry Turbocharger)

Power and Efficiency Without Compromise

The X4 Series offers the most advanced and roomiest cab in its class. Comfortable, automotive-grade high-back seat with head rest provides superior lumbar back support. With a longer and wider seating surface, it reclines to a 155° maximum reclining angle to create a relaxed environment during breaks. Mechanical suspension is standard, with air suspension, seat tilting adjustment and seat heaters available as options.

The cab layout also includes ergonomically-designed arm rests that move with console, maintaining a constant distance between joysticks and arm rests no matter how the seat is adjusted.

- Quiet, pressurized cab
- Joysticks with easy-to-hold grip and switches
- Handy 'radio mute' and one touch wiper switch
- Optional proportional joysticks w/auxiliary hydraulics control
- Cup holder and storage areas for cell phones and other small items
- Dual halogen cab lights standard
- Full time rear camera display
- Optional RH & LH side cameras
- ROPS and FOPS Level 1 certified, optional FOPS Level 2 head guard available
- Optional LED lights use less energy and are 3X brighter!
- Optional retractable rear window shade
- Optional front sun visor
- Improved radio with USB port and Bluetooth for hands-free communication.



High-Definition LCD monitor has a full-color 7" display that rivals the resolution found in luxury automobiles. Controls are easy to read and easy to use. The rear-view camera activates automatically whenever the machine is started, and sight guidelines have been added for increased safety.

- Anti-glare coating on screen
- Track up to 14 service maintenance reminders
- System/machine warning messages
- Easy-to-use auto idle and auto shutdown feature
- Select and set up attachments: 5 presets for breakers; 5 presets for crushers
- In-cab flow & pressure controls for auxiliary hydraulics
- Anti-theft system
- Auto-adjusts for time and calendar
- 24 languages available
- Ability to view fuel consumption

270° WAVES™

WIDE-ANGLE VISUAL ENHANCEMENT SYSTEM

For the ultimate in visibility, X4 machines can be fitted with the Wide Angle Visual Enhancement System - or WAVES for short. Using three closed-circuit cameras, this optional viewing system provides an unbelievable 270° visual coverage around the machine, eliminating any potential blind spots from the operator's line of sight. WAVES images can be displayed on the standard X4 monitor.

Maintenance is a snap, with ground level access to all routine service points, including batteries, fuel filters, engine oil filter, dual-element air filter and cab fresh air filter.

- Radiator screens are easy to remove and clean from ground level...no tools needed!
- A/C Condenser tilts for easy cleaning and maintenance
- Easy battery compartment access; 2 hand-turn knobs
- Improved battery disconnect switch with no keys needed
- Convenient ground-level sample ports in pump compartment
- Green drain plug and hose
- More data collection points
- Automatic door locking mechanism on side door
- Quick and easy access to grease all attachment pivot points
- Grease cylinder track adjusters make adjusting track tension a breeze
- New undercarriage side frame design enables easier cleaning
- In-cab reminders track 14 different maintenance procedures

Get Working Fast With Easy Access to Service Points

RemoteCARE®

RemoteCARE® lets you remotely monitor and track machine location, operational performance, working status and periodic maintenance requirements. It tracks and records both routine and major service intervals for your machines, giving you more flexibility and control when scheduling maintenance procedures. It also lets you be more proactive if potential failure conditions arise; whenever a diagnostic trouble code (DTC) is detected, a warning message appears on the machine display, and an e mail alert is automatically sent to you. RemoteCARE also assists in theft prevention by offering 24/7 surveillance and geofencing capabilities.

- 24/7 Remote Monitoring and Security
- Machine Location
- Geo-fence & Curfew Range
- Actual Fuel Consumption
- Fuel Levels
- Hour Meter Reading
- Radiator Water Temperature
- Machine Working Time/Idle Time
- Attachment Working Hours
- Working Modes
- Service Maintenance Reminders
- Service Warnings
- 6-yr. complimentary subscription

Built Strong to Handle Anything

X4 machines are more rugged and durable, with robust structural improvements to the boom & arm structures, along with improvements to lower frame and travel components.

Boom & Arm

- Improved boss shapes reduce stress on boom and arm pin
- Cast boom tip for increased reliability

Lowers

- Thicker travel motor case - 28% increase
- 9% more stroke recoil spring
- 28% wider idler hub
- Unique side-frame design reduces dirt accumulation and is easier to clean.

Customer Support is Just a Call Away

A network of Link-Belt Excavator dealers across the U.S. and Canada is waiting to serve you. Expect fast and dependable service, backed by 24/7 access to parts.

Rock-Solid Warranty Coverage

All X4 machines are backed by a 1-year/1,800 hour Full Machine Warranty, 2-year/3,000 hour Engine Warranty (2,000 hrs. electrical parts), 3-year/5,000 hour Powertrain Warranty, 3-year/10,000 hour XtraStructure Warranty, 5-year/3,000 hour EPA Emissions Warranty and participation in the X4 Fluids Analysis Program for the life of the warranty. Extended warranty coverage packages are also available.

SPECIFICATIONS

Engine

Isuzu AQ-6UZ1X Final Tier 4 turbocharged diesel engine with electronic control (ECM) and high pressure common-rail fuel injection, 6-cylinder, water-cooled, Exhaust Gas Recirculation (EGR), Intercooler, Variable-Geometry Turbocharger (VGT), Diesel Oxidation Catalyst (DOC) and Selective Catalytic Reduction (SCR) system with Dosing Control Module and heated DEF lines and tank. Electronic fuel pump and priming, Fuel cooler, Auto-idle start, Auto warm-up, EPF engine protection, dual-stage fuel filtration, remote oil filter, engine oil sample port, green plug oil drain, double element air filter.

SAE net horsepower
- without fan pump ..... 362 hp (270 kW) @ 2,000 rpm
- with fan pump ..... 329 hp (245 kW) @ 2,000 rpm

Displacement ..... 600 cu in (9.8 L)
Maximum Torque ..... 1,005 lbf-ft (1 363 Nm) @ 1,500 rpm
Starter ..... 24V - 5.5kW
Alternator ..... 50 amp
Battery ..... (2) 12-volt 128 amp hours

Cab and Controls

ROPS and FOPS Level 1 certified with automatic climate control A/C and heat with defroster, 7" LCD Hi-Definition color monitor with full time rear view camera display, fuel efficiency gauge, low-effort joysticks are pre-wired for auxiliary hydraulics, dual cab lights, control pattern changer, safety glass windows, sunroof with sunshade, shockless cab suspension with four fluid cab mounts, SCM High-Back reclining suspension seat, sliding 4-position tilting control consoles, Bluetooth technology, AM/FM sound system with USB and MP3 auxiliary input jack, digital clock, dome light, seat belt, coat hook, cup holder, storage compartments, floor mat, footrests, ashtray, 24V cigarette lighter, 12V outlet, travel alarm, handrails, mirrors, side-entry cab filter, spare parts kit.

Three selectable work modes, RemoteCARE Telematics GPS system, anti-theft password protection system, onboard self-diagnostic system with memory and service interval reminders, auto idling system, one-touch decelerator, auto-idle engine shutdown, auto-power boost, neutral safety start, gate-lock safety shutoff.

Hydraulic System

Open-center system, two variable-displacement electronically controlled axial-piston pumps and one gear pump for pilot controls, main control valve with one 4-spool section and one 5-spool section with auxiliary spool: stackable, Auxiliary Control System, oil cooler, Auto-Power boost, boom and arm holding valves, 6 micron return filter, firewall, hydraulic oil sample port.

Hydraulic Pumps

Pump Output ..... 2 x 96.2 gpm (364 L/min)
Pilot Pump Maximum Flow ..... 7.9 gpm (30 L/min)

Relief Valve Settings

Boom Up/Arm/Bucket ..... 4,550 psi (31.4 MPa)
in Power Boost ..... 4,980 psi (34.3 MPa)
Boom Down ..... 3,560 psi (24.5 MPa)
Swing Circuit ..... 4,270 psi (29.4 MPa)
Travel Circuit ..... 4,980 psi (34.3 MPa)

Hydraulic Cylinders

number of cylinders - bore x rod x stroke

Boom ..... 2 - 6.7" x 4.5" x 61.0" (170 mm x 115 mm x 1 550 mm)
Arm ..... 1 - 7.5" x 5.1" x 75.6" (190 mm x 130 mm x 1 920 mm)
Bucket ..... 6.5" x 4.5" x 50.6" (165 mm x 115 mm x 1 285 mm)

Swing

Planetary reduction powered by axial-piston motor, Internal ring gear with grease cavity for swing pinion, Swing bearing is single-row, shear type ball bearing, Mechanical disc swing brake, Auto-power swing.

Swing Speed ..... 9.1 rpm
Tail Swing ..... 12' 3"(3.73 m)
Swing Torque ..... 111,000 lbf-ft (150.0 kNm)

Undercarriage

Fixed or expandable sideframes with 17' 11"(5.45 m) LC long undercarriage, Sealed and strutted track chain with track guide, Sealed rollers and idlers, Two-speed independent hydrostatic travel with compact planetary final drive, Disc type brakes, Adjustable track tension, Carbody belly pan.

Carrier Rollers
- Fixed sideframe undercarriage ..... 2 per Side
- Expandable sideframe undercarriage ..... 3 per Side

Track Rollers ..... 9 per Side
Track Link Pitch ..... 9.00"(229 mm)
Shoes ..... 50 per Side
Shoe Width ..... 35.5"(900 mm)

Ground Pressure
- Fixed sideframe undercarriage ..... 8.27 psi (0.057 MPa)
- Expandable sideframe undercarriage ..... 8.41 psi (0.058 MPa)

Travel System

Two-speed independent hydrostatic travel with compact axial-piston motors, Hydraulic motor powered output shaft coupled to a planetary reduction drive and track sprocket, All hydraulic components mounted within the width of side frame, Automatic downshift for high torque to overcome obstacles, Spring-applied hydraulic release parking brake built into each motor, Travel motors equipped with counterbalance valve to prevent over-speeding down an incline, Single-pedal straight line travel.

Travel Speeds ..... 2.0 - 3.3 mph (3.2 - 5.3 km/h)
Drawbar Pull ..... 76,200 lbf (339 kN)
Gradeability ..... 70% (35°)

Attachment

Boom ..... 22' 11" (6.98 m)

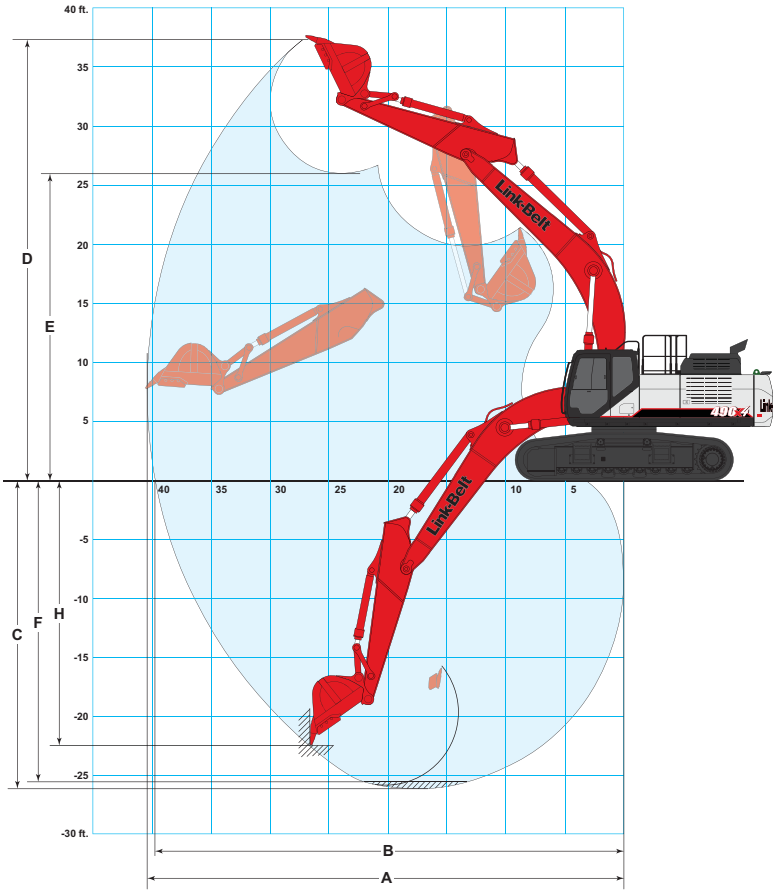
Available Arms	Digging Force
• 11' 1" (3.38 m)	45,200 lbf (201 kN)
with Auto Power Boost	49,500 lbf (220 kN)
• 8' 4" (2.53 m)	55,300 lbf (246 kN)
with Auto Power Boost	60,500 lbf (269 kN)
• 13' 2" (4.00 m)	39,800 lbf (177 kN)
with Auto Power Boost	43,400 lbf (193 kN)
• 15' 11" (4.85 m)	35,500 lbf (158 kN)
with Auto Power Boost	38,900 lbf (173 kN)
• Bucket Digging Force	55,500 lbf (247 kN)
with Auto Power Boost	60,700 lbf (270 kN)

Lubricant & Coolant Capacity

Fuel Tank ..... 172 Gallons (650.0 Liters)
Hydraulic System ..... 122 Gallons (460.0 Liters)
Hydraulic Tank ..... 61 Gallons (230.0 Liters)
Final Drive (per side) ..... 4.0 Gallons (15.0 Liters)
Swing Drive ..... 2.8 Gallons (10.5 Liters)
Engine Oil ..... 10.8 Gallons (41.0 Liters)
DEF Tank ..... 40 Gallons (152.0 Liters)
Coolant System ..... 14.6 Gallons (55.1 Liters)

Operating Weight

Working weight with 35.5" (900 mm) shoes, 22' 11" (6.98 m) boom, 11' 1" (3.38 m) arm, 3,373 lb. (1 530 kg) bucket, 22,000 lb. (10 000 kg) counterweight



Fixed sideframe undercarriage ..... 109,800 lbs. (49 800 kg)
Expandable sideframe undercarriage ..... 112,900 lbs. (51 200 kg)

Mass Excavator

Working weight with 35.5" (900 mm) shoes, 21' 6" (6.55 m) boom, 8' 4" (2.53 m) arm, 5,300 lb. (2 400 kg) bucket, 22,000 lb. (10 000 kg) counterweight

Fixed sideframe undercarriage ..... 112,200 lbs. (50 900 kg)
Expandable sideframe undercarriage ..... 115,100 lbs. (52 200 kg)

Notes: Excavator lifting capacities

1. Lifting capacities shown should not be exceeded. Weight of all lifting accessories must be deducted from the above lifting capacities.
2. Lifting capacities are based on machine standing on firm, uniform supporting surface. User must make allowances for job conditions such as soft or uneven ground.
3. Lifting capacities shown do not exceed 75% of minimum tipping loads or 87% of hydraulic capacities. **Capacities marked with an asterisk (*) are limited by hydraulic capacities.**
4. Least stable position is over the side.
5. Operator should be fully acquainted with the Operator's Manual & Operating Safety Booklet, furnished by LBX before operating the machine.
6. Capacities apply only to the machine as originally manufactured and normally equipped by LBX Company, LLC.
7. Lift capacity ratings are based on ISO 10567, "Earthmoving Machinery - Hydraulic Excavators - Lift Capacity."

Approval Code For Arm/Bucket Combinations

H.....Heavy material *(up to 3,370 lbs./yd³)*
M..... Medium material *(up to 2,700 lbs./yd³)*
L.....Light material *(up to 2,020 lbs./yd³)*
N/A..... Not applicable

STDP - Standard duty plate
HDP - Heavy duty plate
XDP - Extreme duty plate
POWER - HDP for use with ESCO multi-pin grabber only

349F L

Hydraulic Excavator

2017

Engine		
Engine Model	Cat® C13 ACERT™	
Power – SAE J1349	311 kW	417 hp
Power – ISO 14396	317 kW	425 hp

Drive		
Maximum Travel Speed	4.7 km/h	2.9 mph
Maximum Drawbar Pull	335 kN	75,300 lbf
Weights		
Minimum Weight	48 650 kg	107,200 lb
Maximum Weight	51 000 kg	112,400 lb

The 349F L is built to keep your production numbers up and your owning and operating costs down.

Not only does the machine's C13 ACERT engine meet U.S. EPA Tier 4 Final emission standards, but it does so while giving you all the power, fuel efficiency, and reliability you need to succeed.

Where the real power comes in is through the hydraulic system. You can literally move tons of material all day long with a great deal of speed and precision. In fact the hydraulic system and engine work together to keep fuel consumption to an absolute minimum – all without impacting your productivity.

When you add in a quiet operator environment that keeps you comfortable and productive, service points that make your routine maintenance quick and easy, and multiple Cat work tools that help you do a number of jobs very well, you simply won't find a better machine in this size class.

Reliable and Productive

Power to move your material with speed and precision

Hydraulic Horsepower, a Cat Advantage

When it comes to moving heavy material quickly and efficiently, you need hydraulic horsepower – the type of ground-breaking power the 349F L can deliver. Major hydraulic components like pumps and valves are located close together so shorter tubes and lines can be used. This design leads to less friction loss, reduced pressure drops, and more power to the ground for the work you need to get done.

The heavy lift mode increases machine system pressure to improve lift – a nice benefit in certain situations. Heavy lift mode also reduces engine speed and pump flow in order to improve controllability.

Control Like No Other

Controllability is one of the main attributes of Cat excavators, and one of the key contributors to this is the main control valve. The valve opens slowly when your range of joystick lever movement is small and opens rapidly when movement is high. It puts flow where you need it when you need it, which leads to smoother operation, greater efficiency, and lower fuel consumption.

Auxiliary Hydraulics for Added Versatility

Auxiliary hydraulics give you greater tool versatility so you can take on more work with just one machine, and there are several options from which you can choose. A quick coupler circuit, for example, allows you to switch from one tool to another in a matter of minutes.

Fuel Efficient

Engineered to lower your operating costs

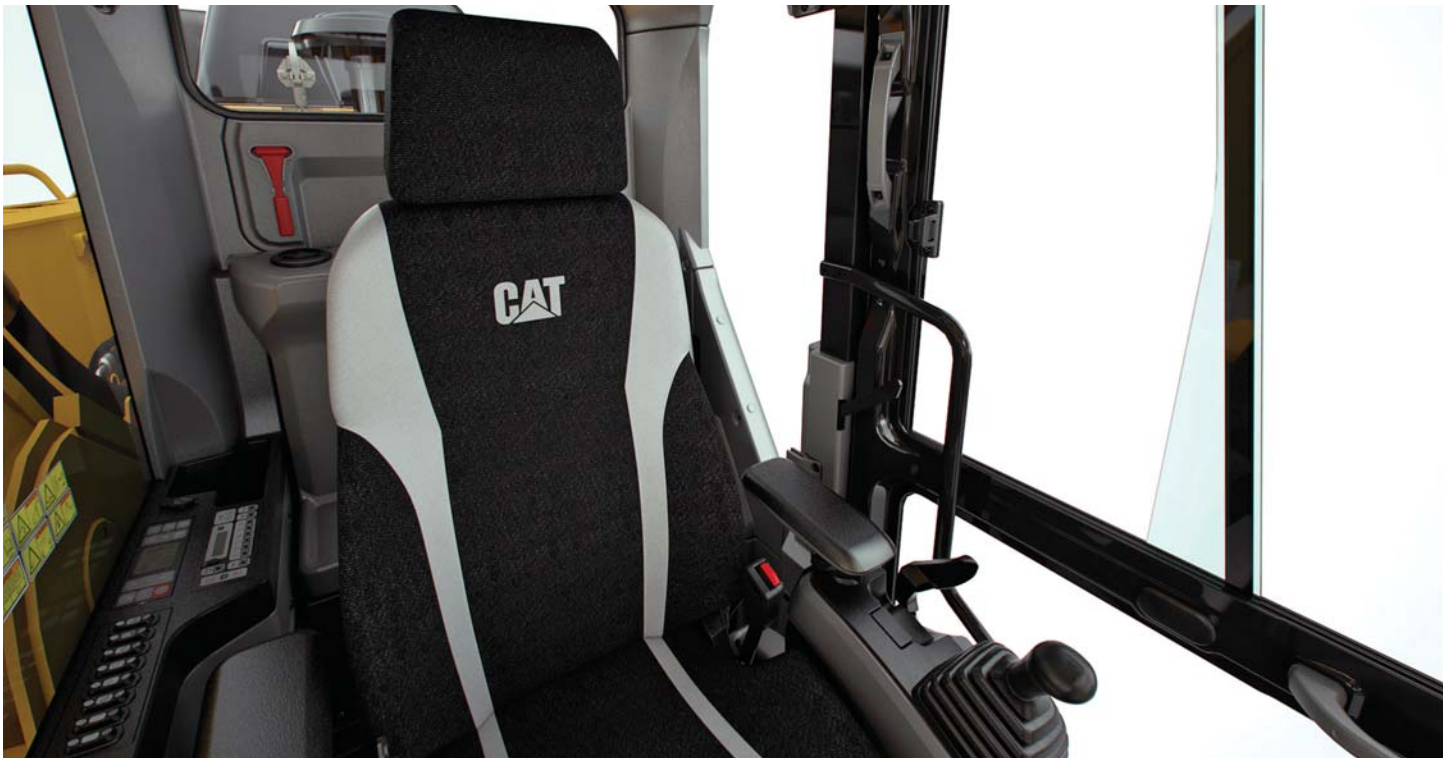
The Cat C13 ACERT engine meets Tier 4 Final emission standards and it does so without interrupting your job process. Simply turn the engine on and go to work. It will look for opportunities in your work cycle to regenerate itself, and it will give you plenty of power for the task at hand – all to help keep your owning and operating costs to an absolute minimum.

A Smart Design for Any Temperature

The 349F L features a side-by-side cooling system that allows you to put the machine to work in extremely hot and cold conditions. The system is completely separated from the engine compartment to reduce noise and heat. Plus it features easy-to-clean cores and a new variable-speed fan that reverses to blow out unwanted debris that may accumulate during your work day.

Biodiesel Not A Problem

The C13 ACERT engine can run on biodiesel fuel up to B20 blended with ULSD. Just fill it up and go.



Proven Technology

The right technologies fine-tuned for the right applications result in:

- **Improved Fuel Efficiency** – Up to 5% improvement over Tier 4 Interim products.
- **High Performance** across a variety of applications.
- **Enhanced Reliability** through commonality and simplicity of design.
- **Maximized Uptime and Reduced Cost** with world-class support from the Cat dealer network.
- **Minimized Impact of Emission Systems** – designed to be transparent to the operator without requiring interaction.
- **Durable Designs** with long life to overhaul.
- **Delivering Better Fuel Economy** with minimized maintenance costs while providing the same great power and response.

Easy to Operate

Comfort and convenience to keep you productive all day long

Safe and Quiet Cab

The cab contributes to your comfort thanks to special viscous mounts and special roof lining and sealing, that limit vibration and unnecessary sound.

Operators will enjoy the quietness and comfort of the all-new cab.

Excellent Ergonomics

Wide seats with air suspension and heat/cooling options, include a reclining back, upper and lower slide adjustments, and height and tilt angle adjustments to meet your needs for maximum comfort.

The fully automatic climate control system keeps operators comfortable and productive all day long in either hot or cold weather.

Storage spaces are located in the front, rear, and side consoles of the cab. A drink holder accommodates a large mug, and a shelf behind the seat stores large lunch or toolboxes.

Power supply sockets are available for charging your electronic devices like an MP3 player, a cell phone, or even a tablet.

Controls Just for You

The right and left joystick consoles can be adjusted to improve your comfort and productivity during the course of a day. The right joystick features a button that will reduce engine speed when you are not working to help save fuel. Touch it once and speed reduces; touch it again and speed increases for normal operation.

Easy to Navigate Monitor

The new LCD monitor is easy to see and navigate. Not only can it memorize up to 10 different work tools, it's also programmable in up to 44 languages to meet today's diverse workforce. The monitor clearly displays critical information you need to operate efficiently and effectively. Plus it projects the image from the rearview camera to help you see what's going on around you so you can stay safely focused on the job at hand.

Durable Structures

Made to work in your tough, heavy-duty applications

Stable Undercarriage

The undercarriage contributes significantly to outstanding stability and durability.

Track shoes, links, rollers, idlers, and final drives are all built with high-tensile strength steel for long-term durability.

Cat Grease Lubricated Track 2 (GLT2) track link protects moving parts by keeping water, debris, and dust out and grease sealed in, which delivers longer wear life and reduced noise when traveling.

Optional guide guards help maintain track alignment to improve the machine's overall performance – whether you're traveling on a flat, heavy bed of rock or a steep, wet field of mud.

Robust Frames

The 349F L is a robust, well-built machine designed to give you a very long service life. The upper frame has mountings made specifically to support the heavy-duty cab. It's also reinforced around areas that take on a lot of stress like the boom foot, skirt, and counterweight.

Great Weight

The counterweight is built with thick steel plates and reinforced fabrications to make it less susceptible to damage, designed with curved surfaces that match the machine's sleek, smooth appearance along with integrated housings to help protect the rearview camera.

Durable Linkages

Options to take on your far-reaching or up-close tasks

Booms and Sticks for Any Job

The 349F L is offered with a range of booms and sticks. Each is built with internal baffle plates and is stress relieved for added durability, and each undergoes ultrasound inspection to ensure quality and reliability. Large box-section structures with thick, multi-plate fabrications, castings, and forgings are used in high-stress areas such as the boom nose, boom foot, boom cylinder, and stick foot to improve durability. Also, the boom nose pin retention method is a captured flag design for enhanced durability.

The Reach boom and sticks offer you excellent all-around versatility for general excavations work like multipurpose digging and loading.

Pins

All front linkage pins have thick chrome plating, giving them high wear resistance. Each pin diameter is made to distribute the shear and bending loads associated with the stick and to help ensure long pin, boom and stick life.

Talk to your Cat dealer to pick the best front linkage for your applications.

Versatile

Do more jobs with one machine

Get the Most from One Machine

The Cat combination of machine and tool provides a total solution for just about any application. Work tools can be mounted either directly to the machine or to a quick coupler, making it fast and easy to release one work tool and pick up another.

Change Jobs Quickly

Cat quick coupler brings the ability to quickly change attachments and switch from job to job. The Cat coupler is the secure way to decrease downtime and increase job site flexibility and overall productivity.

Available tool control remembers pressures and flows for up to 10 tools. Simply toggle through the monitor, select the tool, and go to work for maximum efficiency.

Dig, Rip and Load

A wide range of buckets dig everything from basic top soil to extreme, harsh material like ore and high quartzite granite. Rip through rock as an alternative to blasting in quarries. High-capacity buckets load trucks in a minimum number of passes for maximum productivity.

Break, Demolish and Scrap

A hydraulic hammer ably equips your machine for breaking rock in quarries. It will also make taking down bridge pillars and heavily reinforced concrete on road demolition jobs no problem.

Multi-processor and pulverizer attachments make your machine ideal for demolition jobs and processing the resulting debris.

Shears with 360° rotation mount to the machine for processing scrap steel and metal.

Move and Handle

Add a thumb and you have the ability to move and handle brush, rocks, and debris. For constant material handling, a grapple is your solution. Choose from three different styles for picking, sorting, and loading trash, demolition debris, or recyclables.

Set Up Your Machine for Profitability

Your Cat dealer can install hydraulic kits to properly operate all Cat Work Tool attachments, maximizing the machine's uptime and your profit. All Cat Work Tool attachments are supported by the same Cat dealer network as your Cat machine.

Cat Connect Technologies

Monitor, manage, and enhance job site operations

Cat Connect makes smart use of technology and services to improve your job site efficiency. Using the data from technology-equipped machines, you'll get more information and insight into your equipment and operations than ever before.

Cat Connect technologies offer improvements in these key areas:

EQUIPMENT MANAGEMENT

Equipment Management – increase uptime and reduce operating costs.

PRODUCTIVITY

Productivity – monitor production and manage job site efficiency.

SAFETY

Safety – enhance job site awareness to keep your people and equipment safe.

LINK Technologies

LINK technologies, like Product Link™, are deeply integrated into your machine and wirelessly communicates key information, including location, hours, fuel usage, idle time and event codes.

Product Link/VisionLink®

Easy access to Product Link data via the online VisionLink user interface can help you see how your machine or fleet is performing. You can use this information to make timely, fact based decisions that can boost job site efficiency and productivity, and lower costs.

GRADE Technologies

Grade technologies combine digital design data and in-cab guidance to help you reach target grade quickly and accurately, with minimal staking and checking. That means you'll be more productive, complete jobs faster, in fewer passes, using less fuel, at a lower cost.

Cat Grade with Assist

Cat Grade with Assist ensures you can dig a level base with the right slope each and every time; now it works with tilt buckets to give you even greater versatility. With a touch of a button, the simple-to-use system automates boom and bucket movements typically done by the operator. Regardless of your experience or skill, you will be able to reach target grade up to 45% faster than with traditional grading techniques.

Cat Grade 3D

Cat Grade 3D is perfect for complex excavating projects that require precise cuts and contours. The 254 mm (10 in) color monitor shows you exactly where to work and how much to cut or fill without stacking or grade checking, delivering accuracy within 30 mm (1.18 in). Factory integration of most key components reduces field installation time and labor cost, making the system less costly for you compared to other options. Plus reliability is enhanced because built-in components are protected from damage, ensuring longer service life and more accurate results.

Safe Work Environment

Features to help protect you day in and day out

Secure Contact Points

Multiple large steps as well as hand and guard rails will get you into the cab as well as a leg up to the compartments.

Extended hand and guard rails allow you to safely climb to the upper deck. Anti-skid plates on the surface of the upper structure, and the top of the storage box area, reduce your slipping hazards in all types of weather conditions. They can be removed for cleaning.

Great Views

The rearview camera greatly enhances visibility behind the machine to help the operator work more productively. A panoramic rearview is automatically displayed on the new multi-function monitor during reverse travel. As an option, a second display can be added, providing a dedicated full-time rearview of the job site.

Smart Lighting

Halogen lights provide plenty of illumination. Cab and boom lights can be programmed to stay on for up to 90 seconds after the engine has been turned off to help you safely exit the machine. Optional High Intensity Discharge (HID) lights are available for enhanced night-time visibility.

A Safe and Quiet Cab

The ROPS-certified cab provides you with a safe working environment. It also contributes to your comfort because it's attached to a reinforced frame with special viscous mounts that limit vibration and unnecessary sound. Add in special roof lining and sealing and you have a cab that's as quiet inside as any of today's highway trucks.

Optional Falling Object Guards (FOGS) further protect you from debris coming to the cab.

Ground-Level Access

You can reach most routine maintenance items like fuel and oil filters, fluid taps, and grease points from the safety and convenience of ground level. Not only do compartments feature wide service doors designed to help prevent debris entry, but they also securely latch in place to help make your service work simpler.

Serviceable

Designed to make your maintenance quick and easy

A Fresh Idea

When you select ventilation inside the cab, outside air enters through the fresh air filter. The filter is conveniently located on the side of the cab to make it easy to reach and replace, and it is protected by a lockable door that can be opened with the engine key.

Quick and Convenient Fluids Service

S·O·S℠ Oil sample and pressure ports provide easy checking of machine condition and are standard on every machine.

You can ensure fast, easy, and secure changing of engine and hydraulic oil with the QuickEvac™ option.

The fuel tank's drain cock makes it easy and simple for you to remove water and sediment during routine maintenance. Plus an integrated fuel level indicator pops up to help you reduce the possibility of fuel tank overfilling. An optional fast fill port accessible from ground level can make refueling even easier and faster.

A Smart Cooling Design

The high-ambient cooling system features a fuel-saving variable-speed fan and a side-by-side-mounted radiator and oil and air coolers for easy cleaning.

Sustainable

Generations ahead in every way

The 349F L is designed to compliment your business plan, reduce emissions and minimize the consumption of natural resources.

- The C13 ACERT engine meets Tier 4 Final emission standards.
- The machine has the flexibility of running on either ultra-low-sulfur diesel (ULSD) fuel with 15 ppm of sulfur or less or up to biodiesel (B20) fuel blended with ULSD.
- An overfill indicator rises when the tank is full to help the operator avoid spilling.
- Quick fill ports with connectors ensure fast, easy, and secure changing of hydraulic oil.
- Major components are rebuildable, eliminating waste and saving money by giving the machine and/or major components a second life – and even a third life.
- Link technologies enable you to collect and analyze equipment and job site data so you can maximize productivity and reduce costs.
- The 349F L is an efficient, productive machine that's designed to conserve our natural resources for generations ahead.

Complete Customer Care

Unmatched support makes the difference

Worldwide Parts Availability

Cat dealers utilize a worldwide parts network to maximize your machines' uptime. Plus they can help you save money with Cat remanufactured components.

Financial Options Just for You

Consider financing options and day-to-day operating costs. Look at dealer services that can be included in the machine's cost to yield lower owning and operating costs over time.

What's Best for You Today…and Tomorrow

Repair, rebuild, or replace? Your Cat dealer can help you evaluate the cost involved so you can make the best choice for your business.

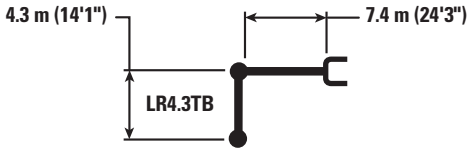
Major Component Weights

	kg	lb
Base Machine (with boom cylinder, without counterweight, front linkage and track)		
Long FIX Undercarriage	24 800	54,700
Counterweight		
9.0 mt (9.9 t)	9000	19,800
Boom (includes lines, pins and stick cylinder)		
Long Reach Boom – 7.4 m (24'3")	5190	11,400
Reach Boom – 6.9 m (22'8")	4630	10,200
Mass Boom – 6.55 m (21'6")	4860	10,700
Stick (includes lines, pins, bucket linkage and bucket cylinder)		
R4.3TB HD (14'1")	2990	6,600
R3.9TB HD (12'10")	2760	6,100
R3.35TB HD (11'0")	2540	5,600
M3.0UB HD (9'10")	2930	6,500
M2.5UB HD (8'2")	3140	6,900
Track Shoes (per two tracks)		
600 mm (24") double grouser	5240	11,600
750 mm (30") triple grouser	5890	13,000
900 mm (35") triple grouser	6640	14,600
Buckets		
TB1880GD – 3.10 m^3 (4.05 yd^3)	2440	5,400
UB1850HD – 3.2 m^3 (4.2 yd^3)	2840	6,300

All weights are rounded up to nearest 10 kg and lb except for buckets. Kg and lb were rounded up separately so some of the kg and lb do not match.



Base machine includes 75 kg (165 lb) operator weight, 90% fuel weight, and undercarriage with center guard.

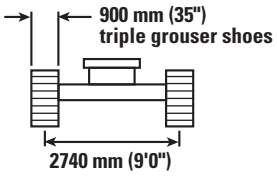
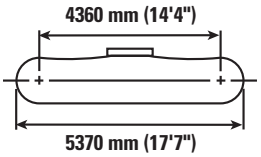
* **ISO 10567**



*Indicates that the load is limited by hydraulic lifting capacity rather than tipping load. The above loads are in compliance with hydraulic excavator lift capacity standard ISO 10567:2007. They do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. Weight of all lifting accessories must be deducted from the above lifting capacities. Lifting capacities are based on the machine standing on a firm, uniform supporting surface. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.



Lift capacity stays with ±5% for all available track shoes.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

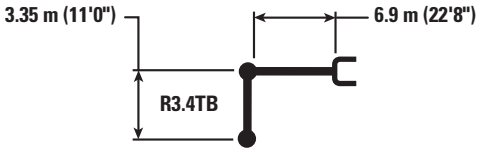
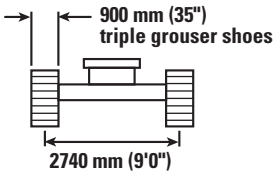
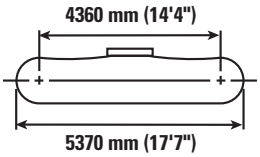
* **ISO 10567**



*Indicates that the load is limited by hydraulic lifting capacity rather than tipping load. The above loads are in compliance with hydraulic excavator lift capacity standard ISO 10567:2007. They do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. Weight of all lifting accessories must be deducted from the above lifting capacities. Lifting capacities are based on the machine standing on a firm, uniform supporting surface. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.



Lift capacity stays with ±5% for all available track shoes.



Always refer to the appropriate Operation and Maintenance Manual for specific product information.

- X Not Recommended

Caterpillar recommends using appropriate work tools to maximize the value customers receive from our products. Use of work tools, including buckets, which are outside of Caterpillar's recommendations or specifications for weight, dimensions, flows, pressures, etc. may result in less-than-optimal performance, including but not limited to reductions in production, stability, reliability, and component durability. Improper use of a work tool resulting in sweeping, prying, twisting and/or catching of heavy loads will reduce the life of the boom and stick.

349F L Standard Equipment

Standard Equipment

Standard equipment may vary. Consult your Cat dealer for details.

ENGINE

- Air cleaner
- Cat C13 ACERT diesel engine
- Biodiesel capable
- Meets Tier 4 Final emission standards
- 2300 m (7,500 ft) altitude capability
- Electric priming pump
- Automatic engine speed control
- Standard, economy and high power modes
- Two-speed travel
- Side-by-side cooling system
- Radial seal air filter
- Primary filter with water separator and water separator indicator switch
- Fuel differential indicator switch in fuel line

HYDRAULIC SYSTEM

- Automatic swing parking brake
- Regeneration circuit for boom and stick
- High-performance hydraulic return filter
- Regeneration circuit for boom and stick
- Capability of installing additional auxiliary circuits
- Bio oil capable
- 52° ambient cooling capability
- Heavy lift mode
- Joystick control pattern changer through monitor
- Fine swing*

CAB

- Wiper and washer
- Mirrors
- Pressurized operator station with positive filtration
- Windshield
  - 70-30 split, sliding, removable lower windshield with in cab storage bracket
- Sliding upper door window (left-hand cab door)
- Openable skylight
- Sunscreen
- Interior:
  - Glass-breaking safety hammer
  - Coat hook
  - Beverage holder
  - Literature holder
  - Interior lighting
  - AM/FM radio
  - Two 12V stereo speakers
  - Storage shelf suitable for lunch or toolbox
  - Power supply with 12V, two power outlets (10 amp)
  - Thumb wheel modulation joystick for use with combined auxiliary control
  - Air conditioner, heater and defroster with climate control
- Seat:
  - Adjustable high-back, heated and ventilated seat with air suspension
  - Seat belt, 51 mm (2 in)
  - Adjustable armrest
  - Height adjustable joystick consoles
  - Neutral lever (lock out) for all controls
  - Travel control pedals with removable hand levers
  - Capability of installing two additional pedals
  - Two speed travel
  - Floor mat, washable
  - Third travel pedal
- Monitor:
  - Clock
  - Video ready
  - Color LCD display with warning, filter/fluid change, and working hour information
  - Language display (full graphic and full color display)
  - Machine condition, error code and tool mode setting information
  - Start-up level check for engine oil, engine coolant and hydraulic oil
  - Warning, filter/fluid change and working hour information
  - Fuel consumption meter

UNDERCARRIAGE

- Grease Lubricated Track GLT4
- Towing eye on base frame
- Heavy-duty track rollers
- Track motor guards
- Swivel guard
- Heavy duty bottom guard

ELECTRICAL

- 80 amp alternator
- Circuit breaker
- Capability to electrically connect a beacon
- Travel alarm

LIGHTS

- Boom light
- Cab lights with time delay
- Exterior lights integrated into storage box

SAFETY & SECURITY

- Cat one key security system
- Door locks
- Cap locks on fuel and hydraulic tanks
- Lockable external tool/storage box
- Signaling/warning horn
- Secondary engine shutoff switch
- Mirrors
- Openable skylight for emergency exit
- Rearview camera
- Capability to connect a beacon
- Bolt-on FOGS capability
- Safety hammer for breaking cab glass

INTEGRATED TECHNOLOGIES

- Product Link
- Rear vision camera

*North America

Optional Equipment

Optional equipment may vary. Consult your Cat dealer for details.

ENGINE
- Quick drains, engine and hydraulic oil* **

HYDRAULIC SYSTEM
- Control pattern quick-changer
- Boom and stick lowering control devices
- HP hydraulic lines for boom and stick
- MP hydraulic lines for boom and stick
- QC hydraulic lines for boom and stick
- QC control
- Bio oil
- Heavy lift

UNDERCARRIAGE
- Tracks:
  - 900 mm (35") triple grouser*
  - 750 mm (30") triple grouser**
  - 750 mm (30") single grouser*
  - 600 mm (24") double grouser** ***
  - 600 mm (24") double grouser Heavy Duty* **
- Track guiding guards:
  - Center
  - Segmented
  - Full length
- Idler:
  - Forging
  - Fabricating

COUNTERWEIGHT
- 8.6 mt (9.4 t) with removal device*
- 9.0 mt (9.9 t)

ELECTRICAL
- Cold weather package
- Jump start receptacle

FRONT LINKAGE
- Reach Boom, 7.4 m (24'2")*
- Reach Boom, 6.9 m (22'8")
- Mass Boom, 6.55 m (21'6")
- Reach stick, R4.3 m TB (14'1")*
- Reach stick, R3.9 m TB (12'10")* **
- Reach stick, R3.35 m TB (11')
- Mass stick, M3.0 m UB (9'10")
- Mass stick, M2.5 m UB (8'2")
- TB bucket linkage with lifting eye
- UB bucket linkage with/without lifting eye
- Pin Grabber coupler

LIGHTS
- Working lights, cab mounted with time delay
- Halogen lights, cab mounted with time delay
- Halogen boom lights
- HID boom lights

SECURITY
- Falling Object Guard system (FOGS)

TECHNOLOGY
- Cat Grade Control (2D, 3D)
- Cat Production Measurement

490X4

SAE Net Horsepower: 362 HP (270 kW)
Operating Weight: 112,900 lbs. (51 200 kg)
Digging Depth: 24 ft 10 in (7.57 m)

SPECIFICATIONS

Link-Belt EXCAVATORS

Performance, Productivity and Reliabilty Come Standard

Link-Belt X4 Series excavators are built to exceed your expectations. We redesigned the control spools and incorporated spool stroke control (SSC) functions into the hydraulic system to reduce pressure loss and distribute hydraulic oil more smoothly, increasing cycle times by 10%. Expect more power and fuel efficiency, thanks to an innovative Final Tier 4 engine that delivers up to 5% improved fuel consumption, **without a Diesel Particulate Filter (DPF) to maintain or replace!** Settle in to the roomiest, most accommodating cab in its class, with more legroom and a new high-back, heated seat for shift-long comfort. Daily maintenance is a snap, with ground-level access to all service points, easily opened by hand.

Innovation and Attention to Details at Every Level

- Three power modes (Speed Priority, Heavy and Applied Power) let you **choose the best blend of power, precision and fuel savings** for the work you're doing

- EPA Final Tier 4 engine is **fuel efficient without sacrificing power**

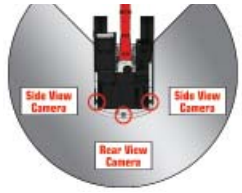
- **No DPF** to ever worry about!
- 2 - 3% DEF (Diesel Exhaust Fluid) consumption rate, combined with one of the largest DEF tank capacities lets you work long hours between refills

- Ground level access to routine service points lets you **cut daily maintenance down to just minutes**

- Quiet, pressurized cab offers **excellent visibility and comfortable, best-in-class seating**
- Enough floor space to **accommodate the largest of work boots**, with cup holders and roomy storage compartments for cell phones, snacks and other personal items

- Dual cab working lights are standard, or choose optional LEDs for **added visibility**

- Ergonomic joysticks **fit your hand perfectly**



- 7" high-definition LCD monitor **keeps you connected to your machine and work environment**

- RemoteCARE® telematics **keeps a watchful eye** on performance, maintenance intervals and theft deterrence

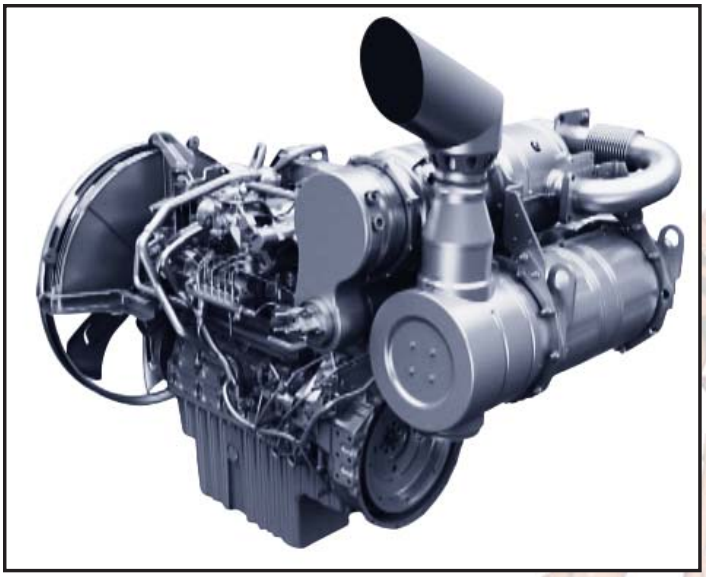
- Full-time, rear-view camera display is standard; add the WAVES™ option for a **seamless 270° view around the machine**

- Structural improvements to the boom and arm **reduce stress and provide greater durability**

- Robust undercarriage features **larger track rollers and thicker plating for longer life**
- Unique side-frame design **reduces dirt accumulation** and is **easier to clean**

**All improvements and percentage increases are in reference to Link-Belt X3 Series excavators, unless otherwise stated*

Quick and Responsive to Take On Tough Challenges



Greater digging power and increased lift capacities are the result of our innovative Spool Stroke Control (SSC) system, which reduces pressure loss and distributes hydraulic oil more smoothly. Pilot pressure sensors detect the type of work being done-such as digging or leveling-and then relays that data to proportional solenoid valves that quickly determine where optimal hydraulic pressures should be directed for that operation.

Two electronically-controlled Kawasaki variable-displacement axial-piston pumps and one Kawasaki gear pump assure that hydraulic power is delivered precisely when and where it's needed. At the same time, hydraulic flows in noncritical areas of the system are reduced.

The result is better breakout force, more lifting strength and faster machine response. You'll dig, swing and dump quicker than ever before... with 10% faster cycle times and improved fuel efficiency!

- Proprietary hydraulic system
- New control valve with larger ports; less restriction means improved hydraulic flow for increased performance
- Electronically-controlled pumps for improved cycle times, quicker response and more efficient machine operation
- Move more dirt per gallon of fuel

The X4 Series features innovative EPA-certified Final Tier 4 engines from Isuzu that strike the ultimate balance between power, productivity and fuel efficiency. You'll experience up to 5% improved fuel efficiency, without having to worry about costly diesel particulate filters (DPF) to maintain or replace. Three engine modes provide reliable power and control for any machine application. Choose Speed Priority (SP mode) to get jobs done quickly, Heavy (H mode) for the best blend of power and fuel savings or Applied Power (A mode), with 13 different RPM settings for precise control of heavy lifting, fine grading or leveling work.

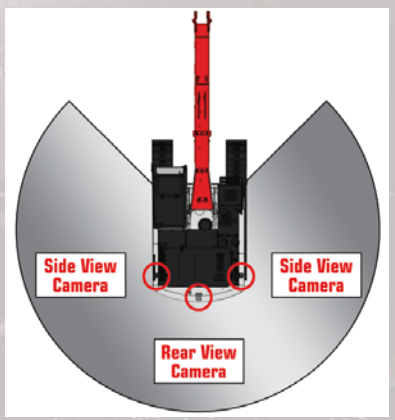
- EPA-certified Tier 4 Final
- No DPF to maintain
- Up to 5% improved fuel economy
- 500-hr. fuel filters service intervals
- 8 diesel tank refills per 1 diesel exhaust fluid (DEF) refill
- 2 - 3% DEF consumption rate
- Two-stage DEF anti-freeze system for protection in harsh operating conditions
- 30 hrs. between SCR regenerations, only takes 5-10 minutes to complete!
- VGT (Variable Geometry Turbocharger)

Power and Efficiency Without Compromise

The X4 Series offers the most advanced and roomiest cab in its class. Comfortable, automotive-grade high-back seat with head rest provides superior lumbar back support. With a longer and wider seating surface, it reclines to a 155° maximum reclining angle to create a relaxed environment during breaks. Mechanical suspension is standard, with air suspension, seat tilting adjustment and seat heaters available as options.

The cab layout also includes ergonomically-designed arm rests that move with console, maintaining a constant distance between joysticks and arm rests no matter how the seat is adjusted.

- Quiet, pressurized cab
- Joysticks with easy-to-hold grip and switches
- Handy 'radio mute' and one touch wiper switch
- Optional proportional joysticks w/auxiliary hydraulics control
- Cup holder and storage areas for cell phones and other small items
- Dual halogen cab lights standard
- Full time rear camera display
- Optional RH & LH side cameras
- ROPS and FOPS Level 1 certified, optional FOPS Level 2 head guard available
- Optional LED lights use less energy and are 3X brighter!
- Optional retractable rear window shade
- Optional front sun visor
- Improved radio with USB port and Bluetooth for hands-free communication.



High-Definition LCD monitor has a full-color 7" display that rivals the resolution found in luxury automobiles. Controls are easy to read and easy to use. The rear-view camera activates automatically whenever the machine is started, and sight guidelines have been added for increased safety.

- Anti-glare coating on screen
- Track up to 14 service maintenance reminders
- System/machine warning messages
- Easy-to-use auto idle and auto shutdown feature
- Select and set up attachments: 5 presets for breakers; 5 presets for crushers
- In-cab flow & pressure controls for auxiliary hydraulics
- Anti-theft system
- Auto-adjusts for time and calendar
- 24 languages available
- Ability to view fuel consumption

270° WAVES™

WIDE-ANGLE VISUAL ENHANCEMENT SYSTEM

For the ultimate in visibility, X4 machines can be fitted with the Wide Angle Visual Enhancement System - or WAVES for short. Using three closed-circuit cameras, this optional viewing system provides an unbelievable 270° visual coverage around the machine, eliminating any potential blind spots from the operator's line of sight. WAVES images can be displayed on the standard X4 monitor.

Maintenance is a snap, with ground level access to all routine service points, including batteries, fuel filters, engine oil filter, dual-element air filter and cab fresh air filter.

- Radiator screens are easy to remove and clean from ground level...no tools needed!
- A/C Condenser tilts for easy cleaning and maintenance
- Easy battery compartment access; 2 hand-turn knobs
- Improved battery disconnect switch with no keys needed
- Convenient ground-level sample ports in pump compartment
- Green drain plug and hose
- More data collection points
- Automatic door locking mechanism on side door
- Quick and easy access to grease all attachment pivot points
- Grease cylinder track adjusters make adjusting track tension a breeze
- New undercarriage side frame design enables easier cleaning
- In-cab reminders track 14 different maintenance procedures

Get Working Fast With Easy Access to Service Points

RemoteCARE®

RemoteCARE® lets you remotely monitor and track machine location, operational performance, working status and periodic maintenance requirements. It tracks and records both routine and major service intervals for your machines, giving you more flexibility and control when scheduling maintenance procedures. It also lets you be more proactive if potential failure conditions arise; whenever a diagnostic trouble code (DTC) is detected, a warning message appears on the machine display, and an e mail alert is automatically sent to you. RemoteCARE also assists in theft prevention by offering 24/7 surveillance and geofencing capabilities.

- 24/7 Remote Monitoring and Security
- Machine Location
- Geo-fence & Curfew Range
- Actual Fuel Consumption
- Fuel Levels
- Hour Meter Reading
- Radiator Water Temperature
- Machine Working Time/Idle Time
- Attachment Working Hours
- Working Modes
- Service Maintenance Reminders
- Service Warnings
- 6-yr. complimentary subscription

Built Strong to Handle Anything

X4 machines are more rugged and durable, with robust structural improvements to the boom & arm structures, along with improvements to lower frame and travel components.

Boom & Arm

- Improved boss shapes reduce stress on boom and arm pin
- Cast boom tip for increased reliability

Lowers

- Thicker travel motor case - 28% increase
- 9% more stroke recoil spring
- 28% wider idler hub
- Unique side-frame design reduces dirt accumulation and is easier to clean.

Customer Support is Just a Call Away

A network of Link-Belt Excavator dealers across the U.S. and Canada is waiting to serve you. Expect fast and dependable service, backed by 24/7 access to parts.

Rock-Solid Warranty Coverage

All X4 machines are backed by a 1-year/1,800 hour Full Machine Warranty, 2-year/3,000 hour Engine Warranty (2,000 hrs. electrical parts), 3-year/5,000 hour Powertrain Warranty, 3-year/10,000 hour XtraStructure Warranty, 5-year/3,000 hour EPA Emissions Warranty and participation in the X4 Fluids Analysis Program for the life of the warranty. Extended warranty coverage packages are also available.

SPECIFICATIONS

Engine

Isuzu AQ-6UZ1X Final Tier 4 turbocharged diesel engine with electronic control (ECM) and high pressure common-rail fuel injection, 6-cylinder, water-cooled, Exhaust Gas Recirculation (EGR), Intercooler, Variable-Geometry Turbocharger (VGT), Diesel Oxidation Catalyst (DOC) and Selective Catalytic Reduction (SCR) system with Dosing Control Module and heated DEF lines and tank. Electronic fuel pump and priming, Fuel cooler, Auto-idle start, Auto warm-up, EPF engine protection, dual-stage fuel filtration, remote oil filter, engine oil sample port, green plug oil drain, double element air filter.

SAE net horsepower
- without fan pump ..... 362 hp (270 kW) @ 2,000 rpm
- with fan pump ..... 329 hp (245 kW) @ 2,000 rpm

Displacement ..... 600 cu in (9.8 L)
Maximum Torque ..... 1,005 lbf-ft (1 363 Nm) @ 1,500 rpm
Starter ..... 24V - 5.5kW
Alternator ..... 50 amp
Battery ..... (2) 12-volt 128 amp hours

Cab and Controls

ROPS and FOPS Level 1 certified with automatic climate control A/C and heat with defroster, 7" LCD Hi-Definition color monitor with full time rear view camera display, fuel efficiency gauge, low-effort joysticks are pre-wired for auxiliary hydraulics, dual cab lights, control pattern changer, safety glass windows, sunroof with sunshade, shockless cab suspension with four fluid cab mounts, SCM High-Back reclining suspension seat, sliding 4-position tilting control consoles, Bluetooth technology, AM/FM sound system with USB and MP3 auxiliary input jack, digital clock, dome light, seat belt, coat hook, cup holder, storage compartments, floor mat, footrests, ashtray, 24V cigarette lighter, 12V outlet, travel alarm, handrails, mirrors, side-entry cab filter, spare parts kit.

Three selectable work modes, RemoteCARE Telematics GPS system, anti-theft password protection system, onboard self-diagnostic system with memory and service interval reminders, auto idling system, one-touch decelerator, auto-idle engine shutdown, auto-power boost, neutral safety start, gate-lock safety shutoff.

Hydraulic System

Open-center system, two variable-displacement electronically controlled axial-piston pumps and one gear pump for pilot controls, main control valve with one 4-spool section and one 5-spool section with auxiliary spool: stackable, Auxiliary Control System, oil cooler, Auto-Power boost, boom and arm holding valves, 6 micron return filter, firewall, hydraulic oil sample port.

Hydraulic Pumps

Pump Output ..... 2 x 96.2 gpm (364 L/min)
Pilot Pump Maximum Flow ..... 7.9 gpm (30 L/min)

Relief Valve Settings

Boom Up/Arm/Bucket ..... 4,550 psi (31.4 MPa)
in Power Boost ..... 4,980 psi (34.3 MPa)
Boom Down ..... 3,560 psi (24.5 MPa)
Swing Circuit ..... 4,270 psi (29.4 MPa)
Travel Circuit ..... 4,980 psi (34.3 MPa)

Hydraulic Cylinders

number of cylinders - bore x rod x stroke

Boom ..... 2 - 6.7" x 4.5" x 61.0" (170 mm x 115 mm x 1 550 mm)
Arm ..... 1 - 7.5" x 5.1" x 75.6" (190 mm x 130 mm x 1 920 mm)
Bucket ..... 6.5" x 4.5" x 50.6" (165 mm x 115 mm x 1 285 mm)

Swing

Planetary reduction powered by axial-piston motor, Internal ring gear with grease cavity for swing pinion, Swing bearing is single-row, shear type ball bearing, Mechanical disc swing brake, Auto-power swing.

Swing Speed ..... 9.1 rpm
Tail Swing ..... 12' 3"(3.73 m)
Swing Torque ..... 111,000 lbf-ft (150.0 kNm)

Undercarriage

Fixed or expandable sideframes with 17' 11"(5.45 m) LC long undercarriage, Sealed and strutted track chain with track guide, Sealed rollers and idlers, Two-speed independent hydrostatic travel with compact planetary final drive, Disc type brakes, Adjustable track tension, Carbody belly pan.

Carrier Rollers
- Fixed sideframe undercarriage ..... 2 per Side
- Expandable sideframe undercarriage ..... 3 per Side

Track Rollers ..... 9 per Side
Track Link Pitch ..... 9.00"(229 mm)
Shoes ..... 50 per Side
Shoe Width ..... 35.5"(900 mm)

Ground Pressure
- Fixed sideframe undercarriage ..... 8.27 psi (0.057 MPa)
- Expandable sideframe undercarriage ..... 8.41 psi (0.058 MPa)

Travel System

Two-speed independent hydrostatic travel with compact axial-piston motors, Hydraulic motor powered output shaft coupled to a planetary reduction drive and track sprocket, All hydraulic components mounted within the width of side frame, Automatic downshift for high torque to overcome obstacles, Spring-applied hydraulic release parking brake built into each motor, Travel motors equipped with counterbalance valve to prevent over-speeding down an incline, Single-pedal straight line travel.

Travel Speeds ..... 2.0 - 3.3 mph (3.2 - 5.3 km/h)
Drawbar Pull ..... 76,200 lbf (339 kN)
Gradeability ..... 70% (35°)

Attachment

Boom ..... 22' 11" (6.98 m)

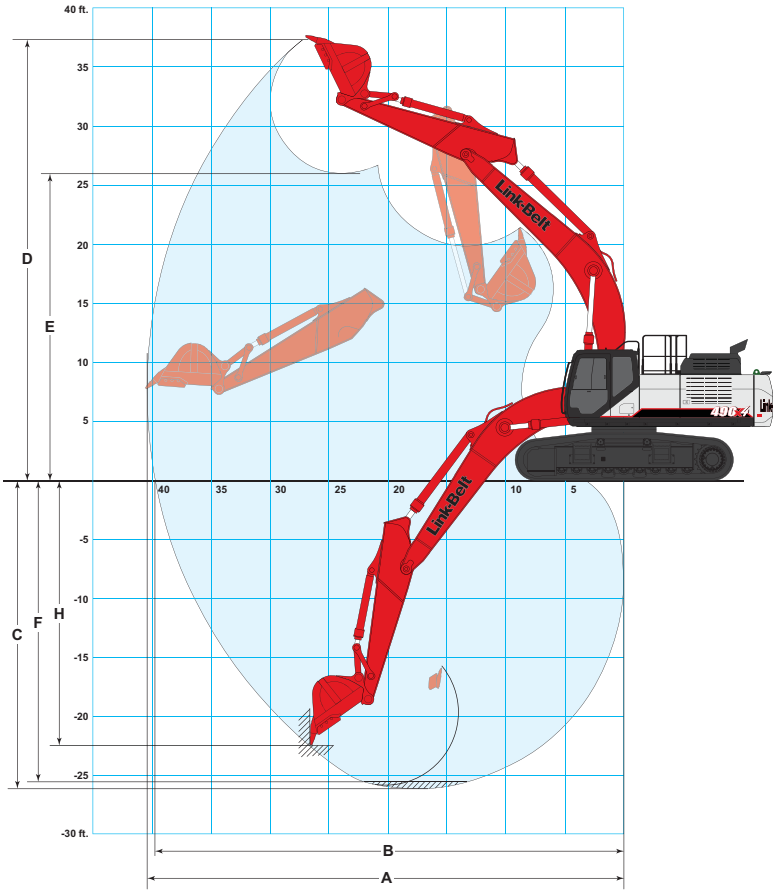
Available Arms	Digging Force
• 11' 1" (3.38 m)	45,200 lbf (201 kN)
with Auto Power Boost	49,500 lbf (220 kN)
• 8' 4" (2.53 m)	55,300 lbf (246 kN)
with Auto Power Boost	60,500 lbf (269 kN)
• 13' 2" (4.00 m)	39,800 lbf (177 kN)
with Auto Power Boost	43,400 lbf (193 kN)
• 15' 11" (4.85 m)	35,500 lbf (158 kN)
with Auto Power Boost	38,900 lbf (173 kN)
• Bucket Digging Force	55,500 lbf (247 kN)
with Auto Power Boost	60,700 lbf (270 kN)

Lubricant & Coolant Capacity

Fuel Tank ..... 172 Gallons (650.0 Liters)
Hydraulic System ..... 122 Gallons (460.0 Liters)
Hydraulic Tank ..... 61 Gallons (230.0 Liters)
Final Drive (per side) ..... 4.0 Gallons (15.0 Liters)
Swing Drive ..... 2.8 Gallons (10.5 Liters)
Engine Oil ..... 10.8 Gallons (41.0 Liters)
DEF Tank ..... 40 Gallons (152.0 Liters)
Coolant System ..... 14.6 Gallons (55.1 Liters)

Operating Weight

Working weight with 35.5" (900 mm) shoes, 22' 11" (6.98 m) boom, 11' 1" (3.38 m) arm, 3,373 lb. (1 530 kg) bucket, 22,000 lb. (10 000 kg) counterweight



Fixed sideframe undercarriage ..... 109,800 lbs. (49 800 kg)
Expandable sideframe undercarriage ..... 112,900 lbs. (51 200 kg)

Mass Excavator

Working weight with 35.5" (900 mm) shoes, 21' 6" (6.55 m) boom, 8' 4" (2.53 m) arm, 5,300 lb. (2 400 kg) bucket, 22,000 lb. (10 000 kg) counterweight

Fixed sideframe undercarriage ..... 112,200 lbs. (50 900 kg)
Expandable sideframe undercarriage ..... 115,100 lbs. (52 200 kg)

Notes: Excavator lifting capacities

1. Lifting capacities shown should not be exceeded. Weight of all lifting accessories must be deducted from the above lifting capacities.
2. Lifting capacities are based on machine standing on firm, uniform supporting surface. User must make allowances for job conditions such as soft or uneven ground.
3. Lifting capacities shown do not exceed 75% of minimum tipping loads or 87% of hydraulic capacities. **Capacities marked with an asterisk (*) are limited by hydraulic capacities.**
4. Least stable position is over the side.
5. Operator should be fully acquainted with the Operator's Manual & Operating Safety Booklet, furnished by LBX before operating the machine.
6. Capacities apply only to the machine as originally manufactured and normally equipped by LBX Company, LLC.
7. Lift capacity ratings are based on ISO 10567, "Earthmoving Machinery - Hydraulic Excavators - Lift Capacity."

LIFT CAPACITIES

349F L

Hydraulic Excavator

2017

Engine		
Engine Model	Cat® C13 ACERT™	
Power – SAE J1349	311 kW	417 hp
Power – ISO 14396	317 kW	425 hp

Drive		
Maximum Travel Speed	4.7 km/h	2.9 mph
Maximum Drawbar Pull	335 kN	75,300 lbf
Weights		
Minimum Weight	48 650 kg	107,200 lb
Maximum Weight	51 000 kg	112,400 lb

The 349F L is built to keep your production numbers up and your owning and operating costs down.

Not only does the machine's C13 ACERT engine meet U.S. EPA Tier 4 Final emission standards, but it does so while giving you all the power, fuel efficiency, and reliability you need to succeed.

Where the real power comes in is through the hydraulic system. You can literally move tons of material all day long with a great deal of speed and precision. In fact the hydraulic system and engine work together to keep fuel consumption to an absolute minimum – all without impacting your productivity.

When you add in a quiet operator environment that keeps you comfortable and productive, service points that make your routine maintenance quick and easy, and multiple Cat work tools that help you do a number of jobs very well, you simply won't find a better machine in this size class.

Reliable and Productive

Power to move your material with speed and precision

Hydraulic Horsepower, a Cat Advantage

When it comes to moving heavy material quickly and efficiently, you need hydraulic horsepower – the type of ground-breaking power the 349F L can deliver. Major hydraulic components like pumps and valves are located close together so shorter tubes and lines can be used. This design leads to less friction loss, reduced pressure drops, and more power to the ground for the work you need to get done.

The heavy lift mode increases machine system pressure to improve lift – a nice benefit in certain situations. Heavy lift mode also reduces engine speed and pump flow in order to improve controllability.

Control Like No Other

Controllability is one of the main attributes of Cat excavators, and one of the key contributors to this is the main control valve. The valve opens slowly when your range of joystick lever movement is small and opens rapidly when movement is high. It puts flow where you need it when you need it, which leads to smoother operation, greater efficiency, and lower fuel consumption.

Auxiliary Hydraulics for Added Versatility

Auxiliary hydraulics give you greater tool versatility so you can take on more work with just one machine, and there are several options from which you can choose. A quick coupler circuit, for example, allows you to switch from one tool to another in a matter of minutes.

Fuel Efficient

Engineered to lower your operating costs

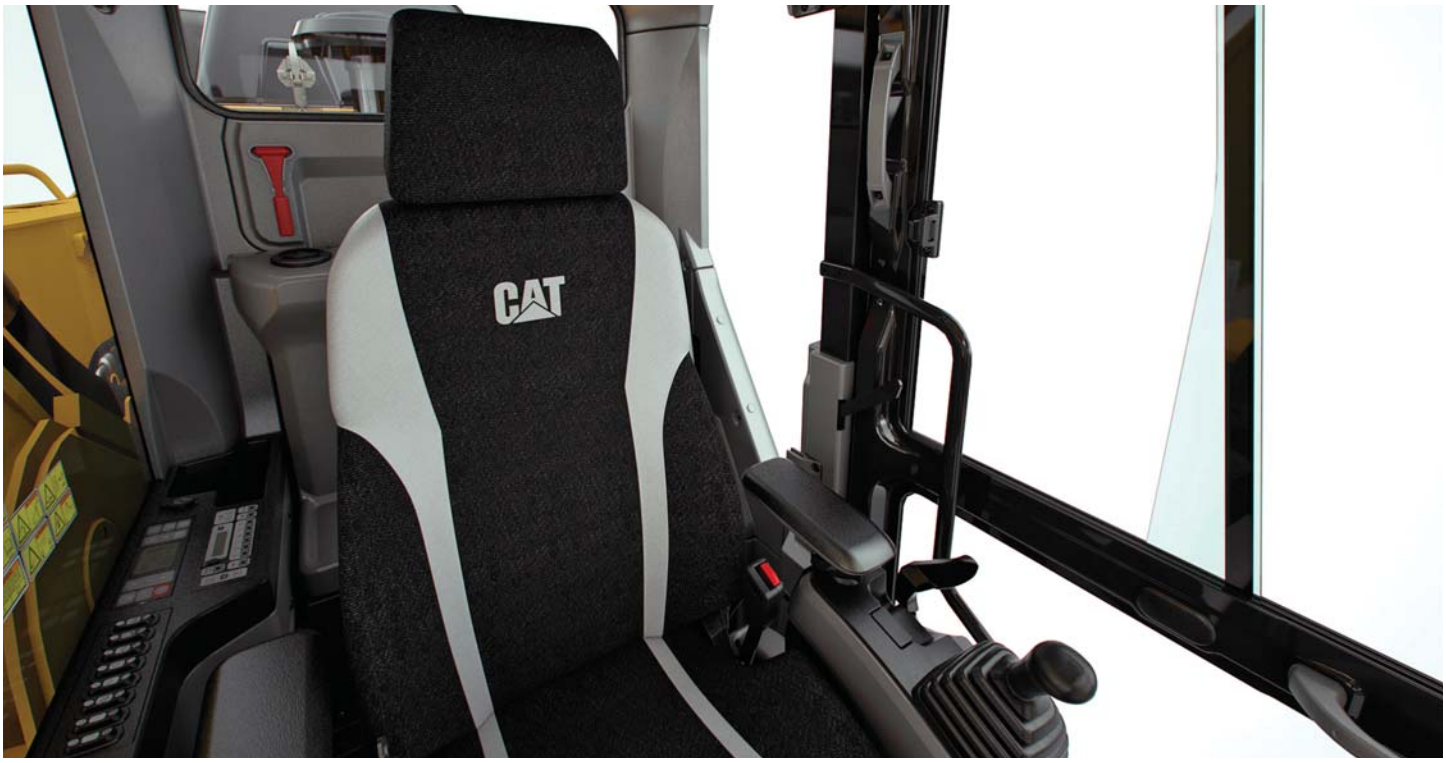
The Cat C13 ACERT engine meets Tier 4 Final emission standards and it does so without interrupting your job process. Simply turn the engine on and go to work. It will look for opportunities in your work cycle to regenerate itself, and it will give you plenty of power for the task at hand – all to help keep your owning and operating costs to an absolute minimum.

A Smart Design for Any Temperature

The 349F L features a side-by-side cooling system that allows you to put the machine to work in extremely hot and cold conditions. The system is completely separated from the engine compartment to reduce noise and heat. Plus it features easy-to-clean cores and a new variable-speed fan that reverses to blow out unwanted debris that may accumulate during your work day.

Biodiesel Not A Problem

The C13 ACERT engine can run on biodiesel fuel up to B20 blended with ULSD. Just fill it up and go.



Proven Technology

The right technologies fine-tuned for the right applications result in:

- **Improved Fuel Efficiency** – Up to 5% improvement over Tier 4 Interim products.
- **High Performance** across a variety of applications.
- **Enhanced Reliability** through commonality and simplicity of design.
- **Maximized Uptime and Reduced Cost** with world-class support from the Cat dealer network.
- **Minimized Impact of Emission Systems** – designed to be transparent to the operator without requiring interaction.
- **Durable Designs** with long life to overhaul.
- **Delivering Better Fuel Economy** with minimized maintenance costs while providing the same great power and response.

Easy to Operate

Comfort and convenience to keep you productive all day long

Safe and Quiet Cab

The cab contributes to your comfort thanks to special viscous mounts and special roof lining and sealing, that limit vibration and unnecessary sound.

Operators will enjoy the quietness and comfort of the all-new cab.

Excellent Ergonomics

Wide seats with air suspension and heat/cooling options, include a reclining back, upper and lower slide adjustments, and height and tilt angle adjustments to meet your needs for maximum comfort.

The fully automatic climate control system keeps operators comfortable and productive all day long in either hot or cold weather.

Storage spaces are located in the front, rear, and side consoles of the cab. A drink holder accommodates a large mug, and a shelf behind the seat stores large lunch or toolboxes.

Power supply sockets are available for charging your electronic devices like an MP3 player, a cell phone, or even a tablet.

Controls Just for You

The right and left joystick consoles can be adjusted to improve your comfort and productivity during the course of a day. The right joystick features a button that will reduce engine speed when you are not working to help save fuel. Touch it once and speed reduces; touch it again and speed increases for normal operation.

Easy to Navigate Monitor

The new LCD monitor is easy to see and navigate. Not only can it memorize up to 10 different work tools, it's also programmable in up to 44 languages to meet today's diverse workforce. The monitor clearly displays critical information you need to operate efficiently and effectively. Plus it projects the image from the rearview camera to help you see what's going on around you so you can stay safely focused on the job at hand.

Durable Structures

Made to work in your tough, heavy-duty applications

Stable Undercarriage

The undercarriage contributes significantly to outstanding stability and durability.

Track shoes, links, rollers, idlers, and final drives are all built with high-tensile strength steel for long-term durability.

Cat Grease Lubricated Track 2 (GLT2) track link protects moving parts by keeping water, debris, and dust out and grease sealed in, which delivers longer wear life and reduced noise when traveling.

Optional guide guards help maintain track alignment to improve the machine's overall performance – whether you're traveling on a flat, heavy bed of rock or a steep, wet field of mud.

Robust Frames

The 349F L is a robust, well-built machine designed to give you a very long service life. The upper frame has mountings made specifically to support the heavy-duty cab. It's also reinforced around areas that take on a lot of stress like the boom foot, skirt, and counterweight.

Great Weight

The counterweight is built with thick steel plates and reinforced fabrications to make it less susceptible to damage, designed with curved surfaces that match the machine's sleek, smooth appearance along with integrated housings to help protect the rearview camera.

Durable Linkages

Options to take on your far-reaching or up-close tasks

Booms and Sticks for Any Job

The 349F L is offered with a range of booms and sticks. Each is built with internal baffle plates and is stress relieved for added durability, and each undergoes ultrasound inspection to ensure quality and reliability. Large box-section structures with thick, multi-plate fabrications, castings, and forgings are used in high-stress areas such as the boom nose, boom foot, boom cylinder, and stick foot to improve durability. Also, the boom nose pin retention method is a captured flag design for enhanced durability.

The Reach boom and sticks offer you excellent all-around versatility for general excavations work like multipurpose digging and loading.

Pins

All front linkage pins have thick chrome plating, giving them high wear resistance. Each pin diameter is made to distribute the shear and bending loads associated with the stick and to help ensure long pin, boom and stick life.

Talk to your Cat dealer to pick the best front linkage for your applications.

Versatile

Do more jobs with one machine

Get the Most from One Machine

The Cat combination of machine and tool provides a total solution for just about any application. Work tools can be mounted either directly to the machine or to a quick coupler, making it fast and easy to release one work tool and pick up another.

Change Jobs Quickly

Cat quick coupler brings the ability to quickly change attachments and switch from job to job. The Cat coupler is the secure way to decrease downtime and increase job site flexibility and overall productivity.

Available tool control remembers pressures and flows for up to 10 tools. Simply toggle through the monitor, select the tool, and go to work for maximum efficiency.

Dig, Rip and Load

A wide range of buckets dig everything from basic top soil to extreme, harsh material like ore and high quartzite granite. Rip through rock as an alternative to blasting in quarries. High-capacity buckets load trucks in a minimum number of passes for maximum productivity.

Break, Demolish and Scrap

A hydraulic hammer ably equips your machine for breaking rock in quarries. It will also make taking down bridge pillars and heavily reinforced concrete on road demolition jobs no problem.

Multi-processor and pulverizer attachments make your machine ideal for demolition jobs and processing the resulting debris.

Shears with 360° rotation mount to the machine for processing scrap steel and metal.

Move and Handle

Add a thumb and you have the ability to move and handle brush, rocks, and debris. For constant material handling, a grapple is your solution. Choose from three different styles for picking, sorting, and loading trash, demolition debris, or recyclables.

Set Up Your Machine for Profitability

Your Cat dealer can install hydraulic kits to properly operate all Cat Work Tool attachments, maximizing the machine's uptime and your profit. All Cat Work Tool attachments are supported by the same Cat dealer network as your Cat machine.

Cat Connect Technologies

Monitor, manage, and enhance job site operations

Cat Connect makes smart use of technology and services to improve your job site efficiency. Using the data from technology-equipped machines, you'll get more information and insight into your equipment and operations than ever before.

Cat Connect technologies offer improvements in these key areas:

EQUIPMENT MANAGEMENT

Equipment Management – increase uptime and reduce operating costs.

PRODUCTIVITY

Productivity – monitor production and manage job site efficiency.

SAFETY

Safety – enhance job site awareness to keep your people and equipment safe.

LINK Technologies

LINK technologies, like Product Link™, are deeply integrated into your machine and wirelessly communicates key information, including location, hours, fuel usage, idle time and event codes.

Product Link/VisionLink®

Easy access to Product Link data via the online VisionLink user interface can help you see how your machine or fleet is performing. You can use this information to make timely, fact based decisions that can boost job site efficiency and productivity, and lower costs.

GRADE Technologies

Grade technologies combine digital design data and in-cab guidance to help you reach target grade quickly and accurately, with minimal staking and checking. That means you'll be more productive, complete jobs faster, in fewer passes, using less fuel, at a lower cost.

Cat Grade with Assist

Cat Grade with Assist ensures you can dig a level base with the right slope each and every time; now it works with tilt buckets to give you even greater versatility. With a touch of a button, the simple-to-use system automates boom and bucket movements typically done by the operator. Regardless of your experience or skill, you will be able to reach target grade up to 45% faster than with traditional grading techniques.

Cat Grade 3D

Cat Grade 3D is perfect for complex excavating projects that require precise cuts and contours. The 254 mm (10 in) color monitor shows you exactly where to work and how much to cut or fill without stacking or grade checking, delivering accuracy within 30 mm (1.18 in). Factory integration of most key components reduces field installation time and labor cost, making the system less costly for you compared to other options. Plus reliability is enhanced because built-in components are protected from damage, ensuring longer service life and more accurate results.

Safe Work Environment

Features to help protect you day in and day out

Secure Contact Points

Multiple large steps as well as hand and guard rails will get you into the cab as well as a leg up to the compartments.

Extended hand and guard rails allow you to safely climb to the upper deck. Anti-skid plates on the surface of the upper structure, and the top of the storage box area, reduce your slipping hazards in all types of weather conditions. They can be removed for cleaning.

Great Views

The rearview camera greatly enhances visibility behind the machine to help the operator work more productively. A panoramic rearview is automatically displayed on the new multi-function monitor during reverse travel. As an option, a second display can be added, providing a dedicated full-time rearview of the job site.

Smart Lighting

Halogen lights provide plenty of illumination. Cab and boom lights can be programmed to stay on for up to 90 seconds after the engine has been turned off to help you safely exit the machine. Optional High Intensity Discharge (HID) lights are available for enhanced night-time visibility.

A Safe and Quiet Cab

The ROPS-certified cab provides you with a safe working environment. It also contributes to your comfort because it's attached to a reinforced frame with special viscous mounts that limit vibration and unnecessary sound. Add in special roof lining and sealing and you have a cab that's as quiet inside as any of today's highway trucks.

Optional Falling Object Guards (FOGS) further protect you from debris coming to the cab.

Ground-Level Access

You can reach most routine maintenance items like fuel and oil filters, fluid taps, and grease points from the safety and convenience of ground level. Not only do compartments feature wide service doors designed to help prevent debris entry, but they also securely latch in place to help make your service work simpler.

Serviceable

Designed to make your maintenance quick and easy

A Fresh Idea

When you select ventilation inside the cab, outside air enters through the fresh air filter. The filter is conveniently located on the side of the cab to make it easy to reach and replace, and it is protected by a lockable door that can be opened with the engine key.

Quick and Convenient Fluids Service

S·O·S℠ Oil sample and pressure ports provide easy checking of machine condition and are standard on every machine.

You can ensure fast, easy, and secure changing of engine and hydraulic oil with the QuickEvac™ option.

The fuel tank's drain cock makes it easy and simple for you to remove water and sediment during routine maintenance. Plus an integrated fuel level indicator pops up to help you reduce the possibility of fuel tank overfilling. An optional fast fill port accessible from ground level can make refueling even easier and faster.

A Smart Cooling Design

The high-ambient cooling system features a fuel-saving variable-speed fan and a side-by-side-mounted radiator and oil and air coolers for easy cleaning.

Sustainable

Generations ahead in every way

The 349F L is designed to compliment your business plan, reduce emissions and minimize the consumption of natural resources.

- The C13 ACERT engine meets Tier 4 Final emission standards.
- The machine has the flexibility of running on either ultra-low-sulfur diesel (ULSD) fuel with 15 ppm of sulfur or less or up to biodiesel (B20) fuel blended with ULSD.
- An overfill indicator rises when the tank is full to help the operator avoid spilling.
- Quick fill ports with connectors ensure fast, easy, and secure changing of hydraulic oil.
- Major components are rebuildable, eliminating waste and saving money by giving the machine and/or major components a second life – and even a third life.
- Link technologies enable you to collect and analyze equipment and job site data so you can maximize productivity and reduce costs.
- The 349F L is an efficient, productive machine that's designed to conserve our natural resources for generations ahead.

Complete Customer Care

Unmatched support makes the difference

Worldwide Parts Availability

Cat dealers utilize a worldwide parts network to maximize your machines' uptime. Plus they can help you save money with Cat remanufactured components.

Financial Options Just for You

Consider financing options and day-to-day operating costs. Look at dealer services that can be included in the machine's cost to yield lower owning and operating costs over time.

What's Best for You Today…and Tomorrow

Repair, rebuild, or replace? Your Cat dealer can help you evaluate the cost involved so you can make the best choice for your business.

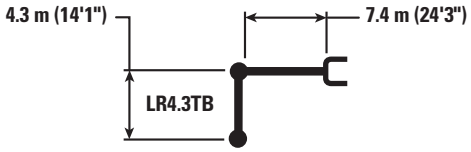
Major Component Weights

	kg	lb
Base Machine (with boom cylinder, without counterweight, front linkage and track)		
Long FIX Undercarriage	24 800	54,700
Counterweight		
9.0 mt (9.9 t)	9000	19,800
Boom (includes lines, pins and stick cylinder)		
Long Reach Boom – 7.4 m (24'3")	5190	11,400
Reach Boom – 6.9 m (22'8")	4630	10,200
Mass Boom – 6.55 m (21'6")	4860	10,700
Stick (includes lines, pins, bucket linkage and bucket cylinder)		
R4.3TB HD (14'1")	2990	6,600
R3.9TB HD (12'10")	2760	6,100
R3.35TB HD (11'0")	2540	5,600
M3.0UB HD (9'10")	2930	6,500
M2.5UB HD (8'2")	3140	6,900
Track Shoes (per two tracks)		
600 mm (24") double grouser	5240	11,600
750 mm (30") triple grouser	5890	13,000
900 mm (35") triple grouser	6640	14,600
Buckets		
TB1880GD – 3.10 m^3 (4.05 yd^3)	2440	5,400
UB1850HD – 3.2 m^3 (4.2 yd^3)	2840	6,300

All weights are rounded up to nearest 10 kg and lb except for buckets. Kg and lb were rounded up separately so some of the kg and lb do not match.



Base machine includes 75 kg (165 lb) operator weight, 90% fuel weight, and undercarriage with center guard.

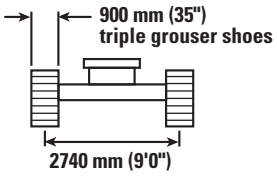
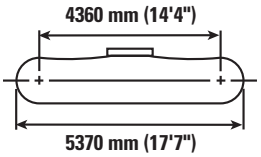
* **ISO 10567**



*Indicates that the load is limited by hydraulic lifting capacity rather than tipping load. The above loads are in compliance with hydraulic excavator lift capacity standard ISO 10567:2007. They do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. Weight of all lifting accessories must be deducted from the above lifting capacities. Lifting capacities are based on the machine standing on a firm, uniform supporting surface. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.



Lift capacity stays with ±5% for all available track shoes.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

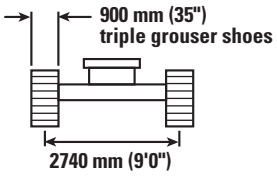
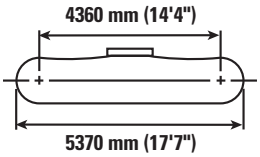
* ISO 10567



*Indicates that the load is limited by hydraulic lifting capacity rather than tipping load. The above loads are in compliance with hydraulic excavator lift capacity standard ISO 10567:2007. They do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. Weight of all lifting accessories must be deducted from the above lifting capacities. Lifting capacities are based on the machine standing on a firm, uniform supporting surface. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.



Lift capacity stays with ±5% for all available track shoes.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

- X Not Recommended

Caterpillar recommends using appropriate work tools to maximize the value customers receive from our products. Use of work tools, including buckets, which are outside of Caterpillar's recommendations or specifications for weight, dimensions, flows, pressures, etc. may result in less-than-optimal performance, including but not limited to reductions in production, stability, reliability, and component durability. Improper use of a work tool resulting in sweeping, prying, twisting and/or catching of heavy loads will reduce the life of the boom and stick.

Caterpillar recommends using appropriate work tools to maximize the value customers receive from our products. Use of work tools, including buckets, which are outside of Caterpillar's recommendations or specifications for weight, dimensions, flows, pressures, etc. may result in less-than-optimal performance, including but not limited to reductions in production, stability, reliability, and component durability. Improper use of a work tool resulting in sweeping, prying, twisting and/or catching of heavy loads will reduce the life of the boom and stick.

349F L Standard Equipment

Standard Equipment

Standard equipment may vary. Consult your Cat dealer for details.

ENGINE

- Air cleaner
- Cat C13 ACERT diesel engine
- Biodiesel capable
- Meets Tier 4 Final emission standards
- 2300 m (7,500 ft) altitude capability
- Electric priming pump
- Automatic engine speed control
- Standard, economy and high power modes
- Two-speed travel
- Side-by-side cooling system
- Radial seal air filter
- Primary filter with water separator and water separator indicator switch
- Fuel differential indicator switch in fuel line

HYDRAULIC SYSTEM

- Automatic swing parking brake
- Regeneration circuit for boom and stick
- High-performance hydraulic return filter
- Regeneration circuit for boom and stick
- Capability of installing additional auxiliary circuits
- Bio oil capable
- 52° ambient cooling capability
- Heavy lift mode
- Joystick control pattern changer through monitor
- Fine swing*

CAB

- Wiper and washer
- Mirrors
- Pressurized operator station with positive filtration
- Windshield
  - 70-30 split, sliding, removable lower windshield with in cab storage bracket
- Sliding upper door window (left-hand cab door)
- Openable skylight
- Sunscreen
- Interior:
  - Glass-breaking safety hammer
  - Coat hook
  - Beverage holder
  - Literature holder
  - Interior lighting
  - AM/FM radio
  - Two 12V stereo speakers
  - Storage shelf suitable for lunch or toolbox
  - Power supply with 12V, two power outlets (10 amp)
  - Thumb wheel modulation joystick for use with combined auxiliary control
  - Air conditioner, heater and defroster with climate control
- Seat:
  - Adjustable high-back, heated and ventilated seat with air suspension
  - Seat belt, 51 mm (2 in)
  - Adjustable armrest
  - Height adjustable joystick consoles
  - Neutral lever (lock out) for all controls
  - Travel control pedals with removable hand levers
  - Capability of installing two additional pedals
  - Two speed travel
  - Floor mat, washable
  - Third travel pedal
- Monitor:
  - Clock
  - Video ready
  - Color LCD display with warning, filter/fluid change, and working hour information
  - Language display (full graphic and full color display)
  - Machine condition, error code and tool mode setting information
  - Start-up level check for engine oil, engine coolant and hydraulic oil
  - Warning, filter/fluid change and working hour information
  - Fuel consumption meter

UNDERCARRIAGE

- Grease Lubricated Track GLT4
- Towing eye on base frame
- Heavy-duty track rollers
- Track motor guards
- Swivel guard
- Heavy duty bottom guard

ELECTRICAL

- 80 amp alternator
- Circuit breaker
- Capability to electrically connect a beacon
- Travel alarm

LIGHTS

- Boom light
- Cab lights with time delay
- Exterior lights integrated into storage box

SAFETY & SECURITY

- Cat one key security system
- Door locks
- Cap locks on fuel and hydraulic tanks
- Lockable external tool/storage box
- Signaling/warning horn
- Secondary engine shutoff switch
- Mirrors
- Openable skylight for emergency exit
- Rearview camera
- Capability to connect a beacon
- Bolt-on FOGS capability
- Safety hammer for breaking cab glass

INTEGRATED TECHNOLOGIES

- Product Link
- Rear vision camera

*North America

Optional Equipment

Optional equipment may vary. Consult your Cat dealer for details.

ENGINE
- Quick drains, engine and hydraulic oil* **

HYDRAULIC SYSTEM
- Control pattern quick-changer
- Boom and stick lowering control devices
- HP hydraulic lines for boom and stick
- MP hydraulic lines for boom and stick
- QC hydraulic lines for boom and stick
- QC control
- Bio oil
- Heavy lift

UNDERCARRIAGE
- Tracks:
  - 900 mm (35") triple grouser*
  - 750 mm (30") triple grouser**
  - 750 mm (30") single grouser*
  - 600 mm (24") double grouser** ***
  - 600 mm (24") double grouser Heavy Duty* **
- Track guiding guards:
  - Center
  - Segmented
  - Full length
- Idler:
  - Forging
  - Fabricating

COUNTERWEIGHT
- 8.6 mt (9.4 t) with removal device*
- 9.0 mt (9.9 t)

ELECTRICAL
- Cold weather package
- Jump start receptacle

FRONT LINKAGE
- Reach Boom, 7.4 m (24'2")*
- Reach Boom, 6.9 m (22'8")
- Mass Boom, 6.55 m (21'6")
- Reach stick, R4.3 m TB (14'1")*
- Reach stick, R3.9 m TB (12'10")* **
- Reach stick, R3.35 m TB (11')
- Mass stick, M3.0 m UB (9'10")
- Mass stick, M2.5 m UB (8'2")
- TB bucket linkage with lifting eye
- UB bucket linkage with/without lifting eye
- Pin Grabber coupler

LIGHTS
- Working lights, cab mounted with time delay
- Halogen lights, cab mounted with time delay
- Halogen boom lights
- HID boom lights

SECURITY
- Falling Object Guard system (FOGS)

TECHNOLOGY
- Cat Grade Control (2D, 3D)
- Cat Production Measurement

Re: BGC-RFI-014: Event Pond Underdrain Clarification

BGC requests JDS provide acknowledgment of receipt of the following design clarification.

Figure 1 presents design Detail 17 from Drawing EGHLF-XD-05-03 for the event pond underdrain discharge pipe. The discharge outlet portion of the underdrain extending beneath the event pond embankment may be alternatively constructed using cut and cover methods (Material 2 backfill without the geotextile and Material 5 select drain fill). Also, the pipe size (150mm) shown on Detail 17 conflicts with the pipe size (200mm) shown on Detail 53. Either pipe size is acceptable.

Re: BGC-RFI-015: Closure Sump Piping Design Clarification

BGC requests JDS provide acknowledgment of receipt of the following design clarification.

Figure 1 presents design Detail 37 from Drawing EGHLF-XD-05-05 for the closure sump piping plan. The 150mm solid PE closure drain pipes connecting the sump to the monitoring vault have been reduced from 3 pipes to 1 pipe due to the as-built pipe flow grade. The perforated pipework in the sump must be modified to accommodate a single outlet pipe. A configuration with elbows connectors and a single tee connector will be acceptable as shown on Figure 2.

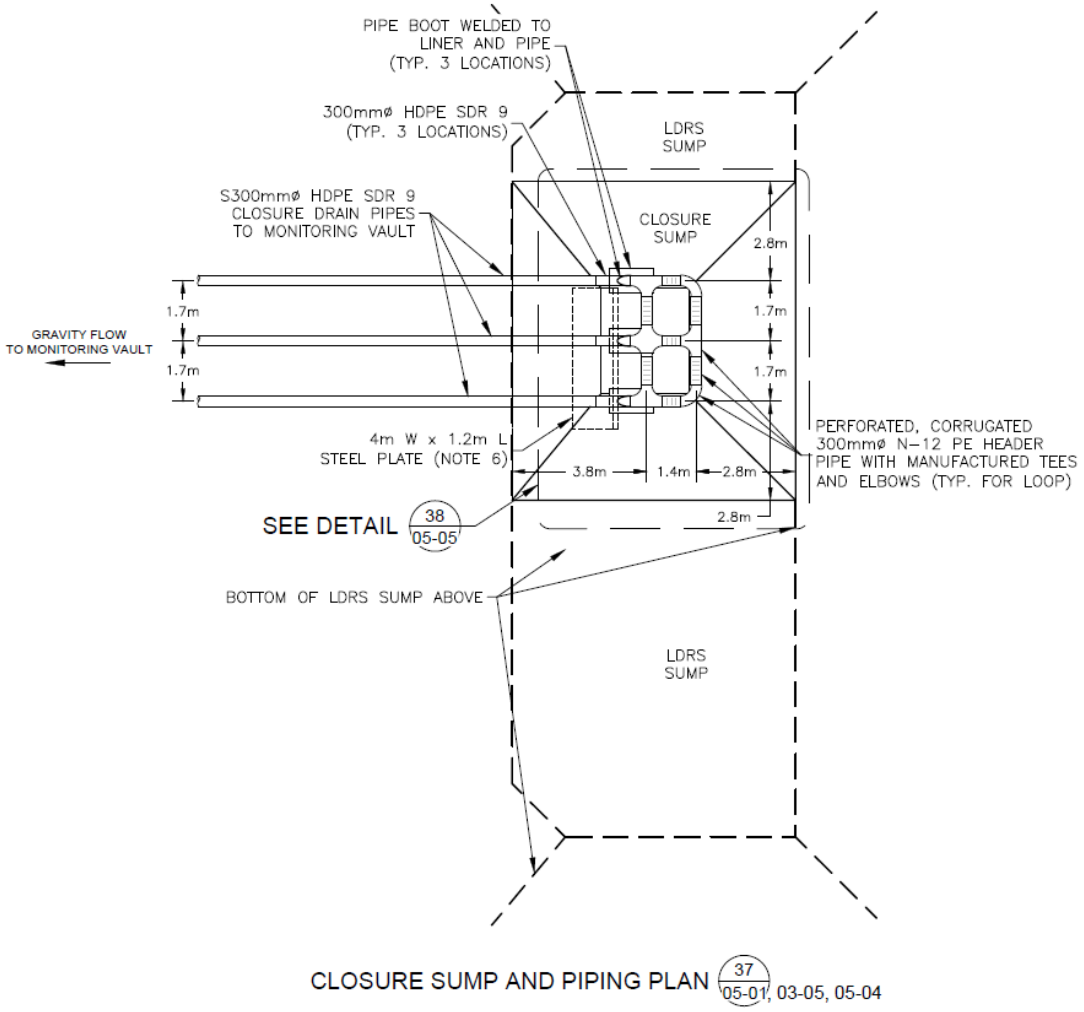

Figure 1 – Detail 37, Drawing EGHLF-XD-05-05

Re: BGC-RFI-016: Geomembrane and ODF Placement in Freezing Conditions

BGC requests JDS provide acknowledgment of receipt of the following technical specification clarification.

Section 4.1.7.2 of the project technical specifications addresses placement of liner in cold weather:

> *No seaming shall be conducted if the temperature measured at 15 cm above the geomembrane is lower than 5°C or above 38°C, without written acceptance by the Engineer. When the temperature is below 10°C, the Installer shall preheat the weld zone by a hot air device.*

The following guidance is provided and shall replace the above specification:

Cold weather installations should follow guidelines as outlined in GRI GM9: *Standard Practice for Cold Weather Seaming of Geomembranes.* No geomembrane material shall be seamed when liner (sheet) temperatures are less than 0 degrees C (32 degrees F) unless the following conditions are complied with:

1. Seaming of the geomembrane at material temperatures below 0 degrees C (32 degrees F) is allowed if the Geomembrane Installer (Layfield) can demonstrate to the Owner's Representatives (Tetra Tech and BGC), using pre-qualification test seams, that field seams comply with the project specifications, the safety of the crew is ensured, and geomembrane material can be fabricated (i.e. pipeboots, penetrations, repairs, etc.) at sub-freezing temperatures.
2. The Geomembrane Installer shall submit to the Owner's Representative for approval, detailed procedures for seaming at low temperatures, including the following:
    a. Preheating of the geomembrane, if necessary.
    b. The provision of a tent or other device if necessary to prevent heat losses during seaming and rapid heat losses subsequent to seaming.

c. Number of test welds to determine appropriate seaming parameters

Trial welds shall always be done in the environment (temperature) and geometry in which production welding is to be done.

Freezing temperatures can cause geomembrane sheets to crack when unrolled, folded, impacted or loaded. Geomembranes when unrolled or folded in cold weather should not crack, craze, or distort in texture. A sheet temperature of minus 10 degrees C (14 degrees F) is the lower limit that a geomembrane shall be unrolled unless it is shown otherwise to the satisfaction of the Owner's Representative.

Section 3.8.1.2 of the project technical specifications addresses placement of Overliner Drain Fill (ODF) on the installed liner. A sheet temperature of minus 10 degrees C (14 degrees F) is the lower limit that ODF shall be placed on the geomembrane unless it is shown otherwise to the satisfaction of the Owner's Representative.

Hello Troy,

I will submit our cold weather installation procedure too you shortly for review.

We are confident that we are able to weld in temperatures below 0 degrees by adjusting our temperatures and speeds accordingly. Please note that preheating the geomembrane or using tents does not work but we will have no issue showing tetra tech and BGC on site with trial welds and seam testing that installation is still possible in cold temperatures

Below is just a quick chart for you information on handling different types materials in relation to the Cold weather deployment

Table1. Cold Temperature Handling Guide

Material	Tested Value (ASTM Method)	Practical Low Temp. Handling Limit
Regular PVC 20 mil	-26°C, -15°F (D1790)	-5°C, +23°F
Regular PVC 30 mil and up	-30°C, -22°F (D1790)	-5°C, +23°F
HAZGARD 100 30mil (U)	-30°C, -22°F (D1790)	-5°C, +23°F
HAZGARD 250 38mil (S)	-40°C, -40°F (D2136)	-15°C, +5°F
HAZGARD 1000 (S)	-40°C, -40°F (D2136)	-20°C, -4°F
HAZGARD 5000 HT (S)	-30°C, -22°F (D2136))	-10°C, +14°F
HDPE 60mil	-70°C, -94°F (D746)	-25°C, -13°F (Welding Limited)
EPDM 45mil	-45°C, -49°F (D746)	+5°C, +41°F (Issues with sealant tape)

Cold Weather Seaming Protocols

Welding can be completed in colder temperatures provided some additional procedures are followed and the trial welds (prequalification welds) are performed in the same environment as the main production seams. The trial welds are very important, as they will verify that the welding equipment has been properly set to meet the site and ambient temperature conditions. Below are some of additional guidelines to follow for the various temperature ranges. The onsite superintendent shall also have the experience to determine whether satisfactory seams can be achieved given the weather and site conditions.

Temperatures between 0˚C and -10˚C: The welding procedure on this temperature range is the same as warm weather welding procedures; however you may require slight adjustments to the welding units' temperature and/or speed settings. When the weather is clear and sunny and the wind is minimal, only very slight adjustments may be required, but when it is overcast, windy and cooler considerable adjustments may be required.

Temperatures between -10˚C and -20˚C+: Additional care must be taken to ensure that the welding units are operating properly in the cold and that the welding temperatures and speeds are adjusted to accommodate the colder temperatures. During the seaming operation, the technician will monitor the welding unit to ensure that the set welding speeds and temperatures are maintained throughout the length of the seam. No welding can take place when it is raining, sleeting, snowing and the moisture caused from these conditions cannot be removed to ensure that the seam areas are 100% dry during the seaming procedure. Extra care must be taken when working when wet, snowy or icy conditions prevail as the liner becomes very slippery under these conditions and is a safety concern. Removal of snow and ice can be completed using various types of low impact snow blowers, brushes, or plastic shovels that will have minimal impact on liner itself

Preparation of the Geomembrane Surfaces to be Seamed

• Extra precautions must be made if it is snowing, sleeting or hailing on the geomembrane in the area to be seamed.

• In the area to be seamed, all frost must be removed from the opposing surfaces of the geomembrane sheets in the regions where the actual seaming is to be performed. The residual moisture left after removing frost must be wiped dry. This can prove more difficult to on textured geomembranes where the texturing extends to the roll edges or roll ends.

• The application of heat to remove moisture using a hand held hot air device may be used; however care must be exercised to prevent excessive heat being applied to the liner. It is recommended an assessment is made by performing a trial seam using the same equipment in the exact site and temperature conditions.

• The specific area to be seamed must be free of soil particles and other foreign matter.

• Take measures for thermal fusion welding that the underside of the lower sheet should also be free of frost and moisture so that the lower drive wheels of the device can move freely and do not slip. It may be necessary to use a rub sheet beneath the area being seamed to separate the geomembrane from frozen soil subgrade. Various materials have been used for rub sheets including smooth membranes, smooth films and even certain types of geotextiles.

• For fillet extrusion welding the thermal tacking of the sheets together should proceed as with similar welding at temperatures above freezing.

Thermal Fusion Seaming (e.g., using a hot wedge welding device)

• In general, the rate of seaming, i.e., the speed of the hot wedge device, is usually slower than when seaming at temperatures above 0°C (32°F). Furthermore, the rate should decrease with decreasing sheet temperature.

• Additional trial seams may be required in colder temperatures. These will be performed at the discretion of the supervisor on site.

• Cold temperature seaming may also require more destructive tests on production seams than when welding above freezing. For example, in addition to the CQA plan written around above freezing temperatures, additional destructive seam samples may be taken at the end(s) of each continuous production seams. *Note 3: The actual schedule for destructive test samples is at the discretion of the CQA Engineer.*

Extrusion Fillet Seaming

• The necessary grinding of the geomembrane surfaces in preparation of placing extradite should be no further ahead of the extrusion gun than 20 minutes.

• In general, the rate of seaming, i.e., the speed of travel, is slower than when seaming at temperatures above 0° (32°F). Furthermore, the rate should decrease with decreasing sheet temperatures.

• Additional trial seams may be required in colder temperatures. These will be performed at the discretion of the supervisor on site.

• Cold temperature seaming may also require more destructive tests on production seams than when welding above freezing. For example, in addition to the CQA plan written around above freezing temperatures, additional destructive seam samples may be taken at the end(s) of each continuous production seam. *Note 4: The actual schedule for destructive test samples is at the discretion of the CQA Engineer.*

Seam Testing

• In general, destructive testing of seams (both shear and peel) made in cold temperatures should follow the same protocol and test methods as for temperatures above freezing.

• Seam tests from trial seams should be taken to a field trailer or other heated enclosure to allow the seam to acclimatize to the designated test temperature (20 degrees Celsius) and tested accordingly. However, seam tests from trial seams which are tested with a tensiometer on-site at temperatures less than freezing is sometimes unavoidable. Weather conditions can change often throughout the day, the supervisor and on site engineer can decide to increase trial seems and destructs as deemed necessary.

Re: BGC-RFI-017: Event Pond Underdrain Outlet Pipe Clarification

BGC requests JDS provide acknowledgment of receipt of the following design drawing clarification.

Drawing EGHLF XD-03-03 shows the alignment of the Event Pond outlet pipe. A profile for this pipe is not provided. Drawing EGHLF XD-07-01 shows the Event Pond survey control. Control Point #9 should be used as the top of trench control for the underdrain outlet pipe. The discharge point at the end of the outlet pipe may be field located but must be south of the event pond and accessible and protected for future monitoring.

Drawing EGHLF XD-03-03, Detail 17 shows the outlet pipe detail. BGC-RFI-14 provides clarification regarding this detail with approval for a cut and cover trench in place of the geotextile wrap and drain gravel arrangement.

Re: BGC-RFI-018: Event Pond Excavation Specification

BGC requests JDS provide acknowledgment of receipt of the following technical specification clarification.

The distribution of permafrost and associated ground ice is likely heterogeneous in both the horizontal and the vertical directions within the Event Pond area. The project technical specifications address excavation and removal of ice-rich materials in Section 3.1:

> *Identify and Remove Ice-Rich Soils - Ice-rich soils in permafrost, when thawed and generating excess pore pressures, can result in soil instabilities and therefore, it is critical to identify and remove any ice-rich soils in the foundation of the HLF prior to liner construction and stacking. On the other hand, if the frozen ground does not contain excess ice (no ice-rich soils) and is thaw stable, there is negligible impact on the stability of the ground upon thaw.*

For excavations at the Event Pond, BGC will require removal of thaw-unstable material. The identification of thaw-unstable soil will be based on the following guidance in the Foundation Improvement Plan (FIP):

> *A volumetric ice content of 15% is considered to reflect a local threshold for thaw sensitivity, where the soil can become unstable upon thaw because of excess pore pressures that cannot dissipate.*

Even if the frozen soil has no visible ice, it may still have considerable ice volume as is illustrated on the collapse and flow of the frozen soil structure when thawed **(Photo 1 and Figure 1**). The procedure for identification is outlined in the FIP as summarized in **Figure 2**. Materials identified as Types III, IV and V may be classified as thaw unstable depending the extent of the ice. If excess ice in the material exceeds 15%, by estimation of the BGC Field Engineer, or if a sample of frozen material exhibits collapse and flow, the material must be removed.

Subject: Closing RFIs

Hi guys. Below are a list of RFIs we sent that just require an acknowledgement of receipt to close them out. They were all small design tweaks, clarifications, and field fit changes that we just wanted to officially track somehow for the construction completion report and we thought this would be an easy way. If you respond to this email acknowledging that you received these changes I can close all of them out. Thanks.

ID	Description	Status
BGC-RFI-018	Event Pond Excavation Specification	Sent September 29, 2018. Waiting confirmation of receipt.
BGC-RFI-019	Closure Sump Steel Plate Detail	Sent October 1, 2018. Waiting confirmation of receipt.
BGC-RFI-022	HLF VALID Liner Testing	Sent October 2, 2018. Waiting confirmation of receipt.

Company:	**JDS**	**Project No.**	**0792021**
From:	**Troy Meyer (BGC)**	**Date:**	**September 30, 2018**
Copied:	**Roy Morlan, Dan Granda (BGC)**	**Record:**	**BGC-RFI-019**

Re: BGC-RFI-019: Closure Sump Steel Plate Detail

BGC requests JDS provide acknowledgment of receipt of the following design detail clarification.

The pipework contractor (Heavy North) asked for clarification regarding the size, location and orientation of the steel protection plate to be installed in the closure sump as show in Detail 33 on Drawing EGHLF XD-05-04and Detail 37 on Drawing EGHLF XD-05-05. The configuration of the Closure Pipe Casings was modified per BGC-RFI-013. As a result the Closure Pipe Casings have been shifted up and away from the HLF Embankment face as show in **Figure 1**. This requies modification of the position of the steel plate. **Figure 2** shows the revised configuration. The steel plate will be positioned at the north edge of the sump at a 20 degree angle from horizontal, as shown. The dimensions of the steel plate are 3m long by 1.2m wide with a 25 cm 90 degree angle. This revised orientation requires a modification to the closure sump pipe drainage loop (see **Figure 3**). This RFI supercedes RFI-015.

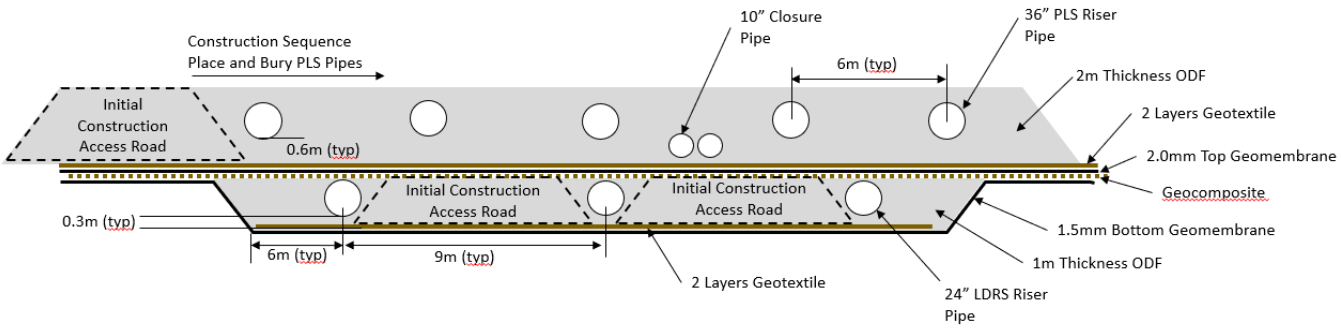

Figure 1: Revised Detail 28, Drawing EGHLF-XD-05-03.

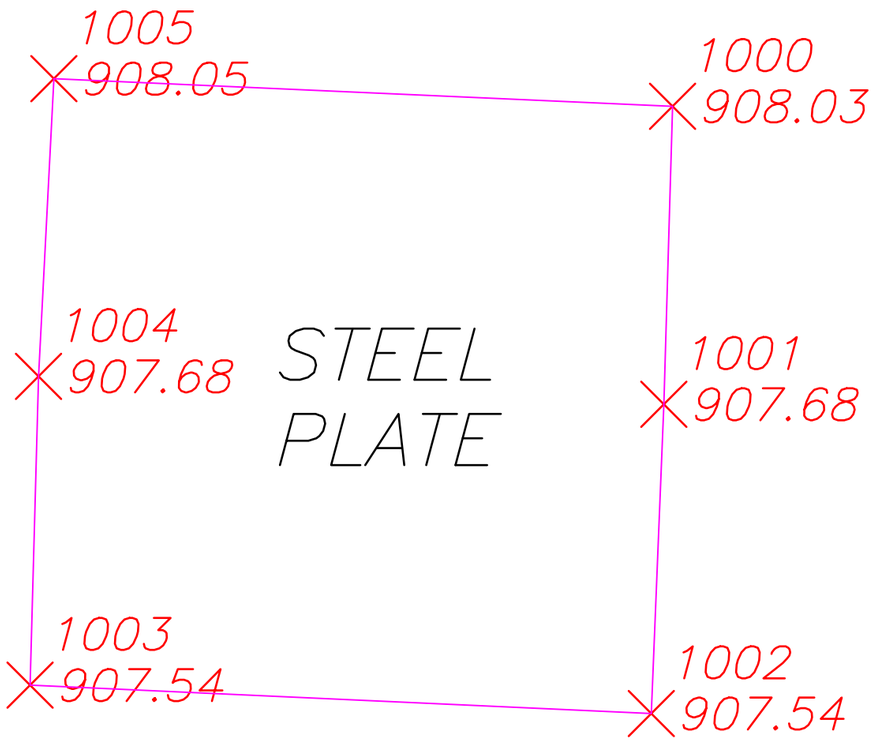
Re: BGC-RFI-020: Steel plate installation and closure drain pipe



BGC requests JDS/Heavy North provide as-built survey information of steel plate installation and closure drain pipe that took place on Oct 6, 2018.

This RFI refers to the clarification BGC-RFI-019: Closure Sump Design Detail sent by Troy Meyer (BGC), September 30th, 2018. The survey as build is needed for record keeping and due to the nature of the usage of these steel plates when closing of the HLF occurs. The T installed on the date should have also been surveyed and as built information should be provided. Survey as-builts was brought up during the installation by BGC representative Daniel Granda during the placement of the steel plates.

Re: BGC-RFI-021: Event Pond Water Management Plan

BGC requests JDS/Pelly provide a water management plan to protect the current construction efforts and winter snow/ice melts during Spring (Freshet) that may oversaturate, flood or damage current approved foundations and accepted compacted lifts.

Water management has been an on-going topic throughout the HLF embankment construction, foundation approvals from 2017 to 2018 and BGC is concern that water will be an issue with the event pond work zone. Figure 1 and 2 show the current grades and undrained susceptible materials that may be affected by poor water management during the construction and shut down of the work area during Winter until Spring.

Figure 1: Looking at an ice rich excavation and slopes grading towards current work zone

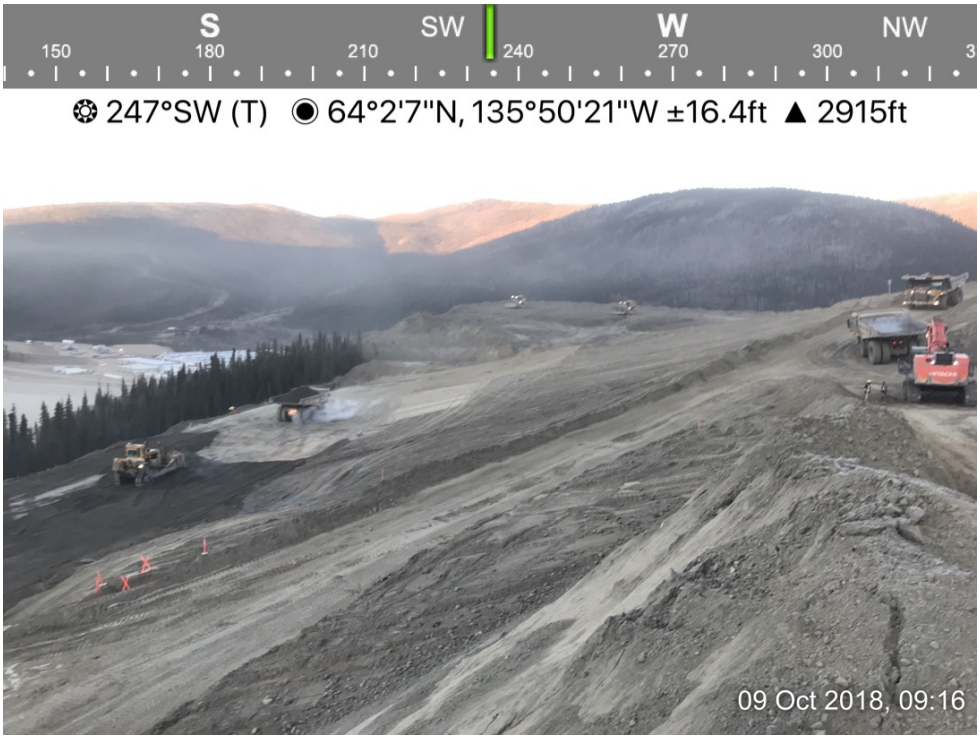

Figure 2: Looking at current lifts placed and roads/slopes grading towards area

Re: BGC-RFI-023: Event Pond Material Source Plan

1.0 REQUEST FOR INFORMATION

BGC would like for JDS to confirm the source of material Event Pond fill. Per the design and specifications the event pond fill should be composed of Material 1. However, Material 3 (Structural Fill) can also be used in conjunction with a bedding of Material 1 to protect the Event Pond liner. Once the source has been confirmed, if different from the existing borrows being used, BGC would like to inspect and possibly sample and test the material to confirm its suitability. Characteristics to be inspected are:

1. Moisture content
2. The presence of ice in the material.
3. Material gradation.
4. The presence of weak material such as phyllite.
5. The presence of organics.

Re: BGC-RFI-024: Event Pond Material Management

1.0 REQUEST FOR INFORMATION

BGC is requesting JDS to label all material source stockpiles for QA/QC and Pelly to effectively haul and compact material on the event pond. On Oct 11, 2018, BGC rejected a lift on the west side of th event pond due to oversaturation. From here on forward, as discussed verbally, BGC and Tetra Tech would need at least 24 hour notice of a new source, with a label, to test (proctor, gradations, etc). BGC may temporary allow the placement of material before testing is complete, but the lift may be rejected if moisture and density on proctor results are not reflected on the lift compaction. Moisture management (part of the RFI 22 water management plan for the event pond) remains to be resolved. If rejected, BGC will not accept lift and this lift will need to be scraped off and recompacted.

Labels for material stockpiles should:

1. Be clear for excavator and Pelly operations, and
2. Be surveyed and marked.
3. Maintained for visibility.

Re: BGC-RFI-025: Event Pond Winterization Plan Criteria

1.0 REQUEST FOR INFORMATION

BGC is requesting JDS to develop a winterization procedure for the event pond as winter conditions begin to affect construction quality, scheduling and material properties.

The winterization plan for the event pond should consider at a minimum the following:

1. At least a 2% grade on last lift to help runoff from melt, rainfall, snowmelt, ice melt to leave event pond embankment.

2. A protective layer on areas that may be affected by winter related erosion (slopes need organics, groins, areas where water could concentrate flow and erode surface).

3. Protect the installed drain pipe from debris, frost, ice by following criteria similar to the Heap Leach Pad underdrains downstream.

Once finalized, JDS should submit plan to BGC for review and approval.

Re: BGC-RFI-027: ODF Durability Testing

BGC requests JDS provide acknowledgment of receipt of the following clarification for the construction record.

Durability testing was performed on samples collected from the ROM Road and Electrical Substation. The following tests were performed on each sample:

- Los Angeles Abrasion – ASTM C131/AASTHO T-96.
- Relative Density and Absorption – ASTM C127/ASTM C128.
- Slake Durability – ASTM D4644

Results from this testing were received and showed that each sample had similar durability with the material from the ROM Road source having slightly better durability. Both sources would be suitable for production of ODF – Material 4. Test results are attached to this RFI.

Re: SLAKE DURABILITY TESTING

This report summarizes laboratory testing conducted by Wood Environment & Infrastructure Solutions, a Division of Wood Canada Limited (Wood), on aggregate samples received in Wood's Burlington, Ontario rock mechanics laboratory. The test results reported here include slake durability.

A total of two (2) test specimens were prepared and tested from two (2) aggregate samples received in the Wood laboratory. Testing was conducted in accordance with ASTM D4644, "Standard Test Method for Slake Durability of Shales and Other Similar Weak Rocks". ASTM D4644 requires a minimum test fragment mass of 40 grams, which corresponds to an average fragment dimension of approximately 25mm. To separate the fragments meeting the minimum mass requirement from the remainder of the sample, both samples were sieved to retain fragments greater than 1". Specimen pieces were chosen from the retained material to represent the sample lithology. Summary tables of the test results are attached as are the pre-test and post-test photographs.

We trust that this information meets your current requirements. If you would like to discuss any portion of the above, please contact this office at your convenience.

Copied:	**Roy Morlan (BGC)**	**Record:**	**BGC-RFI-028**

Re: BGC-RFI-028: PLS Sump and Piping Configuration

BGC requests JDS provide acknowledgment of receipt of the following design clarification. This RFI supersedes BGC-RFI-013.

In discussions between BGC, JDS and Heavy North regarding the construction approach for PLS pipe risers installations, a preferred approach was jointly developed to better match the proposed equipment while protecting the installed pipes and geosynthetic liner system.

The approach will involve conventional equipment (dozer and excavator) traffic within the pipe corridor, as opposed to using a crane or side-boom. This approach requires a modification to the pipe and liner arrangement to ensure protection of the liner system and placed LDRS pipes. Design drawings EGHLF XD-05-01 through 05-04. **Figure 1** presents the revised section through the pipe corridor (looking downstream) on the face of the HLF embankment. This section replaces Detail 28 on Drawing XD-05-03. The PLS pipes will be placed on the embankment face from access points on placed ODF from bottom to top.

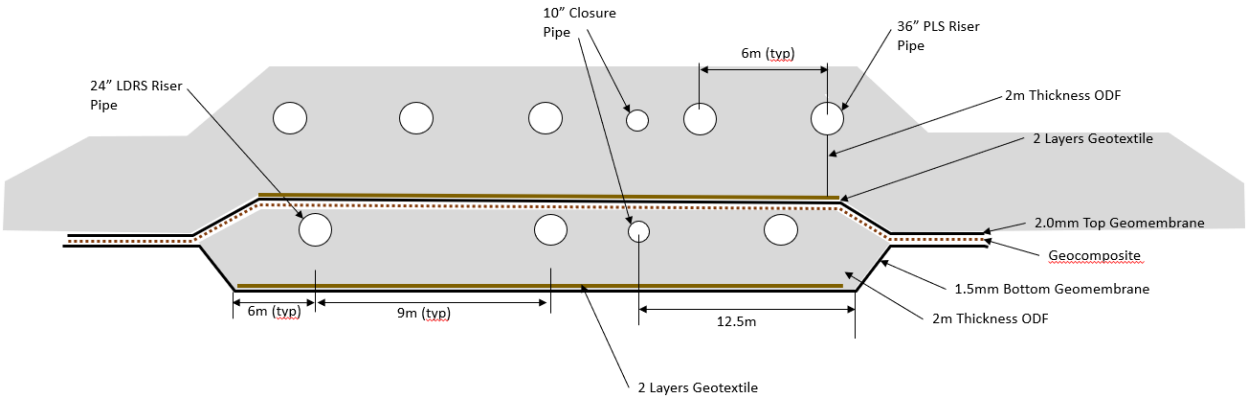

Figure 1: Revised Detail 28, Drawing EGHLF-XD-05-03.

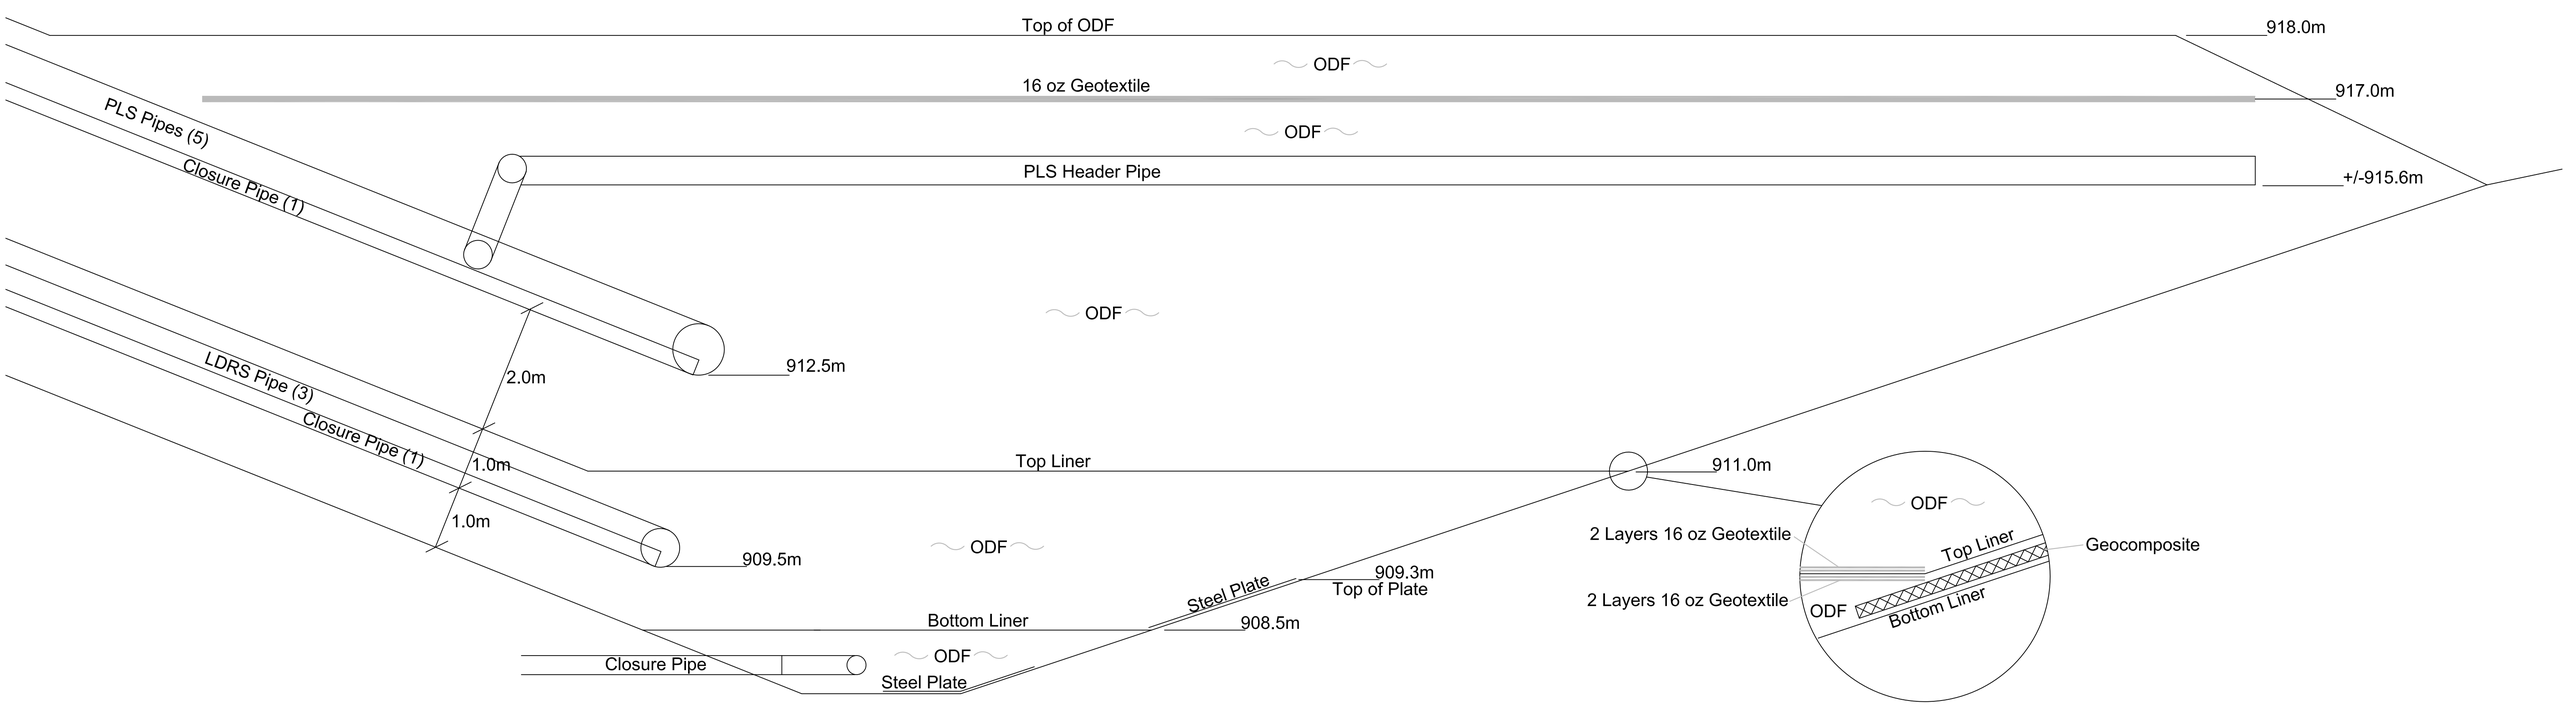

A 2m thick layer of ODF will be placed beneath the riser pipes. The outward shift of the PLS pipes will be accommodated at the bottom by adjusting the dimensions of the PE pipe network in the PLS sump as shown on **Figure 2**. This figure replaces Detail 33 of EGHLF-XD-05-04. A layer of 16 oz. geotextile must be placed at Elevation 917.0m within the ODF over the PLS pipework. This layer is for operational filtering purposes. The top ODF elevation is now 918.0m.

A field test pad has been conducted (BGC Field Memo FM-007) to demonstrate the protection of the liner with ODF thickness from 0.6m to 1.5m and traffic from loaded 40T rock trucks, CAT 3250 trackhoe excavator and D6 dozer. The proposed equipment for pipe placement includes a CAT 349F and Linkbelt 490 excavator (data sheets attached). Based on our estimates of the maximum ground pressure exerted from this equipment with the PLS hammerhead pipes, a minimum of 2m thickness ODF underlain by 2 non-woven geotextile layers to cushion the geomembrane liner will be required. Other equipment must be approved by BGC prior to use. Equipment movement must be slow and turning on the access roads built over the liner will not be allowed.

Re: BGC-RFI-030: ODF produced from the ADR Quarry.

JDS requested review of the ADR quarry as a source for ODF material production. Two samples were collected from the quarry in December 2018 and analyzed for durability and gradation. BGC has reviewed the laboratory results. Below are observations and recommendations based on this review. BGC developed this RFI to track the request and recommendations for the construction record. BGC requests a response to this RFI in order to close it.

Observations

Sample ADR-ODF-01 was collected from a weaker phyllite rich rock source within the ADR Quarry.

Sample ADR-ODF-02 was collected from a harder quartzite rich rock source within the ADR Quarry.

LA abrasion and slake test results for ADR-ODF-01 and ADR-ODF-02 were similar. LA Abrasion results were 33% and 31% respectively. This indicates weaker rock than the original ODF source, which reported LA abrasion results less than 20%, but is still within an acceptable range.

Gradation for ADR ODF 01 shows much more sand and fine gravel than ODF produced from the original source or sample ADR-ODF-02. (***Figure 1***)

Field permeability testing was performed on-site on ADR-ODF-01 by Tetra Tech on January 27. Permeability was determined to be 2.3×10^{-2} m/sec.

ODF material from the ADR source is currently being blasted from the near surface. As the quarry gets deeper durability should improve and gradation should become courser.

Recommendation

This material is approved for use but with the requirements below:

ODF permeability requirements per the technical specifications is $>2 \times 10^{-4}$ m/sec. QC observations made during production will be used to determine if additional testing or if segregation of material that does not meet this requirement is needed.

Due to variability in the quarry QC gradation testing should be performed daily or at a minimum of 1 sampler per 5,000 m^3 produced, whichever produced volume is less. If there is significant visual variability in the gradation of a material produced on any given day then gradation samples should be collected for the 'dirties' (ie the material producing the smallest particle size). Additional tests may be called for if the material appears weaker (richer in phyllite or visually producing a finer gradation and more waste). The Engineer may also request field or lab hardness and strength testing if material strength appears to change significantly. Field strength and hardness testing should follow the USBR Rock Manual guidance or a similar method.

If material strength or gradation tests indicate a significant change the Engineer may require daily observations of the source being excavated to identify areas that may need segregated from use.

Re: BGC-RFI-031: Primary Collector Pipe Spacing Revision and Crushed Ore as ODF

At the request of JDS BGC has performed analysis to determine the collector pipe spacing if crushed rock ODF is replaced with crushed ore ODF. An RFI was not produced by JDS for this analysis. Therefore, BGC is providing the analysis as an RFI to allow tracking in the construction record. BGC requests that JDS provide an acknowledgment of receipt of this information in order to close this RFI.

The criteria given to BGC to perform this analysis is below.

- An application rate of 10L/hr/m^3.
- 16mm crushed ore used as ODF (gradation and permeability provided in the report included as ***Attachment 1***).
- An ODF thickness of 1m.

The use of 16mm ore as ODF is approved. Pipe spacing should be 16m when placed on slopes less than 2.5:1 and 22m when placed on slopes greater than 2.5:1. This spacing is dependent on 1 meter of ODF thickness. Spacing calculations are included in ***Attachment 2***. A figure that includes this spacing applied JDS's subgrade below 990m and the 2018 revisions to the heap pad boundaries is included as ***Figure 13***.

Eagle Gold Project

Hydraulic Conductivity Testing Review

1. Introduction

Victoria Gold Corporation (VGC) commissioned Forte Dynamics, Inc. (Forte) to review and summarize the data resulting from the recent laboratory testing program for ore hydraulic conductivity at the Eagle Gold site, with particular emphasis on the first year of active mining. The recent laboratory testing was performed on samples collected in the upper 20m of the ore body, and from below 20m in depth of the ore body, representing early stages of mining. This report summarizes this recent testing, but also reviews previous testing from ore samples obtained throughout the deposit at various depths.

The following table list was obtained from VGC on the drill hole identifiers and respective locations. Attachment A presents a plan view and sections for these drill holes, obtained from VGC. Interval T20 stands for the top 20m of the drill hole sample, B20 stands for below 20m of drill hole sample.

TABLE 1-1 – Drill Hole Identifiers

Hole_ID	UTM_E	UTM_N	Elevation	UTM Zone	Depth (m)	Year	drillsize	Interval	Weight (kg)
DG17-PQ-1	459823	7099424	1128	NAD83 UTM8	70	2017	PTW	T20, B20	148, 602
DG17-PQ-2	459823	7099424	1128	NAD83 UTM8	19.82	2017	PTW	T20	150.5
DG17-PQ-3	459880	7099589	1153	NAD83 UTM8	70.1	2017	PTW	T20, B20	246.5, 678.5
DG17-PQ-4	459978	7099412	1159	NAD83 UTM8	68.58	2017		T20, B20	223,686.5

DG17-PQ-5	459978	7099412	1159	NAD83 UTM8	22.86	2017		T20	223
DG17-PQ-6	459985	7099623		NAD83 UTM8	28.96	2017		T20	403
DG17-PQ-7	459985	7099623		NAD83 UTM8	33.53	2017	HTW	T20	403
DG17-PQ-8	460087	7099485	1249	NAD83 UTM8	16.76	2017	PTW	T20	224.5

Testing consisted of performing hydraulic conductivity measurements utilizing USBR 5605 method, since the material is representative of crushed rock/ore. Standard laboratory procedures for compositing and quartering of samples were performed for both the T20 and B20 samples. The following testing was then performed on both the T20 and B20 composites, noting the different particle size distributions (PSD's) (laboratory crushed or Bruno simulated) and P80's. Hydraulic conductivity testing was performed on each sample representing 0m, 20m, 40m, and 70m of compacted ore height loading (at an assumed bulk density of 1.8 tonnes/m3 for initial loading calculations).

Performed in 8-inch diameter column:

- Three (3) test samples, ~35kg: P80 = 6.5mm, laboratory crushed
- Three (3) test samples: P80 = 6.5mm, laboratory crushed screened of fines (<5% passing #200 sieve)
- Three (3) test samples: P80 = 6.5mm, fabricated PSD (based on Bruno or other)
- Three (3) test samples: P80 = 6.5mm, fabricated PSD (based on Bruno or other), screened of fines (<5% passing #200 sieve)

Performed in 12-inch diameter column:

- One (1) test sample, ~119kg: P80 = 9mm, fabricated PSD (based on Bruno or other)
- One (1) test sample: P80 = 9 mm, fabricated PSD (based on Bruno or other), screened of fines (<5% passing #200 sieve)
- One (1) test sample: P80 = 12mm, fabricated PSD (based on Bruno or other)
- One (1) test sample: P80 = 12mm, fabricated PSD (based on Bruno or other), screened of fines (<5% passing #200 sieve)
- One (1) test sample: P80 = 16mm, fabricated PSD (based on Bruno or other)
- One (1) test sample: P80 = 16mm, fabricated PSD (based on Bruno or other), screened of fines (<5% passing #200 sieve)

The following Figures 1-1 and 1-2 illustrate the laboratory crushed and fabricated Bruno PSD's, along with the target PSD shown in red.

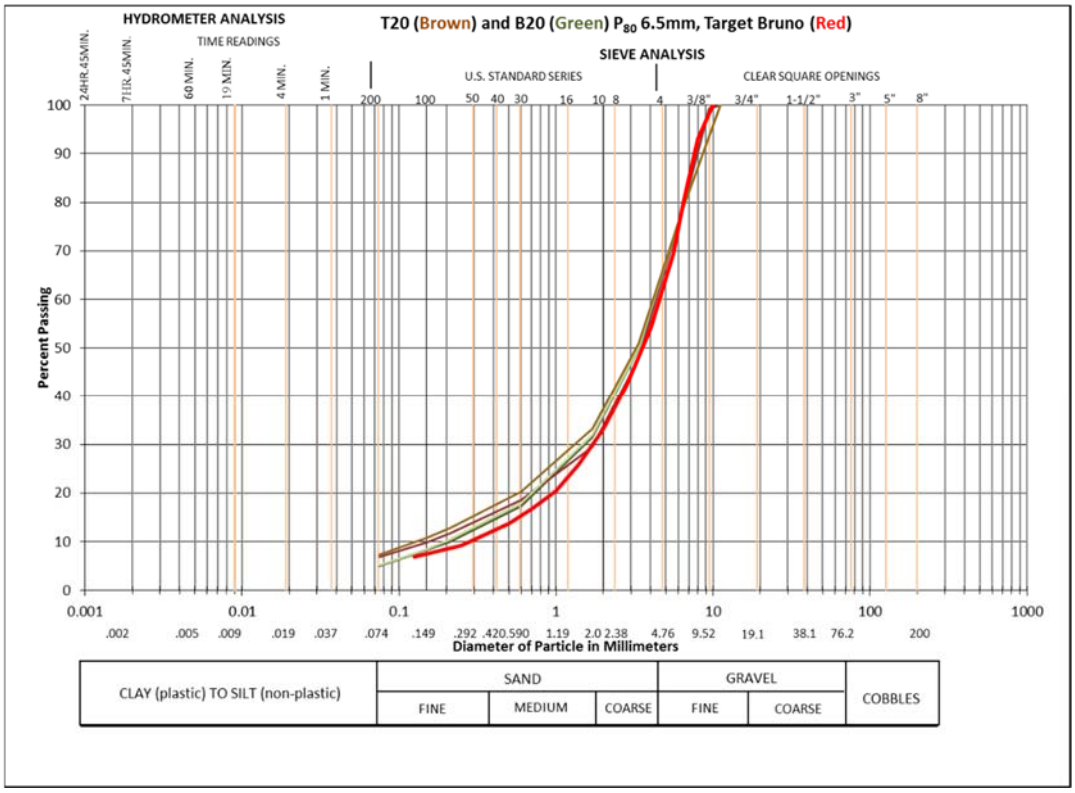

Figure 1-1: Particle Size Distribution 6.5mm P_{80}

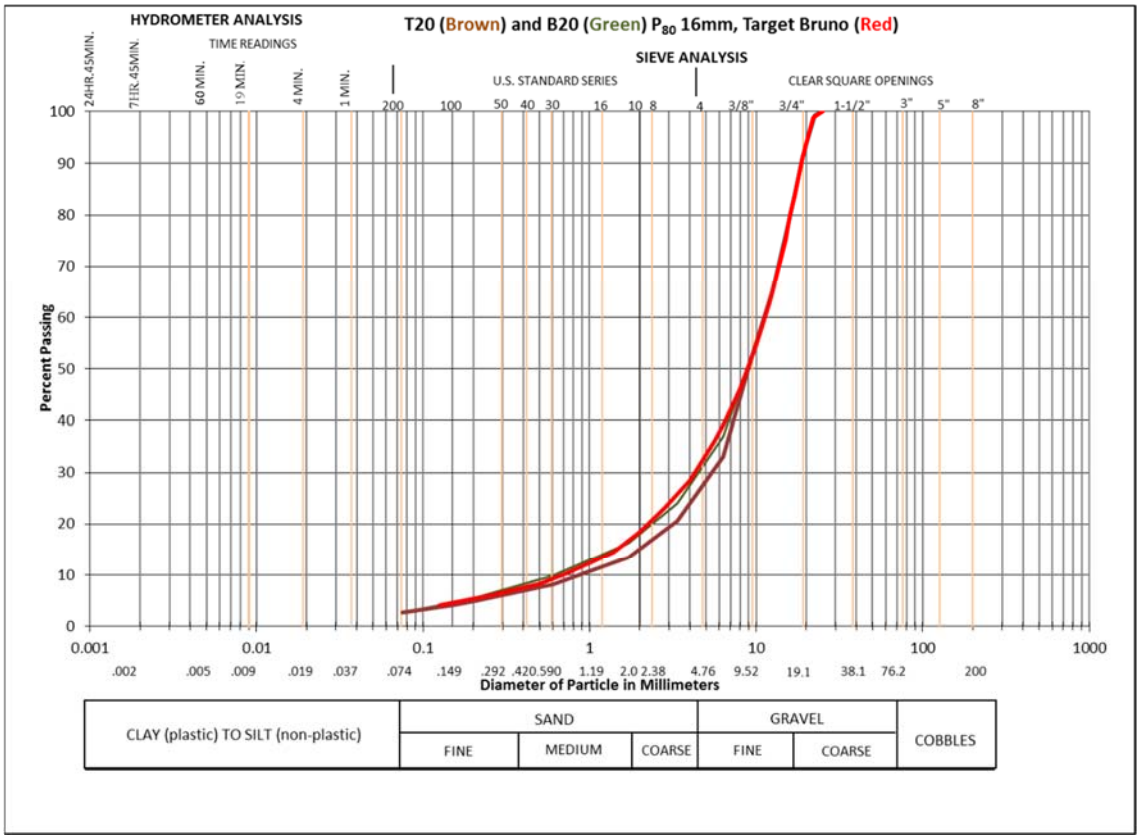

Figure 1-2: Particle Size Distribution 16mm P_{80}

2. Hydraulic Conductivity Testing Results

Test results on the hydraulic conductivity are presented in the following figures. All T20 (top 20m sample depth) samples of the P_{80} 6.5mm tests are grouped together based on either the Bruno simulation for anticipated PSD, or for the No-Bruno or laboratory crushed samples. The same grouping applies to the B20 samples for 6.5mm P_{80}. Results for the T20 16mm and 12mm P_{80} are shown on one graph, and also for the B20 16mm and 12mm P80 samples.

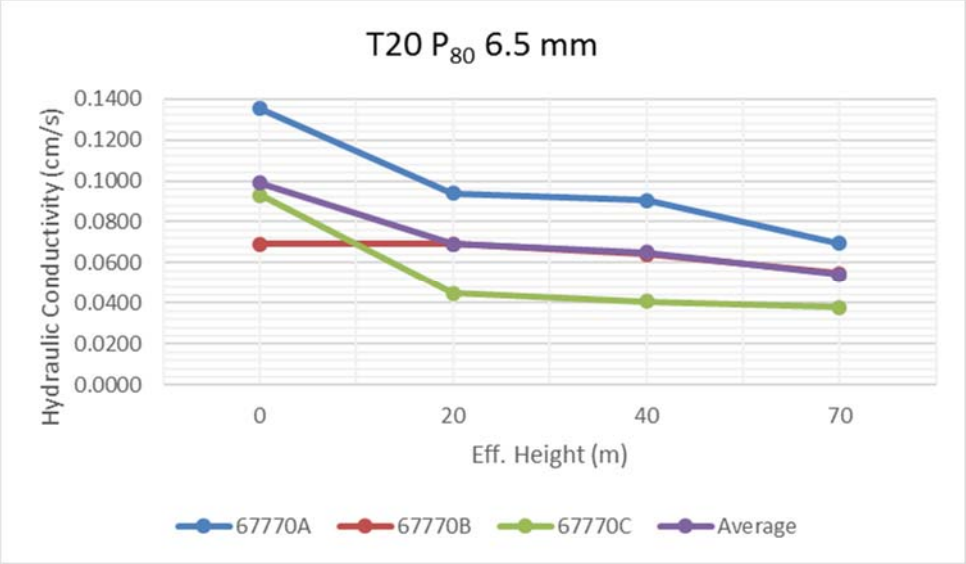

Figure 2-1: Hydraulic Conductivity T20 6.5mm P_{80}

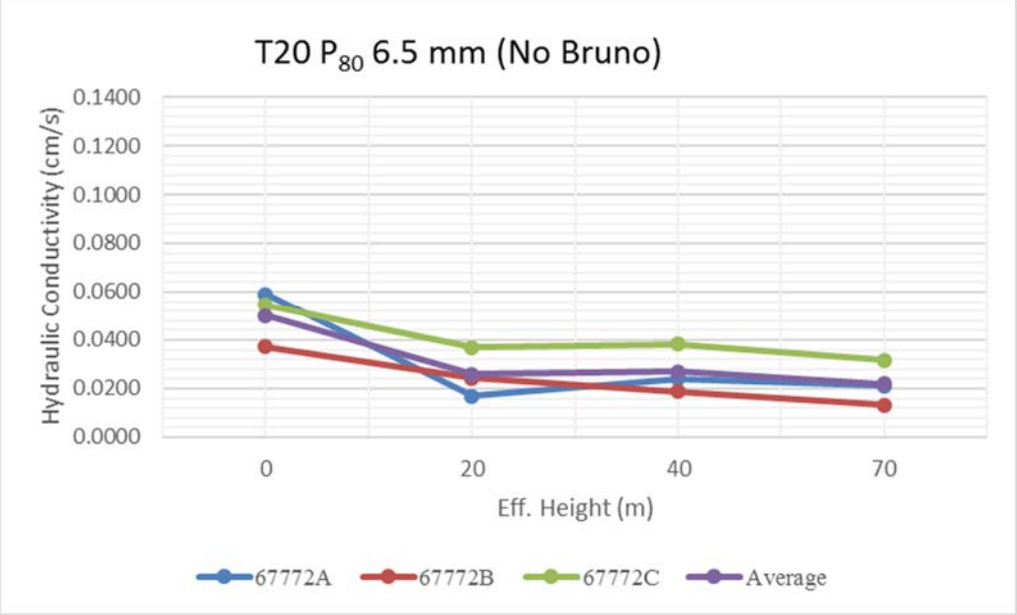

Figure 2-2: Hydraulic Conductivity T20 6.5mm P_{80} (No Bruno)

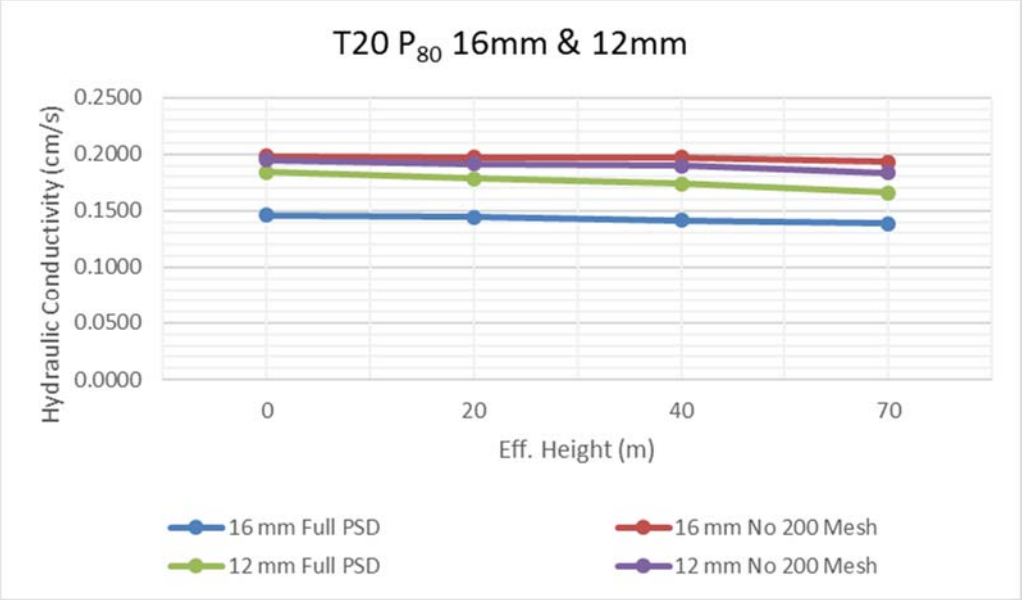

Figure 2-3: Hydraulic Conductivity T20 16mm & 12mm P_{80}

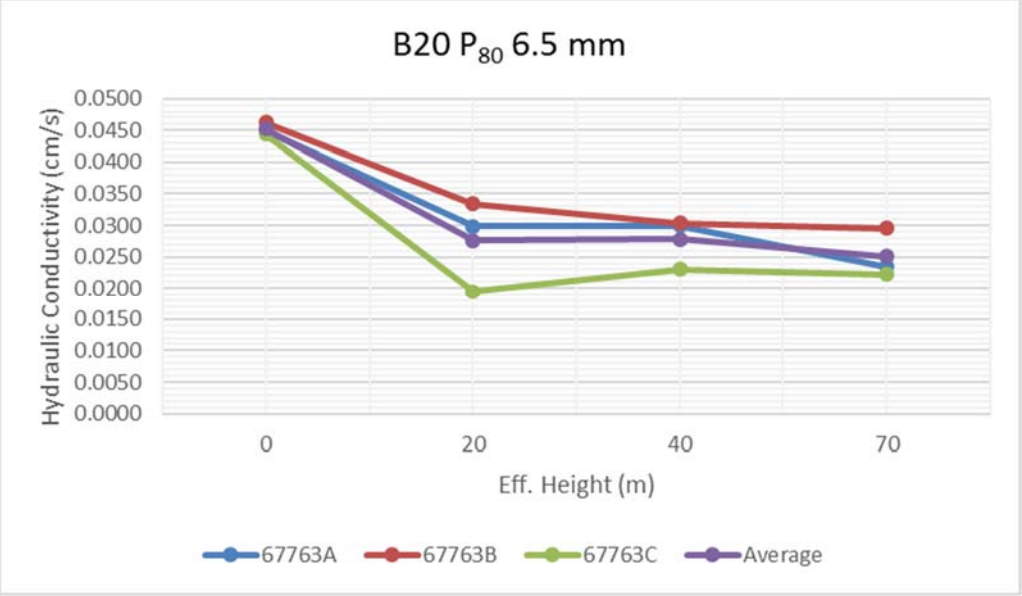

Figure 2-4: Hydraulic Conductivity B20 6.5mm P_{80}

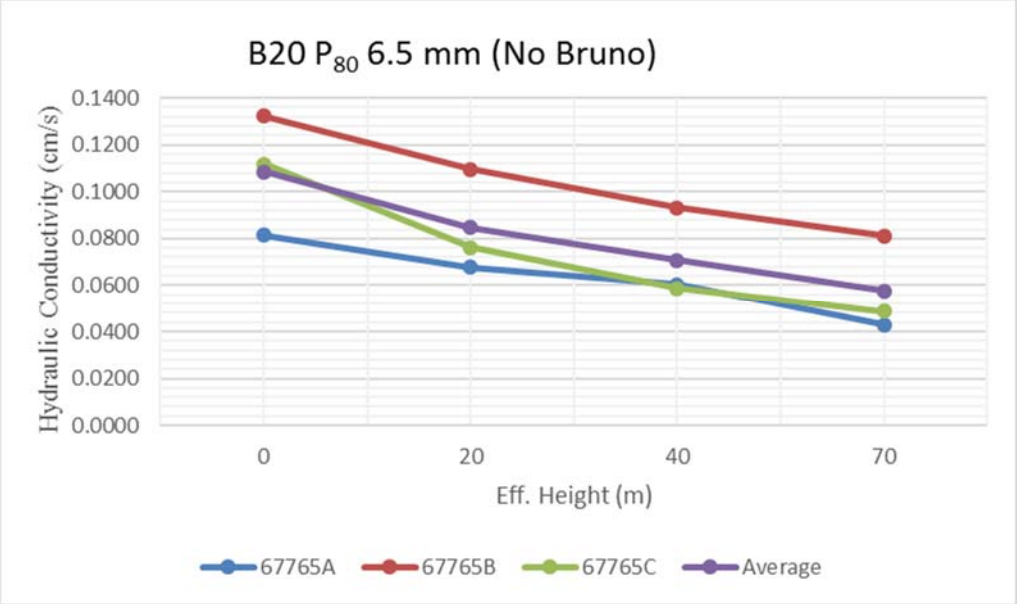

Figure 2-5: Hydraulic Conductivity B20 6.5mm P_{80} (No Bruno)

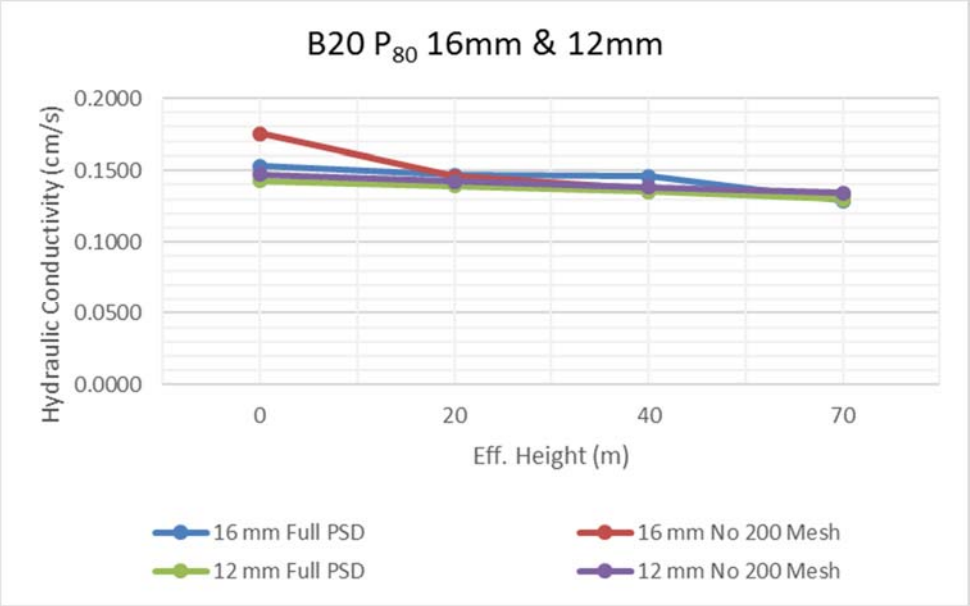

Figure 2-6: Hydraulic Conductivity B20 16mm & 12mm P_{80}

Test results show some interesting results for the 6.5mm P_{80} samples. For the T20 samples, a higher hydraulic conductivity is shown for the Bruno simulations versus the No-Bruno, however the opposite is shown for the B20 samples. Hydraulic conductivity is most sensitive to the degree of percentage fines, and this variability could likely be a result of the varied rock hardness impacting the performance of laboratory (or No-Bruno) crushing simulations. The target Bruno PSD (shown on Figure 1-1) was close on the minus 200 sieve, however there were slight differences above the minus 200 sieve and up to the 10 mesh, or 2mm. Average hydraulic conductivity for the 6.5mm P_{80} samples of T20 and B20 at 70m of ore height loading is 0.0380 cm/s, while the average of just T20 samples is 0.0396 cm/s.

For the 16mm P80 testing, results indicate an average hydraulic conductivity of 0.1660 cm/s for T20, and 0.1309 cm/s for B20, for a combined average of 0.1484 cm/s. These values are representative of 70m of ore height loading.

Forte also reviewed some previous metallurgical testing including hydraulic conductivity testing that was performed in 2011, also from KCA. Compacted hydraulic conductivity testing (representing 70m of ore height loading) was performed on P_{80} 7mm samples. Hydraulic conductivity results of this testing ranged from 0.0099 to 0.2607 cm/s, with an average of 0.1036 cm/s. Average bulk density from these samples was 1.82 tonne/m3.

2.1 Bulk Density from Hydraulic Conductivity Testing

Bulk density analysis was performed on the samples collected and following laboratory crushing. Again, these samples were obtained from the upper zones of the ore body, and while representative of early stages of mining, may not represent densities encountered as mining progresses and ore depth increases.

Bulk density determined from the laboratory testing while performing the hydraulic conductivity testing are as follows:

TABLE 2-1 – Bulk Densities from Lab Testing

Bulk Density (Tonne/m3)*			
Ore Size Tested	**Top 20**	**Bottom 20**	**Average (T20&B20)**
P_{80} 16 mm	1.67	1.68	1.68
P_{80} 16 mm (No 200 mesh)	1.64	1.63	1.63
P_{80} 12 mm	1.71	1.71	1.71
P_{80} 12 mm (No 200 mesh)	1.65	1.67	1.66
P_{80} 6.5 mm	1.68	1.74	

	1.71	1.74	
	1.71	1.75	
Average	1.70	1.74	**1.72**
P_{80} 6.5 mm (No Bruno)	1.73	1.69	
	1.76	1.67	
	1.73	1.67	
Average	1.74	1.67	**1.71**

* Bulk density at final compacted height

Results show an average bulk density for the 16mm P_{80} samples (No 200 mesh) of 1.63 tonne/m3 (101.8 lbm/ft3). Average bulk density results for the 6.5mm P_{80} samples is 1.72 tonne/m3 (107.4 lbm/ft3). Average bulk densities from the June 2011 testing campaign indicated an average of 1.82 tonne/m3. These tests were performed from samples collected at various depths throughout the deposit, while the testing presented herein are from samples collected in the upper 70m of the deposit, and mostly in the upper 40m. However, a sample from the October 2011 testing indicated a bulk density of 1.51 tonne/m3, indicating there is likely variability in ore density throughout the deposit. Testing performed in December 2013, showing average bulk densities of 1.45 tonne/m3, were performed on agglomerated samples and therefore were excluded from comparison here.

3. Preliminary Leaching Application Rate Analysis

Utilizing the testing results from this recent laboratory testing on non-agglomerated ore, Forte performed a preliminary analysis on leaching application rate (flux rate) for the Eagle Gold project. For the 6.5mm P_{80} samples, the following testing results data is used:

- Specific Gravity = 2.65
- Saturated Hydraulic Conductivity = 0.038 cm/s (Laboratory), 0.0038 cm/s (Field)
- Bulk Density = 1.72 tonne/m3

Utilizing an analytical unsaturated flow conditions (Brooks-Corey), varying application rates were applied in order to estimate degree of saturation to reside within 55% to 65%, normally a desired target for Au heap leaching applications. No air permeability testing was performed on the ore, which may modify the desired degree of saturation values for this ore. Analysis indicates a leach application rate of 6 to 8 L/m2/hr (0.00245 to 0.00327 gpm/ft2) would be applicable for this operation. Actual field operational performance may modify this application rate for optimal conditions, i.e., maximum rate without surface ponding.

4. Summary and Recommendations

Laboratory testing for hydraulic conductivity was performed with samples obtained from the upper 70m of the ore deposit, and performed at ore height loadings simulating 0, 20m, 40m, and 70m. Average hydraulic conductivity results, at 70m loading, are as follows:

- T20 6.5mm P_{80} laboratory crushed PSD = 0.0219 cm/s
- T20 6.5mm P_{80} Bruno Fabricated PSD = 0.0541 cm/s
- B20 6.5mm P_{80} laboratory crushed PSD = 0.0575 cm/s
- B20 6.5mm P_{80} Bruno Fabricated PSD = 0.0251 cm/s
- Average all 6.5mm P_{80} = 0.0380 cm/s
- Average Bruno 6.5mm P_{80} = 0.0396 cm/s

- T20 12mm P_{80} = 0.1748 cm/s
- B20 12mm P_{80} = 0.1320 cm/s

- T20 16mm P_{80} = 0.1660 cm/s
- B20 16mm P_{80} = 0.1309 cm/s

There exists some variability in the hydraulic conductivity values between P_{80} sizes, likely due to ore material and hardness variability. It is recommended that for early stages of mining, which represents the samples utilized for this testing, that an average laboratory hydraulic conductivity for 6.5mm of 0.038 cm/s be used, and applying a 10 to 50 reduction for in-field hydraulic conductivity. For the 16mm samples, an average of 0.1484 cm/s laboratory hydraulic conductivity be used, and also applying a 10 to 50 reduction for in-field hydraulic conductivity. Average bulk densities observed during laboratory testing are 1.72 tonne/m3 for the 6.5mm P_{80}, and 1.63 tonne/m3 for the 16mm P_{80}.

The data and results of the samples utilized in this laboratory testing support the hydraulic conductivity of leaching operations without the need for agglomerating the ore, with recommended application rates of 6 to 8 L/m2/hr (0.00245 to 0.00327 gpm/ft2), to be used until further field application and testing is performed to optimize. The ore samples analyzed in the testing herein had little to no clay particles, and less than 10% passing 200 sieve, further indicating agglomeration would not be required.

Subject:	Eagle Gold Heap Leach Facility	By:	TLM
Details:	PLS Pipe Spacing Calculations - 16 mm Crushed Ore	Date:	January 29, 2019

Primary Pipe Spacing [1]		
Units:	Metric	
Application Rate:	0.24	$m^3/day/m^2$
Maximum Desired Head on the Liner:	1.0	m
Hydraulic Conductivity:	12.8	m/day
Pipe Spacing:	16.1	m
Slope Between Pipes:	14.0	degrees
Pipe Spacing:	22.1	m
Slope Between Pipes:	22.0	degrees

Application Rate		
Application Rate:	0.0041	gpm/ft^2
	10.0	$l/hr/m^2$
	0.01	$m^3/hr/m^2$
	0.24	$m^3/day/m^2$
Hydraulic Conductivity [2]		
Hydraulic Conductivity:	0.015	cm/s
	42.1	ft/day
	12.8	m/day

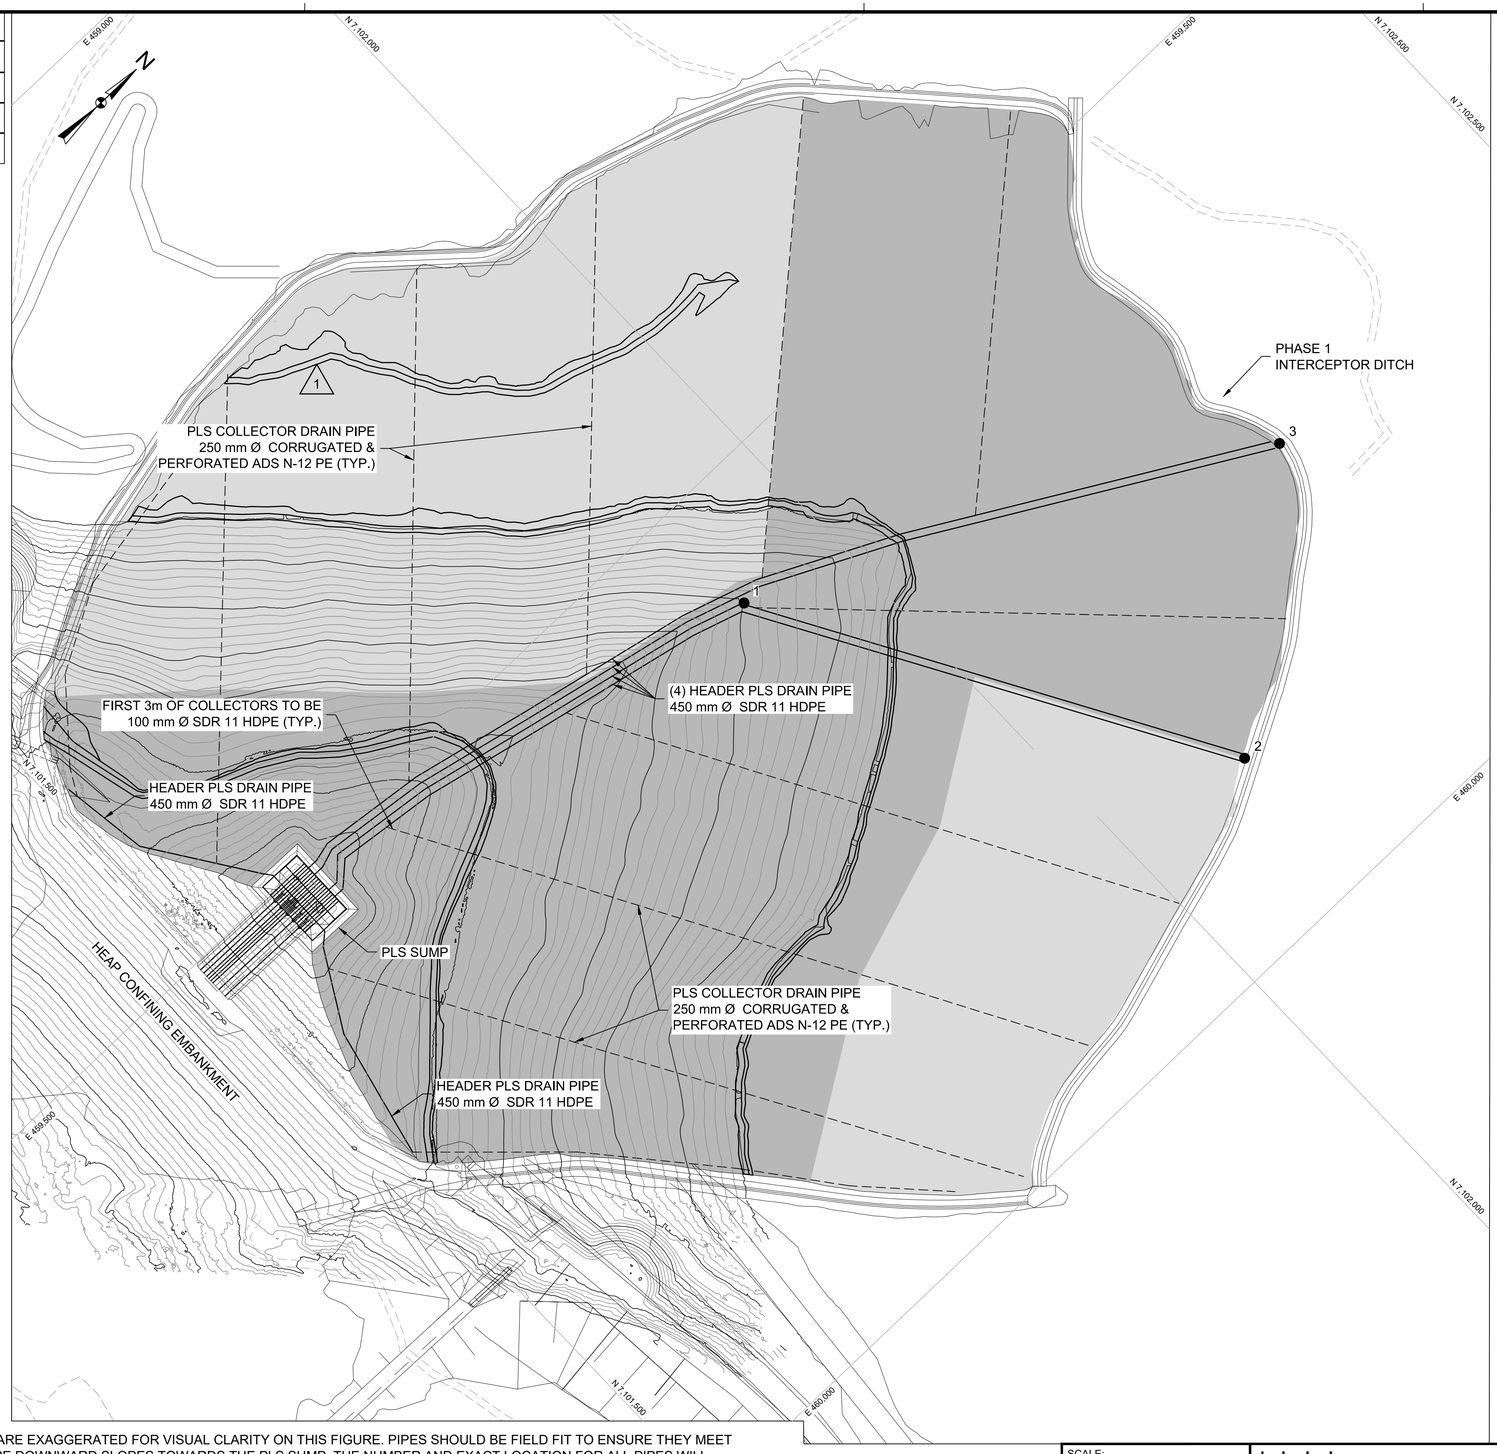
Giroud's equation is shown graphically and mathematically (metric units) as follows:

$$t_{max} = j\frac{\sqrt{\tan^2\beta + 4q_h/k} - \tan\beta}{2\cos\beta}L$$

Where:
- ß = the basin slope between the pipes (degrees)
- q_h = the design rate of liquid supply over a horizontal surface in terms of an equivalent velocity (m/s)
- L = the drainage length of the lateral drain (m)
- K = the permeability of the lateral drain (m/s)
- t_{max} = the maximum head on the liner (m)
- j = the numerical modifying factor which depends on the basin slope (set equal to 1 for conservative solution)

Notes:

1) The slope of the basin generally varies from 14 to 22 degrees.



2) Permeability in the Overliner Drain Fill of 1.5 x 10^{-2} cm/s (field valued) from lab testing (Forte Dynamics 2017)

Re: BGC-RFI-032: Coletenche Liner Assessment

At the request of JDS BGC has assessed the use of Coletanche Bituminous Liner for use in the HLF spillway and Event Pond emergency spillway. A RFI was not produced by JDS for this analysis. Therefore, BGC is providing this response as an RFI to allow tracking in the construction record. BGC requests that JDS provide an acknowledgment of receipt of this information in order to close this RFI.

As part of this assessment BGC was provided with several documents form the vendor and manufacturer of this product. These items included:

- A Coletanche ES 3 product data sheet. (***Attachment 1***)
- A letter format calculations memorandum completed by SLR showing empirical analysis supporting the use of Coletanche ES 3 Liner for use in the HLF spillway. (***Attachment 2***)
- Various lab testing results used to produce the values in the product data sheet.
- Various non-technical marketing brochures that show the product in use in various channel and pond projects.

BGC cannot approve the use of this product as liner for the HLF spillway or the Event Pond emergency spillway. The two approved lining methods remain the Fabriform and Nuna Cloth solutions.

Two major issues that influenced this decision are:

- The SLR analysis does not address potential erosion of the geomembrane from the flow, particularly if the flow contains sediment.
- There are no long term case studies for use of this product in high flow environments. Additionally, there are no large scale lab testing or field testing.

PRODUCT DATA SHEET

COLETANCHE ES 3

DESCRIPTION

COLETANCHE ES 3 is an SBS elastomeric modified bituminous geomembrane.

USE

Extreme level of mechanical resistance, for use as environmental protection and groundworks waterproofing, in particular :
- Railways, directly under ballast,
- Dams,

Product use must be validated by Axter.

APPLICATION METHOD

By torch welding or other similar technique.

STORAGE

Rolls must not be stored directly on the ground. Provide suitable supports (blocks, slides, wooden planks) with a minimum height of 35 cm to be placed under the ends of the mandrel.

COMPOSITION

(indicative)

Reinforcement (g/m²) :	Glass mat	50
Reinforcement (g/m²) :	Non-woven geotextile	300
Binder (g/m²) :	Elastomeric SBS	4800
Surface finish (g/m²) :	Sand	250
Under surface finish (g/m²) :	Polyester antiroot film	15

Re: Bituminous Geomembrane Lining on Spillway Channels
Eagle Gold Mine

Dear Mr. Meyer,

1 GENERAL

The letter was prepared in support of using the bituminous geomembrane Grade ES3 manufactured by AXTER Coletanche to line two spillways at the Eagle Gold Mine Heap Leach Facility (the facility).

This letter was prepared by Tarik Hadj-Hamou, Ph.D., P.E. of SLR International Corporation (SLR) at the request of Mr. Ted Aguirre of AXTER Coletanche.

2 SUMMARY

The calculations presented in the balance of this letter support the use of Coletanche ES3 to line two spillway channels at the Eagle Gold Mine Heap Leach Facility.

To resist the tractive force due to the flow of water in the channels, the geomembrane need to be anchored at specific intervals along the channel.

The spacing between anchors is a function of the inclination of the slope and is indicated in Table 1 below for booth spillways and slope inclination along the spillways courses. The geomembrane will also be anchored at top and bottom and along the edges.

In addition to the subsurface of the spillway channel shall be prepared, compacted to provide firm support, smooth rolled, and monitored to remove profusions in excess of 1.0 cm.

Emergency Event Pond Spillway

Slope Segment Inclination	50%	28.4%	40.6%	9.5%
Spacing between anchors points	6 meters	10 meters	7 meters	30 meters
In Heap Spillway				
Slope Segment Inclination	2%	5.75%	14%	
Spacing	100 meters	35 Meters	15 meters	

Table 1: Spacing of anchorage points in spillway channels

3 INTRODUCTION

The facility includes two spillways and associated spillway channels as shown and highlighted on Figure 1 (Drawing EGHLF-XD-07-01):

- The in-heap pond spillway channel to the north of the facility that connects the heap pond to an event pond.
- The emergency spillway channel to the south of the facility that serves the event pond.

The in-heap pond spillway channel is approximately 500 meters long and connects the heap pond to the event pond. The in-heap spillway channel begins at elevation 937.2 at the heap pond and terminates at elevation 894.5 at the event pond. The in-heap spillway channel is characterized by variable slopes ranging from 2 percent near the heap leach pond to 11 per cent near the event pond.

The emergency spillway channel is approximately 110 meters long and runs from elevation 894.5 meter at the crest of the spillway to elevation 852 meters where it terminates above Dublin Gulch. The slope of the emergency spillway ranges from 9.5 per cent to 50 per cent.

A cross section for the main span of the in-heap pond spillway channel is shown as detail AB on drawing EGHLF-XD-08-01 showing the proposed lining system for the channel. It is namely a double-sided textured HDPE geomembrane overlain with a 0.2 m thick fabriform such as Hydrotex R manufactured by Synthetex. Detail AC refers to the first meter of the channel and is addressed differently.

It is our understanding that Coletanche is proposed to replace the proposed two layer protection system by on single layer of Coletanche Grade ES3.

Using the dimensions provided in detail AB the cross-section of the in-heap spillway channel considered in the analyses presented herein is as follows:

- Trapezoidal shape
- Bottom width = 3.6 m
- Slope at inclination of 2:1 (horizontal to vertical)
- Total depth = 1.0 m. The total depth is reduced by 0.2 m since the fabriform is removed.
- Maximum water depth, assumed full depth

A cross section for the emergency event pond spillway channel is shown as detail Y on drawing EGHLF-XD-07-05m showing the proposed lining system for the channel. It is namely a double-sided textured HDPE geomembrane overlain with a 0.2 m thick fabriform such as Hydrotex R manufactured by Synthetex.

Using the dimensions provided in detail Y the cross-section of the in-heap spillway channel considered in the analyses presented herein is as follows:

- Trapezoidal shape
- Bottom width = 3.1 m
- Slope at inclination of 2:1 (horizontal to vertical)
- Total depth = 0.6 m. The total depth is reduced by 0.2 m since the fabriform is removed.
- Maximum water depth, assumed full depth

4 ASSUMPTIONS AND EQUATIONS

4.1 Terminology

Figure 2 show a typical trapezoidal cross sections of an earth channel. The following elements are defined and will be used in the remainder of the Technical Memorandum.

- Area A: the cross sectional area of the stream
- Wetted perimeter P: the length of the wetted surface of the channel, the line abcde on Figure 2
- Hydraulic radius R = A/P
- Depth D: maximum depth of water in the cross section
- Top Width T: width of the cross section at the water surface
- Mean depth Dm = A/T
- Energy grade, slope So: slope of the channel (Figure 3)

4.2 Flow Equation

The discharge equation used to design channel is the Manning's equations:

$$Q = \frac{k}{n} AR^{2/3} S_0^{1/2} \quad (1)$$

Where K is a constant:

- K = 1.49 for Imperial system of units
- K = 1.0 for SI system of units

And n is a resistance factor known as Manning coefficient. The value of n is a function of a number of variables the primary are being the roughness of the channel. The Manning coefficient n ranges from 0.010 for a smooth concrete lined channel to 0.15 for a weed filled earth channel.

Values of n for Coletanche are discussed in Section 4.4

4.3 Hydrodynamic forces

The hydrodynamic force of water flowing in a channel is known as the tractive force.

The tractive force is equal to the effective component of the drag force acting on the body of water parallel to the channel bottom. The mean boundary shear stress applied to the wetted perimeter is equal to (Chow, 1959):

$$\tau_0 = \gamma R S_0 \quad (2)$$

Where τ_o is the mean boundary shear stress and γ the unit weight of the fluid flowing in the channel. To simplify the design process, the maximum bottom shear stress is usually taken as:

$$\tau_0 = \gamma D S_0 \quad (3)$$

and this value should be less than the allowable value for the lining system selected.

4.4 Manning values for Coletanche

The value of n reported for Coletanche is 0.012. However this value was estimated assuming a perfectly flat geomembrane with no wrinkles, defects, and seams between panels. Such defects are likely to exist in most installations which will affect the quality and velocity of the flow. This impact is reflected through roughness, that is in the value of the Manning coefficient n and the admissible shear stress the Coletanche may be able to withstand.

- Some of the factors that will affect the nature of the flow in the channel include:
- The quality of the subbase under the Coletanche
- Seams between panels of Coletanche

- The quality of the contact between the subbase and the Coletanche
- Slack in the Coletanche which may lead to wrinkles, bumps, or folds.
- Inclination of the channel (S_o), and
- Quality of the water in the channel (amounts of particles carried)

Therefore the value of n selected for design should account for those factors. In addition the design should also account for the allowable stress on the lining. This allowable stress is a material property of the Coletanche grade selected and is dependent upon the level of strain in the Coletanche.

A valued of 0.017 is used herein.

4.5 Coletanche Mechanical Properties

The basic properties of Coletanche Grade ES3 are included in the cut-sheet included as Attachment A. Of interest for the use as liner in a channel are the mechanical resistance parameters. For instance for Coletanche ES3, under ASTM D 7275 the maximum tensile strength in the longitudinal direction is 33 kN/m at 60% elongation and is 29kN/m in the cross-direction.

The tension-strain curve of the Coletanche bituminous geomembranes can be approximately represented by a bilinear curve (Figure 4). In other words, a good approximation of the curve, which can be used in design calculations, is composed of two straight lines, as follows:

- From the origin to a strain of about 4%, the tension-strain curve is a straight line. The modulus of this first part of the curve is referred to as J1.
- After a 4% strain, the tension-strain curve is less steep and can be represented by a straight line with a modulus referred to as J2.

The intersection of the two straight lines is called the “elbow”.

The following tensile characteristics are defined (Figure 4):

- Tension and strain at the elbow of the tension-strain curve: T_{elb} and ε_{elb}.
- Tensile modulus J_1 of the first part of the curve and J_2 of the second part.

A review (Giroud, 2011) of tension-strain curves in the machine direction and in the cross machine direction for the Coletanche bituminous geomembranes ES 3 led to the following approximate values for the tensile characteristics.

- $\varepsilon_{elb} \approx 4\%$ for all Coletanche bituminous geomembranes in both directions, the machine direction and the cross-machine direction.
- $T_{elb} \approx 14$ kN/m for ES 3 in the machine direction.
- $T_{elb} \approx 11$ kN/m for ES 3 in the cross-machine direction.

- $J_2 \approx 25$ kN/m for ES 3 in the machine direction.
- $J_2 \approx 17$ kN/m for ES 3 in the cross-machine direction.

The modulus of the first part of the tension-strain curves can be derived from the above values as follows:

$$J_1 = \frac{T_{elb}}{\varepsilon_{elb}} \quad (4)$$

The following values are thus obtained for J_1:

- In the machine direction: 350 kN/m for ES 3.
- In the cross-machine direction: 275 kN/m for ES 3.

It is assumed herein based on the dimension of the channels that Coletanche will be laid in the channel such that the flow is in the longitudinal direction.

Note the tensile stress in Coletanche like any other geomembrane is provided for each type of product on a per unit width basis and de facto include the thickness of the geomembrane. The same applies for the moduli J_1 and J_2 which are grade specific and account for the thickness (e.g. 4.8 mm for ES3) as illustrated by the units used for the moduli force per unit of length (kN/m) rather than force per unit of area (kN/m^2)

4.6 Allowable Strain

Because of the variability in the inclination of the spillway channel, the velocity in the channels will vary as well as the tractive force applied to the Coletanche. For the in-heap spillway, which is more likely to be used frequently, a maximum allowable strain of 4% is used in the design. For the event pond spillway which is likely to be used only for critical event (design flood) a larger strain may be used. A maximum allowable strain of 15% is used herein.

5 DESIGN OF GEOMEMBRANE

The design of the geomembrane is based on ensuring that the tractive force imposed on the Coletanche does not exceed the tensile resistance of the geomembrane

5.1 Geomembrane Tensile Strengh

The tensile strength of the geomembrane is calculated using the following equations derived from equation (4) and the discussion in Section 4.5 as a function of strain:

$$\sigma = J_1 \varepsilon_{all} \quad if \ \ \varepsilon < 4\% \quad (5)$$

$$\sigma = J_1 \varepsilon_{all} + J_2 \ (\varepsilon_{all} - 4\%) \ \ if \ \ \varepsilon > 4\% \quad (6)$$

For the design allowable strain values of 6% and 10% of the in-heap and event pond spillways the tensile strengths are

For the in-heap spillway channel: $\sigma = (350) * (.04) \varepsilon_{all} = \ 14\ kN/m$ (7)

For the event pond spillway

$\sigma = J_1 \varepsilon_{all} + J_2\ (\varepsilon_{all} - 4\%)\ = (350) * (.04) + 22 * (.15 - .04) = 16.42\ kN/m$ (8)

5.2 Equilibrium of forces

The tensile for in the Coletanche is calculated as for a unit of width B=1:

$F = \ \sigma\ B = 14 * 1 = 14kN$ for the in-heap spillway (9)

$F = \ \sigma\ B = 16.42 * 1 = 16.42\ kN$ for the event pond spillway (10)

The tractive force applied on a panel of width B=1 and length L is calculated from equation 3 as:

$F_t = \gamma D S_0 B L$ (11)

Combining equations 9, 10 and 11 by setting F= F_t the length of panels between anchoring points

The results are reported in Table 1 at the beginning of this letter.

6 CONCLUSIONS

The analyses presented in this letter indicate that Coletanche grade ES 3 and be used to line the channels of the two spillways the Eagle Gold Mine. The tractive force applied to the geomembrane under the flow conditions generate a tensile stress that is within the resistance of the Coletanche ES3 if the geomembrane is anchored as indicated in Table 1.

The factor of safety in using Coletanche is built in in the choice of allowable design strain. For the in-heap spillway channel, we used a design strain of 4% and for the event pond spillway channel we used a design strain of 15%. Considering that the maximum strain at rupture is reported at 50% (Attachment A), the factors of safety against excessive deformation of Coletanche ES3 and rupture are 12.5 for the in-heap spillway channel liner and 3.33 for the event pond spillway channel liner.

Re: Bituminous Geomembrane Lining on Spillway Channels
Eagle Gold Mine

Dear Mr. Meyer,

1 GENERAL

The letter was prepared in support of using the bituminous geomembrane Grade ES3 manufactured by AXTER Coletanche to line two spillways at the Eagle Gold Mine Heap Leach Facility (the facility).

This letter was prepared by Tarik Hadj-Hamou, Ph.D., P.E. of SLR International Corporation (SLR) at the request of Mr. Ted Aguirre of AXTER Coletanche.

2 SUMMARY

The calculations presented in the balance of this letter support the use of Coletanche ES3 to line two spillway channels at the Eagle Gold Mine Heap Leach Facility.

To resist the tractive force due to the flow of water in the channels, the geomembrane need to be anchored at specific intervals along the channel.

The spacing between anchors is a function of the inclination of the slope and is indicated in Table 1 below for booth spillways and slope inclination along the spillways courses. The geomembrane will also be anchored at top and bottom and along the edges.

In addition to the subsurface of the spillway channel shall be prepared, compacted to provide firm support, smooth rolled, and monitored to remove profusions in excess of 1.0 cm.

Emergency Event Pond Spillway

Slope Segment Inclination	50%	28.4%	40.6%	9.5%
Spacing between anchors points	6 meters	10 meters	7 meters	30 meters
In Heap Spillway				
Slope Segment Inclination	2%	5.75%	14%	
Spacing	100 meters	35 Meters	15 meters	

Table 1: Spacing of anchorage points in spillway channels

3 INTRODUCTION

The facility includes two spillways and associated spillway channels as shown and highlighted on Figure 1 (Drawing EGHLF-XD-07-01):

- The in-heap pond spillway channel to the north of the facility that connects the heap pond to an event pond.
- The emergency spillway channel to the south of the facility that serves the event pond.

The in-heap pond spillway channel is approximately 500 meters long and connects the heap pond to the event pond. The in-heap spillway channel begins at elevation 937.2 at the heap pond and terminates at elevation 894.5 at the event pond. The in-heap spillway channel is characterized by variable slopes ranging from 2 percent near the heap leach pond to 11 per cent near the event pond.

The emergency spillway channel is approximately 110 meters long and runs from elevation 894.5 meter at the crest of the spillway to elevation 852 meters where it terminates above Dublin Gulch. The slope of the emergency spillway ranges from 9.5 per cent to 50 per cent.

A cross section for the main span of the in-heap pond spillway channel is shown as detail AB on drawing EGHLF-XD-08-01 showing the proposed lining system for the channel. It is namely a double-sided textured HDPE geomembrane overlain with a 0.2 m thick fabriform such as Hydrotex R manufactured by Synthetex. Detail AC refers to the first meter of the channel and is addressed differently.

It is our understanding that Coletanche is proposed to replace the proposed two layer protection system by on single layer of Coletanche Grade ES3.

Using the dimensions provided in detail AB the cross-section of the in-heap spillway channel considered in the analyses presented herein is as follows:

- Trapezoidal shape
- Bottom width = 3.6 m
- Slope at inclination of 2:1 (horizontal to vertical)
- Total depth = 1.0 m. The total depth is reduced by 0.2 m since the fabriform is removed.
- Maximum water depth, assumed full depth

A cross section for the emergency event pond spillway channel is shown as detail Y on drawing EGHLF-XD-07-05m showing the proposed lining system for the channel. It is namely a double-sided textured HDPE geomembrane overlain with a 0.2 m thick fabriform such as Hydrotex R manufactured by Synthetex.

Using the dimensions provided in detail Y the cross-section of the in-heap spillway channel considered in the analyses presented herein is as follows:

- Trapezoidal shape
- Bottom width = 3.1 m
- Slope at inclination of 2:1 (horizontal to vertical)
- Total depth = 0.6 m. The total depth is reduced by 0.2 m since the fabriform is removed.
- Maximum water depth, assumed full depth

4 ASSUMPTIONS AND EQUATIONS

4.1 Terminology

Figure 2 show a typical trapezoidal cross sections of an earth channel. The following elements are defined and will be used in the remainder of the Technical Memorandum.

- Area A: the cross sectional area of the stream
- Wetted perimeter P: the length of the wetted surface of the channel, the line abcde on Figure 2
- Hydraulic radius R = A/P
- Depth D: maximum depth of water in the cross section
- Top Width T: width of the cross section at the water surface
- Mean depth Dm = A/T
- Energy grade, slope So: slope of the channel (Figure 3)

4.2 Flow Equation

The discharge equation used to design channel is the Manning's equations:

$$Q = \frac{k}{n} AR^{2/3} S_0^{1/2} \quad (1)$$

Where K is a constant:

- K = 1.49 for Imperial system of units
- K = 1.0 for SI system of units

And n is a resistance factor known as Manning coefficient. The value of n is a function of a number of variables the primary are being the roughness of the channel. The Manning coefficient n ranges from 0.010 for a smooth concrete lined channel to 0.15 for a weed filled earth channel.

Values of n for Coletanche are discussed in Section 4.4

4.3 Hydrodynamic forces

The hydrodynamic force of water flowing in a channel is known as the tractive force.

The tractive force is equal to the effective component of the drag force acting on the body of water parallel to the channel bottom. The mean boundary shear stress applied to the wetted perimeter is equal to (Chow, 1959):

$$\tau_0 = \gamma R S_0 \quad (2)$$

Where τ_o is the mean boundary shear stress and γ the unit weight of the fluid flowing in the channel. To simplify the design process, the maximum bottom shear stress is usually taken as:

$$\tau_0 = \gamma D S_0 \quad (3)$$

and this value should be less than the allowable value for the lining system selected.

4.4 Manning values for Coletanche

The value of n reported for Coletanche is 0.012. However this value was estimated assuming a perfectly flat geomembrane with no wrinkles, defects, and seams between panels. Such defects are likely to exist in most installations which will affect the quality and velocity of the flow. This impact is reflected through roughness, that is in the value of the Manning coefficient n and the admissible shear stress the Coletanche may be able to withstand.

- Some of the factors that will affect the nature of the flow in the channel include:
- The quality of the subbase under the Coletanche
- Seams between panels of Coletanche

- The quality of the contact between the subbase and the Coletanche
- Slack in the Coletanche which may lead to wrinkles, bumps, or folds.
- Inclination of the channel (S_o), and
- Quality of the water in the channel (amounts of particles carried)

Therefore the value of n selected for design should account for those factors. In addition the design should also account for the allowable stress on the lining. This allowable stress is a material property of the Coletanche grade selected and is dependent upon the level of strain in the Coletanche.

A valued of 0.017 is used herein.

4.5 Coletanche Mechanical Properties

The basic properties of Coletanche Grade ES3 are included in the cut-sheet included as Attachment A. Of interest for the use as liner in a channel are the mechanical resistance parameters. For instance for Coletanche ES3, under ASTM D 7275 the maximum tensile strength in the longitudinal direction is 33 kN/m at 60% elongation and is 29kN/m in the cross-direction.

The tension-strain curve of the Coletanche bituminous geomembranes can be approximately represented by a bilinear curve (Figure 4). In other words, a good approximation of the curve, which can be used in design calculations, is composed of two straight lines, as follows:

- From the origin to a strain of about 4%, the tension-strain curve is a straight line. The modulus of this first part of the curve is referred to as J1.
- After a 4% strain, the tension-strain curve is less steep and can be represented by a straight line with a modulus referred to as J2.

The intersection of the two straight lines is called the “elbow”.

The following tensile characteristics are defined (Figure 4):

- Tension and strain at the elbow of the tension-strain curve: T_{elb} and ε_{elb}.
- Tensile modulus J_1 of the first part of the curve and J_2 of the second part.

A review (Giroud, 2011) of tension-strain curves in the machine direction and in the cross machine direction for the Coletanche bituminous geomembranes ES 3 led to the following approximate values for the tensile characteristics.

- $\varepsilon_{elb} \approx 4\%$ for all Coletanche bituminous geomembranes in both directions, the machine direction and the cross-machine direction.
- $T_{elb} \approx 14$ kN/m for ES 3 in the machine direction.
- $T_{elb} \approx 11$ kN/m for ES 3 in the cross-machine direction.

- $J_2 \approx 25$ kN/m for ES 3 in the machine direction.
- $J_2 \approx 17$ kN/m for ES 3 in the cross-machine direction.

The modulus of the first part of the tension-strain curves can be derived from the above values as follows:

$$J_1 = \frac{T_{elb}}{\varepsilon_{elb}} \quad (4)$$

The following values are thus obtained for J_1:

- In the machine direction: 350 kN/m for ES 3.
- In the cross-machine direction: 275 kN/m for ES 3.

It is assumed herein based on the dimension of the channels that Coletanche will be laid in the channel such that the flow is in the longitudinal direction.

Note the tensile stress in Coletanche like any other geomembrane is provided for each type of product on a per unit width basis and de facto include the thickness of the geomembrane. The same applies for the moduli J_1 and J_2 which are grade specific and account for the thickness (e.g. 4.8 mm for ES3) as illustrated by the units used for the moduli force per unit of length (kN/m) rather than force per unit of area (kN/m^2)

4.6 Allowable Strain

Because of the variability in the inclination of the spillway channel, the velocity in the channels will vary as well as the tractive force applied to the Coletanche. For the in-heap spillway, which is more likely to be used frequently, a maximum allowable strain of 4% is used in the design. For the event pond spillway which is likely to be used only for critical event (design flood) a larger strain may be used. A maximum allowable strain of 15% is used herein.

5 DESIGN OF GEOMEMBRANE

The design of the geomembrane is based on ensuring that the tractive force imposed on the Coletanche does not exceed the tensile resistance of the geomembrane

5.1 Geomembrane Tensile Strengh

The tensile strength of the geomembrane is calculated using the following equations derived from equation (4) and the discussion in Section 4.5 as a function of strain:

$$\sigma = J_1 \varepsilon_{all} \quad if \ \ \varepsilon < 4\% \quad (5)$$

$$\sigma = J_1 \varepsilon_{all} + J_2 \ (\varepsilon_{all} - 4\%) \ \ if \ \ \varepsilon > 4\% \quad (6)$$

For the design allowable strain values of 6% and 10% of the in-heap and event pond spillways the tensile strengths are

For the in-heap spillway channel: $\sigma = (350) * (.04) \varepsilon_{all} = \ 14\ kN/m$ (7)

For the event pond spillway

$\sigma = J_1 \varepsilon_{all} + J_2\ (\varepsilon_{all} - 4\%)\ = (350) * (.04) + 22 * (.15 - .04) = 16.42\ kN/m$ (8)

5.2 Equilibrium of forces

The tensile for in the Coletanche is calculated as for a unit of width B=1:

$F = \ \sigma\ B = 14 * 1 = 14kN$ for the in-heap spillway (9)

$F = \ \sigma\ B = 16.42 * 1 = 16.42\ kN$ for the event pond spillway (10)

The tractive force applied on a panel of width B=1 and length L is calculated from equation 3 as:

$F_t = \gamma D S_0 B L$ (11)

Combining equations 9, 10 and 11 by setting F= F_t the length of panels between anchoring points

The results are reported in Table 1 at the beginning of this letter.

6 CONCLUSIONS

The analyses presented in this letter indicate that Coletanche grade ES 3 and be used to line the channels of the two spillways the Eagle Gold Mine. The tractive force applied to the geomembrane under the flow conditions generate a tensile stress that is within the resistance of the Coletanche ES3 if the geomembrane is anchored as indicated in Table 1.

The factor of safety in using Coletanche is built in in the choice of allowable design strain. For the in-heap spillway channel, we used a design strain of 4% and for the event pond spillway channel we used a design strain of 15%. Considering that the maximum strain at rupture is reported at 50% (Attachment A), the factors of safety against excessive deformation of Coletanche ES3 and rupture are 12.5 for the in-heap spillway channel liner and 3.33 for the event pond spillway channel liner.

PRODUCT DATA SHEET

COLETANCHE ES 3

DESCRIPTION

COLETANCHE ES 3 is an SBS elastomeric modified bituminous geomembrane.

USE

Extreme level of mechanical resistance, for use as environmental protection and groundworks waterproofing, in particular :
- Railways, directly under ballast,
- Dams,

Product use must be validated by Axter.

APPLICATION METHOD

By torch welding or other similar technique.

STORAGE

Rolls must not be stored directly on the ground. Provide suitable supports (blocks, slides, wooden planks) with a minimum height of 35 cm to be placed under the ends of the mandrel.

COMPOSITION

(indicative)

Reinforcement (g/m²) :	Glass mat	50
Reinforcement (g/m²) :	Non-woven geotextile	300
Binder (g/m²) :	Elastomeric SBS	4800
Surface finish (g/m²) :	Sand	250
Under surface finish (g/m²) :	Polyester antiroot film	15

CHARACTERISTICS

Re: BGC-RFI-033: Event Pond Underdrain Discharge Winterization

BGC is providing this RFI as a response to questions asked by Pelly and JDS. Over the 2018-2019 winter Pelly reported that the Event Pond underdrain outlet pipe froze. A 3m plug was removed from the outlet pipe. Water was reported to have backed up in the outlet pipe to the underdrains. The western portion of the underdrain where water backed up and filled the drains also froze. BGC was asked to provide winterization recommendations.

BGC recommends the following:

Event Pond Underdrain Outlet Pipe: BGC recommends increasing cover over the outlet pipe underdrain. The general configuration of this cover is included in ***Figures 1 and 2***.

Event Pond Underdrains: It appears that the Event Pond underdrains froze after the outlet was plugged, water flow stopped, and water backed up in the drains. JDS and Pelly were concerned that the underdrains needed additional protection. As an additional protection BGC provided the measures ***Figures 3 and 4***.

Re: BGC-RFI-034: Finger Drain on 990 Bench

BGC is providing this RFI as a response to questions asked by Pelly and JDS. Snowmelt runoff is collecting on a portion of the HLF 990 bench near Station 4+30.

BGC recommends installing a L-shaped finger drain to collect the water and convey it to the nearest lateral drain down the slope as shown in ***Figure 1***. The drain should extend along the 990 bench in the wet area (about 10m long) with a connection across the bench and tie into the lateral drain. The minimum drain dimensions should be 1m wide by 0.5m deep and consist of a clean gravel wrapped in non-woven geotextile. A low permeability plug should be installed in the trench at the bend in the L-shaped drain to direct flow down to the lateral and prevent flow traveling along the 990 bench.

Re: BGC-RFI-035: Event Pond Inclined Casings

BGC is providing this RFI as a response to questions asked by Pelly and JDS. Pelly has suggested alternates for the specified event pond LDRS inclined pipes. The design calls for 150mm Schedule 80 PVC, one for pump and one for instrumentation.

The alternates are 150mm HDPE (butt fused) for the instrumentation casing and corrugated (field-perforated) 250mm HDPE for the pump casing. Both pipes will have prefabricated end caps installed. These alternate pipes are approved to replace the specified PVC pipes provided they properly anchored after liner installation to limit thermal movement (sandbags on both sides of pipe).

Re: BGC-RFI-036: HLF Underdrain Transition to Monitoring Vault

BGC is providing this RFI as a response to questions asked by JDS. The HLF underdrains are shown on Drawing XD-05-06 (see Figure 1 below). The battery limits are shown as 2m offset either side of the vault with the vault itself design by JDS. The JDS vault design now incorporates an above-ground sea-can structure with pipes transitioning from buried to above ground entering the vault. The battery limits are therefore changed to the following:

- BGC is responsible for the underdrains in a lined trench to a cutoff berm and JDS is responsible for the pipes after the berm with transition to a cut and cover trench and the insulated and heat-traced pipes above ground.
- JDS is responsible for all aspects of the monitoring vault and the outfall from the vault to environment.

This RFI provides details for the lined trench and cutoff berm. Figure 2 shows a sketch of the proposed section for underdrain transition with the battery limits. There are 4 underdrain pipes, 1 closure pipe and 1 trench drain pipe. The underdrain pipes are gravity flow and can be connected with mechanical couplers. The closure pipe will be pressurized during post-closure operations and needs to be butt-fused to maintain the pipe pressure rating. The trench drain pipe will be perforated in the trench and transition to solid through the cutoff berm. All pipes will be booted to the trench liner. Figure 2 -Detail A shows the cutoff berm detail with fill material types.

Re: Response to CC204-RFI-008:

1.0 RESPONSE

The use of electro-fusion is conditionally approved as a general replacement for butt-fusion in the underdrains at the embankment, HLF, and event pond. Conditions to this approval are as follows:

-Butt fusing is the preferred method. Electro fusion should only be used where butt fusion is not practical (ie limited space, equipment not available, ect).

-Fusion should be performed in strict adherence to the manufactures recommendations and applicable ASTM standards and that fusion should be performed by a qualified technician. The procedure should adhere to the manufacture's quality control requirements. Fusion procedures and QC plans should be reviewed by the engineer prior to use of this technique. BGC has already been provided the fusion equipment's operation manual.

- Pipe couplings at minimum need to meet the standards and specifications for the pipe they will be joining. Coupling specifications should be provided to the Engineer for review and inclusion in the construction record.

-Provide the Engineer with installation details and procedures ensuring and that the liner system and geotextiles will be protected from puncture or tearing if the pipe and couplings are moved across or placed on these surfaces.

-Joints should not be dragged across uneven, jagged, or rocky ground and fills. If this becomes necessary the Constructor should review the process for dragging the pipe with the Engineer.

Client	Pelly	**RFI #**	01
Contract #	27233	**Revision #**	00
Layfield Project #	CT001045	**Layfield Originator**	Jason Wheeler

Type: Change specifications to have horizontal seams approved throughout project

Description: We would like to change the specification in 4.1.7.1. to allow for horizontal seams throughout the project. Most of the project will be at 3H:1V and is allowable as per spec but we are hoping we can avoid delays during installation and have horizontal seams approved in advance instead of cutting at 45 degree angles.

Schedule Impact: Should help maintain or increase our schedule as we have many cross seams to do.

Total Value of Change: Quicker installation and less wasted material

Attached Drawings and/or Documents: Proposed Layout plans, Shear testing results

Subject: HLF Steel Pipe Specifications and Construction	Project Zone/Area: HLF Phase 1
Sub-contractor: Pelly Construction	**Station/Location: HLF Phase 1**
Attention:	**Discipline:**

REQUEST

Related Drawings: **HLF PHASE 1 FINAL DESIGN (Issued For Construction)**	**Other Related Documents:** **BGC-01163_EG18-002_HLF Final Design Report_Stamped**

Information Request/Description of Issue:

(1) **Steel/Pipe specification. Please confirm specification for steel materials. Plans and Design Report call for ASTM 139 High Strength Low Alloy Steel (A606 Type 4). We understand that this specification provides some level of corrosion resistance. However, these materials are more difficult and expensive to procure, approximately double the cost before freight and fabrication considerations.**

(2) **Constructability. The long section of pipe and manifold systems will be onerous to cost and schedule, and create more risk to damaging liner if welding fabrication must occur within the sump areas.**

(3) **Information Request: geotextile wrapping of steel:plastic connections in LDRS and PLS sump systems, what is the purpose of this?**

(4) **N12 perf pipe specification. Some supplier vendors proposing socked material for parts of the scope.**

Proposed Corrective Action

(1) **There was verbal suggestion that all these steel pipe requirements in the HLF could be replaced with common stock steel, using schedule 40 pipe with typical ~150psi pressure rating. Pelly would like this confirmed in writing prior to procurement.**

(2) **Fabrication and installation will be more manageable and readily achieved with less risk to liner through use of segmented components that will be flanged together in the field.**
   a. **Pelly would like confirmation that using a flanged approach is acceptable.**
   b. **Pelly would like to know of any design constraints that these flanges must achieve to ensure same structural and performance integrity:**
      i. **Gasket material specification.**
      ii. **Hardware, bolt pattern specification**

(3) **N/A, clarification request.**

(4) **Pelly is seeking permission to use socked material if cost effective to procure.**

Re: Response to CC204-RFI-012:

1.0 RESPONSE

Question 3: "Information request – geotextile wrapping of steel: plastic connections in LDRS and PLS Sump System, what is the purpose of this?"

Response: Secure geotextile wrapping of both sides of the steel: plastic connections are to decrease the risk of sediment infiltration. This wrapping may also serve as an extra layer of protection against damaging the geomembrane, depending on its location and application. Wrapping these connections were one of the recommendations made during a peer review of the project.

Questions 4: "N12 perf pipe specification. Some supplier vendors propose sock material for parts of the scope."

Wrapping of perforated, corrugated, N-12 PE pipes are not permitted due to potential reduction in permeability over time at the pipe slots.

Request for Information

Contract Title	Eagle Gold Heap Leach	**Date Issued**	May 16, 2018
Client	Pelly	**RFI #**	02
Contract #	27233	**Revision #**	00
Layfield Project #	CT001045	**Layfield Originator**	Jason Wheeler

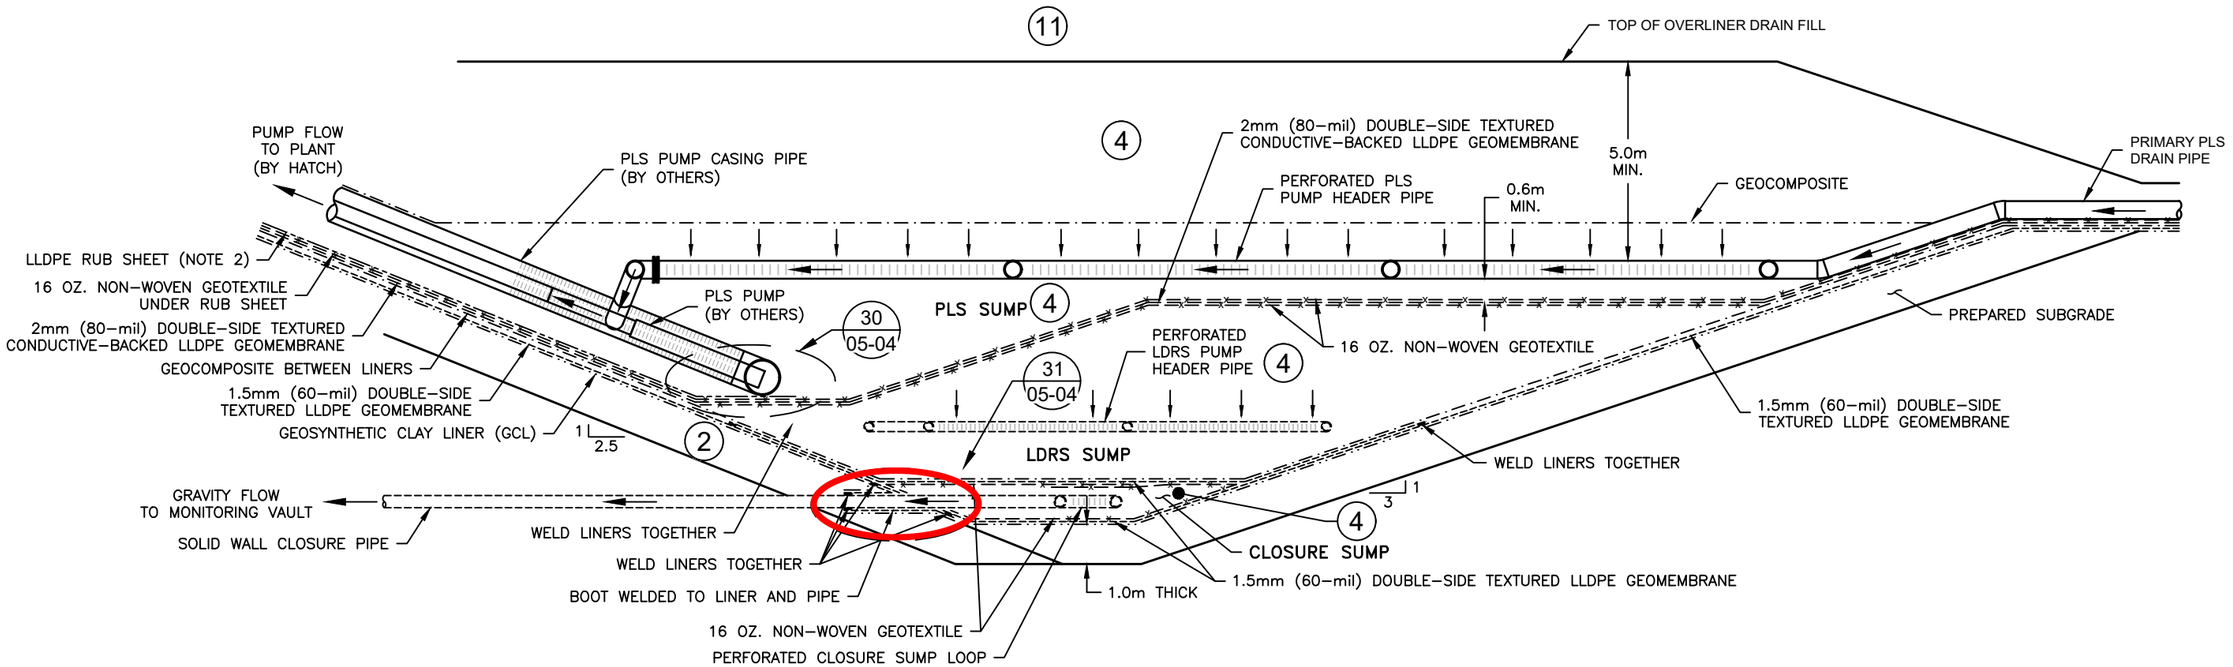
Type: Change specifications to have horizontal seams approved throughout project

Description: On drawing Number EGHLF-XD-05-02 PLS, LDRS & CLOSURE SUMP DETAIL 22, in the closure sump the drawing shows a boot that is inverted and going into the slope. Layfield will not be able to install a boot like this in the field. We would like to propose 2 options for review:

1. If the pipe installation/fusing crew deems it possible installs a HDPE plate at the location where the pipe meets the slope at the proper slope factor. Layfield can attach to the HDPE plate when we are installing the liner system
2. We install a typical sloped pipe boot which would be going into the pond. We will be able to do this when on site for the liner installation

Schedule Impact: Would need to install the boot during slope construction. Chances of the skirt left to attach to being damaged and not repairable is very high

Total Value of Change: N/A



Attached Drawings and/or Documents: Typical sloped pipe boot penetration detail, HDPE plate to pipe penetration, copy of drawing in question

Re: Response to CC204-RFI-017:

1.0 RESPONSE

The embankment toe and drain trench should be completed as shown in the attached ***Figure 1***. Construction should conform with the requirements in the Technical Specifications. Beyond details presented in the figures and specifications the following requirements should also be followed:

- Due to the difficulties of water management in this area and uncertain subsurface conditions the construction approach in this response is discussed in phases. Phase 1 includes identify and preparing competent foundation. Phase 2 includes backfill and drain construction.
- The first step should include water removal, control, and monitoring as well as cleaning loose silt and soil from toe and drain area, as best as possible. Once water runoff to work area is controlled, the work zone should be excavated to take out all sedimentation collected and deteriorated colluvium and type 3. Excavator should indicate when harder material has been reached to Field Engineer.
- Once approved by Field Engineer, Excavator will commence Phase 1 of Detail 1 with approved Rockfill material (should be free draining) by Field Engineer. The Excavator will place material in lifts and compact with bucket until thick enough to bridge out remaining soft wet materials as determined by Field Engineer.
- A geogrid should be placed as a base for the geofabric, before commencing Phase 2 as presented in ***Figure 1***.
- Phase 2 is repeated until surface field matches the point of entry from the underdrain upstream. After this is reached, all aspects of the original design should be considered.
- Course, strong, rockfill can be used as backfill under the pipe trench. The rockfill should be relatively free draining. Rockfill should be approved by the Engineer prior to placement.

- Final elevations will be dependent on work performed to prepare the foundation and will be approved by the Engineer.

Sub-contractor: Pelly Construction	**Station/Location: HLF**
Attention:	**Discipline:**

REQUEST

Type of Change: ☐ Owner Change ☒ Clarification/Info ☐ Field Change ☐ Vendor Change ☐ Design Change ☐ Other

Related Drawings: XD-02-03 & 04 Note: #3	**Other Related Documents:**

Information Request/Description of Issue:

A 1.8m subsoil excavation is required below the 940 elevation and 0.3m subsoil excavation is required above the 940 elevation. The design scope calls for these spoiled materials to be backfilled in 0.15m lifts throughout the pad area.

If these materials are unsuitable as backfill, where must these materials be wasted and what will be the alternative backfilling medium? Please identify which cost item this is applicable to if not already clearly identified.

Proposed Corrective Action

RESPONSE

☐ Approved ☒ Approved as noted ☐ Rejected as noted

Response: EPCM assumes that the Contractor is referring to Note #3 on BGC drawings XD-02-03 & 04. Please see note #6 on XD-00-02 where it states that Contractor is responsible for verifying subsurface conditions. EPCM recommend that Pelly dig a number of test pits with BGC field representative present to confirm subsurface conditions. EPCM have instructed BGC to further clarify what is meant by “prepared subgrade” and a response will be provided in due course.

REQUEST

Type of Change: ☐ Owner Change ☒ Clarification/Info ☐ Field Change ☐ Vendor Change ☐ Design Change ☐ Other

Related Drawings:	**Other Related Documents:**

Information Request/Description of Issue:

Upstream of the Embankment structure Pelly would like confirmation on the underdrain installation depths. The underdrain piping will be below the primary collection and liner systems, it is not entirely clear what min/max depths the underdrains need to be installed relative to other infrastructure or if the same type 3 bedrock constraint must be maintained upstream of the embankment.
Q1. Please describe the constraints and where possible provide 3D dxf/dwg linework of designed pipe invert routing as shown on the IFC drawings.
Q2. Please confirm minimum cover requirements for bearing a loaded 40ton articulated truck without damaging the piping associated with the underdrain systems.

Proposed Corrective Action

Cost Impact:	
Schedule Impact:

RESPONSE

☐ Approved ☐ Approved as noted ☐ Rejected as noted

Response:

The dimensions can also be found from other details e.g. Detail 22 on drawing 05-02 shows a subgrade thickness of 1 metre. The underdrain will be installed at the bottom of this zone and is about 0.5 metres thick, meaning there will be a 0.5 metres subgrade cover over the drain.

Question 1.
Figure 1 presents the type 3 bedrock constraint.

Question 2.

We will require official specifications of the equipment that will be used. Respond with an RFI attaching official CAT information for trucks and dozers for a better response. Please submit a separate RFI with attached official equipment information.

RESPONSE

☐	Approved	☐	Approved as noted	☐	Rejected as noted

Response: Please refer to Section 2.3 of Subgrade preparation in the Technical Specifications. Given that Pelly has cleared vegetation and mechanically moved material. BGC will provide locations of test pits to confirm excavation requirements in work areas as needed and follow Section 2.3 recommendations for testing and preparation. The subgrade shall be prepared to the satisfaction of the Engineer.

EAGLE GOLD PROJECT

REQUEST FOR INFORMATION

EPCM RFI No.:	**Site Location:** Eagle Gold
Sub-Contractor RFI No.: RFI-023	**Date Submitted:** May 26, 2018
Subject: ADR Pad Excavation	**Project Zone/Area:** ADR Plant Pad Area
Sub-contractor: Pelly Construction	**Station/Location: ADR Plant Pad**
Attention:	**Discipline:**

REQUEST

Type of Change:	☐	Owner Change	☒	Clarification/Info	☐	Field Change
	☐	Vendor Change	☐	Design Change	☐	Other

Related Drawings:	**Other Related Documents:**

Information Request/Description of Issue:

It was noted during the contract call on May 25th that civil contractors will require 30-50m buffer away from active heavy earthwork activities. The work plan in the ADR continues to prioritize the excavation in the plant area, while drilling and blasting efforts will be fully accomplished throughout the pad area prior to civil works in the plant foundation area. Remaining excavation activities in the ADR pad area will coincide with civil works in the ADR plant foundation. The issue is a 30-50m buffer creates additional volume that will need to be moved in advance of the civil works in the foundation area; delaying the schedule. Per liner installation requirement, a perimeter deployment access is required, this is the constraint that Pelly has been planning with versus a 30-50m buffer. A 4m access width on the west side of the foundation area that is appropriately bermed from the earthwork activities should be sufficient to safely guard the civil workings.

RESPONSE

☐	Approved	☒	Approved as noted	☒	Rejected as noted

Response:
Refer to Contract Letter #3 issued to the Contractor in May 25th, 2018 instructing the Contractor to provide an updated schedule by June 1st, 2018.

The 30-50m buffer mentioned during the Contract call was the distance EPCM provided to the concrete contractor to notify them that earthworks and concrete activities would be happening simultaneously and in close proximity. EPCM believe this distance range provides a reasonable margin of safety.

Additional guidance for planning are below:

- Concrete contractor requires safe access all around the ADR pad liner,
- There should be no high walls adjacent to the concrete contractors work area,
- There should be no bulk or production blasting on the ADR pad after the concrete contractor has mobilized,
- There must be safe access to and from the ADR plant pad with minimal to no heavy/light vehicle interaction.
- Concrete contractor will access the ADR pad via the ARD Access Road

RESPONSE

☒ Approved ☐ Approved as noted ☐ Rejected as noted

Response:
Please see the attached documents detailing the locations of the exploration holes within the mine footprint.

There doesn't appear to be any in the event pond area below the ADR.

Please note that the precision of the holes may vary as they were surveyed with a handheld GPS unit.

Other Related Documents:

Information Request/Description of Issue:

1) Please confirm the supply and installation of the PLS and LDRS pump casing is by Pelly; this is contrary to what the drawing shows

2) Pelly understands that the PLS and LDRS pump piping, pipe supports, concrete and polylock embedment strip or batten strip liner anchor will be by others, please confirm

3) For ease of fabrication, Pelly would like to know if there are any limiting constraints or specific design criteria associated with the piping and connections between the casing and manifold piping that must be achieved. Angles, spacing, distances. A pipe schematic design diagram with angles and distances is requested.
   Other than some faint hatching on the pipe drawings there are no specific references to slotting requirements for the PLS casing pipes. Please confirm slotting requirements, if any, with the PLS pump casings.

4) Per note #9, slotting of the casing materials for the LDRS sump is specified for the instrumentation casing. Please confirm that no slotting is required for the LDRS pump casings.

5) Given the slope distance and mean average temperature, please confirm overall length of pipe that is required for each casing. To understand constructability constraints, please provide minimum cover and/or submersion requirements for the thermal protection of buried pipe infrastructure over winter/persisting freezing conditions.

6) Albeit different pipe diameter, please confirm the same gasket and bolt requirements are the same for steel components associated with the LDRS system. Please also confirm if flanging is permissible on the embankment slope components (pump and instrumentation casings) that follow the slope. Pelly's fabricator highly recommends a flanged approach for sectioning the spiral pipe components; this will speed up installation, increase quality assurance, reduce overall cost, and reduce risk of damaging liner by reducing onsite welding and fabrication.

Copied:	**Troy Meyer; Roy Morlan**	**Record:**	**Water Management**

Re: Monitoring Well Decommissioning Requirements

The requirements should follow the Protocol for the ***Contaminated Sites Regulation Under the Environment Act, Protocol No. 7: Groundwater Monitoring Well Installations, Sampling and Decommissioning, effective March 1, 2011***. This document, along with ***ASTM D5299-99*** should be the main guide for monitoring well decommissioning requirements.

1.0 PURPOSE

To decommission monitoring wells within the vicinity of the Eagle Gold HLF and achieve the following:

- Preventing contamination of groundwater by surface sources,
- Reducing risk of void creation in foundation area of Heap Leach Facility,
- Reducing environmental and engineering risk through construction phases, operation and closure.

2.0 GROUT MATERIAL

The grout mix should be designed by contractor and meet the following criteria:

- Not react with groundwater or in-situ geology,
- Have a lower than in-situ geology hydraulic conductivity,
- Form a tight bond with the borehole wall (wall should be clean of obstructions),
- Be resistant to cracking and shrinking,
- Be capable of being placed safely, and
- Have sufficient strength to withstand subsurface pressures.

3.0 FIELD PROCEDURE

The suggested field procedure for decommissioning a groundwater monitoring well is described below.

3.1. Inspection and Preparation

Each borehole and decommissioned well should be inspected to confirm depth, obstructions (e.g. debris, and caving) that may interfere with the placement and performance of the grout. A camera survey can identify the depth and construction of the well if this information is not known.

3.2. Casing Removal

Casings will be removed as part of properly sealing a borehole or decommissioned well. The technique of pulling casing using a rig is acceptable only for steel casings. The technique of over drilling, which means drilling around the borehole or decommissioned well casing and pulling out the casing, is also acceptable.

If casing cannot be removed through these two methods, the Engineer with consultation from Victoria Gold's Environmental Representatives will need to approve a plan to seal properly.

3.3. Grouting

The borehole should be pressure grouted using a tremie pipe as the drilling stem is removed. The grout should be applied in one continuous procedure to prevent segregation, bridging and dilution. The tremie pipe should be in constant contact with the grout level inside the borehole or decommissioned well to prevent air pockets from forming. The borehole and decommissioned well should be sealed from the bottom of hole to surface. Grout should be inspected 24 hours after placement for settlement, more grout should be added if needed. Inspection should be done by Engineer.

4.0 ARTESIAN WELLS

Driller should be equipped to handle a 10 litre per minute artesian well. The hole ID: DG17-847C, is 154.25 metres deep, angle with a true azimuth of 50 degrees and adip of -45 degrees. Hole size is HTW. Regulations should be followed on decommissioning this type of hole, grout from bottom of hole to surface is the expected solution.

5.0 DOCUMENTATION

Driller contractor should keep logs of end of construction sealing practices, product certificates and specification. This documentation will be collected for the final construction report from BGC and to document decommissioning of the wells on the Heap Leach Facility.

6.0 PROCEDURES AND PROTOCOL

Contractor should refer to “Protocol for the Contaminated Sites Regulation Under the Environment Act, Protocol No. 7: Groundwater Monitoring Well Installation, Sampling and Decommissioning.

Section 4, titled Well Decommissioning, applies and governs all procedures. The standard used by this document refers to American Society of Testing and Materials (ASTM) standard D 5299-99 Standard Guide for Decommissioning of Ground Water Wells, Vadose Zone Monitoring Devices, Boreholes and Other Devices for Environmental Activities.

7.0 NOTIFICATION

BGC is expected to be notified of activities for decommissioning to observe procedures and conduct an independent inspection 24 hours after grouting was placed. BGC will ask for copy of the logs at the earliest convenience of drilling contractor for records of construction and foundation preparation.

RESPONSE

☐ Approved ☐ Approved as noted ☐ Rejected as noted

Response:

1.) Fish-plating or any method requiring bolting of plates together is not acceptable. Bold can cause stress points on the liner during operation.
2.) Plate width should be 4m wide per the design. If two connected plates are used the total width should be 4m.
3.) The steel angle should be the width of the steel plate (i.e. 4m) and should have a height of 0.5m perpendicular to the steel plate.

Re: Seeps and Finger Drains

1.0 INTRODUCTION

The purpose of this memorandum is to discuss the field observations made along the exposed right abutment and artesian well identified upstream of the partially excavated undrain pipe trench.

Field observations included daily monitoring of potential seeps during no precipitation days, photo records to document observations, and visual confirmation of water flow. The intend of this document is to classify areas that may interfere with moisture conditioning of lifts during construction, damage approved fill placement through water flow and present solutions to be implemented in the field during construction.

2.0 WATER MANAGEMENT FIELD OBSERVATION

On May 26th, 2018, representatives from Pelly and JDS, accompanied BGC Resident Engineer (Daniel Granda) to walk the site (**Figure 1**). This meeting took place a day after significant rainfall and the ground was fairly moist. This was used a baseline for identifying seeps occurring during drier conditions.

Figure 1: Pelly and JDS representatives present for water management field observation visit.

During the visit, the ground was found to be moist. Sediments had been transported on exposed Type 3 foundation in underdrain pipe trench and moisture from the abutments seemed to be rainfall moisture (**Figure 2**).

Figure 2: Seeps were difficult to see after significant rainfall events.

3.0 OBSERVATIONS

During a course of 5 days, and in consistent drier weather, moisture spots remained concentrated in areas identified. **Figure 3** presents observations from June 1st, 2018 inspection. **Figure 4** presents field interpretation and seep identification.

Figure 3: Upstream view from proposed embankment toe looking upstream

Figure 4: Field Interpretation of seeps with identifications for descriptions.

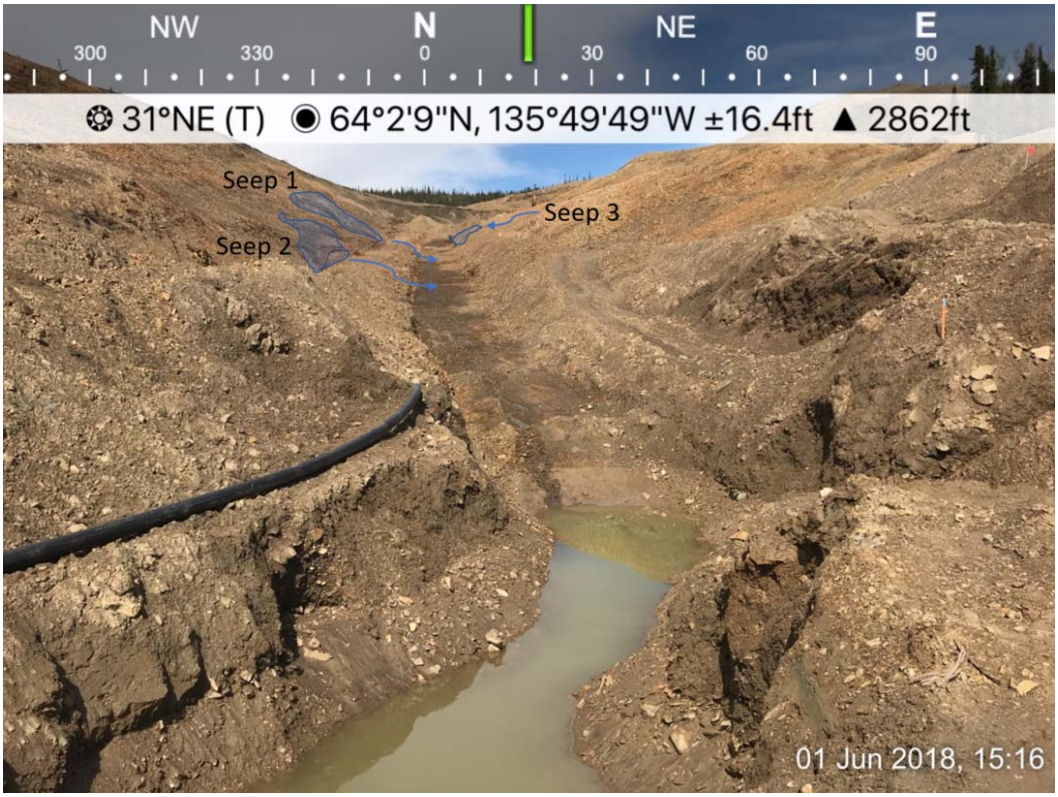

Figure 4: Field Interpretation of seeps with identifications for descriptions.

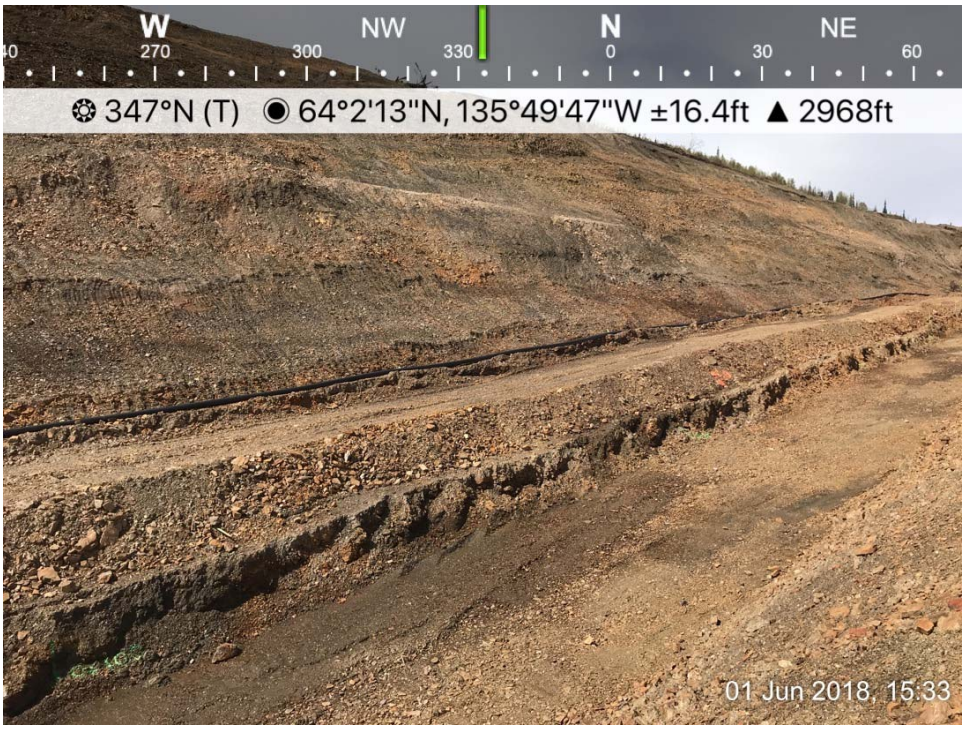

Figure 5: Seep 1 view from left abutment.

Both Seep 1 and 2 have been occurring for the past 5 days. Weak, very moist and low resistance to puncture zones were identified by applying finger pressure on wet areas. **Figure 6** presents the interpretation that may be confirmed during abutment foundation preparation for seep 1.

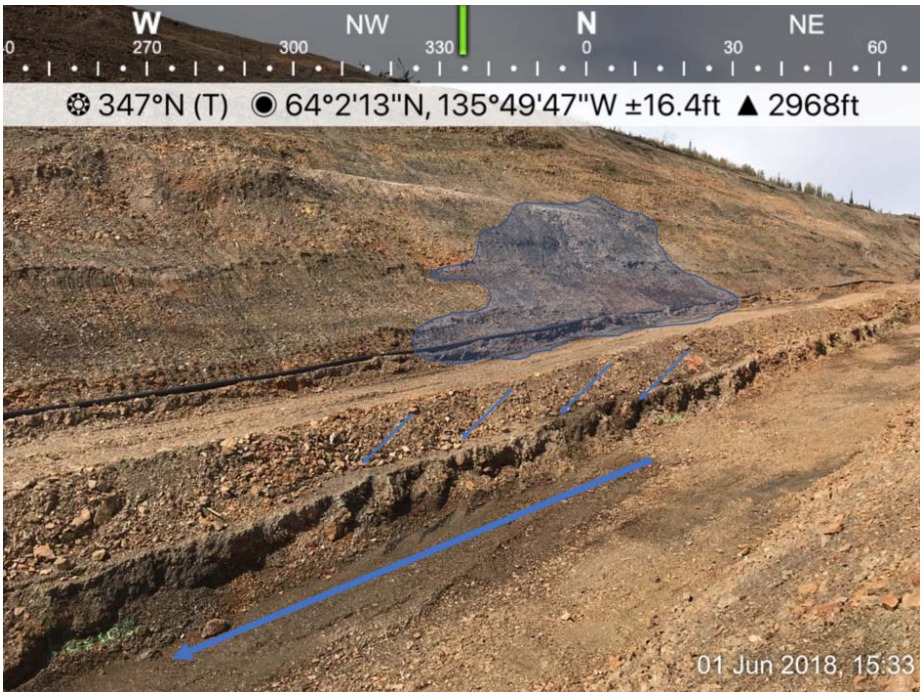

Figure 6: Seep 1 interpretation of potential flow path.

The specific source zone point is unknown as the materials on the abutment have high moisture absorption and fine lenses exhibit matric suction properties. In seep 1, the moisture is visible at the close sight on the abutment, liquid is transported downstream of the abutment and reconnects to the underdrain trench sides.

Figure 7: Seep 2 view from left abutment.

Seep 2 exhibits the same characteristics as seep 1, with ponded water on surface on bench between abutment and bottom of underdrain trench.

Figure 8: Seep 2 interpretation of potential flow path.

Figure 9: Seep 3 view from upstream underdrain trench

Seep 3 is believed to be coming from the artesian source identified during inspections. There is a clear connection of moisture oriented from the assumed source to the underdrain trench.

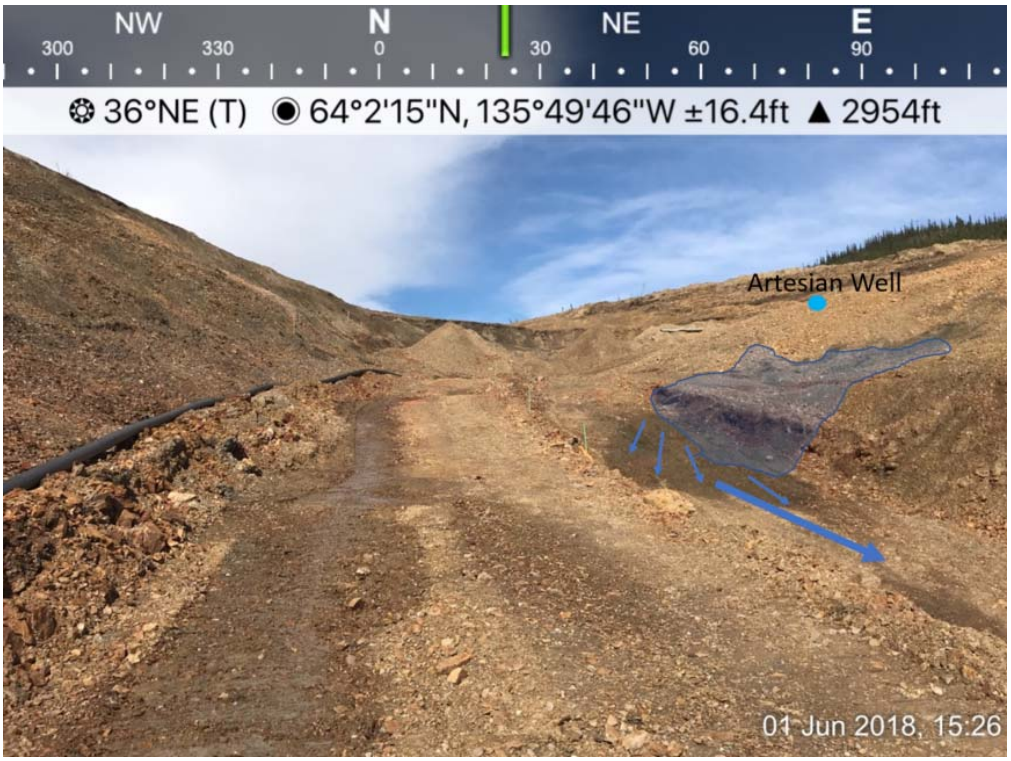

Figure 10: Seep 3 interpretation of potential flow path.

4.0 SUGGESTED MITIGATION

A field design to help the contractor to dissipate seepage and surface runoff from the abutments during construction seems to be the best approach. The goal of this mitigation is to provide a way of transporting excess water during construction (lift placements and compaction) to meet compaction specifications, transport and reduce pore water pressures inside the constructed embankment for long term stability.

5.0 FINGER DRAIN

A total of 3 finger drains are proposed (one finger drain at Seep 1, one finger drains at Seep 2, and one finger drain at Seep 3). The centerline location of each finger drain was surveyed by Pelly's survey team. A figure showing the location was not provided to BGC before completion of this memorandum. However, each drain will be an estimated 10 m in length. Although it is not currently anticipated, these finger drains can be extended in length if moisture along the abutments appear to be an issue during construction.

The finger drain trenches should be a minimum of 2 m wide, by a minimum of 0.75 m high, with a 2:1 slope on each side. The drain trench should be excavated in Type 3 Bedrock or better. Similar requirements to the underdrain will be used to construct it (e.g. geotextile overlap, select throughout). The final drain will be field fitted and the final length and construction details will be dependent on the ground conditions and its ability to tie into the Pipe Trench. However, the drain should meet the minimum dimensions discussed here. The detail for the minimum requirements is presented as **Figure 11**.

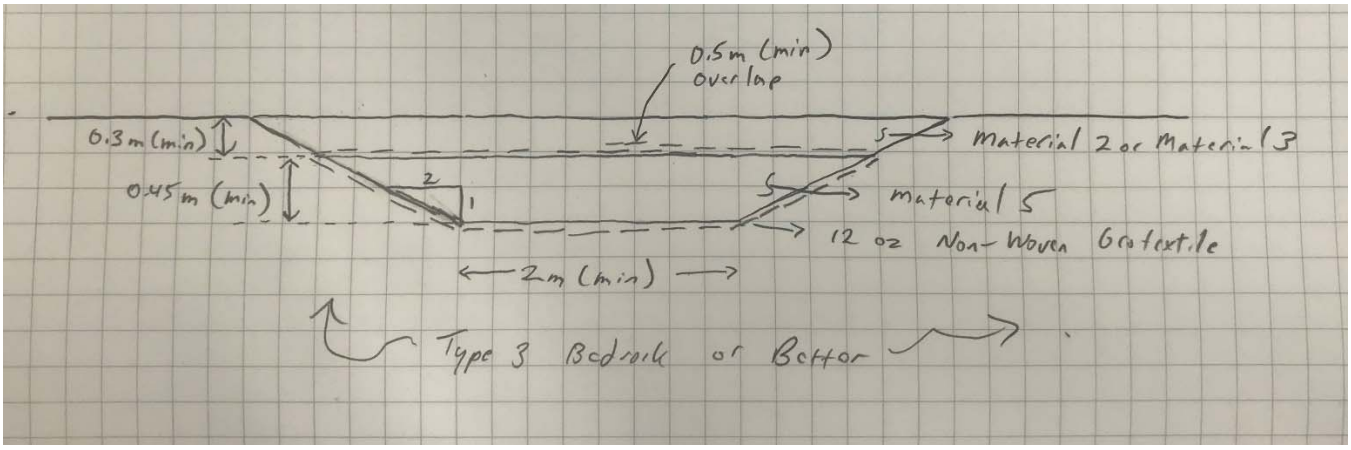

Figure 11: Typical section for finger drain.

Finger drains will tie into the drain rock at the pipe trench. Geotextile in the finger drains should overlap with the pipe trench by a minimum of 0.5 m. The Constructor should propose a method to overlap the geotextile at this connection based on constructability. BGC should review this connection prior to construction. The following sketch is a plan view of the finger drains in relation to the pipe trench (**Figure 12**).

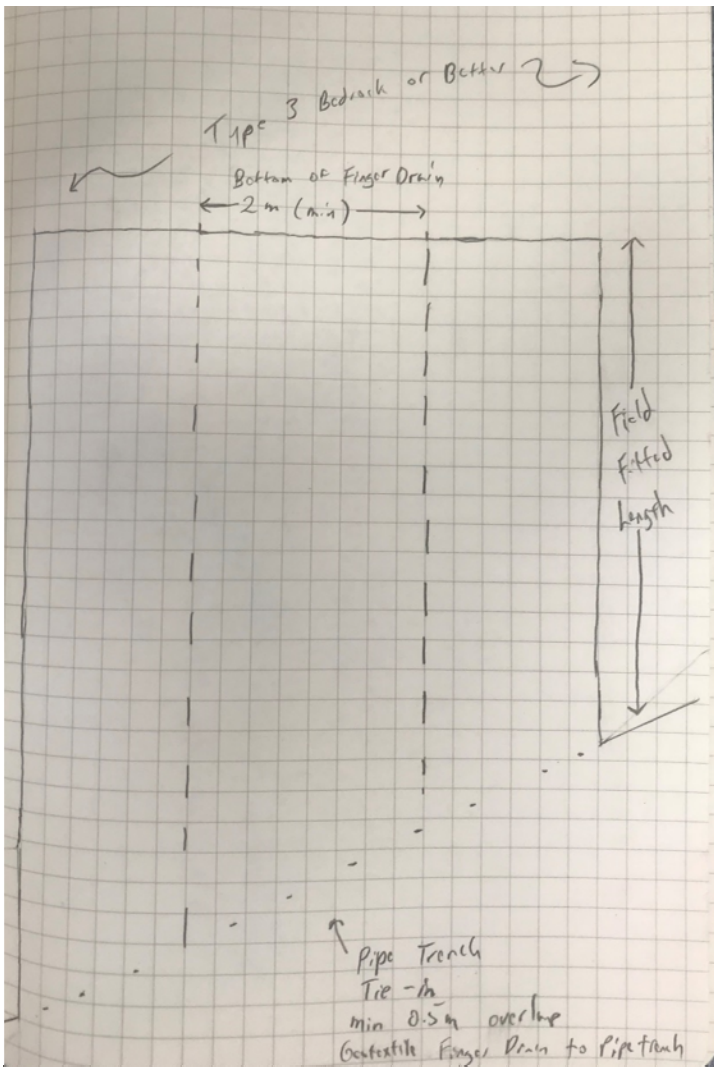

Figure 12: Plan view for finger drain layout.

6.0 SUMMARY AND RECOMMENDATIONS

A finger drain will be needed to reduce porewater pressures during construction through operations. The design presented could help drain slopes and maintain control of water during material lift placements prior to compaction.

This drain design is not intended for the control of the water on the east side of the embankment where the artesian hole was discovered. A separate design will be developed for the drain on that side of the embankment.

7.0 CLOSURE

BGC Engineering Inc. (BGC) prepared this document for the account of JDS. The material in it reflects the judgment of BGC staff in light of the information available to BGC at the time of document preparation. Any use which a third party makes of this document or any reliance on decisions to be based on it is the responsibility of such third parties. BGC accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this document.

As a mutual protection to our client, the public, and ourselves, all documents and drawings are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents and drawings, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending BGC's written approval. Related Drawings:	**Other Related Documents:**
XD-06-02-Detail 47 and 49	

Information Request/Description of Issue:

1) Regarding detail #47 (EGHLF-XD-06-02):
   -calls for 3m of 300mm SDR11 connected to 250mm Corrugated & Perforated PE N-12. I'd like to proceed as we did with the underdrain laterals with the ADS N-12 material fused onto the end of the HDPE pipe. This will require a slight change in the design whereby the upstream end of the 3m 12" HDPE pipe will have a 12"x10" HDPE reducer incorporated that is then fused with the ADS. Total assembly rated to 0 PSI due to the ADS end connection. For your reference I've attached the ADS-N12 manufacturer specifications.
2) Regarding detail #49 (EGHLF-XD-06-02):
   -Trying to understand the reasoning for this in the design?? Seems like a cumbersome requirement for installation, not to mention added cost.
   -for the double pipe section, are these required to be 1m minimum distance apart as noted in other detail?
   -assuming 1m clearance, I think a T connection with pair of 90's will be required versus a wye connection.
3) Use of sleepers. Constructability and fusing on top of liner, can we utilize sleepers (wood dunnage to prop pipe off of the liner) to provide clearance and for aligning pipe to perform fusing in place? Is this permissible, and what kind of precautions should we need in place to protect liner – I'm thinking in terms of point loading, ie. 16oz rub sheet on top of liner, overlain by plywood of sum area(?), overlain by dimensional blocking (8" sleeper) to support the pipe. If impractical to remove without risking damage to liner, can we leave these sleepers in place (permanently? -I anticipate this only for the 18" HDPE piping.

For (1) and (2), hoping to hear from you in next few hours so I can line up final ordering details and fabrication requirements by end of today.

Cost Impact:	
Schedule Impact:	

Requested by:

Shipeng Zheng		**Sept 21, 2018**
Name	Signature	Date

RESPONSE

☐	Approved	☐	Approved as noted	☐	Rejected as noted

Response: 1) the proposed pipe arrangement is acceptable. 2) detail #49 can be disregarded due to recent reduction in the design process flow rate. 3) BGC suggests the use of geosynthetics in place of wood, where possible. A geocomposite and geomembrane rub sheet combination should provide protection for the liner and could be left in place. Wood products shall not be left in place.

Information Request/Description of Issue:

Pelly is requesting confirmation for the following:
1. 18" DR11 collection piping can be pulled over the HLF liner providing there is a rub sheet between the collection pipe and HLF liner.
2. The aforementioned rub sheet will consist of a 16oz non-woven geotextile over and under a layer of 2mm (80-mil) double-side textured LLDPE geomembrane.
3. There is no geomembrane on geomembrane contact permitted – meaning in the case where geomembrane rolls are wider than those of the geotextile, the geotextile will require multiple rolls in width (both over and under the geomembrane).
4. Rub sheets meeting these requirements will be permitted to be left in place.

BGC Response

Item 1: The use of a flange connection is permitted. Flanges can only be used if a minimum of 0.5m of ODF material is placed between the flange and the liner. To help protect the liner during butt welding or electrofusion a minimum of 0.3m of ODF material should be placed between the Primary PLS Drain Pipe and the liner. It should be noted that cover should be a minimum of 0.5m or twice the pipe diameter, whichever is larger, over the top of all pipes per IFC drawings EGHLF-XD-06-02 and EGHLF-XD-06-03. See ***Figure 1***.

Item 2: To be responded to by JDS.

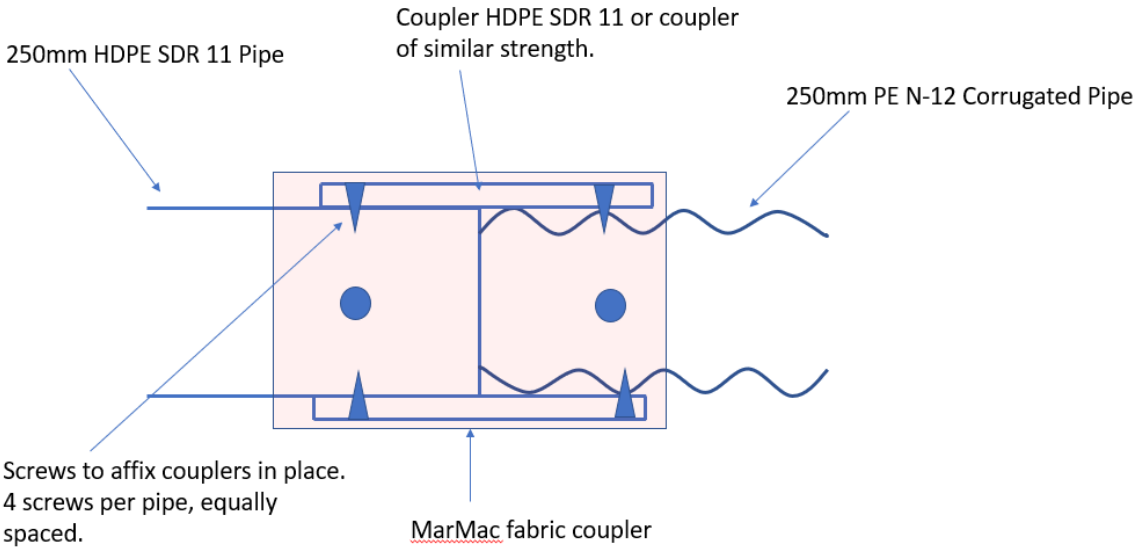

Photo 1: PLS header to collector pipe connection

1.0 RESPONSE TO QUESTION 2

The use of this product is approved. However, due to the potential for shearing at the joints BGC will require one of the two configurations below be used.

Configuration 1: Pipe configuration suggested by MarMac. Corrugated pipe fits into smooth wall pipe and then is wrapped. If mastic does not stick due to cold weather or other issues then additional compression rings may be required. If this method is used 4 screws, equally spaced around the diameter of the pipe, should be used to affix the smooth walled pipe to the corrugated pipe.

Configuration 2: An HDPE coupler, or a coupler with similar strength, is used. Mar Mac coupler would be installed per manufacture's instructions. If mastic does not stick due to cold or other issues then additional compression rings may be required.

Attachment A

Ground Pressure

745C Ground pressure is the same as 740B

Cat Conf YELLOW

•All figures based on Michelin XADN tyres

Use of Ground Pressure Charts

Articulated trucks are normally equipped with wide base radial tires, for improved flotation in poor underfoot conditions. Ground pressure is a function of tire deflection and is also affected by tire penetration. The charts in this section provide a means to estimate ground pressure for 0 and 76 mm (3") tire penetration, when gross vehicle weight, axle load distribution and tire inflation pressure are known. The ground pressure charts on the following pages are based on Michelin XADN tire characteristics. Results may differ for other tread patterns.

Tire load can be calculated by the following formula:

$$\text{Tire Load} = \frac{\text{Heaviest Axle Load}}{2}$$

Example

Find the ground pressure generated by a 725C fully loaded with zero and 76 mm (3") tire penetration. The machine is equipped with standard Michelin 23.5R25 tires, inflated to the recommended pressure.

$$\text{725C Tire Load} = \frac{46\,820 \text{ kg} \times 0.34}{2} = 7959 \text{ kg}$$

$$\text{725C Tire Load} = \frac{103{,}220 \text{ lb} \times 0.34}{2} = 17{,}547 \text{ lb}$$

From the tire section in this book, inflation pressure for the 725C is 325 kPa = 3.25 bar (47 psi).

From the ground pressure chart for 23.5R25 tires, Ground pressure = 3.1 kg/cm^2 (44 psi) with zero tire penetration.

Ground pressure = 1.4 kg/cm^2 (21 psi) with 76 mm (3") tire penetration.

See the Wheel Tractor Scraper section for explanation on using:

- **Rimpull-Speed-Gradeability Curves**
- **Retarder Curves**

Features:

- **Cat® engines with ACERT™ Technology** meet U.S. EPA Tier 4 Final/EU Stage IV/Japan 2014 (Tier 4 Final), or Tier 2/Stage II/Japan 2001 (Tier 2) equivalent emission standards. The four core elements of meeting these standards are:

  I) Common Rail;

  II) Electronics, ADEM™ A4;

  III) Fuel delivery, Mechanical-activated Electronic Unit Injection (MEUI™ A-C);

  IV) Air Management, Wastegate Turbocharging, Air to Air Aftercooling (ATAAC) with the proven technology of a crossflow cylinder head.

- **Cat electronically controlled transmissions** ... Transmissions purpose built and designed for articulated trucks and their applications. Advanced Productivity Electronic Control Strategy (APECS) delivering smooth shifting transmissions with improved acceleration and high productivity. Providing complete integration with the engines for efficient power delivery as well as offering advanced diagnostic and troubleshooting capabilities.

- **Articulating and fully oscillating hitch** ... Links front and rear frames for exceptional maneuverability and traction on uneven terrain while eliminating damaging twisting of the frames. Bolted hitch design allows optimum material choices for the cast hitch head and the hard-wearing tube. Bolted design allows easier rebuild and repair.

- **Three-point front suspension** ... Three-point front suspension with long-stroke, low-pressure suspension cylinders provide unparalleled ride quality for operator comfort and higher average haul speeds. Front and rear suspension together with the hitch provide for excellent traction in all conditions.

- **Wide, long and low dump body design** ... For excellent loadability and high fill factors, excellent machine stability and load retention as well as a good match for other Cat loading systems. Diverging flow design also gives excellent material ejection.

- **Standard ROPS/FOPS, low sound level cab** ... Two man cab common across the range. Large cab with excellent visibility, ergonomic control layout and plentiful storage.

- **High capacity low pressure tires in single formation** ... For superior traction and flotation in poor underfoot conditions.

- **Bare Chassis offerings** ... For certain applications the Caterpillar OEM Solutions Group offers non-dumper/Bare Chassis arrangements.

  Bare Chassis arrangements applications could include: water, service (fuel and lube), high capacity body (waste, coal, etc.), open body (log, pipe, etc.), container carrier, hook lift, tow, cable reel, etc. Please refer to specific OEM for additional information.

EAGLE GOLD PROJECT

REQUEST FOR INFORMATION

EPCM RFI No.:	**Site Location:** Eagle Gold
Sub-Contractor RFI No.: RFI-049	**Date Submitted:** April 5, 2019
Subject: Spillway North Slope Redesign	**Project Zone/Area:** HLF Event Pond
Sub-contractor: Pelly Construction Ltd	**Station/Location: HLF Event Pond and EP Spillway**
Attention:	**Discipline:**

REQUEST

Type of Change: ☐ Owner Change ☐ Clarification/Info ☒ Field Change ☐ Vendor Change ☒ Design Change ☐ Other

Related Drawings:	**Other Related Documents:**
1. EGHLF-XD-08-01	1. Attached redesign sketch of section AC

Information Request/Description of Issue:

The current spillway design near the entrance into the Event Pond has the north slope at 2:1 from the outside edge of the flat bench. To establish the design toe, a cut into the slope was required. However, from shaping performed in 2018 the existing slope is already at a 2:1. Pelly requests BGC approval of proposed change.

Proposed Corrective Action

Cut the slope at 1.5:1 from the toe until it intersects with the existing ground, at which point the slope will continue at 2:1 up to the crest.

Cost Impact:	
Schedule Impact:	

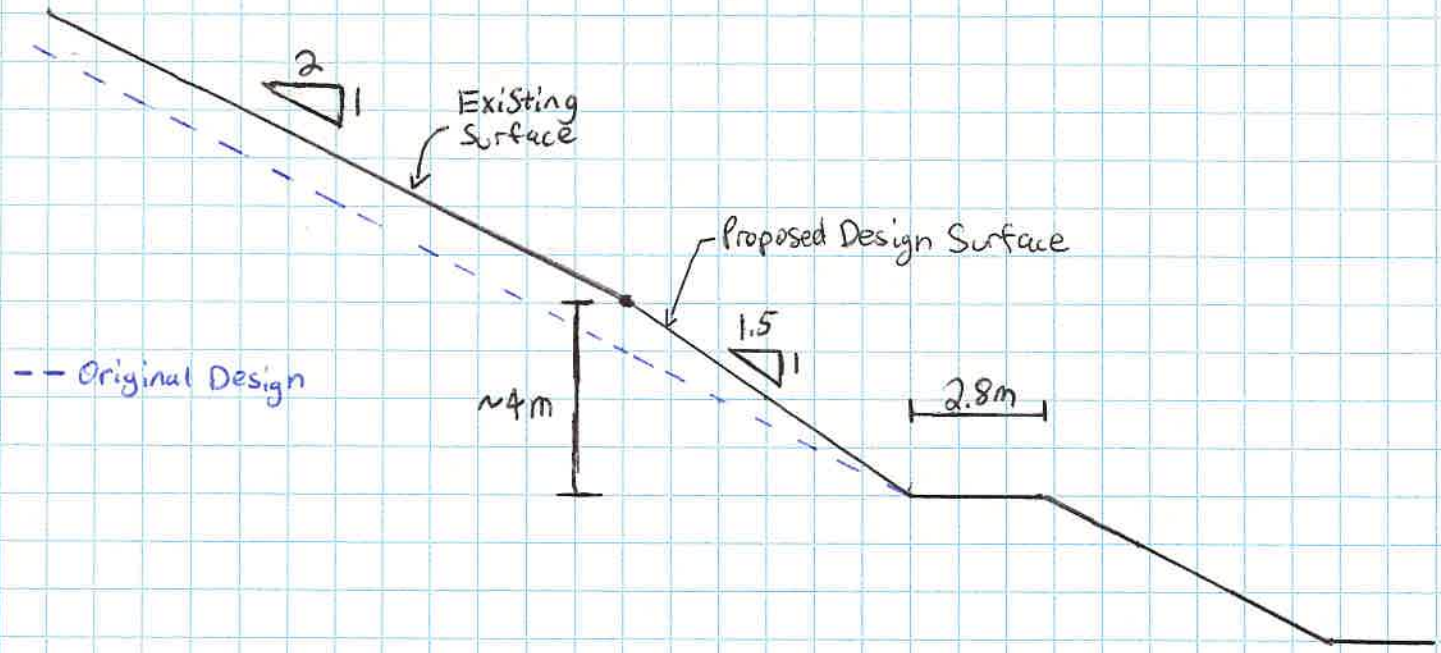
Requested by:

Yuheng Fei		**April 5, 2019**
Name	Signature	Date

RESPONSE

☐ Approved ☒ Approved as noted ☐ Rejected as noted

Response:



Approved for area at the spillway turn as noted by Pelly. If needed in other sections BGC should review and approve. 2:1 slope should be carried to the top of hill and all soil overhangs and trees that may slide into the spillway construction should be removed. This may be modified if weaker zones are observed during construction.

EAGLE GOLD PROJECT

REQUEST FOR INFORMATION

EPCM RFI No.:	**Site Location:** Victoria Gold
Sub-Contractor RFI No.: CC204-RFI-001	**Date Submitted:** 08/25/2017
Subject: Requesting additional culverts	Project Zone/Area:
Sub-contractor: Pelly Construction Ltd.	**Station/Location: HLF Embankment, Topsoil Stockpile B**
Attention: Jeff Depape	**Discipline:**

REQUEST

Related Drawings:	**Other Related Documents:**

Information Request/Description of Issue:

1) Pelly is planning to construct a temporary road within the HLF embankment which allows easier removal of top soil. A culvert is required to allow drainage into the sediment pond below the embankment.

2) Pelly will also be widening an existing section of the Eagle Pub road to allow for heavy truck access to the Topsoil Stockpile B. There is a small section of the existing culvert crossing that's too narrow. Pelly is requesting to extend the existing culvert (900mm) to allow the construction of a wider road section.

Proposed Corrective Action

1) The proposed culvert length is 15.0m and the size of the culvert will be dependent on the recommendation from the owner.
2) The proposed culvert length is 10.0m and the size of the culvert will be 800mm. The proposed culvert will be placed upstream side allowing the culvert to slide into the existing culvert eliminating the need for a collar.

Type of Change: ☐ Owner Change ☐ Clarification/Info ☐ Field Change ☐ Vendor Change ☐ Design Change ☐ Other

Cost Impact:	Cost increase over additional culverts
Schedule Impact:	Allows Pelly to access the Topsoil Stockpile B

Requested by:	**Jason Abel**	**08/25/207**

Subject: Fwd: Cobalt CC205 RFI 1 - Control Pond Outlet structures

In case I didn't send last Friday, below is initial acceptance from Mauricio on proposed outlet structures.

Also pipe all the way at 450mm

I'll follow up with EPG on pipe price for us in the morning.

Richard

Sent from my Samsung Galaxy smartphone.

To: Richard Boehnke <richardb@jdsmining.ca>
Subject: RE: Cobalt CC205 RFI 1 - Control Pond Outlet structures

Richard

As discussed I'm OK with the proposed changes as outlined in your email below. As I mentioned the outlet can be a 450 HDPE all the way, no need to have the 450 and then transition into a 600.

Regards,

Mauricio

Good Morning Mauricio,

Can you please provide an email approving the attached design changes. We need to be sure that the outlet design is acceptable. I can also call you to discuss this morning if you have a few minutes.

Cheers,

Richard Boehnke P Eng

Hi Mauricio,

Just as an FYI, I sent the attached and the below email to the contractor to price out the modifications. Unless you have any objections, we will be proceeding with the design as described here.

I also sent them a separate note clarifying that the bentonite plug will stay in the design.

Let me know if you have any questions or concerns. Looks like I am only available Thursday morning at 8 in Vancouver, if you want to discuss anything. I will be travelling all day tomorrow.

Subject: Cobalt CC205 RFI 1 - Control Pond Outlet structures

Bruce,

After the meeting we had last week, I prepared an RFI for you on the issues we discussed wrt to the control pond outlet structures from EBA-TetraTech design package, WTRM03037-01 - Eagle Gold Design_IFC R2.

Please proceed to price and source out all the materials and installation for work for the clarifications and redesigns in the attached RFI and two sketches provided in the attached documents. ASAP. Then advise cost and schedule of items for construction.

Also, going forward for the work on this contract, please provide an RFI if there are and requests for information, clarifications or proposed design changes for any IFC or specific instructions provided to Cobalt for work here at the Victoria Gold site. I have also attached a blank RFI template for the project.

Let me know if you have any questions or require further clarifications.

Best regards,

Richard Boehnke, P.Eng.

REQUEST FOR INFORMATION

EPCM RFI No.:	**Site Location:** Victoria Gold
Sub-Contractor RFI No.: CC204-RFI-003	**Date Submitted:** 09/06/2017
Subject:	Project Zone/Area: **HLF embankment underdrain pipes**
Sub-contractor: Pelly Construction	**Station/Location: STA 2+88**
Attention: Chris Copley/Jeff Depape	**Discipline:**

REQUEST

Related Drawings: **EGHLF-XD-03-05**	**Other Related Documents:**

Information Request/Description of Issue:
Safeguarding the construction workings to help reduce construction continuation delays in 2018 associated with the underdrains and in-heap sump components.

Frozen conditions coupled with spring freshet, will likely:

- **increase the required effort to restore conditions (ice, snow, mud removal) for construction;**
- **lengthen the schedule for completing the in-heap sump scope of work, a critical path component to other pipe and geomembrane activities within the HLF;**

Deferral of 160mm/6" SDR9 pipe order and installation, will likely:

- **lengthen the schedule for completing the in-heap sump scope of work, a critical path component to other pipe and geomembrane activities within the HLF;**

Proposed Corrective Action

(1) Further clearing and grubbing to limits (to be provided by JDS) outside of the in-heap pond sump.
(2) Further underdrain installation 160mm/6" SDR9 below and safely past the in-heap pond sump (assuming SDR9 pipe availability for completion this fall) or can this section be completed with continuation of SDR11, including approval to order required materials (which in itself may be worth considering in 2017 versus waiting for 2018; this approach may also protect the underdrains from inadvertent damage at exposed ends when excavating/preparing the sump area in 2018.
(3) Establishing diversion ditching upslope of the works, temporary or otherwise, to help direct freshet runoff away from the workings, reduce amount of ice, water and off-spec material (mud) that will need be removed from the sump area.

Type of Change:	☐	Owner Change	☐	Clarification/Info	☐ Field Change
	☐	Vendor Change	☐	Design Change	☐ Other

Cost Impact:	**Incremental to 2017, but most likely an overall savings in schedule driven costs attributed to 2018 construction.**

STRATAGOLD
EAGLE GOLD PROJECT

Schedule Impact:	**Lower risk to startup and delays affecting 2018 schedule**

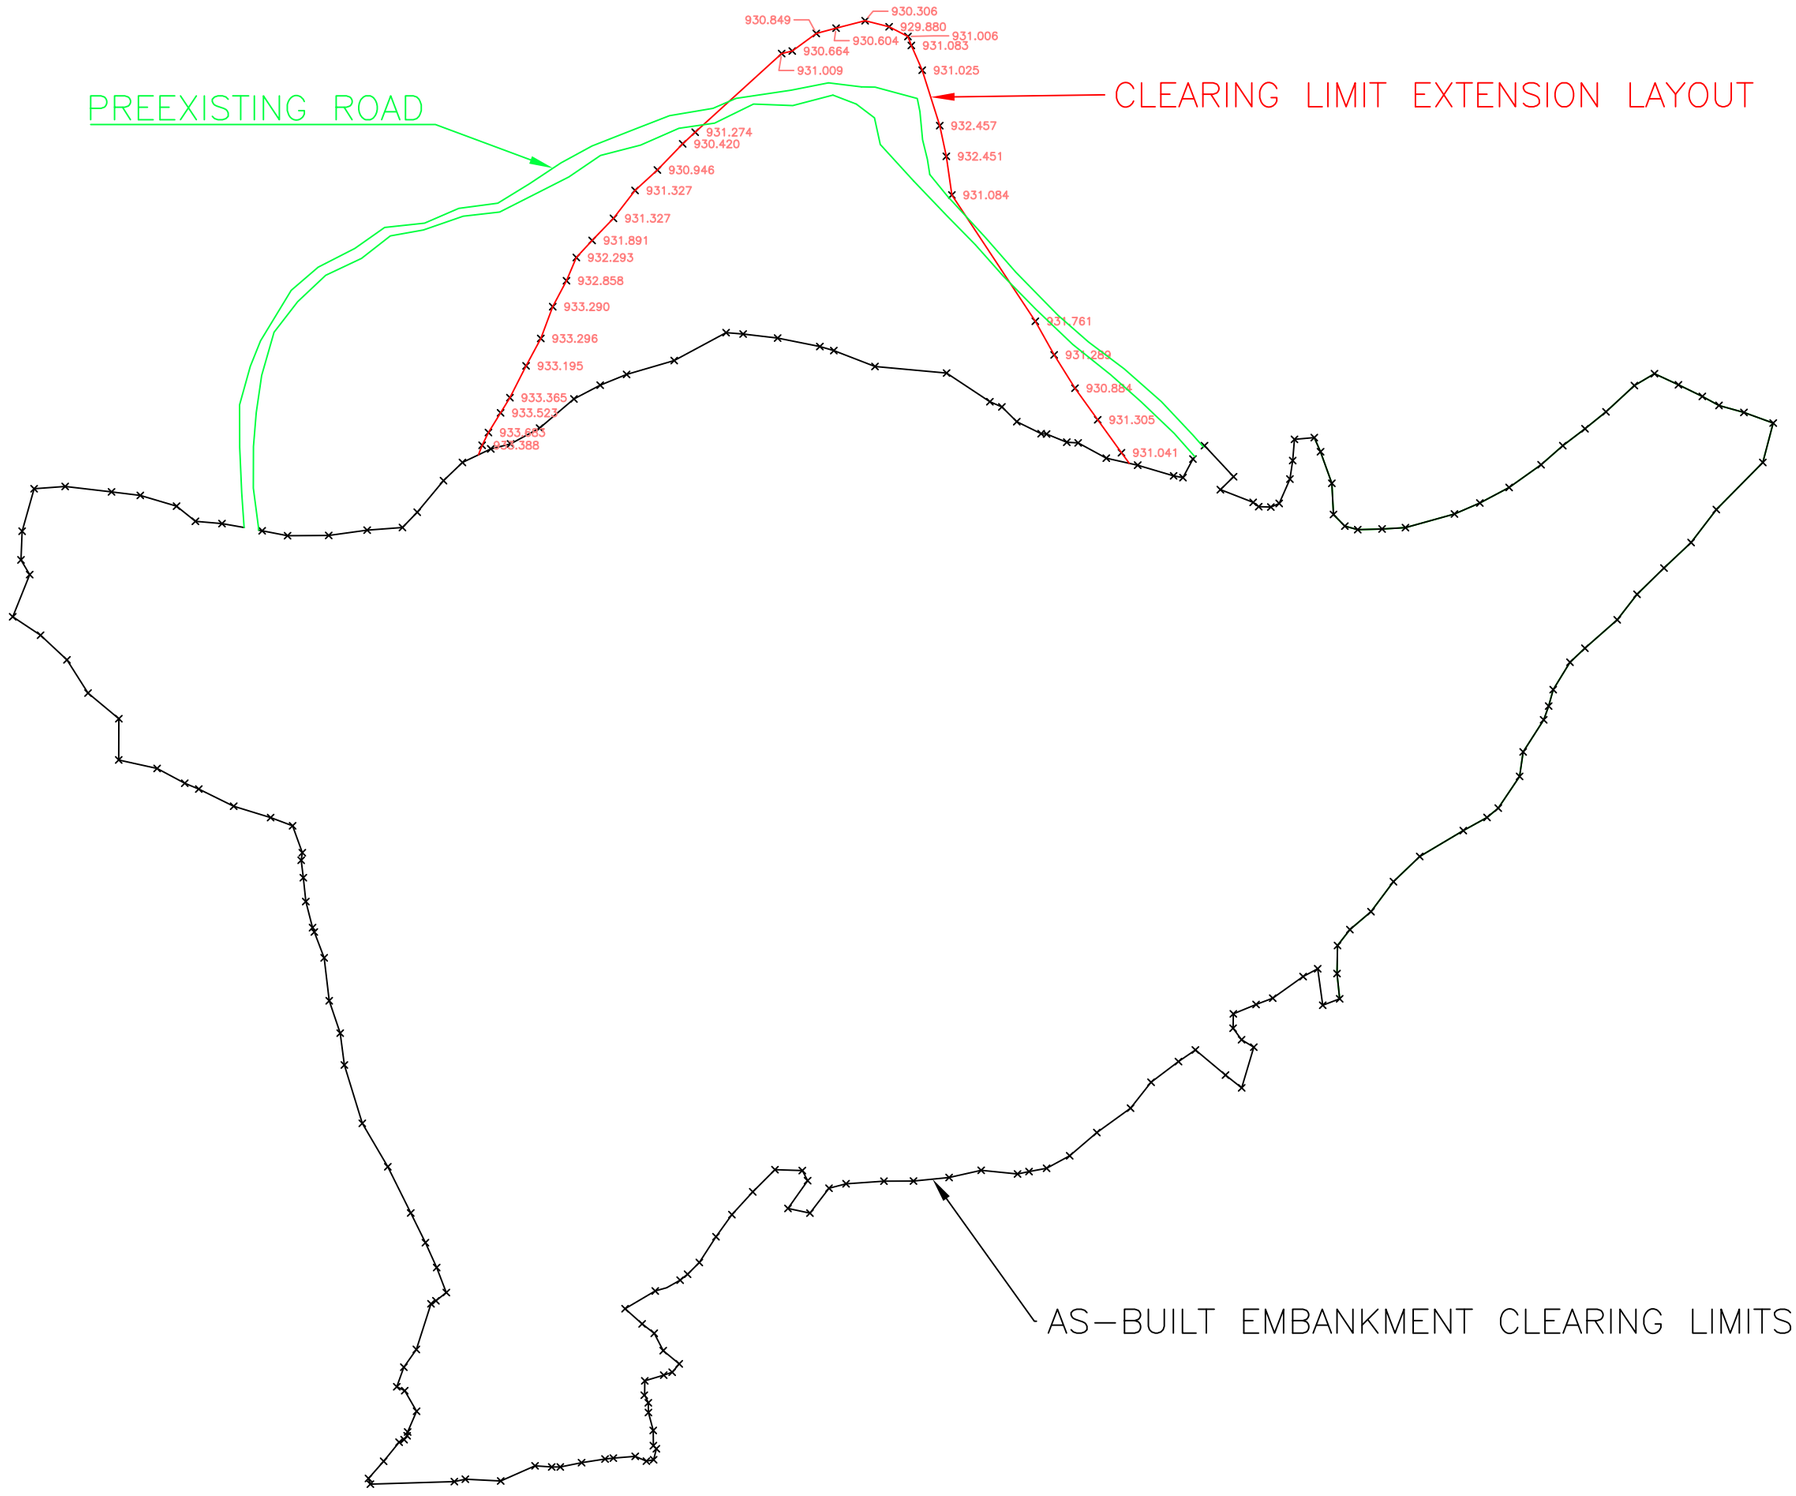
RESPONSE

☐ Approved ☐ Approved as noted ☐ Rejected as noted

Response:

1: Contractor to clear area required to access the in-heap pond sump safely and practically.



2: BGC agrees and approves the continuation beyond the closure sump for off-season protection as described. The transition to 160mm DR9 pipe will occur at approximately Station 0+400. Please advise if this length beyond the closure sump I adequate for this year's construction.

3: Contractor to proceed with establishing diversion ditches upslope of works. Contractor to propose alignment of ditches for review to EPCM supervisor for approval prior to proceeding.

Hi Dan,

Calvin will respond formally to the RFI, but in concept, this is approved as discussed. SDR11 can be extended to the upslope side of the sump.

Can you please also RFI the lift thickness spec we discussed last night and I'll run that by Troy as well?

Thanks,
Chris

	Name	Signature	Date

Note: Response to this RFI does not constitute authorization to perform a change to any Contract. The Requestor may proceed with the response only on the basis

The borrow for use as general fill is defined as "course grained colluvial/alluvial soils or weathered bedrock with little or no ice content and/or coarse grained sands and gravels with zones of variable ice content." The excavated material coming from the ADR cut is beginning to turn hard. If it continues to be rippable it should meet the criteria for weathered bedrock which is within specification.

Should the material become unrippable, it will be necessary to complete the excavation by drilling and blasting, the resulting material should still be quite satisfactory and is likely to be denser than the specified general fill and still be porous enough to better aid in the prevention of pore pressure build up from moisture entering the embankment from the insitu contacts. Good consolidation can be achieved by placing the material in 0.5 meter lifts and consolidating by cat packing and passing over each lift with a vibratory compactor equipped with Elliot Grid drum surface. Any pieces larger than can be accommodated in the lift could be bladed off of the fill. There would be no change in the unit prices other than the drill and blast costs that will be incurred in any case.

If the use of shot rock is not permitted in the embankment, the alternative is to take that material to the waste dump and replace it with other material which may be very hard to source nearby. This would raise the cost of the embankment fill considerably.

Response to CC204-RFI-006

To:	**D'Arcy Comerford**	**Project:**	**Eagle Gold HLF**
Company:	**JDS**	**Project No.**	**0792021**
From:	**Roy Morlan**	**Date:**	**May 10, 2018**
Copied:	**Troy Meyer; Dan Granda**	**Record:**	**Response to CC204-RFI-006**

Re: Response to CC204-RFI-006:

1.0 INTRODUCTION AND OBJECTIVE

Use of rock generated from blasting for Rockfill as a substitution for structural fill is permittable. A final determination of Rockfill suitability should be evaluated by BGC once the material is generated. In general, Rockfill used in the embankment should conform with the following:

- Shot-rock will generally be allowed provided it meets the requirements for Rockfill in the project specifications.
- The rockfill shall generally have 300 mm maximum rock particle size and oversized rocks larger than 300 mm shall be removed to the exterior fill slopes. Rocks larger than 300 mm may be incorporated in thicker fill lifts provided the rocks do not protrude from the lift surfaces after compaction and the required compaction of the lifts is proven achievable by a test fill.
- Larger particles (>8”) should have a rock strength of at least an R3 on the International Society of Rock Mechanics Field Identification Hardness Scale.
- A test fill should be performed using the Rockfill material to determine the lift size and compaction/wetting method. A lift thickness of 50cm has been proposed by Pelly and can be tested with a test fill. The max Rockfill particle size should be 2/3 the lift thickness. Therefore, a 50cm lift would require a maximum particle size of 33cm (13 -inches). Other lift thicknesses can also be tested depending on the maximum particle sizes being generated.
- Rockfill and Structural Fill lifts cannot be interbedded. Rockfill and Structural Fill materials cannot be interchanged during construction of a single lift. Zones defined in EPCM-RFI-002 should be maintained.
- A method for keying the rockfill and structural fill zones should be proposed by Pelly and reviewed by BGC. It should include the equipment proposed to do the work.

- The QC program for Rockfill placement at the embankment will be developed by BGC after the test fill observations.

Response to CC204-RFI-022

To:	**Calvin Goldschmidt**	**Project:**	**Eagle Gold HLF**
Company:	**JDS**	**Project No.**	**0792021**
From:	**Roy Morlan**	**Date:**	**June 16, 2018**
Copied:	**Troy Meyer; Dan Granda**	**Record:**	**Response to CC204-RFI-022**

Re: Response to CC204-RFI-022:

1.0 RESPONSE

The use of rockfill for construction of the HLF embankment was approved and initially described in EPCM-RFI-002. A drawing was included in the response to that RFI to provide guidance for the use of Rockfill and is presented as ***Figure 1***.

Sketch illustrating acceptable area for placement of Compacted Rockfill, shown in red shade. Background drawing (black) is for reference only, not for construction.

Figure 1: Figure included in response to EPCM-RFI-002 showing the general configuration of Material 7 – Rockfill and Material 3 – Structural Fill in the embankment.

CC204-RFI-022 requested design lines provided in a dxf/dwg file. Design lines cannot be provided by BGC because the amount of Structural Fill Pelly will substitute with Rockfill is unknown to us. For this reason we provided the general guidelines in the EPCM-RFI-002 response.

The following response provides further clarification to the use of Material 7 – Rockfill in the embankment to help Pelly plan for its use.

Configuration of Zones

BGC originally approved the use of Material 7 using the dimensions shown in Figure 1. Take-off volumes for the conditions set forth in Figure 1 were provided to Pelly and JDS via email on May 5, 2018. As shown in Figure 1, rockfill should be placed in a separate zone downstream of the structural fill core. The structural fill should have a base of a minimum of 50 m measured from the center line of the crest to the downstream toe of the Structural Fill core zone. The contact between the Rockfill and Structural Fill on the downstream side of the embankment should be sloped in the downstream direction and should not be greater than 1 vertical for every 2 horizontal. A near horizontal slope at the contact between the Rockfill and Structural Fill is not acceptable as it can potentially create a zone susceptible to increased pore water pressure and/or water accumulation at this contact. Rockfill and Structural Fill cannot be interbedded. The height of the structural fill on the downstream side of the embankment will be governed by the final thickness of rockfill and the downstream slope of the Structural Fill/Rockfill contact. Rockfill cannot be in contact with Material 2 – Select Fill used as bedding underneath the upstream liner system.

Construction Considerations

If Rockfill is used in the construction of the embankment lift thicknesses should be chosen to allow the Rockfill to be easily tied into the Structural Fill lifts. Downstream lifts should be keyed into upstream construction by removing all lose material from the face of the slope and excavating a key platform to allow a minimum 1m overlap (measured horizontally). Key platforms must be prepared as a typical lift surface prior to placement and compaction of the Rockfill lift as is required in the Technical Specifications.

Alternative Sloping of the Contact Between Rockfill and Structural Fill

Alternative grade breaks in the contact between Rockfill and Material 3 – Structural Fill can be considered. The location of the grade break would be determined by the volumes of materials being generated. Pelly should propose a grade break based on material quantities available and constructability. All grades used at the contact between the rockfill on the downstream side of the embankment should be a minimum 1 vertical for every 2 horizontal. Slopes should be sufficient to allow water filtration from the overlaying rockfill to drain towards the downstream underdrain. An example of the grade break proposed by Pelly is included in ***Figure 2***.

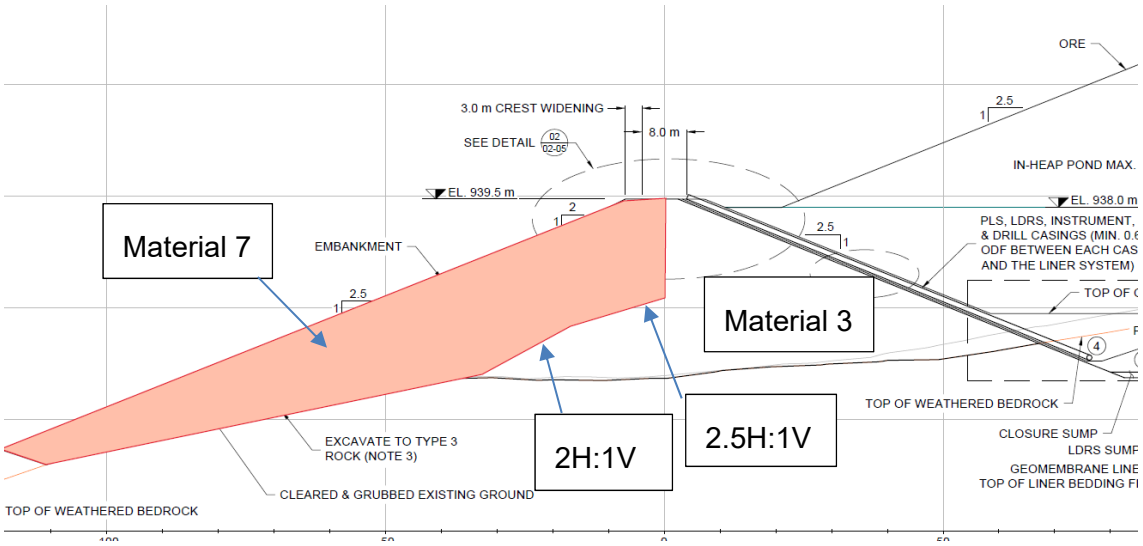

Figure 2: Example of potential grade break.

Upstream Construction Phasing

Pelly discussed the potential use of upstream construction by building a portion of the upstream embankment face with Material 3 then completing the remaining raise of the dam using both Material 3 and Material 7 as shown in ***Figure 3***. This is an acceptable method if Pelly finds it more efficient to construct. Configurations of zones should follow the layout previously discussed in this document. Downstream embankment phases must be keyed into the upstream phase as discussed earlier in this document. The top surface of the Phase 1 construction should be prepared like a typical lift surface as discussed in the Technical Specifications.

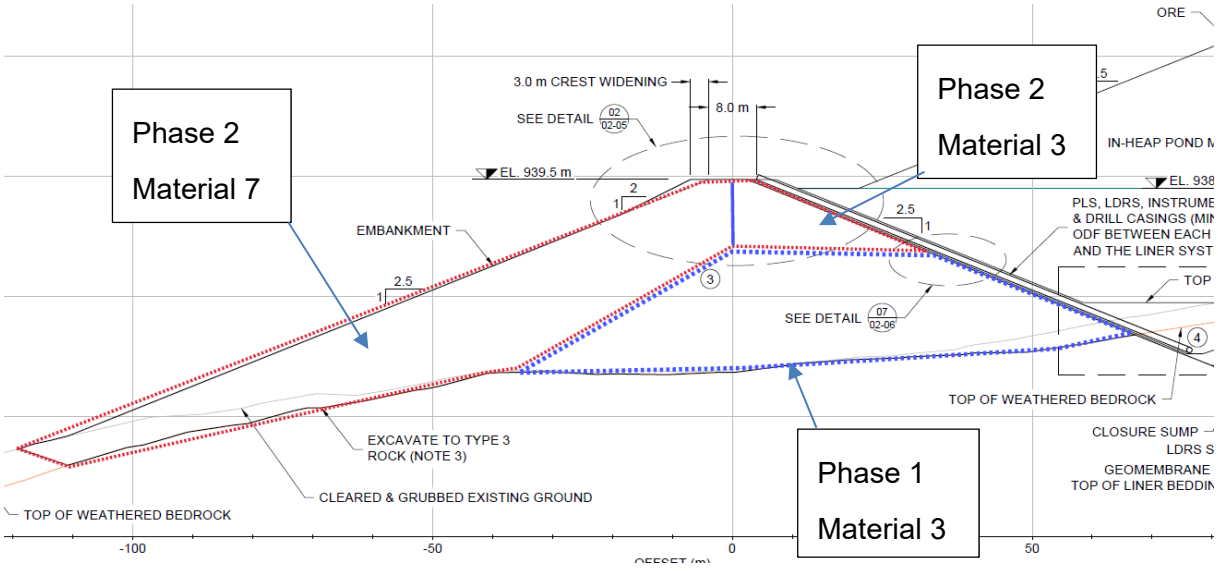

Figure 3: Phase construction proposed by Pelly.

Construction using Material 3 over Material 7

The use of Material 3 over Material 7 is not recommended as it can result in piping from the Material 3 into the Material 7. Options to prevent piping in such a configuration would include development of transition zones and/or engineering the gradation of both the Material 3 and 7. Both options would limit the availability of the materials, increase the complexity of the design, and could add a significant amount of cost to the project.

Information Request/Description of Issue:

Issue:

(1) The majority of surface water and groundwater seepage is found at the interface between colluvial material and bedrock, as a result, the use of temporary sumps and ditching in the overlying colluvium are not sufficient to capture/divert upslope drainage from reaching embankment underdrain system during course of construction.

The colluvium materials exhibit signs of high moisture: a solution is required to help drain elevated moistures in advance of subsequent pad development while helping to reduce unsuitable material classification that results from excessive moisture content.

The wet colluvium materials and drainage along bedrock contacts is already disruptive to planned productivities in achieving timely embankment construction and threatens to delay further embankment and pad area preparations if not sufficiently addressed.

(2) Potential encroachment conflict between underdrain piping and overlying liner and PLS collection systems.

(3) IFC drawings showing a pitchfork arrangement for the closure underdrain that splits into 3 runs leading up to the closure sump. This was changed from Y connections in the course of the draft drawings in response to procurement options that were being explored.

(4) The drawings do not specify the exact type of ADS N12 product to use, therefore Pelly is seeking formal approval of the ADS N12 pipe material that our vendor can supply.

Proposed solution for approval relative to above numbering:

(1)

a. Begin construction of pad area underdrains upstream of the embankment. Pelly seeks approval to proceed with the sump and pad area underdrain installations (associated with this will be COR#3 pertaining to

4110.5.03/04 pad area underdrains, to follow after confirmation of the construction approach).

b. Help ensure drainage occurring at the interface with bedrock is most efficiently captured by the underdrains by excavating trenches for the underdrains such that the underdrains are sufficiently recessed below the bedrock contact, including consideration for Select Fill and Select Drain Fill.

   i. Trench spoil will be side cast as there will be no practical means to achieve hauling access for loading out materials; colluvial and bedrock materials will both be casted and mixed together.

   ii. Once the headers and laterals are installed, colluvium to design depth will be dozed down slope, above/across installed underdrains for loading out where practical truck access may be achieved.

(2) Pelly requests a 3D profile of the trench before backfill that establishes the maximum elevation profile for underdrain piping occurring below the PLS header piping. This is needed to ensure a minimum excavation depth such that there is no encroachment on the liner and PLS collection system requirements, with consideration for minimum thicknesses for Select Fill and Select Drain Fill, liner bedding and geometries as may be applicable.

(3) Revert to Y connection arrangement as originally shown on EGHLF-XD-03-05 REV A; insofar as the Y type connections versus a cross connection with 2x 90 degree elbows to establish the 3 runs to the closure sump.

(4) ADS N12 BXS HDPE Perforated Corrugated.

Re: Response to CC204-RFI-037:

1.0 RESPONSE

Response to Question 1: The use of heap leach underdrains as water control for construction.

Construction of the Header Trench and Lateral Trenches into Bedrock

The Header Trench and Lateral Trenches will meet the design intent if excavated into the upper bedrock zone and the drains constructed. If done so, the final construction to grade should be as shown in ***Figure 1*** where colluvium will separate the drain construction from the liner system. Construction can be done prior to preparation of subgrade at the Phase 1 HLF, as is suggested in the RFI. BGC would provide approval of what constitutes the upper bedrock zone based on the Technical Specifications. Excavation should not be performed unless BGC is present.

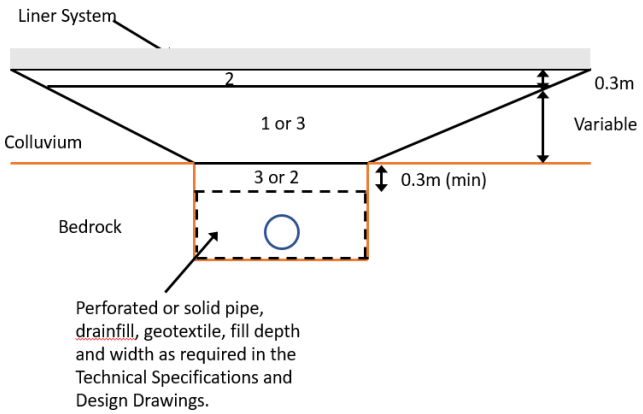

Figure 1: Typical completed drain trench design when build in bedrock with colluvium overburden.

Construction considerations

The following construction considerations should be taken into account:

- Trench spoils can be side cast from the trench with the assumption that they will be removed or used later in construction.
- Trench spoils may be used to backfill in the trench. However, the spoils must meet requirements in the Technical Specifications for the zone it will be used in (i.e. Material 1, Material 2, or Material 3).
- Dozing over drain construction is acceptable if the drain fill maintains a cover of at least 0.3m. Trafficking over a drain with less than 0.3m of cover may result in excavation and re-construction of the drain due to the potential for damaging of the drain pipe.
- If dozing during site grading results in undercutting of the pipe trench fill materials or adjacent bedrock then the undercut area will be filled back to grade with Material 2 or Material 3. Damage to the geotextile in the drain will result in excavation and repair of that drain.
- All Lateral Drains must be sloped at a minimum of 2% towards the Header Trench through the entire run of the drain.
- If high velocity water flows are observed in the drain trenches measures may be needed to reduce the volume and/or flow velocities in order to place materials.
- Material 2 and Material 1 must be graded such that they are filter compatible when placed next to each other. The field engineer will determine compatibility based on lab testing and recommend mitigation measure (such as geotextile separation) if appropriate.
- Drain construction (i.e select drain fill, geotextile, and 30cm cover) should be protected from erosion caused by surface flow. This can be done by placing sacrificial lifts above the construction. Pelly can propose other methods to protect the construction for BGC's review.
- Installed drain rock, piping, and geotextile should not be left exposed where siltation can occur.
- The final spacing, location, and number of the laterals may be altered by the field engineer to accommodate observed field conditions and/or to collect observed seeps and drain wet areas.

Response to Question 2: 3D profile

BGC can provide a 3D profile of the Lateral and Header pipe trenches before backfill, pursuant on JDS's approval of the costs associated with the effort. For Pelly's planning purposes it should be understood that before a profile can be generated BGC will need to be provided a detailed topography and raw data for the entire area to be modeled with a resolution of 1m. BGC will require 7 days from the time we receive this data to complete the model and perform quality control.

Response to Question 3: Y Connection

A Y connection will be acceptable.

Response to Question 4: ADS N12

The cell classification for ADS N12 BXS HDPE perforated, corrugated pipe provided does not meet all criteria of the Technical Specifications. Pelly should provide pipe manufacture information that shows a minimum compliance with all cell classification or an explanation from the pipe manufacture how a comparable test method shows compliance with the cell classifications.

Pelly should provide BGC specifications sheets showing that the perforations in the pipe meet the required standards referenced in the Technical Specifications.

Via an email sent by Dan Russel (Pelly) on June 21, 2018 Pelly has also asked for approval to remove wire ties from the ADS N12 installation. BGC recommends that the wire ties not be removed due to risk of pipe separation.

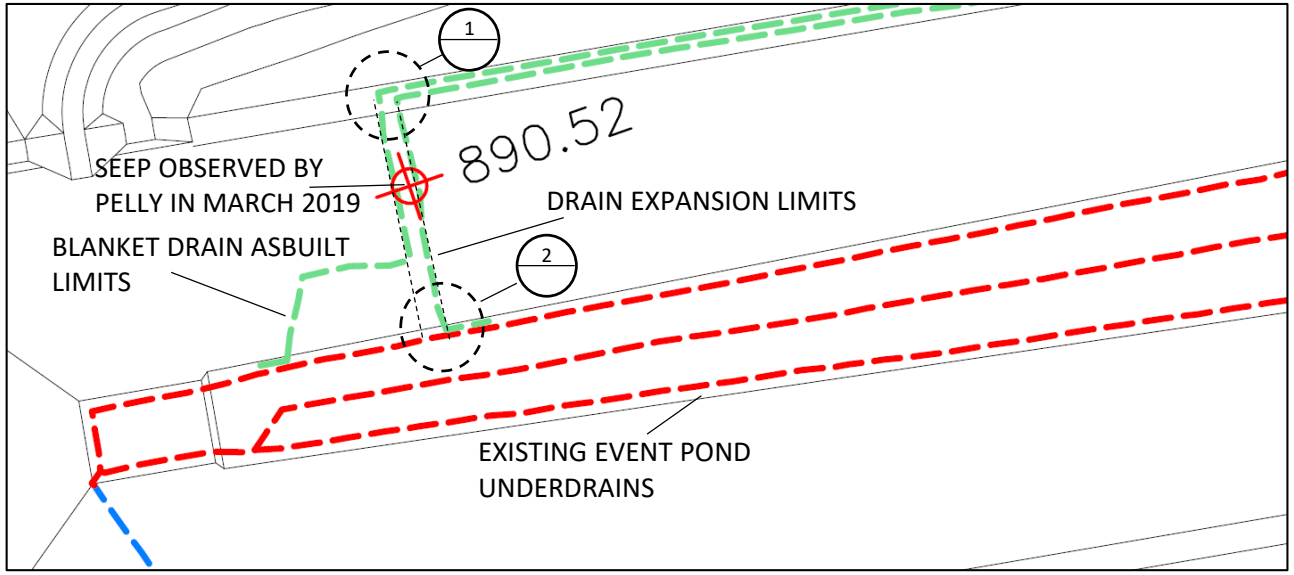
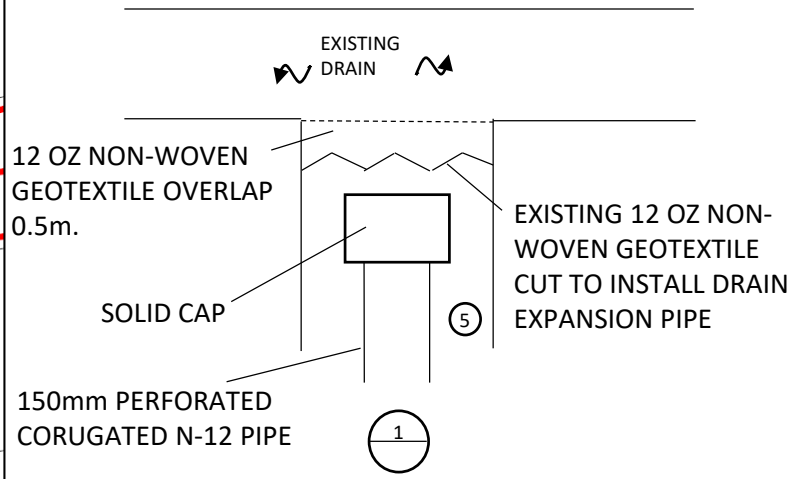
Response to CC204-RFI-048

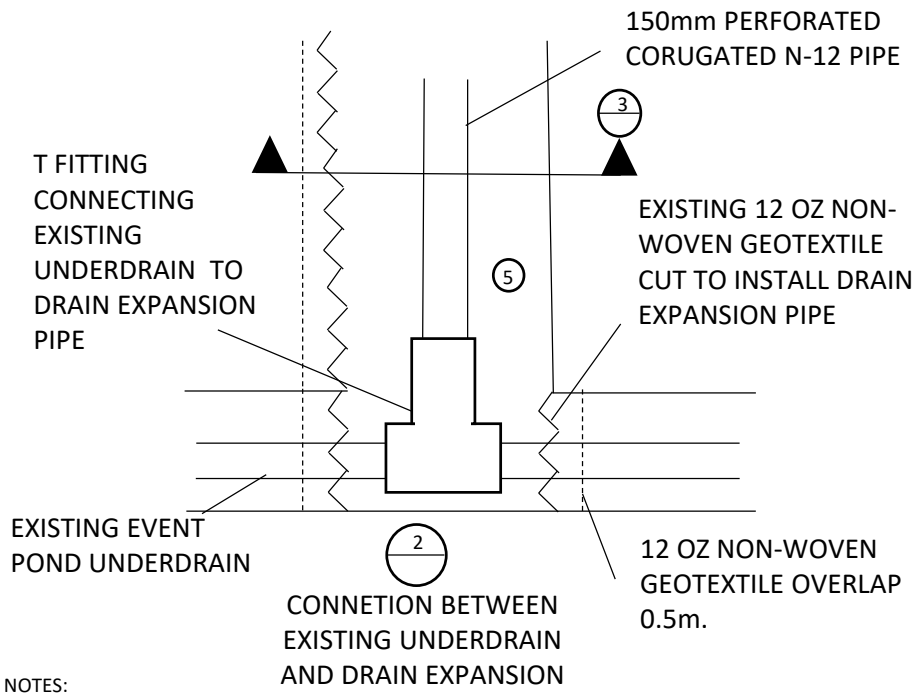


To:	**Calvin Goldschmidt**	**Project:**	**Eagle Gold HLF**
Company:	**JDS**	**Project No.**	**0792021**
From:	**Roy Morlan**	**Date:**	**April 7, 2019**
Copied:	**Troy Meyer**	**Record:**	**Response to CC204-RFI-048**



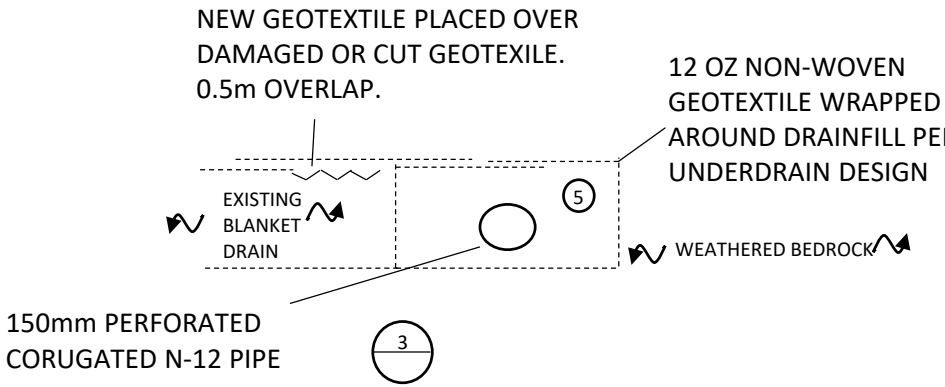
Re: Response to CC204-RFI-048:

1.0 RESPONSE



To mitigate the seeps on the north side of the Event Pond wall the blanket drain on the north wall was excavated and replaced with a piped drain as shown in ***Figure 1***.

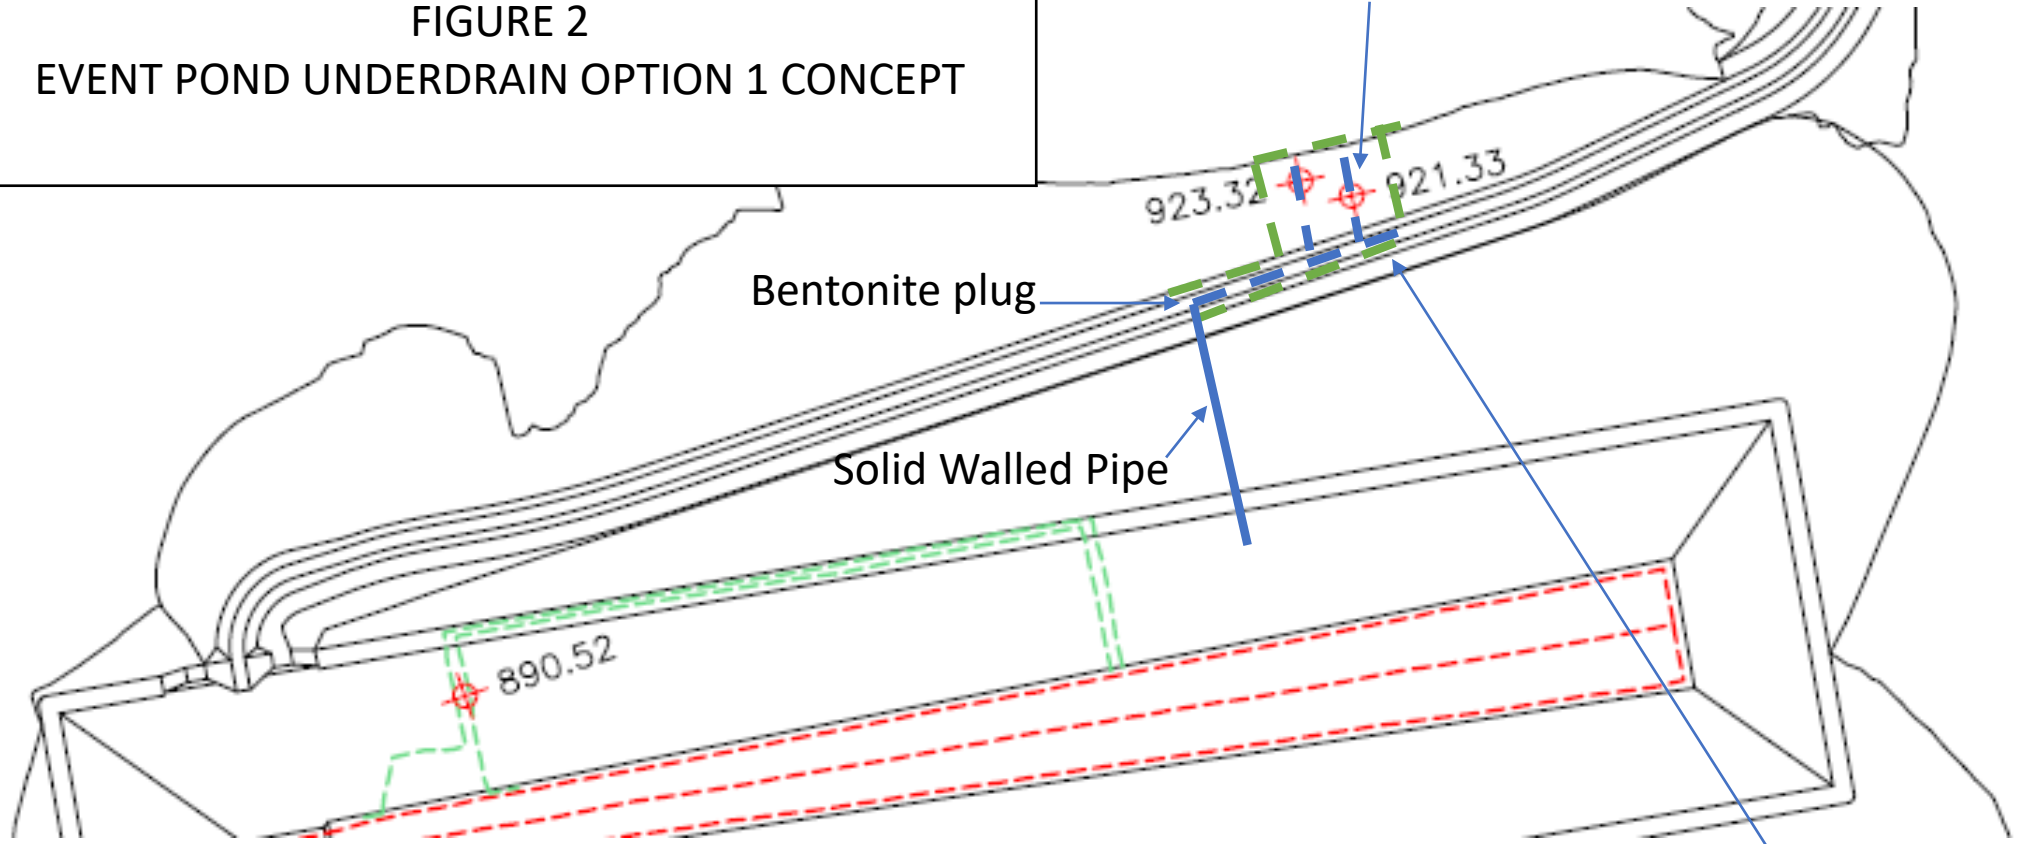
To mitigate seepage along the spillway alignment an underdrain will be constructed. Three concepts were presented to JDS and Pelly for this drain. One providing a drain outlet to the lined Event Pond (***Figure 2***), one connecting the spillway underdrain to the Event Pond underdrains (***Figure 3***), and one diverting the spillway underdrain into a lined channel and discharging it to the west of Event Pond and away from the waste pile next to the Event Pond (***Figure 4***). JDS requested a design for the 3rd option believing it is more constructible. JDS also requested that the underdrain not be located directly under the spillway therefore it was moved to the northern extent of the spillway construction. The general design for this underdrain follows the typical underdrain design discussed in the IFC drawings with field fitting modification assumed and the special requirements discussed in ***Figures 5, 6, and 7***.



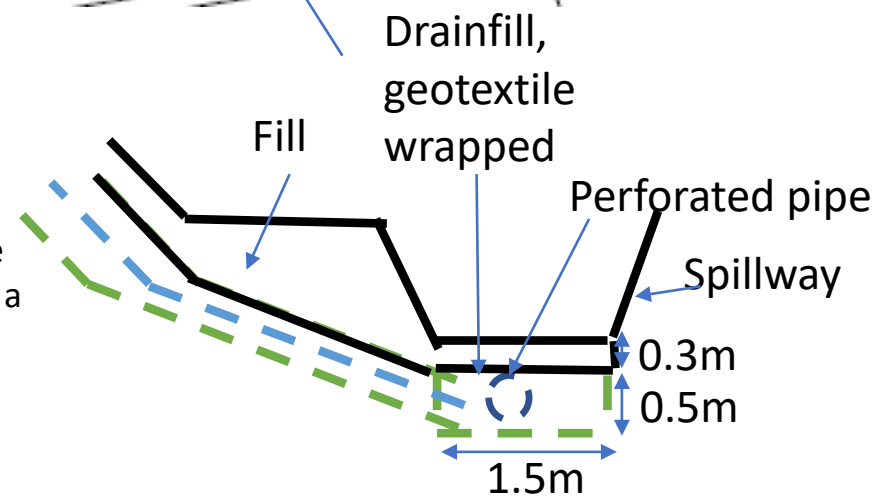
CONNECTION BETWEEN EXISTING FINGER DRAIN AND DRAIN EXPANSION

CONNETION BETWEEN EXISTING UNDERDRAIN AND DRAIN EXPANSION

TYPICAL DRAIN EXPANSION DETAIL



NOTES:
1. Drain size field fit to current blanket drain finger size or wide enough to install piping properly.
2. Damaged geotextile should be overlapped with new geotextile by 0.5m.
3. Drain design is typical for Event Pond udnerdrains as shown in drawings EGHLF-XD-07-03 unless otherwise specified in this drawing.
4. (5) = Material 5: Select Drain Fill
5. Not to scale.

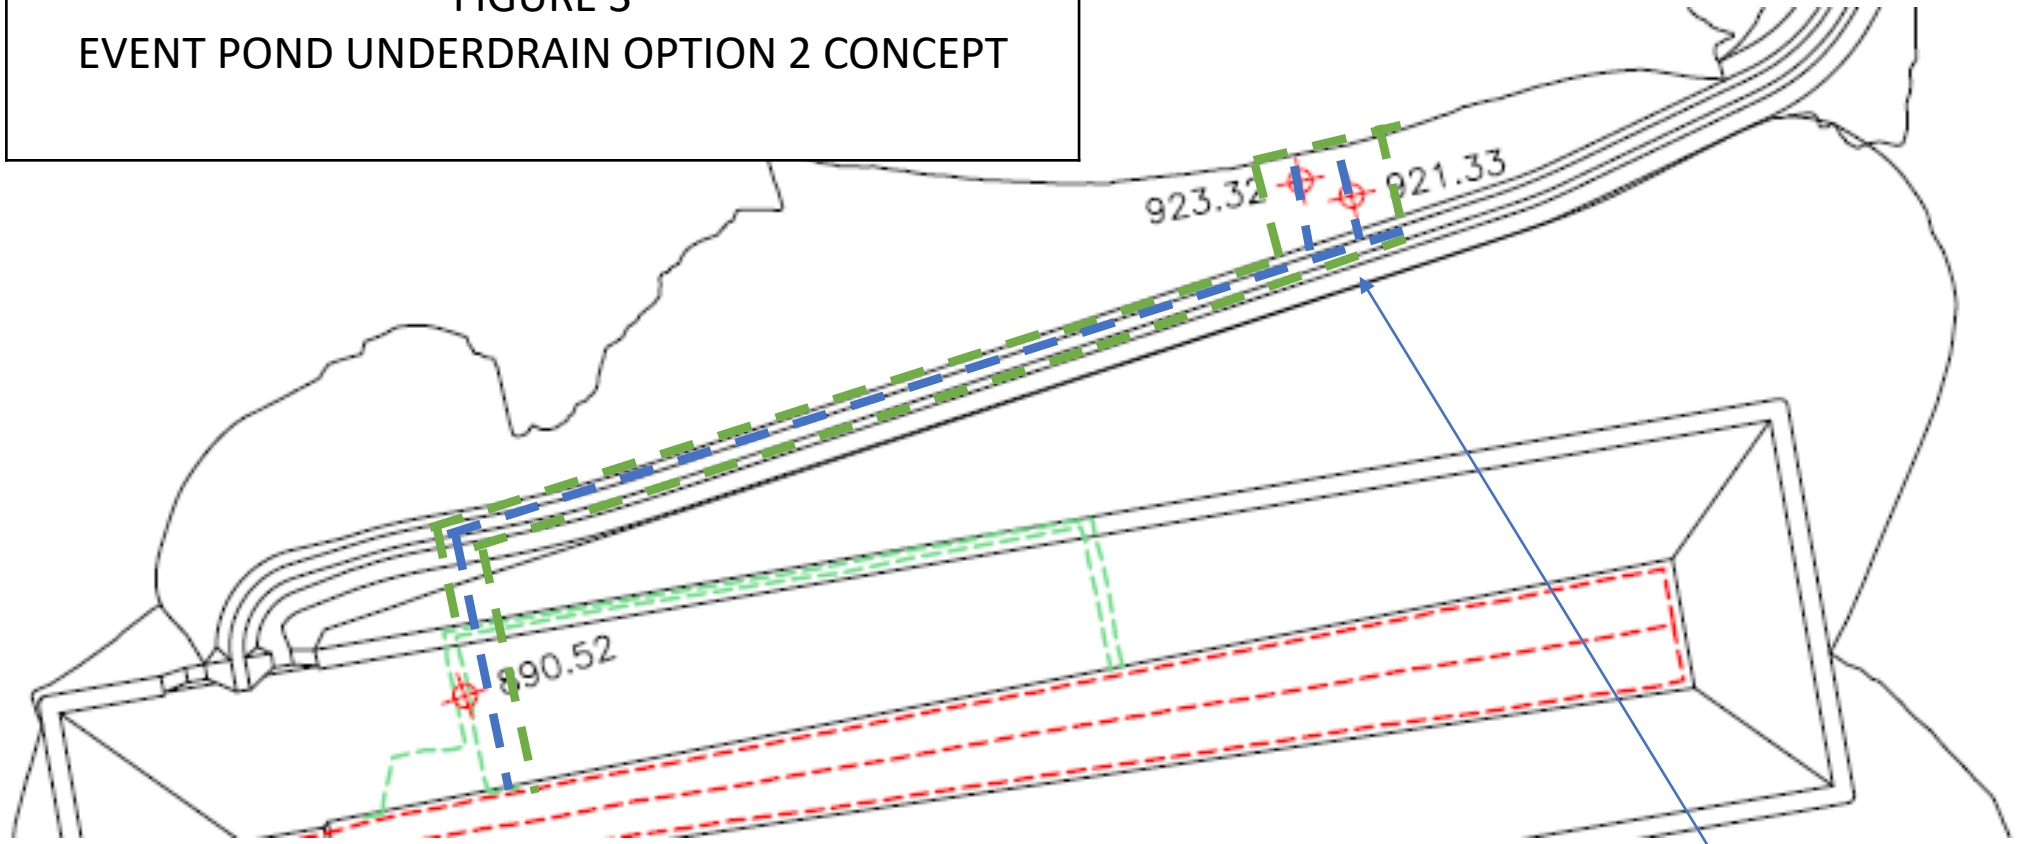


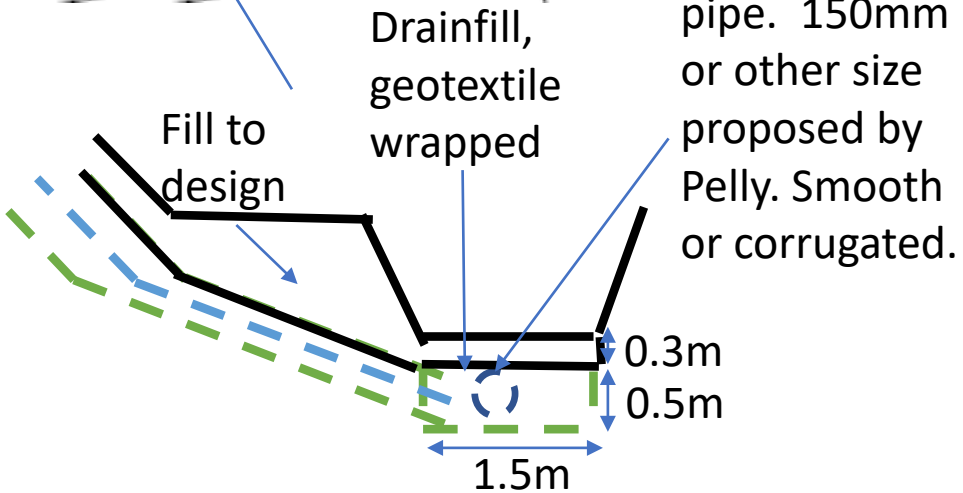
EAGLE GOLD – HEAP LEACH FACILITY

FIGURE 1
EVENT POND BLANKET DRAIN EXPANSION DETAILS

EAGLE GOLD – HEAP LEACH FACILITY

FIGURE 2
EVENT POND UNDERDRAIN OPTION 1 CONCEPT

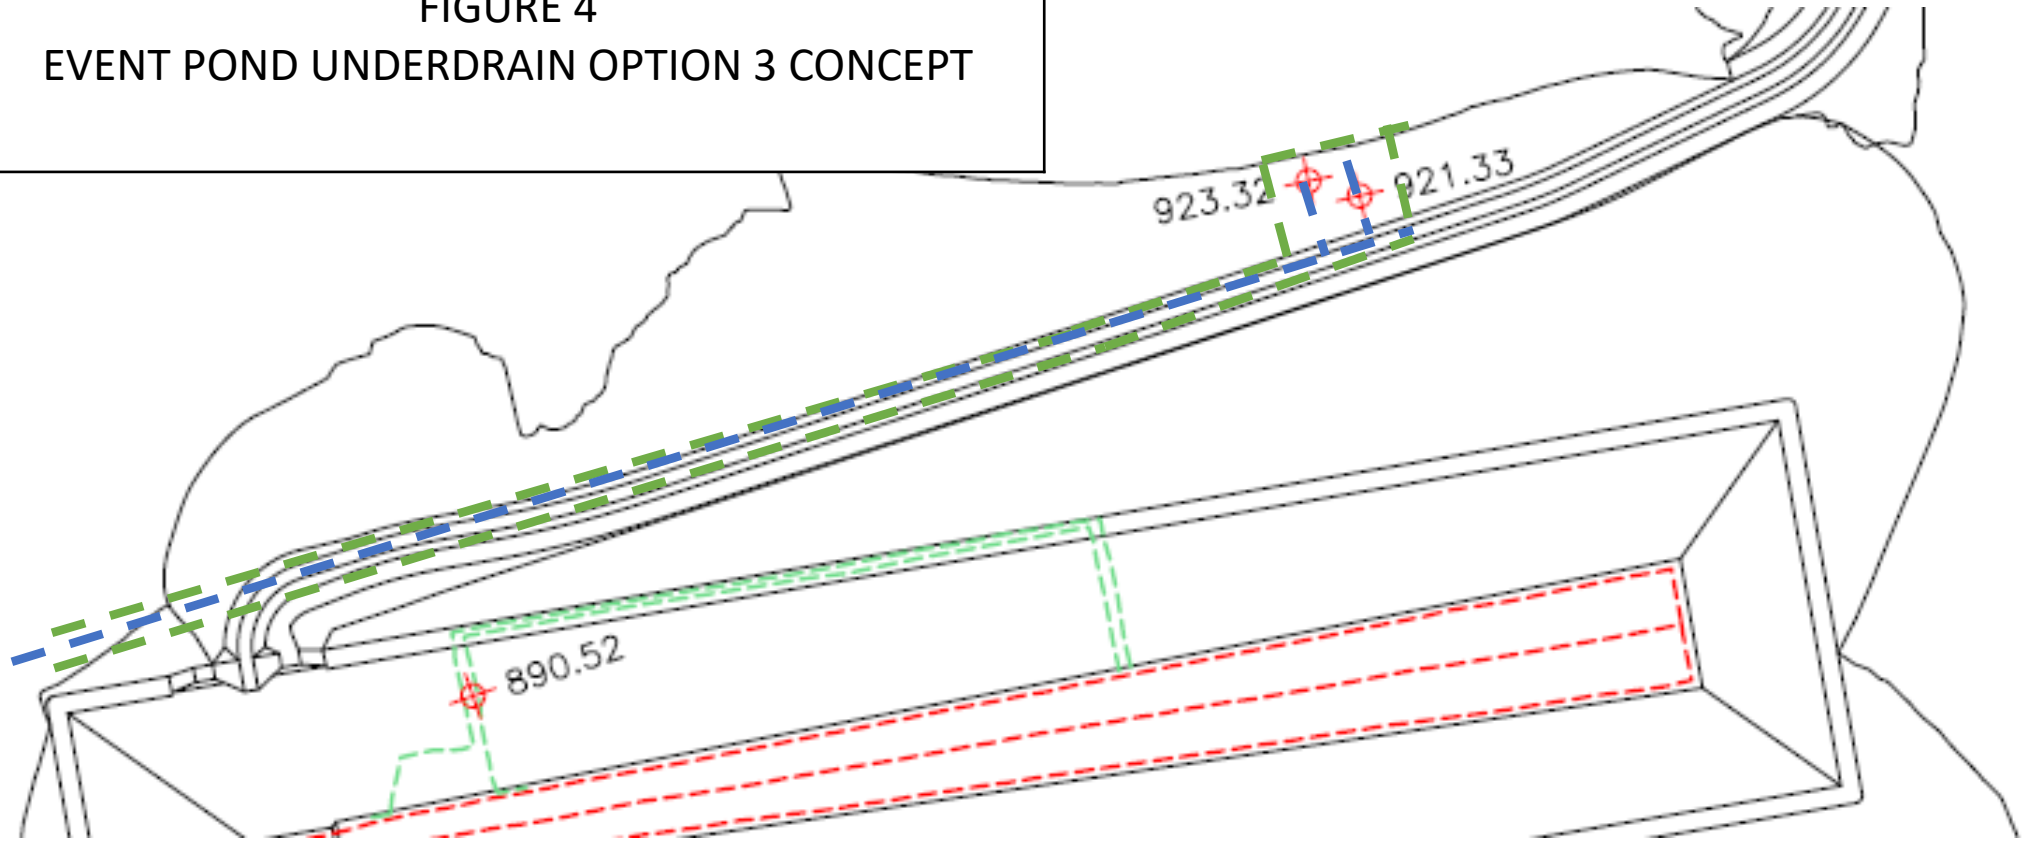


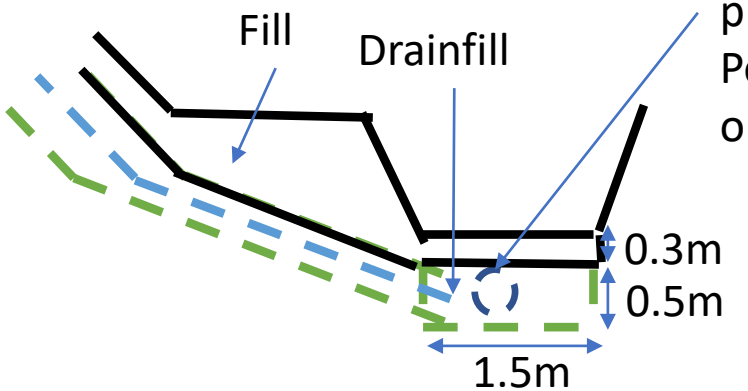


Drain ending with bentonite plug and solid walled (non perforated) pipe. Solid walled pipe can be run above ground or buried and flow into the lined event pond or around it to the east of there is a suitable place to discharge. Solid pipe would need to be affixed or supported to prevent it from damaging the bentonite plug. Pipe would need winterization.

EAGLE GOLD – HEAP LEACH FACILITY

FIGURE 3
EVENT POND UNDERDRAIN OPTION 2 CONCEPT

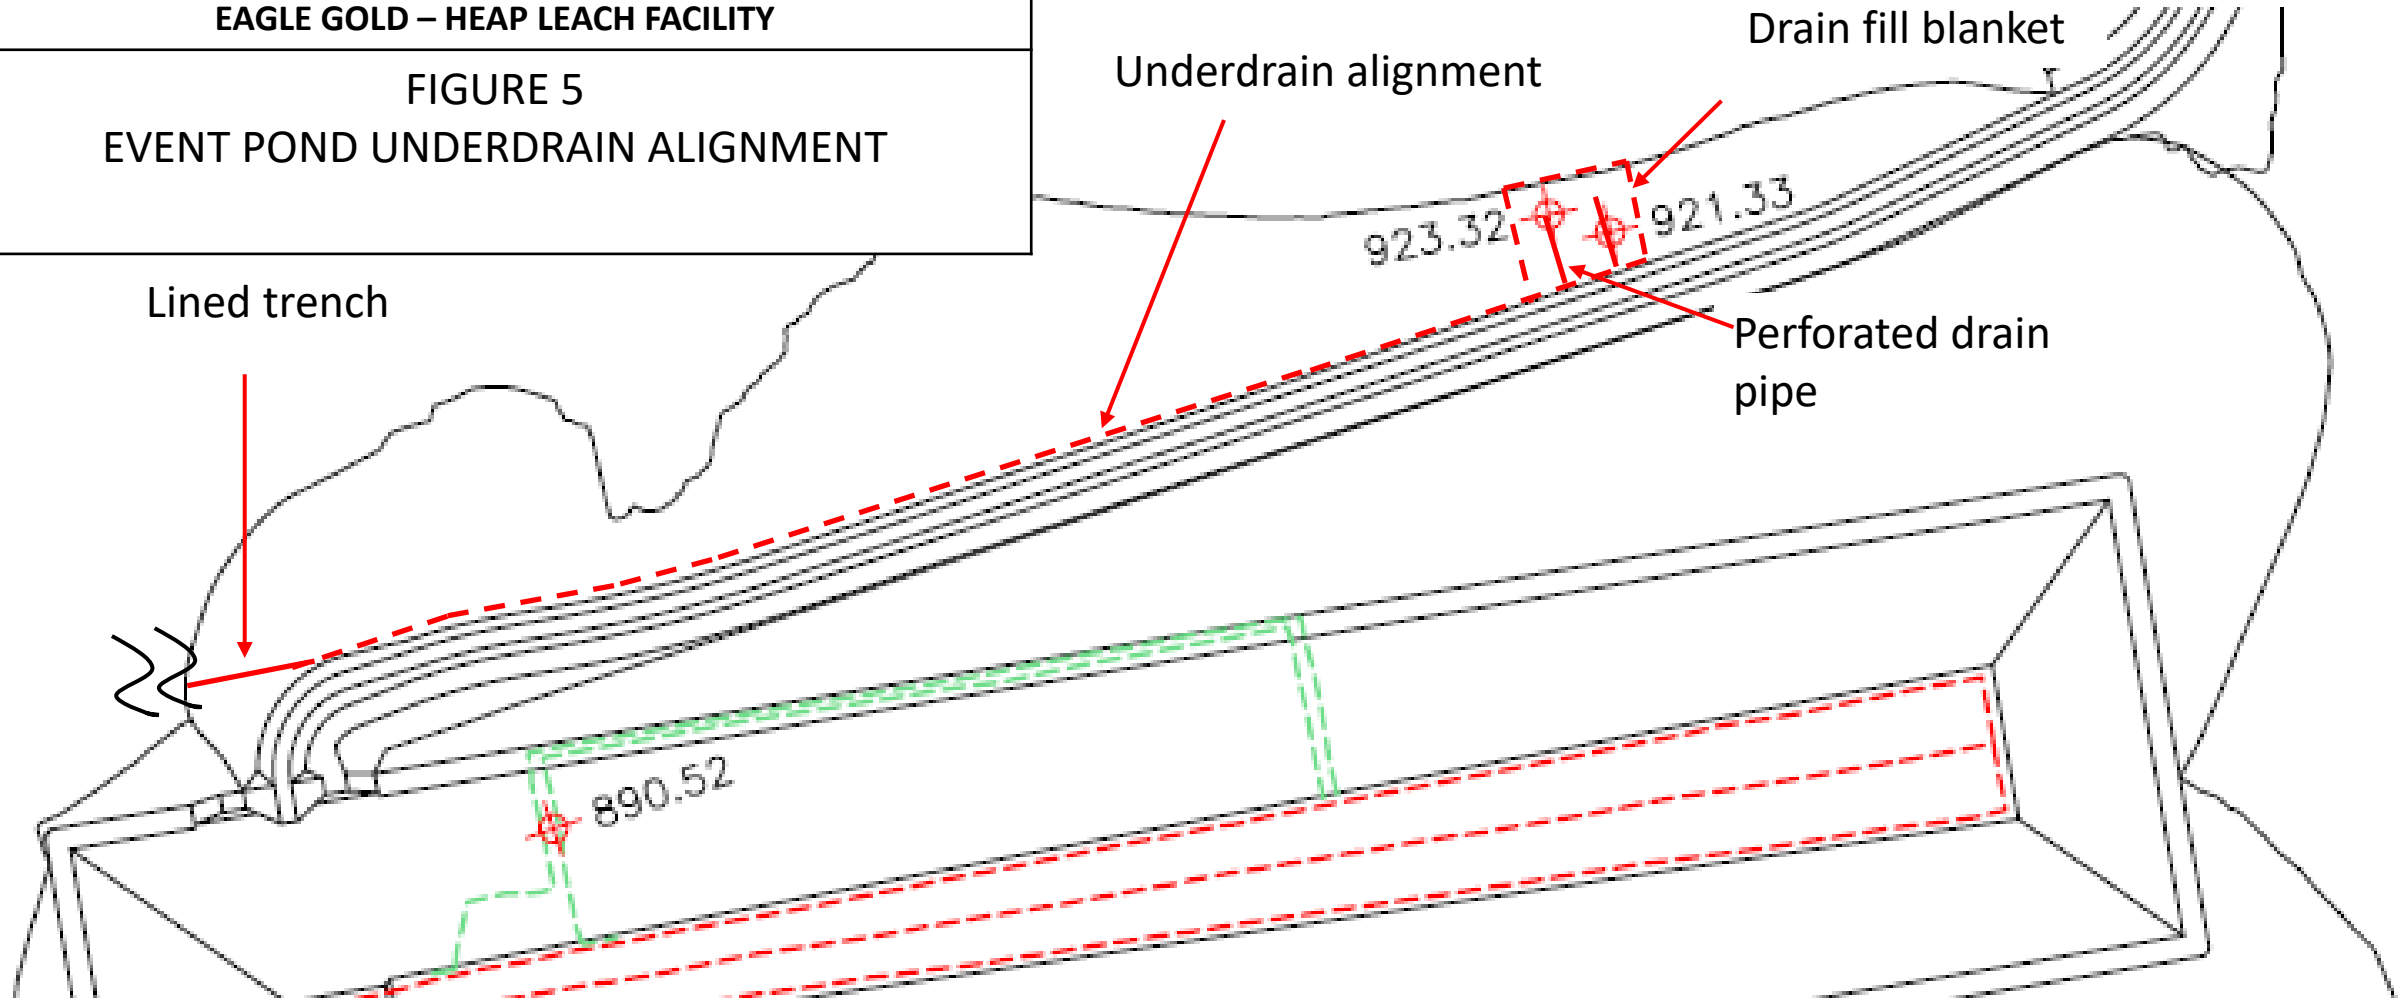




Spillway under drain is connected to the underdrain to be built on the event pond north slope.

EAGLE GOLD – HEAP LEACH FACILITY

FIGURE 4
EVENT POND UNDERDRAIN OPTION 3 CONCEPT



Underdrain outflow west of the spillway. Outflow would have to be controlled so it does not destabilize the waste pile and event pond berm by saturating them or their foundations.

Perforated pipe. 150mm or other size proposed by Pelly. Smooth or corrugated.

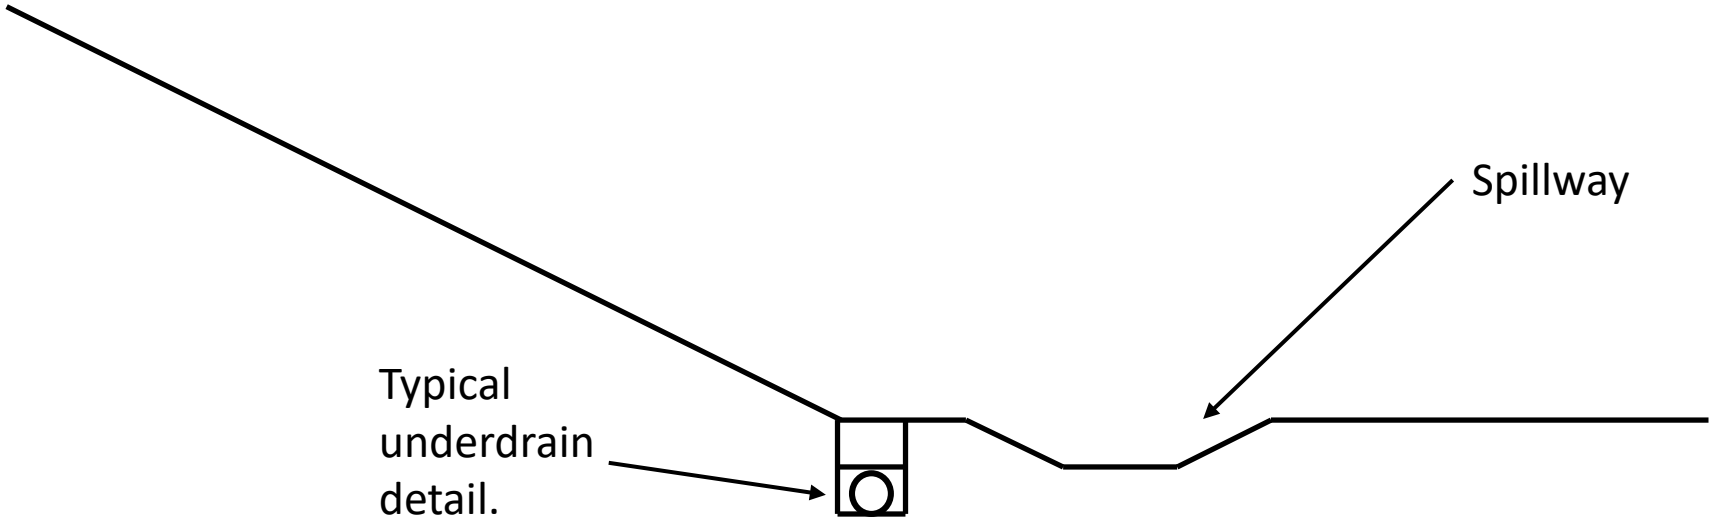
EAGLE GOLD – HEAP LEACH FACILITY

FIGURE 5
EVENT POND UNDERDRAIN ALIGNMENT

Notes:

1.) Length and alignment of lined trench to be field fitted to drain away from the Event Pond and waste pile located directly west of the Event Pond. Alignment and final length to be approved by BGC.

2.) Blanket drain to be min 0.45m thickness for drain fill and 0.5m of cover. Drainfill should be wrapped with geotextile.



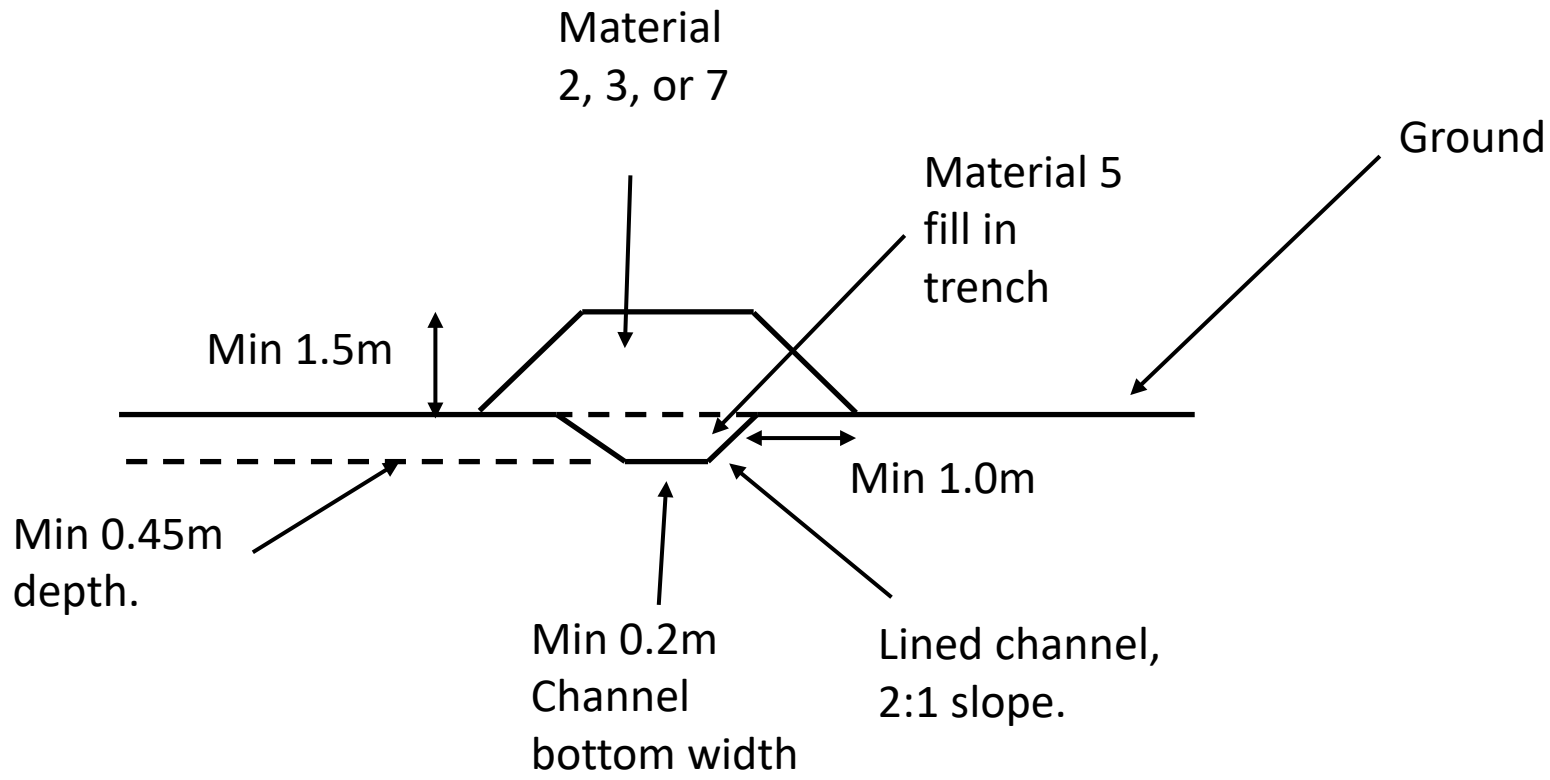
3.) Pipe sizes to be proposed by Pelly based on material available and approved by BGC.

4.) Size of blanket, number of pipes, and final location dependent on seepage observations observed during excavation. Blanket pipe to be tied into spillway underdrain perforated pipe using a T fitting or Y fitting depending on availability.

5.) No portion of the underdrain and lined trench should have a grade less than 2%.

EAGLE GOLD – HEAP LEACH FACILITY

FIGURE 6
SPILLWAY UNDERDRAIN TYPICAL SECTION



Notes:

1.) Typical Event Pond Underdrain details per IFC EGHLF-XD-03-04.

2.) Perforated drain pipe size to be chosen by Pelly based on availability and approved by BGC. Drain trench size may be modified to allow 0.1m of drain rock below the pipe and 0.2m of drain rock above depending on size of pipe.

3.) Top of drain fill should be no higher than the bottom of the spillway for any given section.

4.) Alignment of underdrain to be field fit to north extent of spillway bench.

Notes:

1.) Channel to be lined with geomebrane. Liner thickness, type , and bedding to be proposed by Pelly based on available material and approved by BGC. Lining to overlap min 0.5m in downstream direction.

2.) Channel to end in min 1m radius rip rap fan to be field fitting at construction.

3.) Trench cover should be compacted.

4.) JDS/Victoria Gold Environmental to determine if channel outlet is an acceptable distance from waste pile and if it meets environmental discharge requirements.

Name Signature Date

RESPONSE

☐ Approved ☑ Approved as noted ☐ Rejected as noted

Response:
The maximum particle size of Structural Fill is increased from 150 mm to 200 mm.
BGC will allow placement of oversize material, as described in the Compacted Rockfill specifications. Compacted Rockfill may be placed only in the downstream section of the embankment as shown in attached sketch, and shall not be in direct contact with any material other than Site Grading Fill, Select Fill and Structural Fill. Compacted Rockfill shall not be interlayered with other fill products. If the Compacted Rockfill is judged by the Engineer to not be filter compatible with surrounding material, additional transition material or geotextile will be required.

Answered by: **Tony Monasterio** **Sept. 28, 2017**

Response to EPCM-RFI-012

To:	**D'Arcy Comerford**	**Project:**	**Eagle Gold HLF**
Company:	**JDS**	**Project No.**	**0792021**
From:	**Roy Morlan**	**Date:**	**May 11, 2018**
Copied:	**Troy Meyer; Dan Granda**	**Record:**	**Response to EPCM-RFI-012**

Re: Response to EPCM-RFI-012:

The downstream to of the embankment can be keyed into the existing ground. Details for this connection are depicted in ***Figure 1***. These details apply to locations where the embankment toe abuts against natural colluvium as shown in Design Drawings EGHLF-XD-04-02 and EGHLF-XD-04-03. General requirements for this connection include the following:

- The contact slope between the natural ground and embankment fill should maintain a slope of 2H:1V, where possible. Final slope may be modified with the Engineer's approval based on actual ground conditions encountered.
- The natural ground surface should be composed of dense colluvium as approved by the Engineer. Natural ground surface should meet the requirements discussed in Technical Specifications – Heap Leach Facility, Section 3.2 – Subgrade Preparation and Section 3.4 – General Fill Placement Procedures.
- The portion of the toe in direct contact with the natural ground should be constructed using Material 3 - Structural Fill as shown in ***Figure 1***. Structural Fill should be placed as described in the Technical Specifications and subsequent RFI responses.
- If the embankment face is constructed with Material 8 – Rockfill as described in the response to EPCM-RFI-002 then the contact between the Structural Fill and Rockfill should maintain a near vertical face as shown in ***Figure 1***.

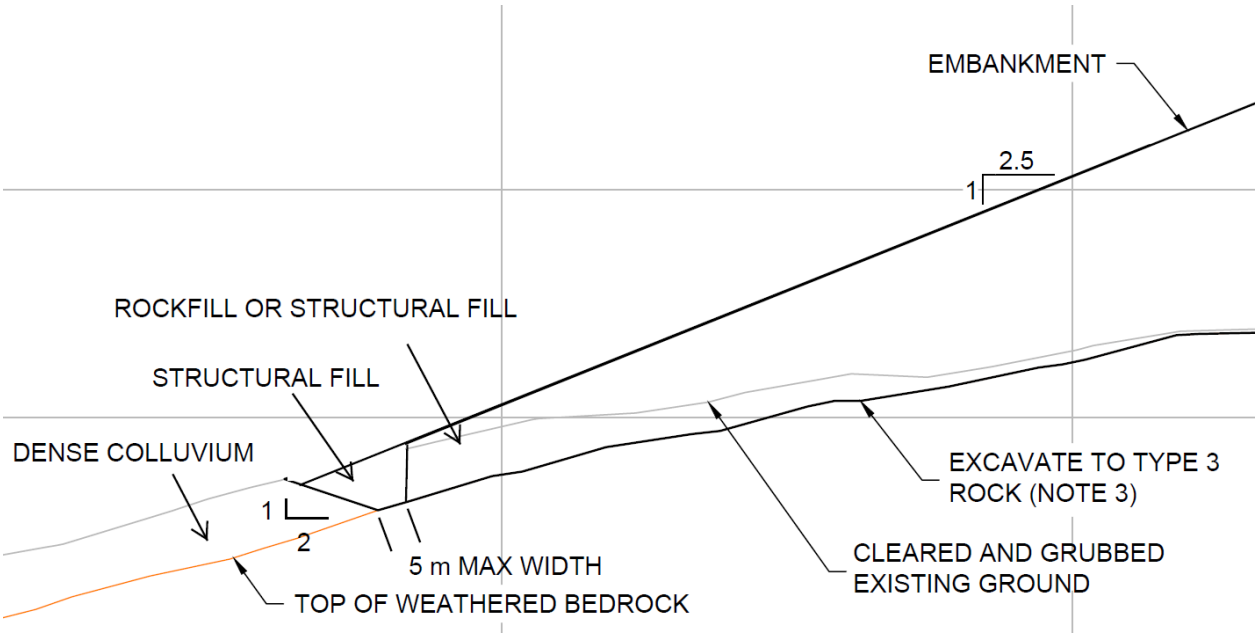

Figure 1: Details for the contact between the HLF Embankment and colluvium.

Re: Material 2 Test Fills 01 and 02

1.0 INTRODUCTION AND OBJECTIVE

On June 26, 2018 BGC developed and oversaw a test fill to evaluate the engineering properties of crusher reject sand for use as Material 2 – Select Fill and to determine if loose lift thickness could be increased from 0.15 m to 0.03 m using a 6 ton compactor. The test fills were intended to simulate placement and compaction of the material over the HLF embankment pipe trench drain fill and, therefore, no vibration was used while compacting.

2.0 TEST FILL CONSTRUCTION AND EXECUTION

The test fill was performed on June 26, 2018. BGC's representative, Roy Morlan, developed the test fill and was present during the test fills execution. Two test fill pads were constructed. Material 2 – Test Fill 01 was placed in 0.3m loose lifts. Material 2 – Test Fill 02 was placed in 0.15 m loose lifts. The test fills were constructed and survey control was provided by Pelly Construction. Sampling and testing was performed by Tetra Tech. The following sections discuss the execution of the test fill.

2.1. Test Fill Materials

The material use in the test fill was waste product from the Neway crusher operation (referred to as reject sand). Gradation, moisture, and a standard proctor test was performed by Tetra Tech at their on-site field laboratory prior to placement of the material. The results from this testing are included in ***Attachment 1***. The material generally consists of a well graded sand with a maximum size of 10 mm and a fines content of approximately 10%. Standard proctor results reported a maximum dry density of 2,080 kg/m3 and an optimum moisture of 9.5 %.

2.2. Test Fill Foundation

An area on Eagle Pup Road formally used as an equipment parking yard was used as the test foundation. The foundation consisted of sandy, gravely soils which were well compacted by heavy equipment traffic. The foundation was flat and dry. The foundation was proof rolled using a loaded 400D Deere haul truck (***Photo 1***). No deflection was noted in the foundation.

Photograph 1: Loaded haul truck proof rolling test fill foundation surface.

2.3. Lift Placement

Lifts were placed by end dump material from the haul truck then spreading the material with a Link Belt track mounted excavator. Material 2 – Test Fill 1 was placed in one 0.3 m loose lift. Material 2 – Test Fill 02 was place in one 0.15 loose lift. Lift thickness was measured by Pelly's surveyor using a mobile station. Each test fill measured approximately 6m x 6m.

2.4. Moisture Conditioning

Moisture was not added to the material prior or during the test fill.

2.5. Compaction Testing and Settlement Surveying

To perform compaction tracking at the test fill a flat (approximately 2cm thick), hard rock was placed in the center of the lift and used as a monitoring point. Initial survey of the settlement monitoring points was collected using a GPS surveying rod. The entire test fill surface was then compacted with one cycle (2 pass) of a CAT CS54 B vibratory compactor with an effective drum weight of 5,760 kg. (***Photo 2***) No vibration was used while compacting. After completion of one compaction cycle, settlement was measured at the settlement points. This compaction/survey procedure was repeated for 4 full compaction cycles.

***Photograph 2*:** Compaction of 0.30 m lift.

Settlement data collected is included in ***Table 1***.

	Pass 1 (mm)	Pass 2 (mm)	Pass 3 (mm)	Pass 4 (mm)
Test Fill 01	80	50	20	10
Test Fill 02	90	50	10	0

2.6. In-situ Density and Moisture Testing

In-situ density and moisture testing was performed by Tetra Tech using a nuclear density gauge. Density and moistures reported by Tetra Tech are included in ***Table 2***. Tetra Tech's data report for this testing is included in ***Attachment 1***.

	Comp % SPD	Moisture (%)
Test Fill 01	96.5	6.5
Test Fill 02	95.0	6.1

Table 1: Density Reported by SGSCM

2.7. Field Testing Observational

Little surface yield was observed in the lifts after the initial compaction pass. Excavations through the compacted material lifts revealed a well compacted, well graded matrix with little void space. Moisture within the lift was spread evenly. No material degradation or pulverization was observed. (***Photo 3***)

Photograph 3: Excavation through the compacted Test Fill 01 lift.

3.0 CONCLUSIONS

The results of the test fill indicate that the crusher reject sand can achieve sufficient densities for use as Material 2 – Select Fill with a minimum of 3 passes of a minimum 6,000 kg compactor, with or without vibration, and in lifts of up to 0.30m. As the material's stockpiled moisture was approximately 3% below optimum moisture the addition of water would likely result in compaction properties greater than 95% SPD when compacting without vibration. BGC recommends the addition of moisture to achieve - 1%/+ 3% optimum moisture when compacting without vibration over the drain pipe trenches. All other areas where the material is used can maintain a moisture of +/- 2% (per the Technical Specifications) and should be placed using vibratory roller compaction.

Re: Material 7 Test Fill 01

1.0 INTRODUCTION AND OBJECTIVE

On June 30, 2018 BGC developed and oversaw a test fill to evaluate the engineering properties of Material 7 – Compacted Rockfill for use in the embankment construction. The rockfill was generated from the ADR excavation mostly from ripping and blasting bedrock.

2.0 TEST FILL CONSTRUCTION AND EXECUTION

The test fill was performed on June 30, 2018. BGC's representative, Roy Morlan, developed the test fill and was present during the test fills execution. Material 7 – Rockfill was placed in 0.9m loose lifts. The test fills were constructed and survey control was provided by Pelly Construction. Material sampling and testing was performed by Tetra Tech. Water replacement density testing was overseen by BGC. The following sections discuss the execution of the test fill.

2.1. Test Fill Materials and Borrow Description

The rockfill used in the test fill was generated by Pelly construction as borrow from excavation of the ADR plant foundation. Gradation testing was performed on the finer (3" minus) fraction of the material by Tetra Tech. Mid-fraction material (3" to 8") was estimated by Tetra Tech by scalping this material from the 3" sample. Larger fraction (>8") was visually estimated. Moisture content for the finer fraction of material was analyzed by Tetra Tech. The results from this testing are included in ***Attachment 1***. The material generally consists of a well graded gravel and sand matrix with approximately 30% rocks greater than 8" and a maximum size of 23". Moisture content of the fine fraction was reported as 3.2 %.

The rock used in the test fill was derived from a mostly quartzite source, which is the predominant rock type at this borrow. The quartzite material properties are mostly fine grained, orange brown, some banding present, slightly weathered (W2), strong to very strong (R4 to R5), and hard (H3).

Although not used in the test fill, zones of a weaker phyllitic rock (potentially phyllite or phyllonite) are also present within this borrow. This material is platy, very fine grained (aphantic), micaceous, has a significant amount of graphite, is gray, slightly weathered (W2), with rock quality ranging from (R1 to R3), and varies from soft (H6) to moderate hard (H4). The general recommended approach will involve mixing the stronger quartzite rock with the weaker phyllitic rock to produce an acceptable material for embankment fill. Additional test fills will be necessary to evaluate rock fill with significant portions of phyllitic rock. Alternatively, the weaker phyllitic material could be sorted and used as Material 3 fill.

2.2. Test Fill Foundation

An area on top of the ADR Material 3 Stockpile was used as the test location because it was close to the source material and relatively traffic free (***Figure 1***). The test location was hard, dry and previously compacted by heavy equipment traffic. However, the location was not flat so a leveling pad was constructed for the test fill. The leveling pad was constructed with Material 7 rockfill placed in an approximately 0.5m lift and compacted using a CAT CS68 B vibratory compactor and 4 passes. (***Photo 1***). The final foundation was flat, dry, and dense. No deflection from roller passes was noted in the foundation after compaction.

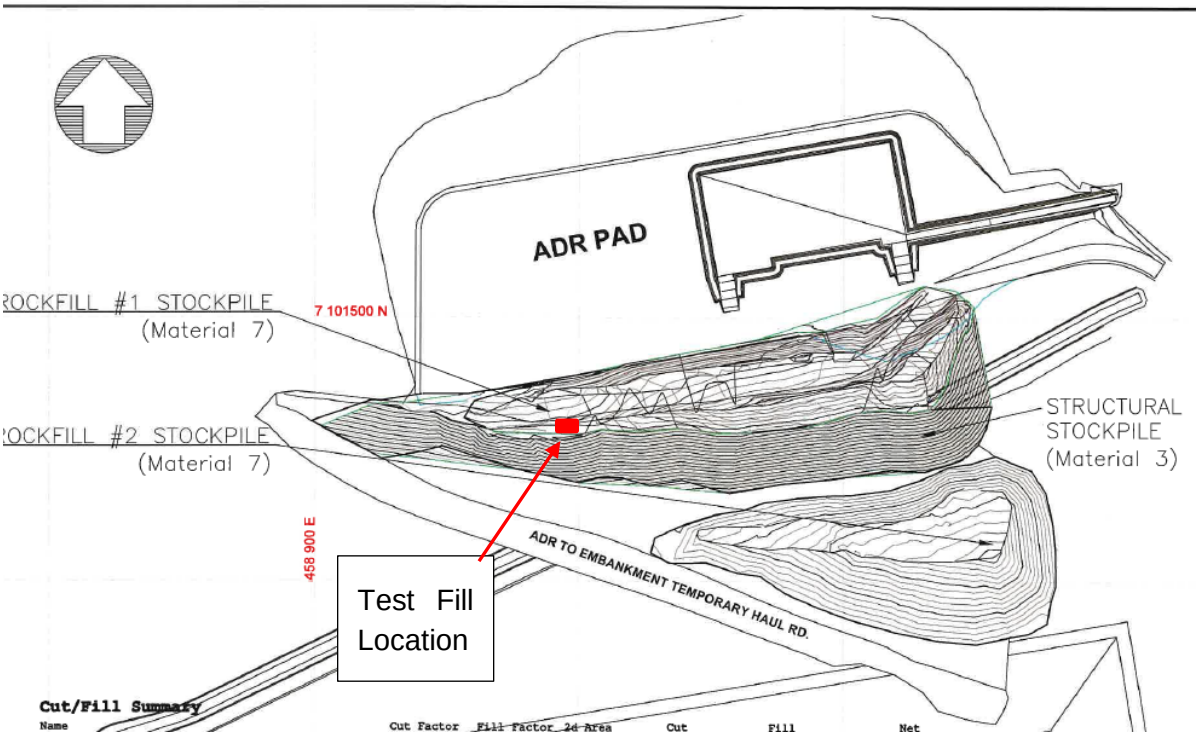

Figure 1: Test Fill Location

Photo 1: Construction of the test fill foundation leveling lift.

2.3. Test Fill Lift Placement

The test fill lift was placed by a Link Belt track mounted excavator directly from the stockpile. Material 7 – Test Fill 1 was placed in one 0.9 m loose lift. Lift thickness was measured by Pelly's surveyor using a mobile station. The test fill measured approximately 8m x 6m.

2.4. Moisture Conditioning

Moisture was not added to the material prior or during the test fill. However, moisture conditioning is generally encouraged during rock fill placement to facilitate compaction and will likely be necessary.

2.5. Compaction Testing and Settlement Surveying

To perform compaction tracking three steel plates were placed in a row down the center of the lift and used as a monitoring points (***Figure 2***). Initial survey of the settlement monitoring points was collected using a GPS surveying rod. The entire test fill surface was then compacted with one cycle (1 forward pass and 1 reverse pass) of a CAT CS68 B vibratory compactor with an effective

drum weight of 8,920 kg. After completion of one compaction cycle, settlement was measured at the settlement points. This compaction/survey procedure was repeated for 4 full compaction cycles.

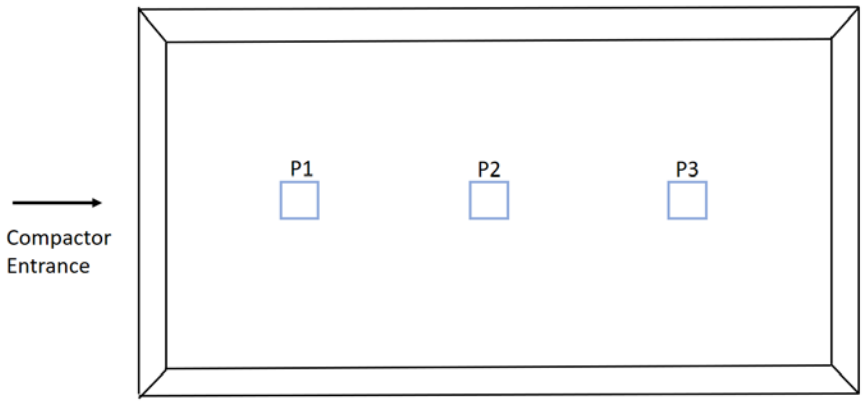

***Figure 1*:** Approximation of test fill pad and survey points

Settlement data collected is included in ***Table 1***. A settlement graph is shown in ***Figure 3***.

	Pre-Compaction	Pass 1	Pass 2	Pass 3	Pass 4
Survey Point 1 (P1)	950.40 m	950.37 m	950.35 m	950.33 m	950.32 m
Survey Point 2 (P2)	950.55 m	950.46 m	950.46 m	950.43 m	950.43 m
Survey Point 3 (P3)	950.59 m	950.49 m	950.47 m	950.46 m	950.45 m

Table 1: Survey elevation data collected during settlement tracking.

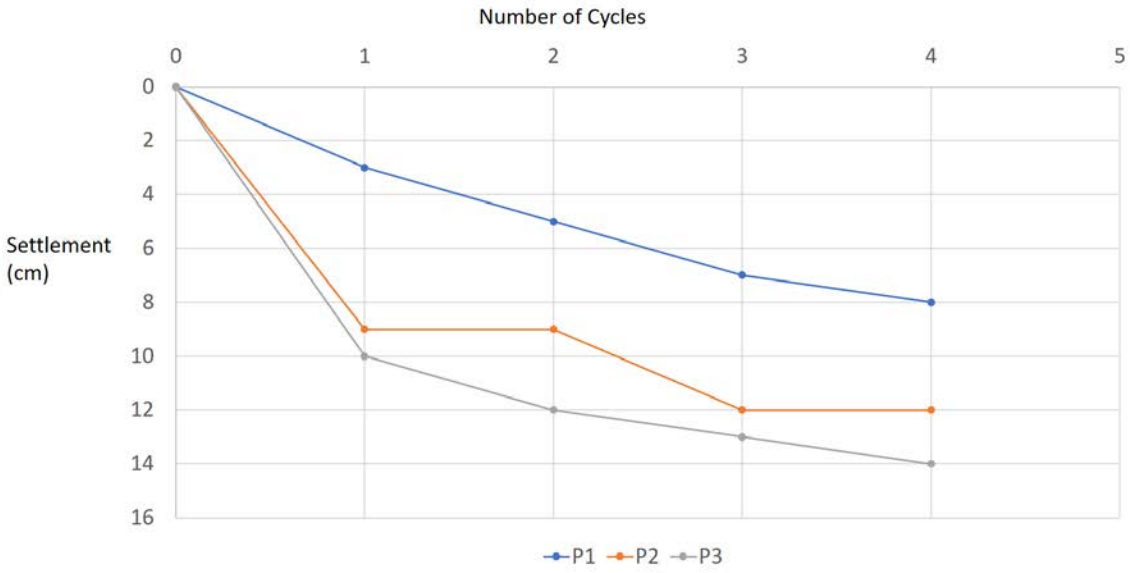

***Figure 3*:** Settlement recorded for each cycle.

2.6. In-situ Density and Moisture Testing

In-situ density and moisture collected by Tetra Tech

In-situ density and moisture testing was collected for reference by Tetra Tech using a nuclear density gauge. Results from nuclear density gauge testing on rockfill are known to be unreliable due to the presence of large, dense rocks and void spaces caused by displacement of rocks when hammering the steel rod. Therefore, these tests were performed for reference only. Water content was also analyzed by Tetra Tech in their field laboratory from a sample of the rockfill's finer material fraction (>3"). Density and moistures reported by Tetra Tech are included in ***Table 2***. Tetra Tech's data report for this testing is included in ***Attachment 1***.

	Dry Density (kg/m^3)	Moisture (%)
Nuclear Gage Test 1	2224	4.6
Nuclear Gage Test 2	2137	5.0
Standard Lab Testing	NA	3.2%

Table 2: Tetra Tech testing results

Water Replacement Test

A water replacement test was performed to determine the density of the compacted soil (***Photo 2 and 3***). A test pit was dug in the compacted lift. Material excavated from the pit was placed in three super sacks and weighed using Pelly's Terex Crane RT780 crane. The test pit was lined with 60 mil poly urethane liner and filled with water. The volume of water used was recorded and the density determined using the weight of the material excavated and the volume of the test pit.

The weight of the material was reported as 2,676 kg and volume of the test pit was determined to be 1.33 cubic meters. The density of the compacted rockfill was determined to be 2,012 kg/m^3 wet density and an estimated 1,965 kg/m^3 dry density assuming 70% rock smaller than 8".

Photo 2: Volume determination using water.

Photo 3: Super sacks with material excavated for the water replacement test.

2.7. Field Testing Observational

Little surface yield was observed in the lifts after the initial compaction pass. Excavations through the compacted material lifts revealed a well compacted, well graded matrix with little void space. Moisture within the lift was spread evenly. Rock was predominantly supported by the sandy gravel matrix. No material degradation or pulverization was observed. (***Photo 4***)

Photo 4: Compacted rockfill observed in the test fill trench cut.

3.0 CONCLUSIONS

The results of the test fill indicate that the rockfill produced from a mostly quartzite source at the ADR borrow can achieve sufficient compaction with a minimum of 4 cycles (1 forward and 1 reverse pass per cycle) of a minimum 9,000 kg compactor with vibration, and in lifts of up to 0.90m. These results were obtained with a stockpile moisture of 3.2% within the fill's fine fraction matrix.

BGC recommends that this criteria be used for placement and compaction of the rockfill within the embankment. If rock size and/or rock type, or general gradation varies significantly within this material an additional test fill will be required. If moisture content of the rockfill is below 3.2 % the Engineer may require additional moisture to be added before placement. Overly wet material may require the removal of moisture before placement. The Engineer will inspect the rockfill material during borrowing or placement to make these determinations.

As the rockfill generated from the ADR borrow area is variable due to the presence of weaker zones of phyllitic material, BGC recommends that the above criteria be used on rockfill produced from the zones of harder quartzite formations, which are more predominant at this borrow. Small zones of phyllitic material should be blended within the quartzite rockfill before use. Phyllitic material should not be allowed to be placed in a manner that would create lifts or zones within a lift composed of predominately weaker phyllitic material. Since these zones are more prone to material breakdown and develop a finer matrix they may be sorted and re-stockpiled for use as Material 3 – Structural Fill. A sperate test fill should be performed to determine if these phyllitic materials can be used as the predominant component of a Material 7 lift.

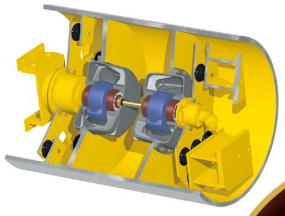
Smooth Drum
Vibratory Soil Compactors

Comfort to Operate with Confidence



- NEW • *Comfortable redesigned cab with best-in-class climate control, multi-position windows*
- NEW • *Control console and display are integrated with pivoting seat* (optional deluxe cloth seat available)*
- NEW • *Display provides instrumentation data and diagnostics at a glance**
- • *Exceptional visibility to tires and drum edge*
- NEW – *Larger mirrors for enhanced rear visibility*
- NEW – *Narrower rear frame*
- NEW • *Optional light package upgrade provides four additional lights for excellent low light visibility*

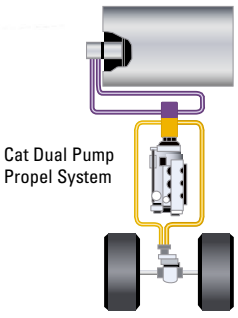
Do More

- NEW • *Exclusive Cat® dual pump propel system with electronic control† provides:*
  - *– Exceptional traction and gradeability*
  - *– Plenty of power for leveling blade*
- *Optional equipment:*
  - *– Leveling blade*
  - *– Oval pad or square pad shell kit*

Work Smarter with Optional Compaction Measurement Technology

- NEW • *Cat Compaction Control*
  - *– Factory installed, dealer supported; integrated with machine for better protection from theft, vandalism*
  - *– Two sensor options available:*
    - NEW *- Machine Drive Power (MDP): exclusive Cat technology, rolling resistance-based*
    - *- Compaction Meter Value (CMV), accelerometer-based*
  - *– Mapping/Positioning option*
    - *- SBAS GNSS; upgradeable to RTK*
    - *- Includes seperate display, GNSS antenna*

Cat® Pod-style Vibratory System



Cat Compaction Control with GNSS Mapping (SBAS)

Achieve Quality Compaction Faster

- • *Enhanced compaction force*
- NEW – *More weight at the drum*
- NEW – *Best-in-class amplitude*
- NEW • *Enhanced propel system with electronic control for better performance†*
- NEW • *Standard technology automates functions that enable high quality and uniformity:*
  - *– Automatic Speed Control†*
  - *– Auto-vibe*

Best Value Available

- • *Designed for easy maintenance, long service intervals*
- • *High reliablity due to robust design*
- • *Powerful and efficient engine*
  - *– Meets emissions standards where applicable*
  - NEW *– Reduces fuel burn when Eco-mode is used*
  - *– Self-monitors and alerts operator to abnormal engine performance*
- • *Highest resale value in the industry*

Cat Dual Pump Propel System

Re: Material 3 Test Fill 01 and 02

1.0 INTRODUCTION AND OBJECTIVE

On July 27, 2018 BGC developed and oversaw two test fills to evaluate the engineering properties of Material 3 – Structural Fill for use in the embankment construction. The material was generated from the ADR excavation.

2.0 TEST FILL CONSTRUCTION AND EXECUTION

BGC's representative, Roy Morlan, developed the test fills and was present during the execution. Two tests were conducted using Material 3 – Structural Fill. The test fills were constructed and surveyed by Pelly Construction. Material sampling and testing was performed by Tetra Tech. The following sections discuss the execution of the test fill.

2.1. Test Fill Materials and Borrow Description

The material used in the test fills was generated by Pelly as borrow from excavation of the ADR plant foundation and the area labeled as ADR West. Gradation testing was performed on the finer (3" minus) fraction of the material by Tetra Tech. Mid-fraction material (3" to 8") was estimated by Tetra Tech by scalping this material from the 3" sample. Moisture content for the finer fraction of material was analyzed by Tetra Tech. The results from this testing are included in ***Attachment 1***. The material generally consists of a well graded gravel and sand matrix with approximately 15% rock between 3" and 8". Moisture content was measured at approximately 5%. (***Photograph 1***)

Photograph 1: Photograph of loose material used in both test fills.

The 3” to 8” rocks in the test fill material were mostly quartzite, which is the predominant rock type at this borrow. The quartzite material properties are mostly fine grained, orange brown, some banding present, slightly weathered (W2), strong to very strong (R4 to R5), and hard (H3). Rocks were resistant to scratching and broke after several blows with a hammer (***Photograph 2***).

Photograph 2: Example of material between 3” and 8”.

Phyllitic material is present in the Material 3 mixture. The phyllitic material content is approximately 20 to 30% and mostly present in particle sizes less than 0.5”. This material is platy, very fine grained (aphanitic), micaceous, has a significant amount of graphite, is gray, slightly weathered (W2), with rock quality ranging from (R1 to R3), and varies from soft (H6) to moderate hard (H4).

2.2. Test Fill Foundation

An area on top of the ADR Material 3 Stockpile was used as the test location because it was close to the source material and relatively traffic free (***Figure 1***). The test location was hard, dry and previously compacted by heavy equipment traffic. No deflection from roller passes was noted in the foundation.

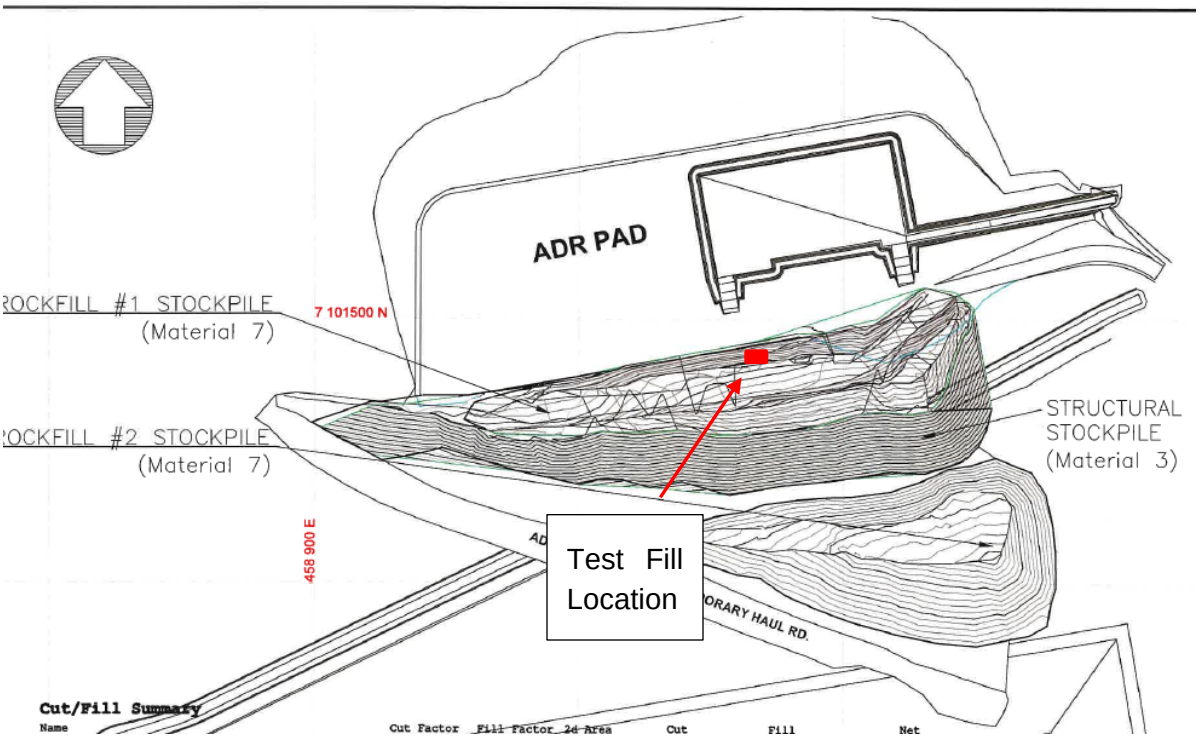

Figure 1: Test Fill Location

2.3. Test Fill Lift Placement and Compaction

Both test fills were constructed by pushing the material from the stockpile to the prepared foundation using a CAT D7 track mounted dozer. For Test Fill 01 material was placed in a 0.5m loose lifts. For Test Fill 02 material was placed in a 0.75 m loose lift. Lift thickness was measured by Pelly's surveyor using a mobile station. The test fill measured approximately 8m x 6m.

2.4. Moisture Conditioning

Moisture was not added to Test Fill 01 or Test Fill 02.

2.5. Test Fill 01 Compaction and Settlement Measurements

To perform compaction tracking three steel plates were placed in a row down the center of the lift and used as a monitoring points (***Figure 2***). Initial survey of the settlement monitoring points was collected using a GPS surveying rod. Test fill surfaces were compacted with one cycle (1 forward pass and 1 reverse pass) of a CAT CS78 B vibratory compactor with an effective drum weight of 13,440 kg. After completion of one compaction cycle, settlement was measured at the settlement points. This compaction/survey procedure was repeated for 3 full compaction cycles for Test Fill 01 and 4 full cycles for Test Fill 2. Specifications for the CAT CS78 B compactor are included in ***Attachment 1***.

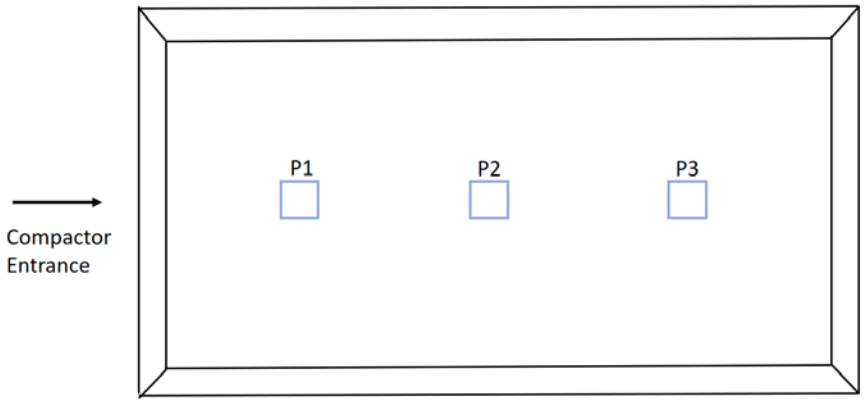

Figure 2**:** Approximation of test fill pad and survey points

Settlement data collected is included in ***Table 1***. Settlement graphs are shown in ***Figure 3 and 4***.

	Pre-Compaction (m)	Pass 1 (m)	Pass 2 (m)	Pass 3 (m)	Pass 4 (m)
Test Fill 01					
Survey Point 1 (P1)	948.80	948.79	948.76	948.75	NA
Survey Point 2 (P2)	948.80	948.79	948.75	948.74	NA
Survey Point 3 (P3)	948.79	948.76	948.75	948.74	NA
Test Fill 02					
Survey Point 1 (P1)	949.10	949.07	949.07	949.05	949.05
Survey Point 2 (P2)	949.08	949.03	949.03	949.00	949.01
Survey Point 3 (P3)	949.02	948.97	948.96	948.94	948.94

Table 1: Survey elevation data collected during settlement tracking.

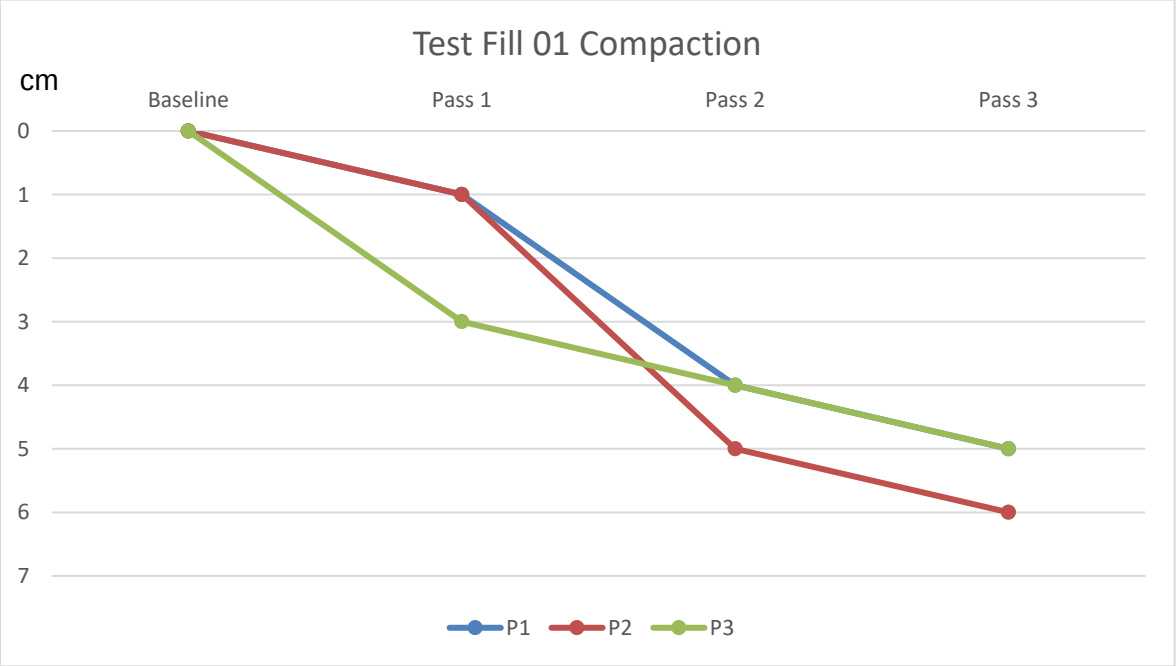

Figure 3: Test Fill 01 settlement recorded for each cycle.

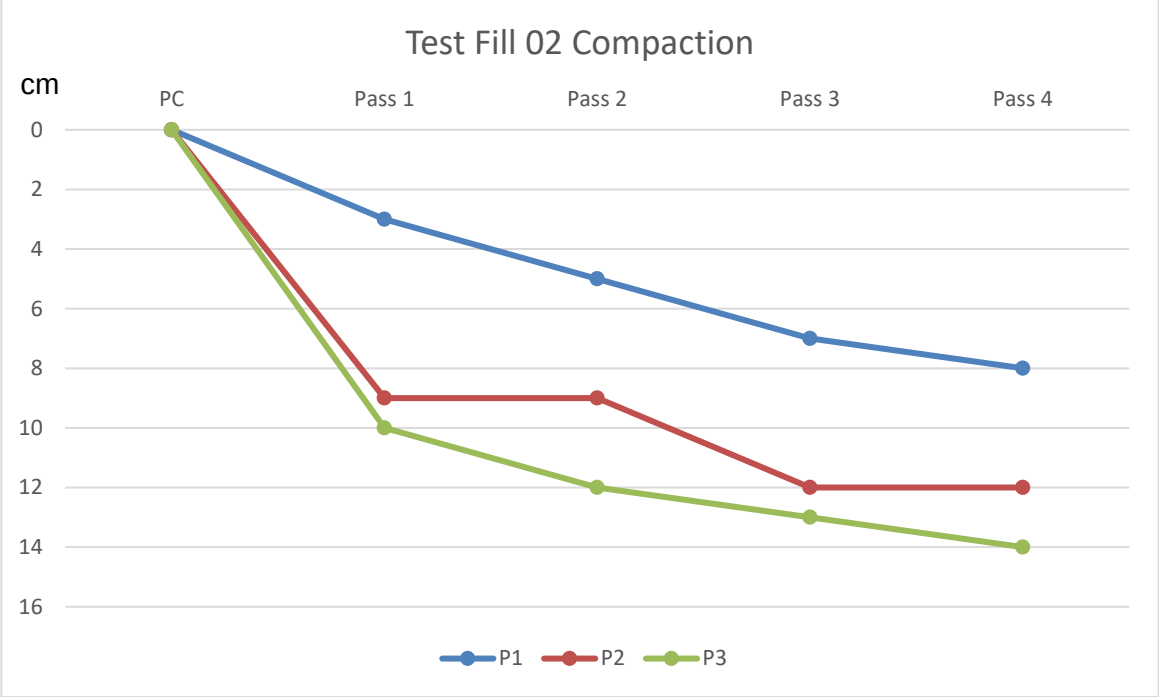

Figure 4: Test Fill 02 settlement recorded for each cycle.

2.5.1. In-situ Density and Moisture Testing

In-situ density and moisture testing was collected by Tetra Tech using a nuclear density gauge. Results were compared to the proctor for this material performed by Tetra Tech. The sample was scalped at material greater than 3". A rock correction was applied to the results by Tetra Tech. Optimum moisture was reported as 6.5% and density at this moisture was reported as 2,270 kg/m^3. Density and moistures reported by Tetra Tech are included in ***Table 2***. Tetra Tech's data report for this testing is included in ***Attachment 1***.

	Depth (cm)	Dry Density (kg/m^3)	Moisture (%)
Test Fill 01			
Test 1 (uncompacted)	30	2037	5.3
Test 2 (1 pass cycle)	30	2235	6.0
Test 3 (2 pass cycles)	30	2286	5.6
Test 4 (3 pass cycles)	30	2281	5.9
Test Fill 02			
Test 1 (uncompacted)	30	2,015	5.0
Test 2 (1 pass cycle)	30	2,160	5.4
Test 3 (2 pass cycles)	30	2,272	5.4
Test 4 (3 pass cycles)	30	2,271	5.2
Test 5 (4 pass cycles)	30	2,236	5.1
Test 6 (4 pass cycles)	70	1,812	5.3

Table 2: Tetra Tech nuclear density gauge testing results

2.5.2. Field Testing Observations

Some surface yield was observed in both test fills after the initial compaction pass. Excavations through each compacted test fill revealed a well compacted, well graded matrix with little void space. Moisture within the lift was spread evenly. Rock was predominantly supported by the sandy gravel matrix. No material degradation or pulverization was observed. A trench was photograph of Test Fill 01 is included as ***Photo 3***. A trench wall photograph of Test Fill 02 is included as ***Photo 4***.

Photo 3: Trench wall photograph from Test Fill 01.

Photo 04: Trench wall photograph from Test Fill 02.

3.0 CONCLUSIONS

The results of the test fills indicate that the Material 3 tested can achieve sufficient densities with a minimum of 2 passes of a minimum 13,000 kg compactor with vibration, and in lifts of up to 0.50m. These results were obtained with an average moisture of approximately 5.7%. Test Fill 02 did not achieve sufficient compaction below 0.5m even after 4 passes.

BGC recommends that the following criteria be used for placement and compaction of the Material 3 within the embankment:

- A maximum loose lift thickness of 0.45m should be used.
- Moisture content should be maintained between 5% and 7%. This will likely require moisture conditioning at the stockpile during loading for placement.
- Gradation of the material should not vary significantly from the material used in this test fill. If gradation varies significantly additional testing may be required.

- A minimum of two pass cycles (1 forward pass and 1 back pass per cycle) using a 13,000 kg vibrating compactor should be used. Use of lighter compactors should be approved by the Engineer and may require additional testing.
- Material should be sourced from a stockpile approved by the Engineer.
- QC should be performed by tracking and reporting the above. In-situ QC testing using a nuclear density gauge should also be performed. Testing should report density and moisture. A minimum of 6 tests per compacted lift should be performed. The amount of test can be reduced by the engineer after observing placement and compaction of the first several lifts and all criteria appear consistent. The average of the tests should determine to either pass or fail: 95% of 2,270 kg/m^3; moisture between 5% and 7%.

If general gradation or material composition (quartzite content) varies significantly within this material an additional test fill will be required. If moisture content of the rockfill is below 5 % the Engineer may reject the material until it is moisture conditioned. Overly wet samples may require the removal of moisture before placement. The Engineer will inspect the material during borrowing or placement and review QC reports to make these determinations.

BGC recommends that the above criteria be used on material produced from the zones of harder quartzite formations, which are more predominant at this borrow. Small zones of phyllitic material should be blended within the quartzite before use. Phyllitic rich material (25% to 100% phyllitic material) should be used on the upstream side of the lift. Phyllitic rich material should not constitute an entire lift or along the downstream face of the embankment.

Re: Material 3 Test Fill 03

1.0 INTRODUCTION AND OBJECTIVE

On August 21, 2018 BGC developed and oversaw a test fill to evaluate the engineering properties of Material 3 – Structural Fill generated from the Event Pond excavation.

2.0 TEST FILL CONSTRUCTION AND EXECUTION

BGC's representative, Troy Meyer, developed the test fills and was present during the execution. The test fill was constructed and surveyed by Pelly Construction. Material sampling and testing was performed by Tetra Tech. The following sections discuss the execution of the test fill.

2.1. Test Fill Materials and Borrow Description

The material used in the test fills was generated by Pelly as borrow from excavation of the Event Pond and Spillway. This material has been designated as Material 3 Structural Fill. Gradation, moisture, and proctor testing was performed by Tetra Tech. The results from this testing are included in ***Attachment 1***. Material 3 was generated from a portion of the stratigraphy below the organic rich topsoil and the colluvial overburden in an area where bedrock is becoming more competent with depth. The material generally consists of broken weak rock in a matrix of gravel and sand with few fines (***Photograph 1***).

Photograph 1: Photograph of loose material used in the test fill.

2.2. Test Fill Foundation

A cleared area at the Event Pond excavation was used as the test location because it was close to the source material and relatively traffic free (***Figure 1***). The test foundation was compacted with 5 forward and 5 backwards passes with a vibratory compactor. The resulting foundation was hard and dry (***Photograph 2***). No significant deflection from roller passes was noted in the foundation.

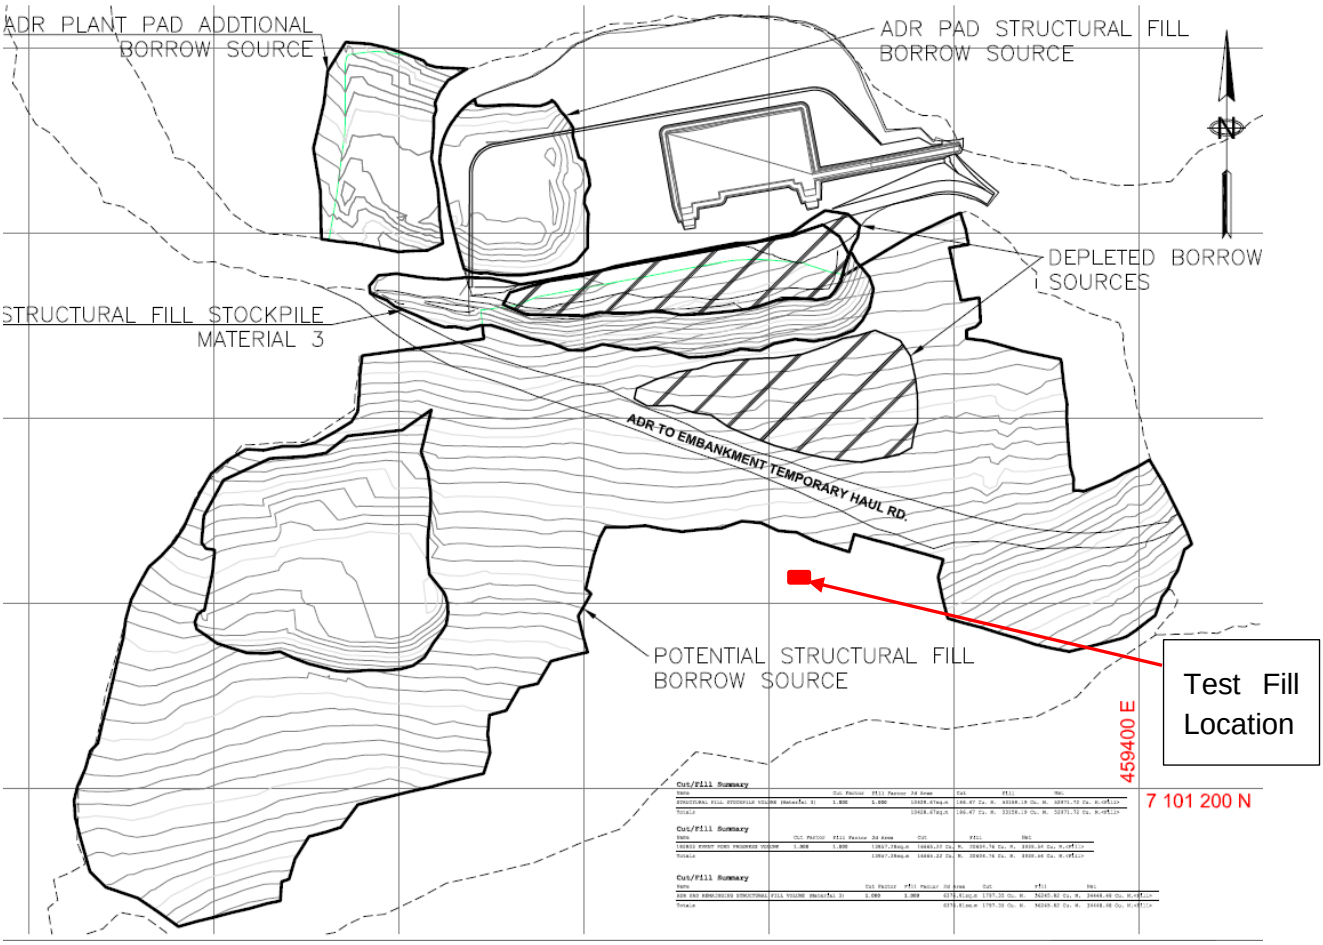

Figure 1: Test Fill Location

Photograph 2: Compaction of the test fill foundation.

2.3. Test Fill Lift Placement and Compaction

The test fill was constructed by a CAT 3751 track mounted excavator as a 0.5m loose lift. Lift thickness was measured by Pelly's surveyor using a mobile station. The test fill measured approximately 8m x 6m.

2.4. Moisture Conditioning

Moisture was not added to the test fill material.

2.5. Test Fill Compaction and Settlement Measurements

To perform compaction tracking three steel plates were placed in a row down the center of the lift and used as a monitoring points (***Figure 2***). Initial survey of the settlement monitoring points was collected using a GPS surveying rod. Test fill surface was compacted with one cycle (1 forward pass and 1 reverse pass) of a Volvo CS68B vibratory compactor with an effective drum weight of 9,150 kg. After completion of one compaction cycle, settlement was measured at the settlement

points. This compaction/survey procedure was repeated for 4 full compaction cycles. Specifications for the Volvo CS68B compactor are included in ***Attachment 1***.

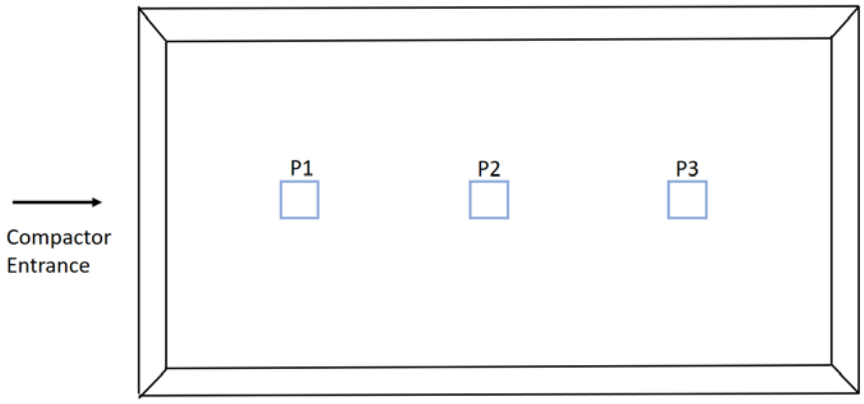

Figure 2**:** Approximation of test fill pad and survey points

Settlement data collected is included in ***Table 1***. A settlement graph is shown in ***Figure 3***.

	Pre-Compaction (m)	Pass 1 (m)	Pass 2 (m)	Pass 3 (m)	Pass 4 (m)
Survey Point 1 (P1)	905.884	905.834	905.819	905.814	905.812
Survey Point 2 (P2)	905.903	905.854	905.836	905.826	905.825
Survey Point 3 (P3)	905.956	905.881	905.867	905.853	905.852

Table 1: Survey elevation data collected during settlement tracking.

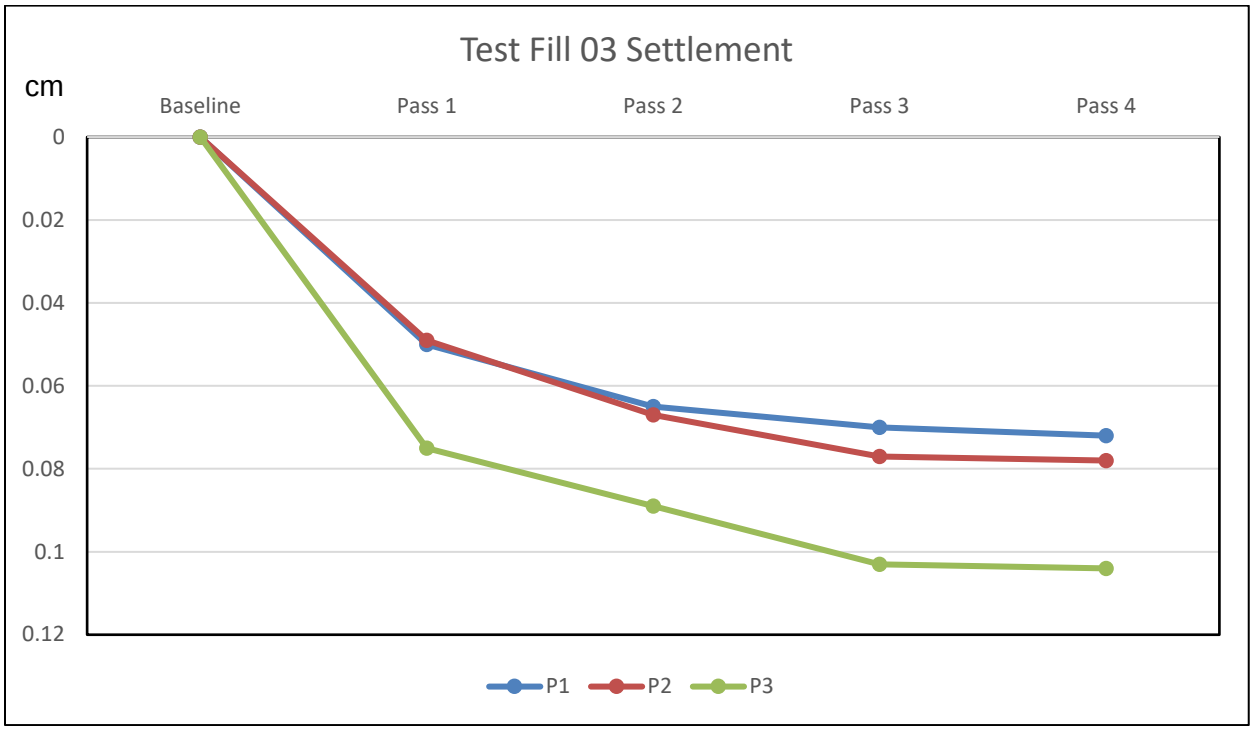

***Figure 3*:** Test Fill 03 settlement recorded for each cycle.

2.5.1. In-situ Density and Moisture Testing

In-situ density and moisture testing was collected by Tetra Tech using a nuclear density gauge. Results were compared to the proctor for this material performed by Tetra Tech. The standard proctor performed on the material reported a maximum dry density of 2,185 kg/m^3 at an optimum moisture of 8.7%. Density and moistures reported by Tetra Tech are included in ***Table 2***. The values represent over 96% of maximum dry density. Tetra Tech's data report for this testing is included in ***Attachment 1***.

	Depth (cm)	Dry Density (kg/m^3)	Moisture (%)
Test 1 (4 pass cycles)	30	2126	5.1
Test 2 (4 pass cycles)	30	2116	6.2

Table 2: Tetra Tech nuclear density gauge testing results

2.5.2. Field Testing Observations

Some surface yield was observed in the compaction pass. Excavations through the compacted test fill revealed a well compacted, well graded matrix with little void space. Moisture within the lift was spread evenly. No material degradation or pulverization was observed.

A lens of phyllitic material was observed in the shallow excavation made to produce the test fill material **Photograph 3**. A deeper excavation was later made, and the material was observed to become more competent and rocky with depth **Photograph 4**.

Photograph 3: Shallow excavation made for test fill material.

Photograph 4: Deeper excavation into Event Pond borrow material.

3.0 CONCLUSIONS

The results of the test fill indicates that Material 3 excavated from the Event Pond area can achieve sufficient densities with a minimum of 3 passes of a minimum 9,000 kg compactor with vibration, and in lifts of up to 0.50m.

BGC recommends that the following criteria be used for placement and compaction of the Material 3-4 within the embankment:

- A maximum loose lift thickness of 0.50m should be used.
- Moisture content should be maintained between 3% and 8%. This is not expected to require moisture conditioning at the active face of the borrow excavation if direct loading is performed. If the material is stockpiled, moisture conditioning may be needed upon loading. Moisture conditioning should be avoided in freezing air temperatures.
- Gradation of the material may vary significantly from the material used in this test fill. The rock is expected to become gradually more competent with depth. Based on experience

with material from the ADR cut and ADR West borrow located above the event pond, the rock is expected to be moderately weathered at depth and will and will produce a coarser structural fill. Additional testing is not anticipated since previous test fills on this type of material have been completed. Approved finer grained Material 3 from the Event Pond should be placed and spread at the HLF embankment in such a manner to blend with the ADR Material 3. This can be accomplished by dumping piles of each material and pushing together with a dozer during spreading. As the material at the Event Pond becomes more competent and coarser with depth, blending may not be needed.

- A minimum of three (3) pass cycles (1 forward pass and 1 back pass per cycle) using a minimum 9,000 kg vibrating compactor should be used. Use of heavier compactors should follow the recommendations from previous test fills on structural fill (generally 2 passes for vibrating compactors heavier than 11,000 kg).
- Material 3 excavated from the Event Pond should be free of soft phyllitic material. Localized lenses of this material may be encountered in the excavation. This material is weak and unsuitable as structural fill.
- Stockpiles of topsoil and overburden material are being generated at the Event Pond area. Segregation of usable material from unsuitable material should be carefully managed to avoid cross-contamination. The colluvial overburden and highly weathered (soil-like) rock has been tested in a separate test fill and found to be suitable as Material 1 (Site Grading Fill). This material can be used for general fills but shall not be used in construction of the HLF or Event Pond embankments.
- QC should be performed by tracking and reporting the above. In-situ QC testing using a nuclear density gauge should also be performed. Testing should report density and moisture. A minimum of 1 tests per compacted lift should be performed. The number of tests can be reduced by the engineer after observing placement and compaction of the first several lifts and all criteria appear consistent. The average of the tests should determine to either pass or fail. The rock-corrected values from the Proctor test should be used: 95% of 2,236 kg/m^3; moisture between 4% and 8%.

Re: Material 7 Test Fill 02

1.0 INTRODUCTION AND OBJECTIVE

On November 5, 2018 BGC developed and oversaw a test fill to evaluate the engineering properties of Material 7 – Compacted Rockfill for use in the embankment construction. The rockfill was generated from the required excavation of the Event Pond and from blasted rock at the ADR West borrow.

2.0 TEST FILL CONSTRUCTION AND EXECUTION

The test fill was performed on November 5, 2018. BGC's representative, Troy Meyer developed the test fill and was present during the test fills execution. Material 7 – Rockfill was placed in a 0.9m loose lifts. The test fills were constructed and survey control was provided by Pelly Construction. Material sampling and testing was performed by Tetra Tech. Field density testing was overseen by BGC. The following sections discuss the execution of the test fill.

2.1. Test Fill Materials and Borrow Description

Two separate sources of rockfill were used in two separate test fills. The material referred to as "ADR Blast Rock" was generated by Pelly construction as borrow from blasting and excavation at the borrow located west of the ADR plant. he material referred to as "Event Pond Cut" was generated by Pelly construction from required excavations at the eastern end of the event pond.

The material generally consists of quartzite rock with low to moderate strength and a maximum size of 60 cm. The quartzite material properties are mostly fine grained, orange brown, some banding present, slightly weathered (W2), strong to very strong (R4 to R5), and hard (H3).

The ADR Blast Rock contains a higher percentage of large rock than the Event Pond Cut material, which is more well-graded with a gravel and sand matrix. Both materials classify as Material 7 – Rockfill having more than 30 percent particles larger than 19. Moisture content of the minus 6-inch fraction was reported as 3.2 % for ADR Blast Rock and 4.6 % for Event Pond Cut.

Although not used in the test fill, zones of a weaker phyllitic rock (potentially phyllite or phyllonite) are also present within each source area. This material is platy, very fine grained (aphantic), micaceous, has a significant amount of graphite, is gray, slightly weathered (W2), with rock quality ranging from (R1 to R3), and varies from soft (H6) to moderate hard (H4).

2.2. Test Fill Foundation

An area on top of the south Event Pond embankment crest was used as the test location. ***Figure 1*** shows the locations of the test pad and the borrow areas. The test location was frozen, hard and previously compacted by heavy equipment traffic. ***Photo 1*** shows initial placement of fill on the test pad.

Photograph 1: ADR Blast Rock Test fill construction.

Figure 1: Test Fill and Borrow Locations

Photograph 3: Event Pond Cut material as delivered.

2.3. Test Fill Lift Placement

The test fill lift was placed by dumping and spreading with a GPS enabled D6 dozer. Both test fills were placed in one 0.9 m loose lift. Lift thickness was controlled by the Dozer and spot checked by Pelly's surveyor using a mobile station. Each test fill measured approximately 8m x 10m.

2.4. Moisture Conditioning and Temperature

Moisture was not added to the material prior or during the test fill. The ambient air temperature was -19 deg C. The delivered material temperature was measured with a thermal gun:

- ADR Blast Rock +10 deg C
- Event Pond Cut +4 deg C

The temperature of both materials reduced to -5 to -10 deg C at the time of compaction.

2.5. Compaction Testing and Settlement Surveying

To perform compaction tracking three steel plates were placed in a row down the center of the lift and used as a monitoring points (***Figure 2***). Initial survey of the settlement monitoring points was collected using a GPS surveying rod. The entire test fill surface was then compacted with one cycle (1 forward pass and 1 reverse pass) of a CAT CS68 B vibratory compactor with an effective drum weight of 9,150 kg. After completion of one compaction cycle, settlement was measured at the settlement points. This compaction/survey procedure was repeated for 4 full compaction cycles.

A loaded CAT777 haul truck was also used for compaction on adjacent sections of the test pads. The truck was trafficked at a slow speed over the plates and settlement measure by survey after each single pass.

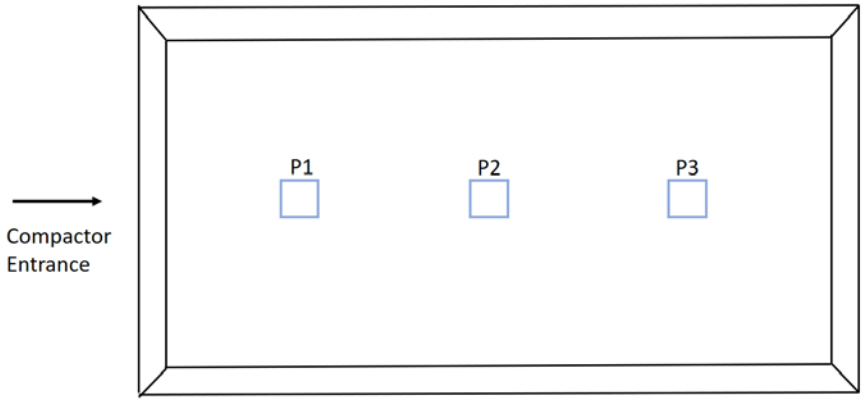

***Figure 2*:** Approximation of test fill pad and survey points

Settlement data collected is included in Table 1 through 4 and settlement graphs are shown as Figures 3 through 6.

Table 4: Survey Data for Event Pond Cut with Loaded Haul Truck.

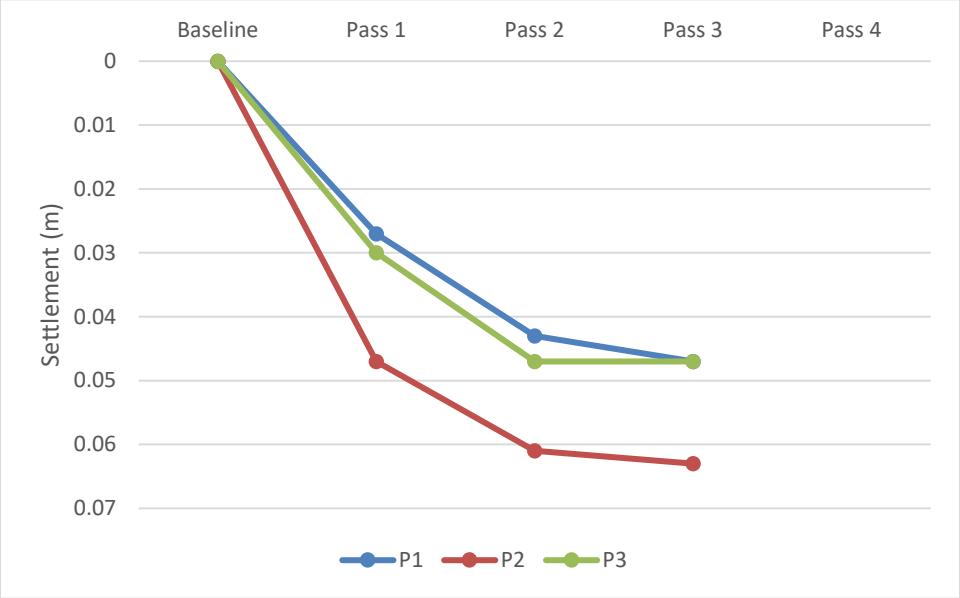

***Figure 6*:** Settlement for Event Pond Cut with Loaded Haul Truck.

2.6. In-situ Density and Moisture Testing

A volumetric test was performed to determine the density of the compacted soil (***Photo 4***). A test pit was dug in the compacted lift. Material excavated from the pit was placed in three super sacks and weighed using a digital scale suspended by a forklift. The test pit volume was determined from drone surveys by Underhill Surveyors.

Test Fill	Weight (kg)	Volume (m3)	Calculated Wet Density (kg/m3)	Estimated Moisture Content (%)	Calculated Dry Density (kg/m3)
ADR Blast Rock	2485	0.96	2588	3.2%	2508
Event Pond Cut	2766	1.1	2515	4.6%	2404

Table 5: Density data.

The dry density of the compacted rockfill was determined to be 2,508 kg/m^3 and 2,404 kg/m^3 for the ADR Blast Rock and Event Pond Cut material, respectively.

Photograph 5: Filling sacks for weighing.

3.0 CONCLUSIONS

The results of the test fill indicate that the rockfill produced from a mostly quartzite source at the ADR borrow and Event Pond cut can achieve sufficient densities with a minimum of 3 passes of a minimum 9,000 kg compactor with vibration, and in lifts of up to 0.90m. Alternatively, one pass with a loaded haul truck will provide adequate compaction. These results were obtained with a material moisture of under 6% within the fill's fine fraction matrix.

BGC recommends these criteria be used for placement and compaction of the rockfill within the Event Pond embankment. If rock size or general gradation varies significantly within this material an additional test fill will be required. If moisture content of the rockfill is above 6% the compaction may be inhibited by frost. Recommendations for placement of winter fills is provided in FM18-020 issued by BGC and dated October 27, 2018.

As the rockfill generated from both the ADR borrow area and Event Pond cut is variable due to the presence of weaker zones of phyllitic material, BGC recommends that the above criteria be used on rockfill produced from the zones of harder quartzite formations. Small zones of phyllitic material should be blended within the quartzite rockfill before use since these zones are more prone to material breakdown and frost. Phyllitic material should not be allowed to be placed in a manner that would create lifts or zones within a lift composed of predominately this material.

The Engineer will inspect the rockfill material during borrowing or placement to make these determinations. Quality control and assurance will be performed by BGC and Tetra Tech based on visual observations of material characteristics and proof rolling with loaded CAT777 trucks. Modifications to lift thickness may be recommended based on observations and additional field density tests may be required by the Engineer to verify compaction, as needed.

STANDARD EQUIPMENT *Varies by market- contact your Dealer for specifics.*

ELECTRICAL
- 24 volt Electrical System
- 100 ampere Alternator
- 750 Cold-cranking Amps Battery Capacity

OPERATOR ENVIRONMENT
- ROPS/FOPS Cab with Climate Control (Heat, Air Conditioning)
- Cloth Adjustable Pivoting Seat with Integrated Console and LCD Display, Seat Belt
- Multifunction LCD Display with gauges and/or audible warning alarm for: *Hydraulic oil temperature, Engine oil pressure, Engine coolant temperature, Alternator charge, Fuel level, Service hour meter, Engine RPM, Ground speed, Vibe frequency, Fuel rate, Air filter constriction, Engine load and Optional Cat Compaction Control*
- Adjustable Tilting Steering Column with Integrated Cup Holders
- 12-volt Power Outlet
- Floor Mat
- Interior Rear View Mirror
- Horn, Backup Alarm
- Radio-ready

POWER TRAIN
- Cat® C4.4 Diesel Engine
- Air Cleaner, Dual Element
- Three-speed Throttle Switch w/ Eco-mode, Automatic Speed Control
- Dual Propel Pumps; One for Drum Drive, One for Rear Axle
- Fuel Filter, Water Separator, Electronic Priming Pump, Water Indicator
- Tilting Radiator/Hydraulic Oil Cooler
- Dual Braking System
- Two-speed Hydrostatic Transmission

VIBRATORY SYSTEM
- Smooth Drum
- Dual Amplitude, Single Frequency
- Dual Pod-Style Eccentric Weight Housings
- Auto-vibe Function
- Front Adjustable Steel Scraper

OTHER
- Hydraulic Oil Level Sight Gauge
- Radiator Coolant Level Sight Gauge
- Cat® ToughGuard™ Hose
- S·O·S℠ Sampling Valves, Engine Oil and Hydraulic Oil

OPTIONAL EQUIPMENT
- Padfoot Shell Kit
- Leveling Blade
- Variable Vibration Frequency
- Beacon, Rotating
- Polyurethane Drum Scrapers
- Steel Rear-side Drum Scraper
- Bio-oil Factory Fill
- Sun Visor
- Deluxe High-back Air-ride Pivoting Seat
- Cat Compaction Control, Machine Drive Power or CMV
- SBAS GNSS Mapping for Cat Compaction Control (RTK available)
- Upgraded Halogen Light Package
- Cab Internal Rear View Mirrors
- Cab Internal Roll-down Sun Screen
- Product Link
- Additional Rear View Mirrors

Re: Excavation of HLF Foundation to Type 3 Rock

1.0 INTRODUCTION

The purpose of this memorandum is to provide guidance on excavation to Type 3 rock within the foundation of the Heap Leach Facility footprint to ensure that the final foundation meets the requirements of the design.

2.0 DESCRIPTION AND IDENTIFICATION OF TYPE 3 ROCK

The “Type 3” rock is the first “rock-like” material underlying the overburden materials, and is defined as being rock that is highly or less weathered metasedimentary rock (i.e. W4 or better), and has intact strength greater than R0 (minimum UCS strength 1 MPa and up to 5 MPa). Type 3 bedrock is the lowest quality rock mass that is considered to behave as rock (rather than as a soil) and can be recognized on the basis of evident preserved fabric of the parent rock within the highly-weathered rock mass. It is expected that Type 3 rock can be excavated with normal excavating equipment with a moderate level of effort but may require up to 40 percent ripping.

Type 3 rock is described as dark brown, reddish-brown, to reddish or dark grey color. Weathering is typically observed in foliated, horizontal to subhorizontal layers, with blocky intact metasedimentary rock common which would follow the orientation of a joint set. Therefore, in-situ blocks would be oriented similarly when encountered. Oxidization and seepage is common which would occur along the rock foliations and joint sets. Localized (ie spotty) silicification was observed in some of core recovered from drilling into the intact Type 3 rock. Fracture/joint infilling in the Type 3 rock may appear as sand and gravel and will have the similar color and composition as the parent rock. These sands and gravel will typically be homogenous, weakly cemented, well graded gravel and sand. Portions of the rock will also breakdown into sand and gravel while being excavated which will be evident in the excavation spoils.

HLF foundation should be excavated to the top of Type 3 rock or better (ie Type 2, Type 1). The top of Type 3 rock can be identified by the increased effort needed to excavate, including some ripping. Spoils from the top of Type 3 rock would contain platy, foliated rock fragments and sometimes blocky segments of rock mixed with sand and gravel of the same composition as the parent rock (ie quartz and mica sand; metasedimentary gravel; similar oxidation and color as parent rock). The photographs that follow provide examples of and further description of how Type 3 rock previously encountered at the project site.

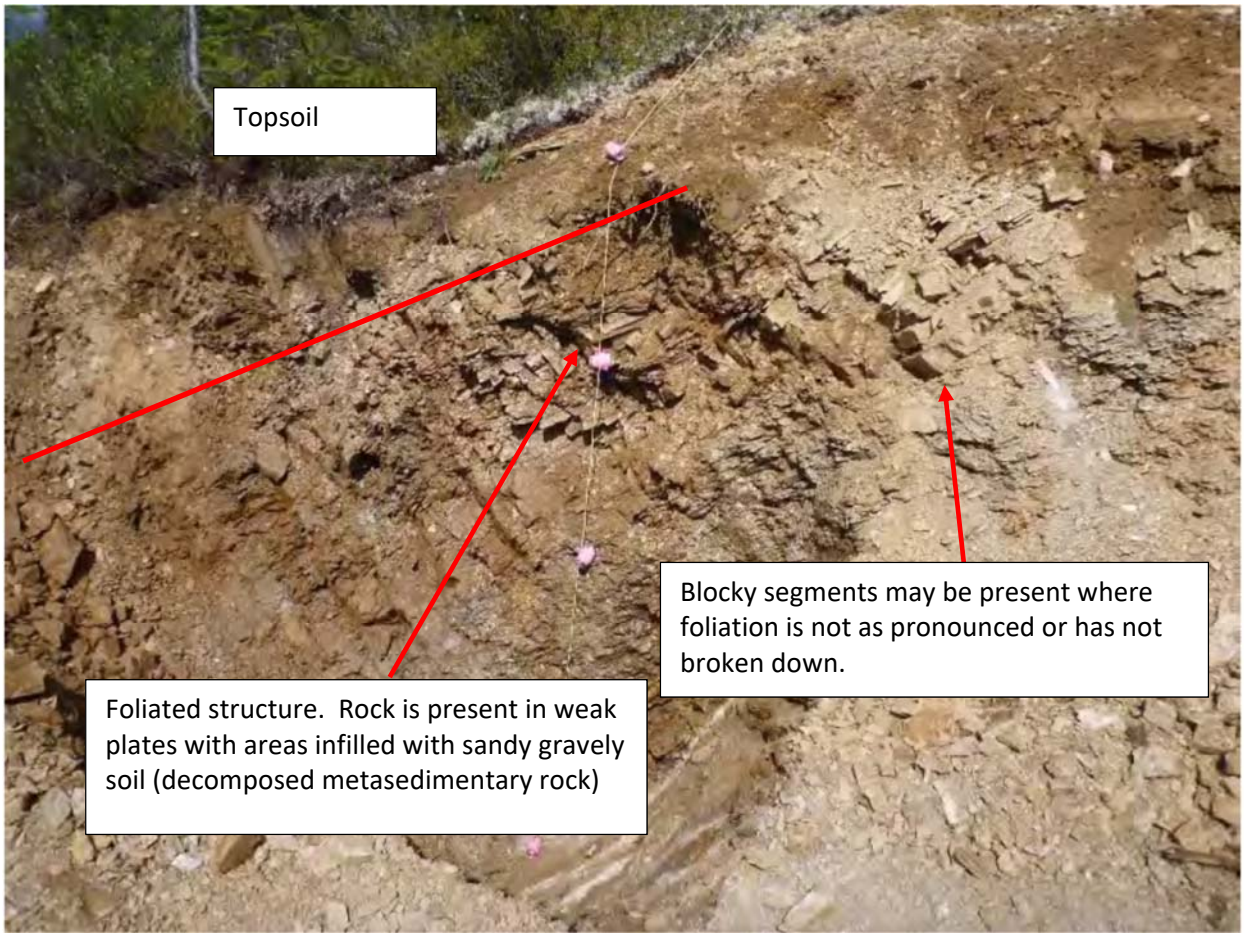

Photo 1: Test pit wall showing blocky and foliated Type 3 metasedimentary bedrock.

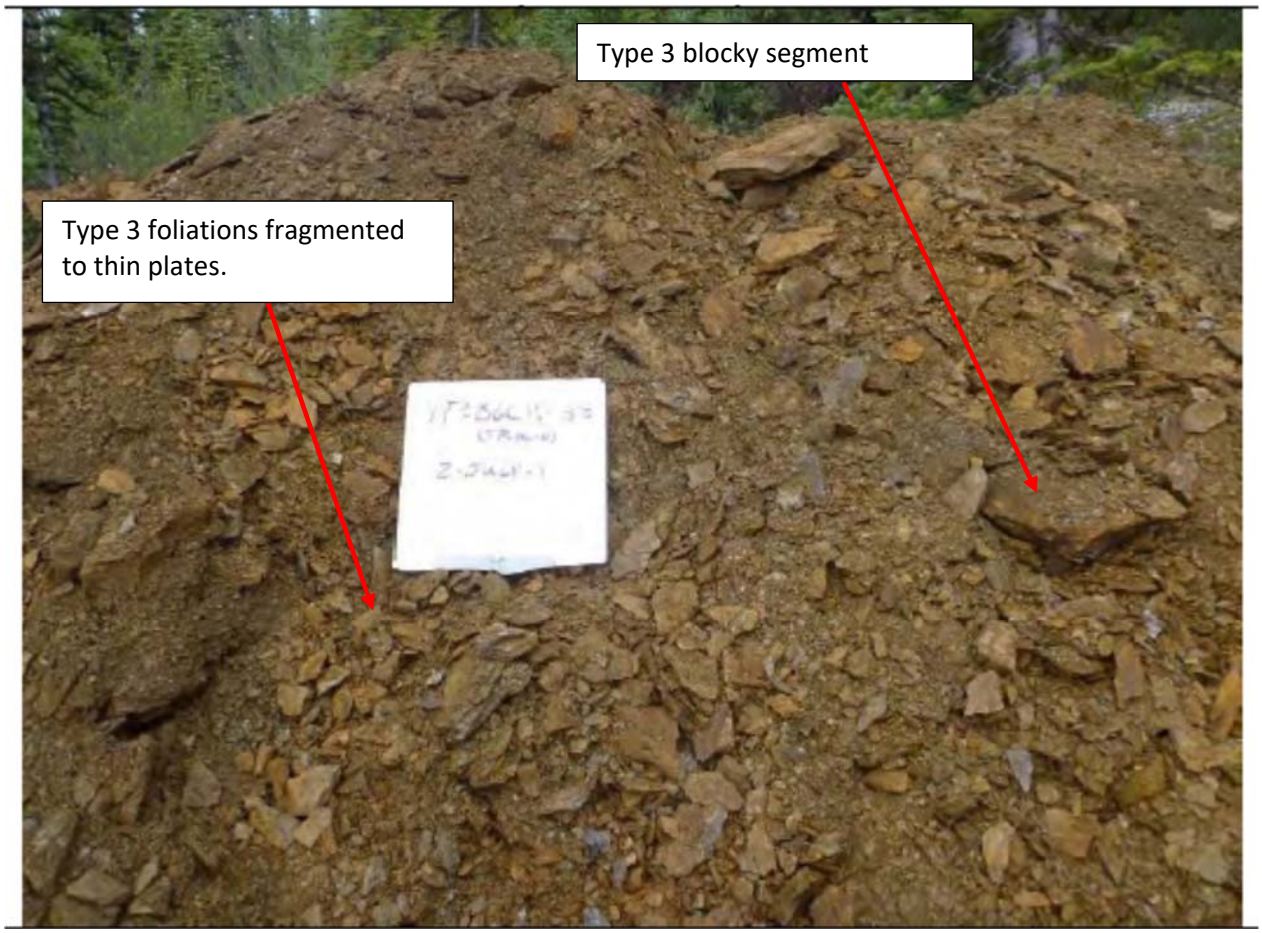

Photo 2: Excavation spoils will contain a high amount of platy, weathered rock fragments from separation at the foliations. Larger, stronger segments of rock will excavate as more blocky pieces. Excavation spoils will also contain gravelly, sandy material that results from weathering of the bedrock and breakdown from ripping. Gravels and sand will be similar to parent rock (color, composition)

Photo 3: Example of Type 3 metasedimentary rock with less platy, more blocky structure. Orange oxidation present through most of the exposed area. Type 3 material encountered was distinguishable from the colluvium/ decomposed bedrock as it was harder to excavate and was more homogenous.

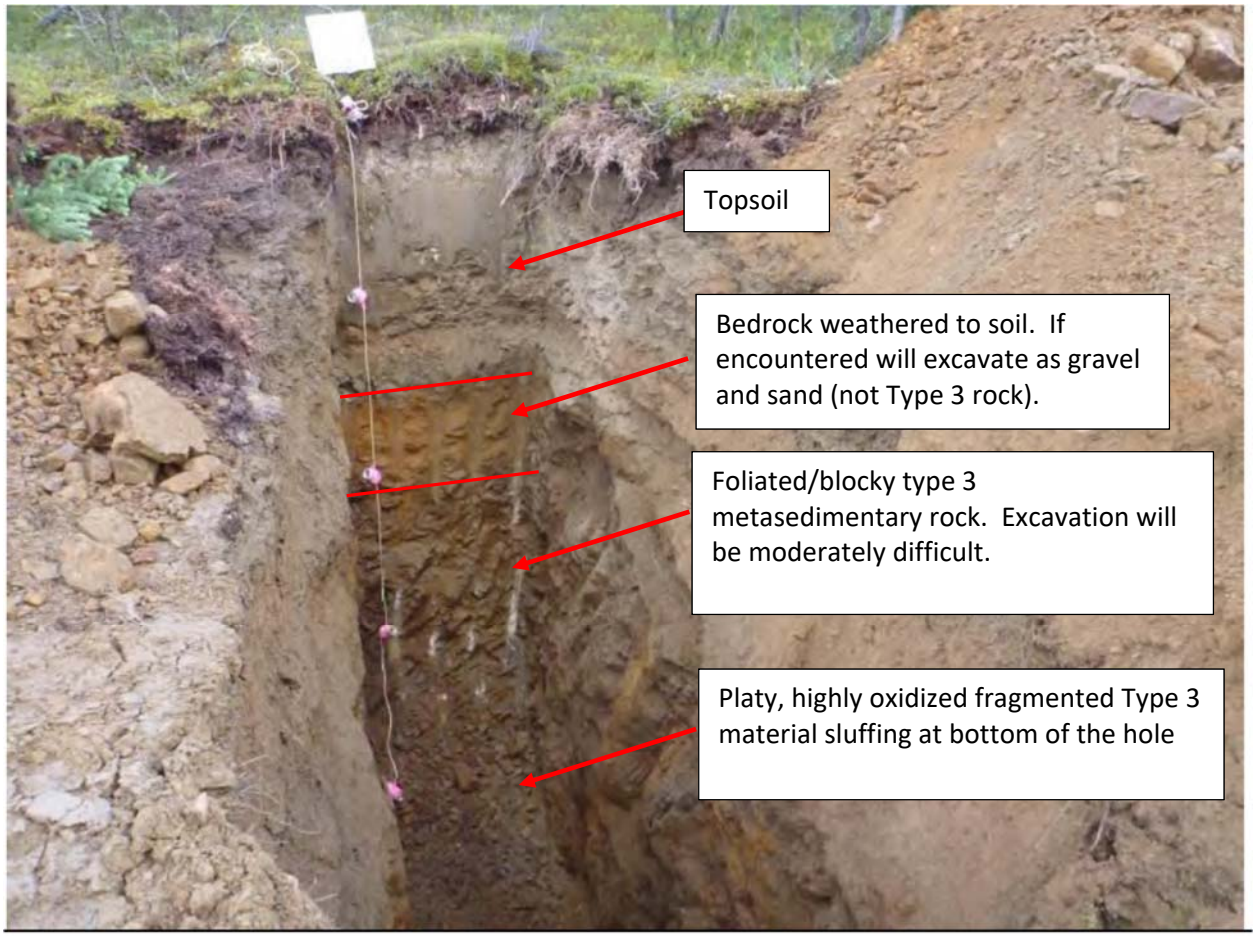

Photo 4: This photo shows a defined strata leading to Type 3 bedrock. Topsoil is high in organics and generally reduced to a gray/brown color. Zone above the Type 3 bedrock has been weathered to soil and was excavated as sandy and gravel with the same composition as the bedrock (ie quartz and mica sand; metasedimentary gravels). Type 3 material is apparent by platy foliations with some blocky zones. Some light ripping was needed to excavate the Type 3 material as can be seen in the white gouge marks.

Photo 5: Excavation of a slope to Type 3 bedrock.

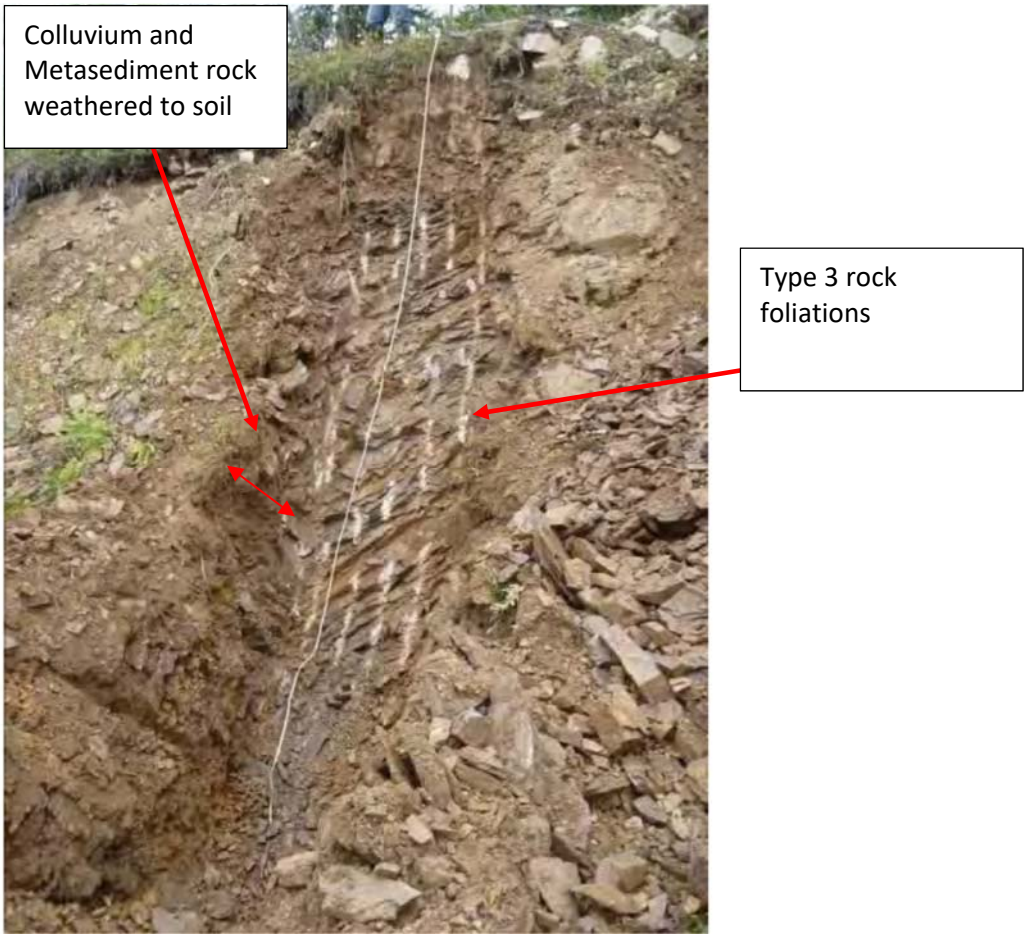

Photo 6: Photograph of surface from Photo 5 excavated to Type 3 rock, parallel to foliations.

Photo 7: Spoils from test excavation in Photo 6. Mix of platy and blocky dark colored metasedimentary rock visible in the forefront of the spoils.

3.0 FROZEN GROUND CONSIDERATIONS

If frozen ground is encountered the engineer should be made aware right away and should be present for the supervision of its removal. Frozen soils will be removed to competent bedrock. This may be Type 3 bedrock. However, since some zones of Type 3 bedrock are weathered to friable layers that can be susceptible to loss of internal strength during freeze/thaw events additional diligence is needed to ensure they are removed. The engineer will make the determination where to end the excavation (typically in a more competent zone still within the Type 3 rock type).

Photo 8: Example of Type 3 material that may be susceptible to loss of internal strength.

4.0 USE OF SPOILS AS MATERIAL 3 STRUCTURUAL FILL

The description of the Material 3 – Structural Fill from the project technical specifications are:

“Structural Fill shall consist of glacial till, alluvium, colluvium, and residual highly weathered bedrock obtained from required excavations and site grading or other approved sources. Structural Fill shall consist of material with a minimum of 10 percent passing the No. 200 ASTM sieve size, have less than 30 percent rock particles retained on the 19 mm (3/4 in.) ASTM sieve size and a maximum 150 mm rock size. No gap graded material as determined by the Engineer, shall be acceptable. The structural fill material shall be moisture conditioned to +2/-2 percent of optimum moisture content, placed in 0.3 m maximum loose lifts and compacted to a minimum 95 percent of the Standard Proctor maximum dry density (ASTM D-698).”

Material 3 will be used in the construction of the dam embankment which would be classified as an earthfill dam (as opposed to a rockfill dam) due to material particle size and resulting permeability. A QC sample should be collected from the first stockpiled/blended soils generated to ensure it meets these criteria. The main design criteria for Material 3 are:

- Greater than 10% fine material.

- Greater than 30% material larger than 19mm (3/4”).
- A maximum size of 150mm (6”).
- No gap grading. This means that material should be well graded so to allow space between larger particles to be supported by varying sizes of smaller particles (ie is well graded). Gap grading can result in unstable construction. Care should be taken to ensure that gap grading is not occurring when mixing soils types. Gradation will be confirmed per the QC testing program.
- Free of organics.
- Relatively uniform in gradation and composition. This would mean that the material being used to construct all portions of the dam have a relatively similar gradation, compatibility, and water draining properties. This is typically achieved by producing from the same borrow source or a borrow source of similar origin.

A gradation band for Material 3 is provided below. It should be noted that the gradation band is wide. However, the requirements of having a well graded and uniform material is still necessary, even though gap graded and variable material gradations would still fall within this band.

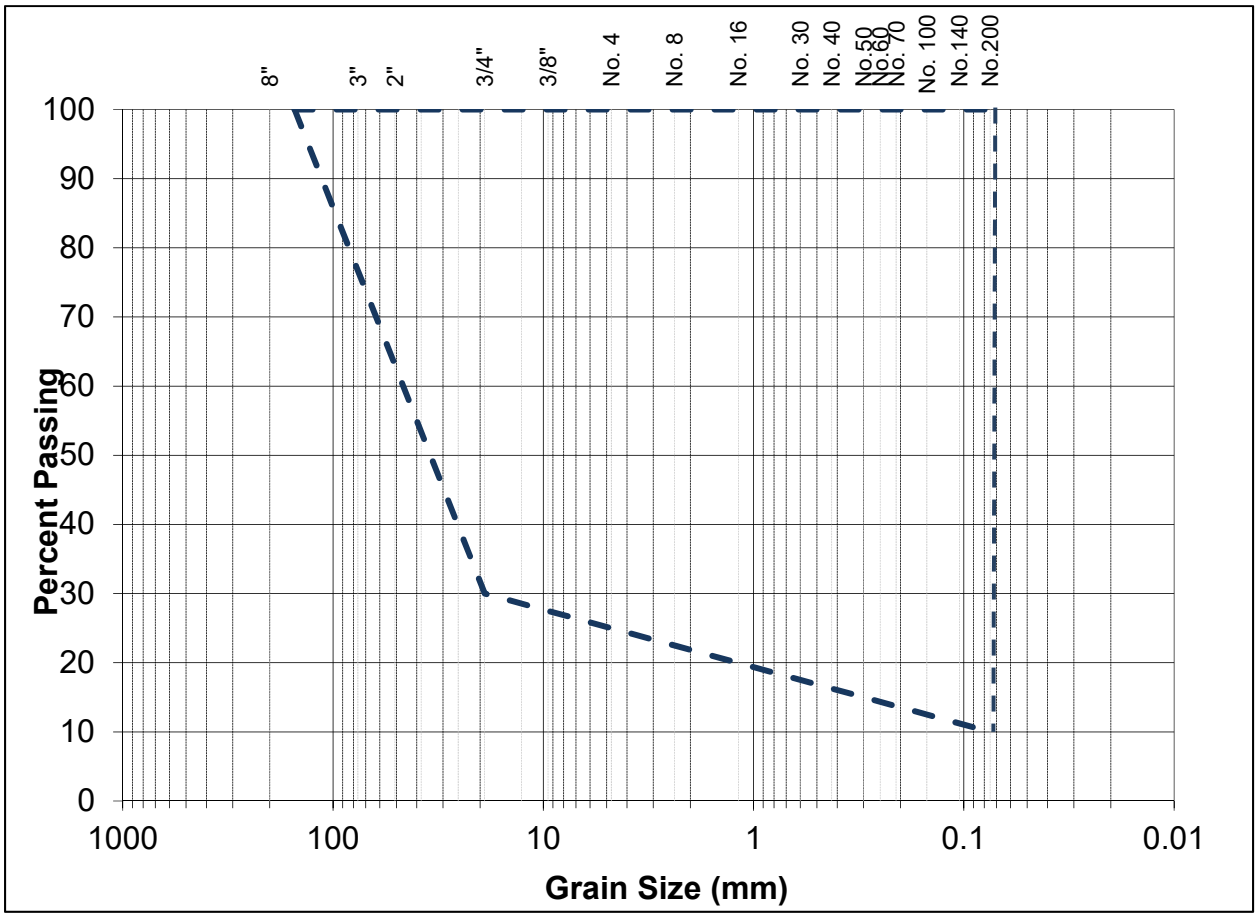

Figure 1: Material 3 Gradation Band

Re: Seeps and Finger Drains

1.0 INTRODUCTION

The purpose of this memorandum is to discuss the field observations made along the exposed right abutment and artesian well identified upstream of the partially excavated undrain pipe trench.

Field observations included daily monitoring of potential seeps during no precipitation days, photo records to document observations, and visual confirmation of water flow. The intend of this document is to classify areas that may interfere with moisture conditioning of lifts during construction, damage approved fill placement through water flow and present solutions to be implemented in the field during construction.

2.0 WATER MANAGEMENT FIELD OBSERVATION

On May 26th, 2018, representatives from Pelly and JDS, accompanied BGC Resident Engineer (Daniel Granda) to walk the site (**Figure 1**). This meeting took place a day after significant rainfall and the ground was fairly moist. This was used a baseline for identifying seeps occurring during drier conditions.

Figure 1: Pelly and JDS representatives present for water management field observation visit.

During the visit, the ground was found to be moist. Sediments had been transported on exposed Type 3 foundation in underdrain pipe trench and moisture from the abutments seemed to be rainfall moisture (**Figure 2**).

Figure 2: Seeps were difficult to see after significant rainfall events.

3.0 OBSERVATIONS

During a course of 5 days, and in consistent drier weather, moisture spots remained concentrated in areas identified. **Figure 3** presents observations from June 1st, 2018 inspection. **Figure 4** presents field interpretation and seep identification.

Figure 3: Upstream view from proposed embankment toe looking upstream

Figure 4: Field Interpretation of seeps with identifications for descriptions.

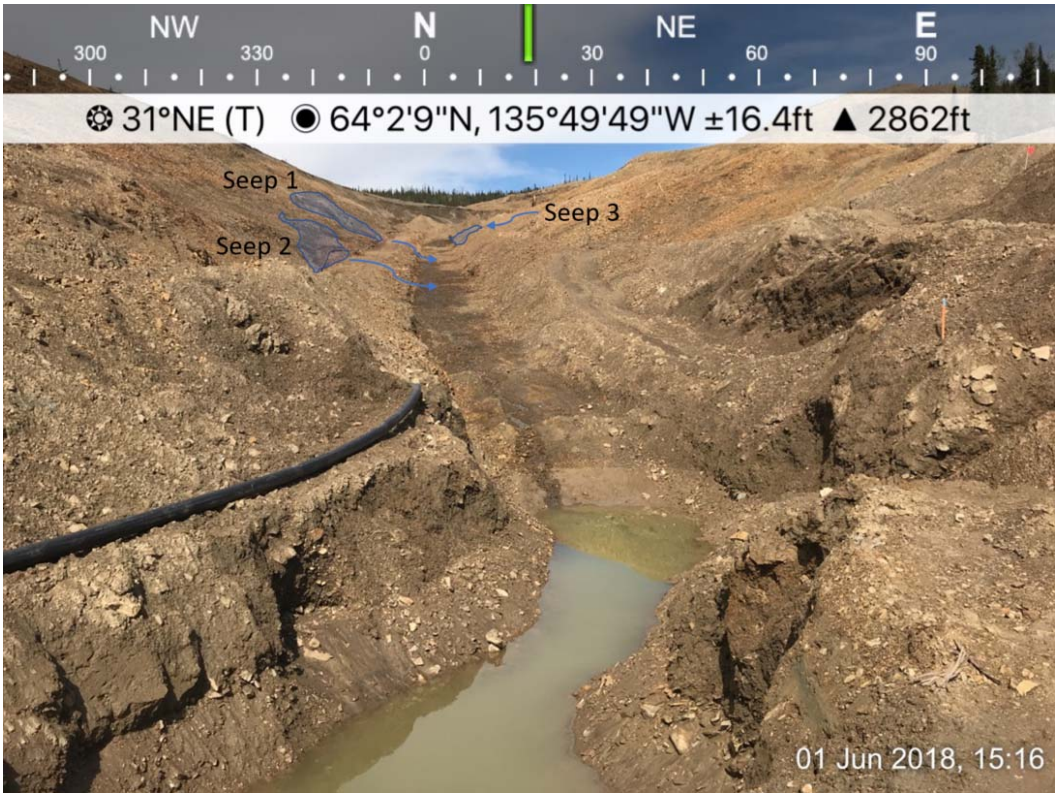

Figure 4: Field Interpretation of seeps with identifications for descriptions.

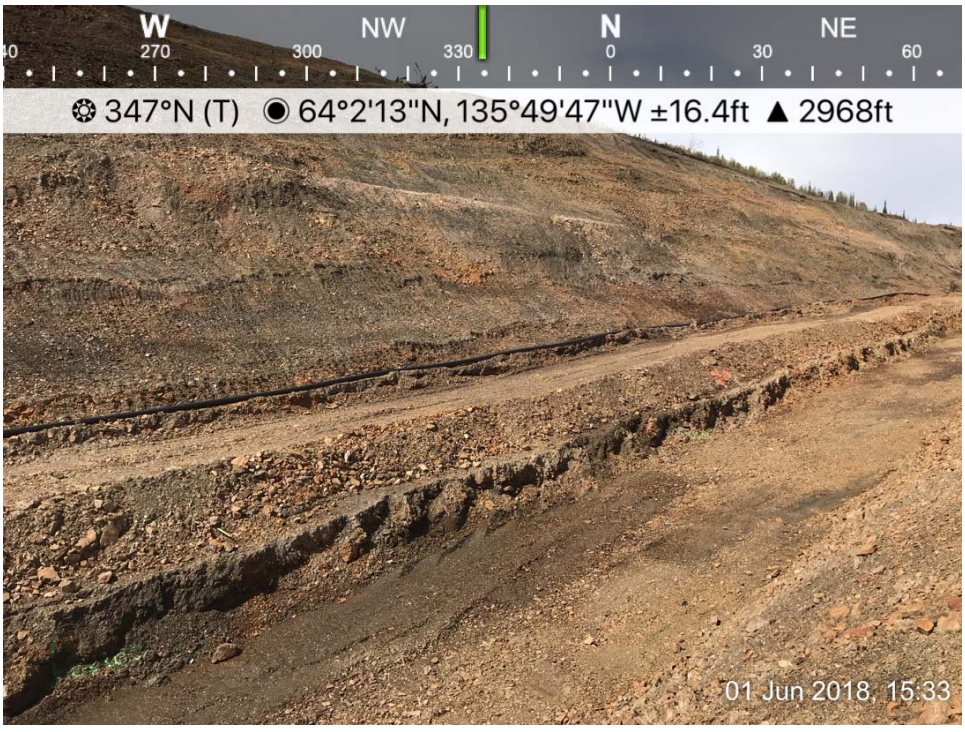

Figure 5: Seep 1 view from left abutment.

Both Seep 1 and 2 have been occurring for the past 5 days. Weak, very moist and low resistance to puncture zones were identified by applying finger pressure on wet areas. **Figure 6** presents the interpretation that may be confirmed during abutment foundation preparation for seep 1.

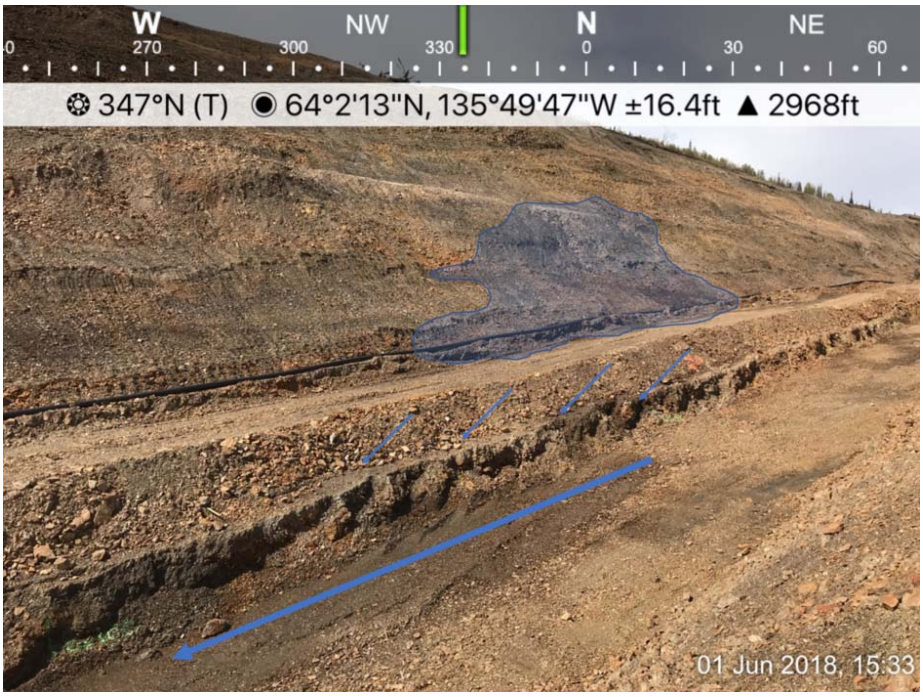

Figure 6: Seep 1 interpretation of potential flow path.

The specific source zone point is unknown as the materials on the abutment have high moisture absorption and fine lenses exhibit matric suction properties. In seep 1, the moisture is visible at the close sight on the abutment, liquid is transported downstream of the abutment and reconnects to the underdrain trench sides.

Figure 7: Seep 2 view from left abutment.

Seep 2 exhibits the same characteristics as seep 1, with ponded water on surface on bench between abutment and bottom of underdrain trench.

Figure 8: Seep 2 interpretation of potential flow path.

Figure 9: Seep 3 view from upstream underdrain trench

Seep 3 is believed to be coming from the artesian source identified during inspections. There is a clear connection of moisture oriented from the assumed source to the underdrain trench.

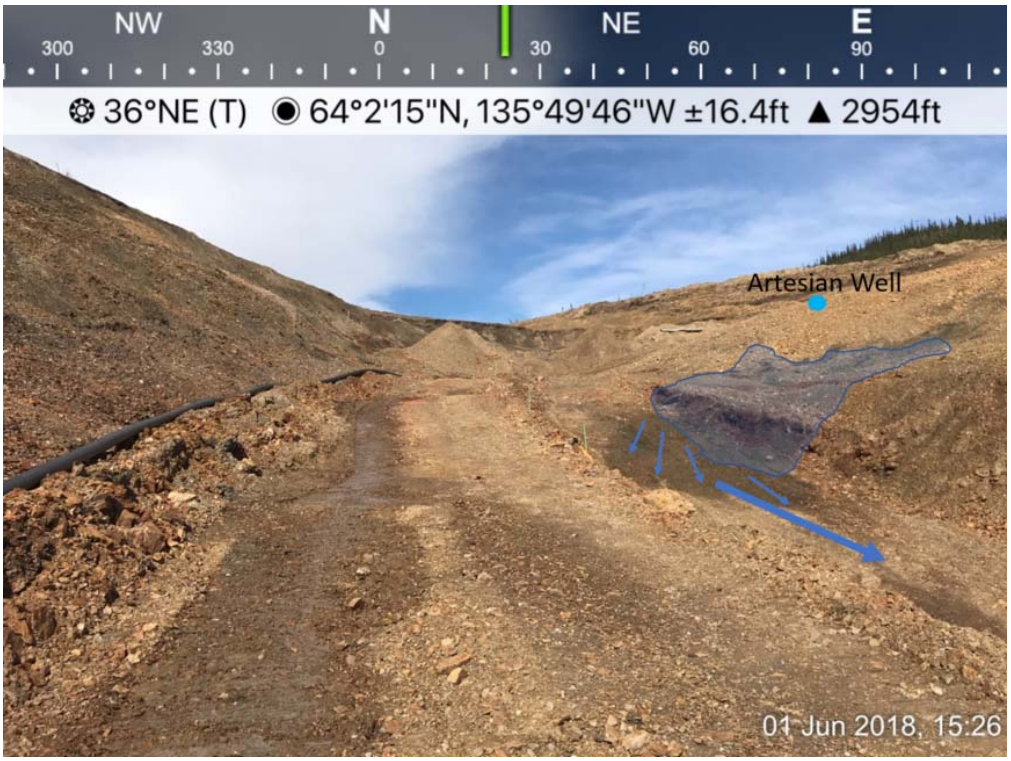

Figure 10: Seep 3 interpretation of potential flow path.

4.0 SUGGESTED MITIGATION

A field design to help the contractor to dissipate seepage and surface runoff from the abutments during construction seems to be the best approach. The goal of this mitigation is to provide a way of transporting excess water during construction (lift placements and compaction) to meet compaction specifications, transport and reduce pore water pressures inside the constructed embankment for long term stability.

5.0 FINGER DRAIN

A total of 3 finger drains are proposed (one finger drain at Seep 1, one finger drains at Seep 2, and one finger drain at Seep 3). The centerline location of each finger drain was surveyed by Pelly's survey team. A figure showing the location was not provided to BGC before completion of this memorandum. However, each drain will be an estimated 10 m in length. Although it is not currently anticipated, these finger drains can be extended in length if moisture along the abutments appear to be an issue during construction.

The finger drain trenches should be a minimum of 2 m wide, by a minimum of 0.75 m high, with a 2:1 slope on each side. The drain trench should be excavated in Type 3 Bedrock or better. Similar requirements to the underdrain will be used to construct it (e.g. geotextile overlap, select throughout). The final drain will be field fitted and the final length and construction details will be dependent on the ground conditions and its ability to tie into the Pipe Trench. However, the drain should meet the minimum dimensions discussed here. The detail for the minimum requirements is presented as **Figure 11**.

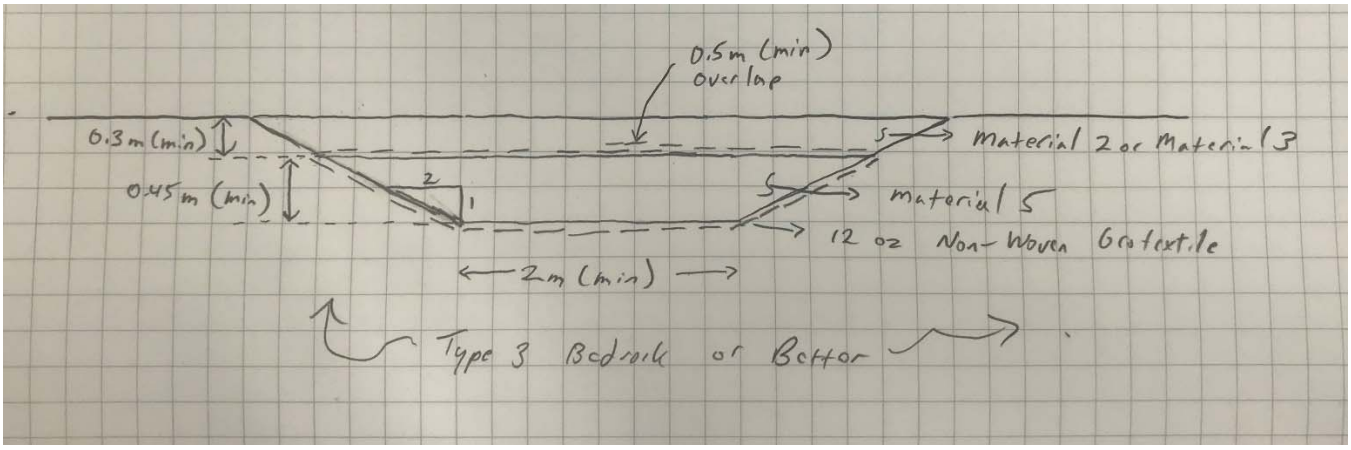

Figure 11: Typical section for finger drain.

Finger drains will tie into the drain rock at the pipe trench. Geotextile in the finger drains should overlap with the pipe trench by a minimum of 0.5 m. The Constructor should propose a method to overlap the geotextile at this connection based on constructability. BGC should review this connection prior to construction. The following sketch is a plan view of the finger drains in relation to the pipe trench (**Figure 12**).

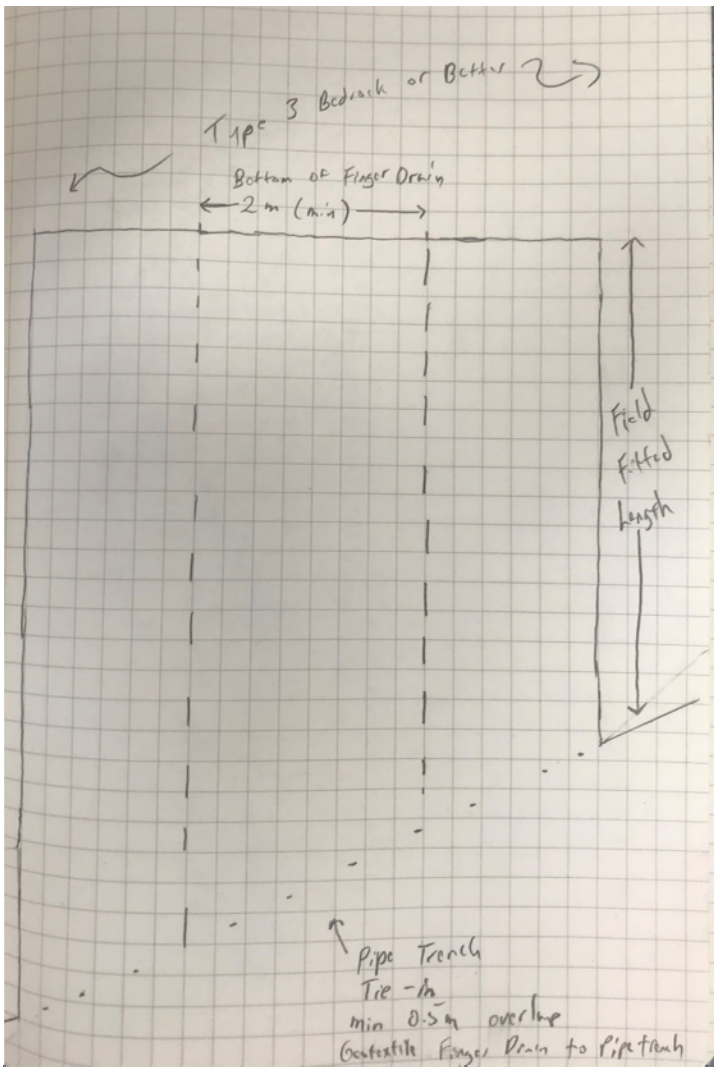

Figure 12: Plan view for finger drain layout.

6.0 SUMMARY AND RECOMMENDATIONS

A finger drain will be needed to reduce porewater pressures during construction through operations. The design presented could help drain slopes and maintain control of water during material lift placements prior to compaction.

This drain design is not intended for the control of the water on the east side of the embankment where the artesian hole was discovered. A separate design will be developed for the drain on that side of the embankment.

Re: HDPE Pipe Leak Test

1.0 INTRODUCTION

The purpose of this memo is to provide a summary of the pipe testing observations made by BGC Engineering (BGC) during Pelly Constructions (Pelly) testing of the HDPE SDR 17 portion of the Closure Pipe to be used between stations 0+29.3 to 1+81.4. Pelly performed pressure testing on June 16th, 2018 between 11:30 HRS and 17:35 HRS based on ASTM F2164-13.

2.0 OBSERVATIONS AND RESULTS

Pelly provided a description of the test procedure and testing equipment components, which can be viewed in the attached memo from Pelly (Attachment 1).

BGC observed the HDPE pipe test throughout the time of testing. Pressure was checked by Pelly using a regulator attached to one end of the pipe. Photos were taken by BGC of each of the 9 butt-fused pipe joints at regular intervals in addition to the flange-pipe connections at the ends of the pipe (Attachment 2).

The test was started early in the morning following a night of light rain. The pipe at the start of the test was wet on the outside from the overnight rain. The pipe gradually dried during the test, assisting in potential leak detection. BGC observed that pressure within the pipe was stable through the duration of the test with fluctuations ranging between 0 and 5 psi. A summary of BGC's observations for each regular check interval can be viewed in the attachments (Attachment 3).

3.0 CONCLUSIONS

Pelly reported that the pipe passed the pressure test. BGC's observations confirm this. BGC's observations also confirm that Pelly followed the ASTM standard being used for the pipe test. Visual inspection of the pipe did not indicate the presence of air or water leaks. BGC attributed

the slight fluctuation in psi to compressor variation and regulator performance, not to a leak along butt-fused pipe joints.

4.0 CLOSURE

BGC Engineering Inc. (BGC) prepared this document for the account of JDS. Work Plan:	HLF Embankment Underdrain Pipe Leak Test	**Revision:**	0
Location:	HLF Embankment approx. 1.5km Dublin Road	**Date:**	2018-06-20

OBJECTIVE

The objective of this CWP is to outline the procedure and provide results of a leak test to be completed on the underdrain pipe(s) to be installed within the HLF Embankment in Response to BGC RFI-004.

SUMMARY

The scope of work includes:

1. Test pipe for leaks following guidelines outlined in ASTM F2164-13
2. Monitor and record test results
3. Approval of tested pipe

SAFETY

Potential Hazard	Precautions and Actions
Outlined in attached JHA	Job Hazard assessment completed for work to be done

SCOPE OF WORK

Description	
1. <u>Test pipe for leaks</u> **Test Pipe:** The test pipe will consist of approx. 150m length of HDPE SDR 17 pipe to be used as the closure pipe between station 0+29.3 (upstream vault contact) and 1+81.4 SDR 17 to SDR 11 connection as per drawing EGHLF-XD-03-05. • Pipe leak test will be completed guided by procedures and safety precautions included in ASTM F2164-13 (attached). Most recently fused pipe will be selected as a spot test to prove quality of welds and free of any leaks. In the event that the selected pipe fails the procedure, all pipes will then have to be tested as quality assurance. **Procedure:** • Flanges will be fused onto the selected pipe consisting of a cap and gasket to seal pressure at one end and introduce water and pressure into the other end. • The pipe will be placed into a confining ditch where all welds in question are visible. Pipe will be placed in a constant graded position to minimize undulations and air pockets. • The pipe will be filled with water to capacity. • Pneumatic pressure will be introduced into the pipe in stages of 20 – 30 psi up 100 psi agreed upon by BGC representative. Each stage must sustain constant pressure for 15 minutes while remaining free of any leaks. • The pipe will be required to sustain 100 psi of constant pressure and be

This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.

Designation: F2164 – 13

Standard Practice for Field Leak Testing of Polyethylene (PE) and Crosslinked Polyethylene (PEX) Pressure Piping Systems Using Hydrostatic Pressure[1]

This standard is issued under the fixed designation F2164; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope*

1.1 This practice provides information on apparatus, safety, pre-test preparation, and procedures for conducting field tests of polyethylene and crosslinked polyethylene pressure piping systems by filling with a liquid and applying pressure to determine if leaks exist in the system.

1.2 This practice does not address leak testing using a pressurized gas (pneumatic testing). For safety reasons, some manufacturers prohibit or restrict pneumatic pressure testing of their products. Failure during a pressure leak test can be explosive, violent, and dangerous, especially if a compressed gas is used. In a compressed gas test, both the pressure stress on the system and the energy used to compress the gas are released at a failure. Contact component manufacturers for information about testing with gas under pressure.

1.3 This practice does not apply to leak testing of non-pressure, gravity-flow, negative pressure (vacuum), or non-thermoplastic piping systems. For field-testing of plastic gravity flow sewer lines, see Test Method F1417.

1.4 The values stated in inch-pound units are to be regarded as standard. The values given in parentheses are mathematical conversions to SI units that are provided for information only and are not considered standard.

1.5 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.* Additional safety information is presented in Section 7 and throughout this standard.

having jurisdiction." In many circumstances, the property owner or his authorized engineer or agent assumes the role of the "authority having jurisdiction"; at government installations, the commanding officer or departmental official may be the "authority having jurisdiction."

3.2.2 *approved, vt*—acceptable to the authority having jurisdiction.

3.2.3 *pressure piping system, n*—a piping system where all components in the system are pressure rated and intended for conveying a fluid under continuous internal pressure. (See also Terminology F412, *pressure pipe* and *non-pressure pipe*.) To verify suitability for pressure service, consult the component manufacturer.

NOTE 1—PPI TR-4 provides information about stress ratings for some plastic materials and products.

3.2.4 *restraint, n*—temporary or permanent structural measures or devices which restrict, guide, prevent, or safely limit disjoining or movement of piping system components while the system is under pressure during testing or service conditions. Restraint may include backfill, anchors, thrust blocks, external clamps and tie rods (joint restraints), pipe guides, and so forth. Restraint means that if violent separation or failure occurs during the test, any movement of components or parts is sufficiently constrained such that damage or injury is prevented.

3.2.5 *system design pressure, n*—the limiting continuous internal pressure specified by the piping system designer. System design pressure may be less than the pressure ratings of components in the system. System design pressure may be limited by component pressure ratings, by code or application requirements, or by other restrictions.

3.2.6 *visible leakage, n*—the visible escape (drip, spray, stream, flow, and so forth.) of test liquid from the test section through components, joints, connections, appurtenances, and the like in the test section.

4. Summary of Practice

4.1 The section of the piping system to be tested is isolated from other parts of the system and restrained against movement to prevent catastrophic failure. Components that are not to be subjected to test pressure or could be damaged by test pressure are isolated or removed as necessary. Isolated components are vented to atmosphere. The test section is filled with the testing liquid, raised to the test pressure, and allowed to stabilize. The system is inspected or monitored for leakage, and then test pressure is relieved. If repairs or corrections are necessary, they are performed only when the test section is depressurized. If necessary, a retest is performed after a relaxation period. At the conclusion of an acceptable test, the test section may be placed in service. Purging and disposal of the test liquid from the test section may be necessary.

4.2 Acceptance is determined by the approval of the authority having jurisdiction.

4.3 The authority having jurisdiction may specify procedures or requirements for test liquid disposal or erosion control.

5. Significance and Use

5.1 If required by the authority having jurisdiction, hydrostatic pressure leak testing may be conducted to discover and correct leaks or faults in a newly constructed or modified polyethylene or crosslinked polyethylene pressure piping system before placing the system in service. Leakage or faults usually occur at connections, joints, and mechanical seals where sealing under pressure is required. (**Warning**—Safety is of paramount importance when conducting hydrostatic pressure leak tests because testing under pressure may cause sudden violent rupture or failure.)

5.2 This practice uses a pressurized liquid to test for leaks. It does not verify if a piping material or a piping system design is suitable for pressure service. The suitability of a piping system for pressure service and its pressure rating or operating pressure is determined solely by its design and its installed components.

5.3 Systems that are not suitable for pressure testing should not be pressure tested. Such systems may contain lower pressure rated or non-pressure rated components that cannot be isolated from test pressure, or temporary caps or closures may not be practical. In these systems, leak inspections should be conducted during and after installation. Inspections typically include visual examination of joint appearance, mechanical checks of bolt or joint tightness, and other relevant examinations. See also Test Method F1417.

5.4 *Leakage Allowance*—There is no leakage allowance for a section of heat-fusion joined polyethylene piping, because properly made heat fusion joints do not leak. See 7.6.1.

5.4.1 Other types of joints or connections in the system may have a leakage allowance. Contact the joint or connection manufacturer for information.

5.5 *Expansion Allowance*—When test pressure is applied, polyethylene or crosslinked polyethylene pipe will expand slightly due to elasticity and Poisson effects. To compensate for expansion, make-up water is added during the initial expansion phase. The amount of make-up water (expansion allowance) will vary because expansion is not linear. This procedure compensates for expansion with an initial expansion phase, followed by a test phase. In the test phase, expansion is suspended by slightly reducing test pressure. See 9.6.

5.6 *Poisson Effect*—When test pressure is applied to plastic piping systems that have fully restrained joints (joints such as heat fusion, electrofusion, bolted flanges, and so forth.), diametrical expansion of the pipe may reduce the overall length of the fully restrained section. Poisson-effect length reduction may affect or cause disjoining in other contiguous sections that have partially restrained or non-restrained joints, such as bell-and-spigot joints, when such joints are in-line with the test section. To prevent Poisson-effect disjoining, take measures such as the installation of external joint restraints (diametrical clamps and tie-rods) on in-line non-restrained joints, installing in-line thrust anchors at the ends of the fully restrained section, or isolating the fully restrained test section from piping with non-restrained or partially restrained joints.

NOTE 2—When a tensile stress is applied to a material, it will elongate

Copyright by ASTM Int'l (all rights reserved); Mon Jun 11 11:42:54 EDT 2018
Downloaded/printed by
Jana Purmalis (BGC Engineering) pursuant to License Agreement. No further reproductions authorized.

in the direction of the applied stress, and will decrease in dimension at right angles to the direction of the applied stress. The ratio of decrease to elongation is the Poisson ratio. Under test pressure, piping materials will expand slightly in diameter and contract in length slightly according to the Poisson ratio of the material.

6. Apparatus and Equipment for Hydrostatic Procedures

6.1 *General*—Components such as caps, valves, blind flanges, manual or automatic air release devices, vents, and other devices that are used to isolate the test section from other parts of the system, to purge air from the system, and to isolate components that are not to be subjected to test pressure are generally needed.

6.1.1 Test section isolation and closure components are to be rated for pressures equal to or greater than the test pressure applied to the test section.

6.1.2 Although section isolation and closure components may only be connected to the test section for the duration of the test, the joint between the test section and a closure or isolation component should be at least as strong as joints in the test section. Additional restraint may be required.

6.1.3 Air release devices should be located at all high points along the test section.

6.1.4 Excessively worn or deteriorated equipment is unsuitable and is not to be used.

6.2 *Test Liquid*—An adequate supply of a safe test liquid, such as water, is necessary. The test liquid should be of appropriate safety and quality so that the environment, system, test equipment, and disposal (if necessary) are not adversely affected.

6.2.1 Where an existing water supply is used to supply test water, protect the existing water supply from backflow contamination in accordance with local codes or as required by the authority having jurisdiction. Remove backflow protection and isolate the test section from the existing water supply before testing.

6.2.2 Excluding retesting (if necessary), the quantity of liquid needed to fill the internal volume of the pipe test section and accommodate test section expansion and possible leakage at non-fusion joints and seals is estimated using:

$$V_{gal} = 1.015 \times 0.04 \times (ID_{in.})^2 \times L_{ft} \quad (1)$$

$$V_{m^3} = 1.015 \times 0.785 \times 10^{-6} \times (ID_{mm})^2 \times L_m$$

where:

V_{gal} = pipe section volume, U.S. gal,
$ID_{in.}$ = pipe inside diameter, in.,
L_{ft} = test section length, ft,
V_{m^3} = pipe section volume, m^3,
ID_{mm} = pipe inside diameter, mm, and
L_m = test section length, m.

6.3 *Filling and Pressurizing Equipment*—Liquid filling and pressurizing equipment such as pumps, and pressure regulating devices will usually be necessary. Filling equipment should be capable of filling the test section in a reasonable time against any elevation head pressure that may be present. Pressurizing equipment should be able to maintain the necessary test pressure in the test section and provide sufficient quantities of make-up test liquid for the duration of the test. Pressure regulating equipment should be capable of maintaining test pressure for the duration of the test.

6.3.1 Filling equipment and pressurizing equipment do not need to be the same equipment.

6.4 *Pressure Monitoring*—Use at least one calibrated pressure gage or sensor accurate to within two percent (2 %) of full scale. It is preferred that the gage or sensor full scale value not be more than twice the test pressure, and that scale graduations be no greater than two percent (2 %) of the full scale value. Using a valved tee, a gage cock for bleeding, a pressure snubber, and a duplicate, back-up pressure gage are recommended. A continuous pressure-recording device may be required.

6.4.1 Locate the test pressure gage or sensor to monitor test pressure at the lowest point in the test section. Pressure may be monitored at other points in the test section as well.

NOTE 3—Test pressure is a combination of pump pressure and the height (head) of liquid in the pipeline. Therefore, test pressure is always monitored at the lowest elevation point in the section where pressure is highest. Test pressure will be lower at higher points in the section. If a minimum test pressure at higher elevations must also be met, select test sections so that the minimum test pressure is met at the higher elevation, but do not increase test pressure at the lowest point. Excessive test pressure can cause damage or pipeline failure.

6.5 Other equipment to connect the pump(s) to the test section and the test liquid supply, control the flow of test liquid, power the pump(s), connect the pressure gage(s) or sensor(s) to the test section, monitor pressure, and drain or purge the test liquid from the test section may also be necessary.

7. Specific Safety Precautions

7.1 This specific safety information is in addition to the safety information in other sections of this practice.

7.2 Always take precautions to eliminate hazards to persons near lines being tested. For the entire duration of the procedure, including filling, initial pressurization, time at test pressure, and depressurization, only persons conducting the test or inspecting the system being tested should be allowed near the section under test. These persons should be fully informed of the hazards of field pressure testing. All other persons should be kept a safe distance away.

7.3 The test section is to be supervised at all times during pressure testing.

7.4 Failure may result in sudden, violent, uncontrolled, and dangerous movement of system piping, or components, or parts of components.

7.5 *Restraint Against Movement*—Take measures to ensure that all parts of the section under test are restrained against movement if failure occurs. Such measures may include backfilling, anchoring, or other appropriate means.

7.5.1 *Partial Backfilling During Testing*—When underground connections, joints, and seals are to be exposed for observation during the test, use sufficient backfill material placed between the joints, and over the pipe to prevent movement, giving due consideration to restraining thrust forces. In particular, pipes connected to restrained joints that

Copyright by ASTM Int'l (all rights reserved); Mon Jun 11 11:42:54 EDT 2018
Downloaded/printed by
Jana Purmalis (BGC Engineering) pursuant to License Agreement. No further reproductions authorized.

derive their stability from the interaction of the pipe and soil are to be backfilled prior to testing.

7.6 Leakage usually occurs at a connection, joint, or seal in the system. Depending upon the type of connection, joint, or seal, leakage may be seepage, spray, or a stream of internal test liquid.

7.6.1 When properly made, heat fusion joints in polyethylene pipe are as strong as the pipe and do not leak. Leakage at a fusion joint indicates a faulty joint that may rupture completely at any time. If leakage is observed at a fusion joint, move away immediately, and depressurize the test section.

8. Pre-Test Preparation and Set-Up

8.1 *General:*

8.1.1 Before testing, heat fusion joints are to be completely cooled. Mechanical joints are to be completely assembled with all necessary seals and all fasteners installed and tightened.

8.1.2 Flushing, pigging, or other means of cleaning the system to remove dirt and debris that may damage valves, regulators, and so forth, may be required before testing.

8.1.3 Allow concrete supports and anchors in the test section to cure until they have developed sufficient strength to withstand test pressure thrust forces.

8.1.4 Restrain all parts of the test section against movement in the event of failure. Temporarily remove, restrain, or isolate expansion joints and expansion compensators before starting.

8.2 *Test Section*—Testing may be conducted on the entire system, or on sections of the system. Test section size is determined by the capacity of the filling and pressurizing equipment. It is necessary to fill, pressurize, and test the section within the allotted overall time for the test. Equipment that has inadequate capacity may not be able to complete the test within allowable testing time limits. If so, use higher capacity test equipment, or test a smaller (shorter) section of the system.

8.3 *Test Temperature*—Polyethylene and crosslinked polyethylene piping materials are typically pressure rated at 73°F (23°C). At higher temperatures, reduced pressure ratings and test pressures may be required. Contact pipe, fitting, or component manufacturers for assistance with elevated temperature pressure ratings.

8.4 *Maximum Test Pressure*—Maximum test pressure is designated by the authority having jurisdiction in accordance with 8.4.1 – 8.4.4.

8.4.1 The maximum test pressure for pressure-rated polyethylene or crosslinked polyethylene piping is not to exceed 1.5 × the system design pressure where lower pressure-rated components or devices are not present, or have been removed or isolated from the test section.

8.4.2 The maximum test pressure is not to exceed the pressure rating of the lowest pressure-rated component in the test section, where lower pressure-rated components or devices cannot be removed or isolated from the test section. Consult the component manufacturer for pressure ratings.

NOTE 4—Lower pressure-rated components or devices may include components or devices such as pipe or fittings made from other plastics or metals, or appurtenances such as valves, hydrants, regulators, pressure relief devices, or the like, or some types of mechanical connections such as lower pressure-rated compression couplings or flanges with lower pressure-rated back-up rings.

8.4.3 Do not use higher test pressure even though some components in the test section may have a higher pressure rating.

8.4.4 To determine the maximum test pressure at elevated temperature, apply an elevated temperature system design pressure reduction per 8.3.

8.5 *Test Duration*—Test duration is limited for safety reasons and to prevent damage to the system. Per 7.2 and 7.3, access to systems under test is controlled for the duration of the test.

8.5.1 When the maximum test pressure is between system design pressure and 1.5 × the system design pressure or at 1.5 × the system design pressure, total testing time including the time required to pressurize, stabilize, hold test pressure, and depressurize should not exceed 8 h.

8.5.1.1 If retesting is necessary, the test section should be depressurized for 8 h prior to retesting.

8.5.2 When the maximum test pressure is the system design pressure or less, the total test time including time required to pressurize, stabilize, hold test pressure, and depressurize should be limited to a practical time period. See 7.2 and 7.3. (A test time of about 72 h or less is suggested.)

8.5.3 Before pressure is applied, examine test equipment and all connections to and in the test section to ensure that all are in proper operating condition and tightly connected.

8.5.4 Before pressure is applied, isolated components or devices are to be vented to atmosphere.

8.5.5 Before pressure is applied, disconnect or isolate and vent all low pressure filling lines and other low pressure items.

9. Hydrostatic Test Procedure

9.1 Use appropriate apparatus per Section 6, and water or an appropriate test liquid per 6.2.

9.2 Observe all safety precautions and specific safety precautions per Section 7.

9.3 Prepare and set-up the test section for hydrostatic pressure leak testing per Section 8.

9.4 *Filling*—Fill the test section slowly. Purge all air. Take all appropriate precautions to ensure that no air is trapped in the test section. (**Warning**—Entrapped air can result in an explosive, violent, and dangerous catastrophic failure because both the pressure stress on piping and the energy used to compress the entrapped air are released.)

9.4.1 To allow air to escape from the test section, flow velocities during filling should not exceed the capacities of air release devices or other openings used to release entrapped air. To avoid or limit transient pressure surges, the filling flow velocity should not exceed the design velocity of the piping system.

9.5 *Temperature Equalization*—Allow the test section and the test liquid to equalize to a common temperature.

9.6 *Pressurizing—Initial Expansion Phase*—When the test section is completely filled and purged of air, gradually increase pressure in the test section to the required test pressure.

Copyright by ASTM Int'l (all rights reserved); Mon Jun 11 11:42:54 EDT 2018
Downloaded/printed by
Jana Purmalis (BGC Engineering) pursuant to License Agreement. No further reproductions authorized.

9.6.1 If the test pressure cannot be attained, or if it takes an unreasonably long time to reach test pressure, there may be faults such as excessive leakage, entrapped air, or open valving, or the pressurizing equipment may be inadequate for the size of the test section. If such faults exist, discontinue pressurizing, and correct them before continuing.

9.6.2 Add make-up water as necessary to maintain maximum test pressure for 4 h.

9.7 *Test Phase*—Reduce test pressure by 10 psi (69.0 kPa) and monitor pressure for 1 h. Do not increase pressure or add make-up water.

9.8 *Pass/Fail Criteria*—If no visual leakage is observed, and pressure during the test phase remains steady (within 5 % of the test phase pressure) for the 1 h test phase period, a passing test is indicated.

9.9 *Retesting*—If retesting is necessary, depressurize the test section per 9.10 and correct any faults or leaks in the test section. Do not attempt to correct faults or fix leaks while the test section is under pressure.

9.9.1 When maximum test pressure is between system design pressure and 1.5 × system design pressure or at 1.5 × the system design pressure, allow the test section to "relax" for at least 8 h before re-pressurizing. After the relaxation period, repeat the initial expansion and test phases per 9.6 and 9.7.

9.10 *Depressurization*—Depressurize the test section by reducing pressure or releasing test liquid at a controlled rate. Sudden depressurization can cause water hammer.

9.11 *After the Test*—Remove temporary closure and isolation devices from the test section. Depending upon the application, flushing, disinfecting, or draining may be necessary. Regulations and codes may restrict or require specific procedures for some post-test procedures such as test liquid draining and disposal.

10. Test Records

10.1 Information about the leak test may need to be recorded if required by the authority having jurisdiction. Documentation may include the following information:

10.1.1 The test liquid.

10.1.1.1 Backflow prevention devices, if used.

10.1.2 The weather conditions and ambient temperature at the site during the test.

10.1.3 The test pressure.

10.1.3.1 The type of test gages in the test section.

10.1.3.2 The placement of test gages in the test section, such as test gage location distances and elevations from the beginning of the section.

10.1.3.3 Test gage calibration records.

10.1.3.4 Test pressures recorded during the test.

10.1.3.5 Any adjustments made to test pressure for elevated temperature.

10.1.4 The test duration.

10.1.5 A description of the test section length, elevations, and site location.

10.1.6 A description of the test section components.

10.1.7 Description of any leaks or failures and the corrective actions taken.

10.1.8 The date and time of day of the test.

10.1.9 The identification of the party conducting the test.

11. Keywords

11.1 crosslinked polyethylene; field leak test; hydrostatic leak test; leak test; polyethylene pipe

SUMMARY OF CHANGES

Committee F17 has identified the location of selected changes to this standard since the last issue (F2164–10$^{\varepsilon 1}$) that may impact the use of this standard.

(1) Title was revised.
(2) 1.1 was revised.
(3) 5.1 was revised.
(4) 5.5 was revised.
(5) 8.3 was revised.
(6) 8.4.1 was revised.
(7) Section 11 was revised.

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

Artesian Finger Drain

To:	**Calvin Goldschmidt**	**Project:**	**Eagle Gold HLF**
Company:	**JDS**	**Project No.**	**0792021**
From:	**Daniel Granda**	**Date:**	**July 6, 2018**
Copied:	**Troy Meyer; Roy Morlan**	**Record:**	**Artesian Finger Drain Design**

Re: Artesian Finger Drain:

1.0 PURPOSE

To drain artesian source to the underdrain trench by constructing a finger drain trench.

2.0 EXCAVATION DESIGN

The design of the drain starts at the artesian source where a minimum 3 metre (m) by 4 m and 1 m (deep) excavation will take place to expose the artesian area for a perforated ring pipe installation.

The initial excavation will be monitored by Engineer to confirm the source is being targeted to confirm artesian source before ring pipe installation.

Once excavation is approved by Engineer, the bottom surface should have a minimum grade of 1% (toward the finger drain trench connecting to the underdrain trench). A 1 m by 3 m and 1 m (depth) excavation (minimum 2% grade) should be included as a finger drain extension. The finger drain extension will allow this drain to be used in case further seep sources are located during foundation preparation upstream of the artesian source.

The excavation then moves to the finger drain which connects the artesian source to the underdrain trench. This trench will be 3 m in width by 1 m in depth with a minimum grade of 2%. All excavations should be surveyed controlled and approved by Engineer before proceeding.

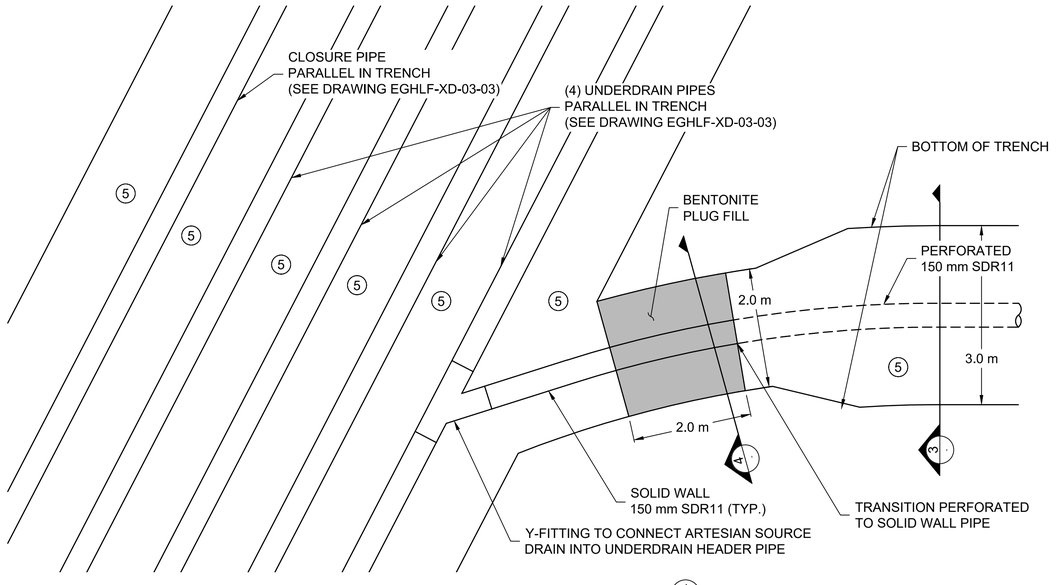
3.0 CONSTRUCTION DESIGN

The finger drain will have a perforated HDPE pipe connecting to the underdrain pipe through a Y connection. A solid HDPE pipe will connect the Y, though a 2 to 3 m bentonite/concrete plug zone to the finger drain. The plug zone will help mitigate potential backpressures coming up the drain during operations and help concentrate the flow of through the select drain fill to the perforated pipes coming from the artesian source.

After the plug zone, the finger drain is constructed with a geotextile wrap with a minimum 0.5 m overlap and select drain fill. A perforated HDPE pipe with a minimum of 0.3 m bedding will be placed throughout and will be connected to the artesian well source upstream.

The artesian well zone will have perforated pipes aligned in a ring system or approximately 2 m by 2 m, connected through a T connection to the finger drain and a T connection to the finger drain extension zone.

4.0 CONSTRUCTION CONSIDERATIONS



During excavation of artesian source, water management controls should be considered to properly install drains and geotextile fabric. After construction of finger drain is completed, consideration of equipment potentially damaging finger drain should be considered during the rest of the embankment construction process. All dimensions in this design may change depending on the final dimensions of the artesian source exposure excavation, this design is intended to provide typical details of this type of finger drain.

Re: Liner Test Pad Procedure

1.0 INTRODUCTION AND OBJECTIVE

A test pad was constructed to define acceptable haulage, placement and spreading procedures for overliner drain fill (ODF) over the Heap Leach Facility (HLF) liner system using the proposed equipment. The HLF design incorporates two separate liner systems. The test pad was constructed over two days (August 18th and 19th) and supervised by Troy Meyer, P.Eng. of BC. The lining system for the In-Heap Pond areas are comprised of the following, from top to bottom:

- A min. 1m thick layer of overliner drain fill (ODF) with imbedded perforated drainage piping
- A 2.0mm (80-mil) LLDPE double-textured primary liner
- A geonet that is part of the LDRS and located between the primary and secondary liners
- A 1.5mm (60-mil) low-linear density polyethylene (LLDPE) secondary liner
- A geosynthetic clay liner (GCL)
- Prepared subgrade beneath the GCL.

The lining system for the HLF pad (up-gradient of the In-Heap Pond) are comprised of the following, from top to bottom:

- A min. 0.6m thick layer of overliner drain fill (ODF with imbedded perforated drainage piping
- A 2.0mm (80-mil) LLDPE double-textured liner
- A geosynthetic clay liner (GCL)
- Prepared subgrade beneath the GCL.

A dedicated access/haul road on the liner is planned to allow construction of the sump components and ODF behind the dam. It is envisioned that this road will be constructed of a thickened section of ODF with a geotextile cushion placed between the ODF and liner. To best simulate the construction of the ODF layer, three test pad sections were constructed:

- Section A - 1.5m layer of ODF over 2 layers of geotextile
- Section B – 1.0m layer of ODF over 2.0mm liner over GCL
- Section C - 0.6m layer of ODF over 2.0mm liner over GCL

The Sections B and C pads allows evaluation of both the single and double liner systems to be constructed at the HLF, while the Section A pad allows evaluation of the planned ODF haul road over the liner.

2.0 TEST PAD MATERIALS AND EQUIPMENT

2.1. Material 4 – ODF

The Overliner Drain Fill (ODF) for the leach pad liner cover fill shall consist of free-draining granular material with 38-mm maximum particle size and a maximum of 5 percent fines passing the No. 200 ASTM sieve size (0.075-mm). No moisture conditioning or compaction is required. The ODF material shall be placed in such a manner as to reduce segregation and protect the liner from damage and keep compaction of the ODF material to a minimum. The ODF above the geomembrane will be placed in a single lift by suitable dozer and truck equipment, as approved by the Engineer.

2.2. Geosynthetics

The geomembrane for the test pad was Solmax (RT) 2.0mm LLDPE. The GCL was GSE NWL 60. The geotextile was 12 oz non-woven. Data sheets for the material used in the test pad are included in Attachment A.

2.3. Equipment

JDS indicated the primary equipment planned for ODF construction is 40T rock trucks and D6 dozers. Data sheets for the equipment used in the test pad are included in Attachment A. The test pad was also trafficked with a CAT 3250 trackhoe excavator and a 30T dump truck during construction.

3.0 TEST PAD CONSTRUCTION AND EXECUTION

The constructed test fill configuration with liner sample locations is depicted in Figure 1. The configuration was developed to simulate haul traffic operations with stopping and turning on the haul road portion (Section A).

The surface was prepared by spreading subgrade material with a dozer and packing and smoothing with the excavator bucket. The material was imported from the ADR borrow area and was broken and weathered rock fragments in a matrix of sand and silt (**Photos 1 and 2 in Attachment B**).

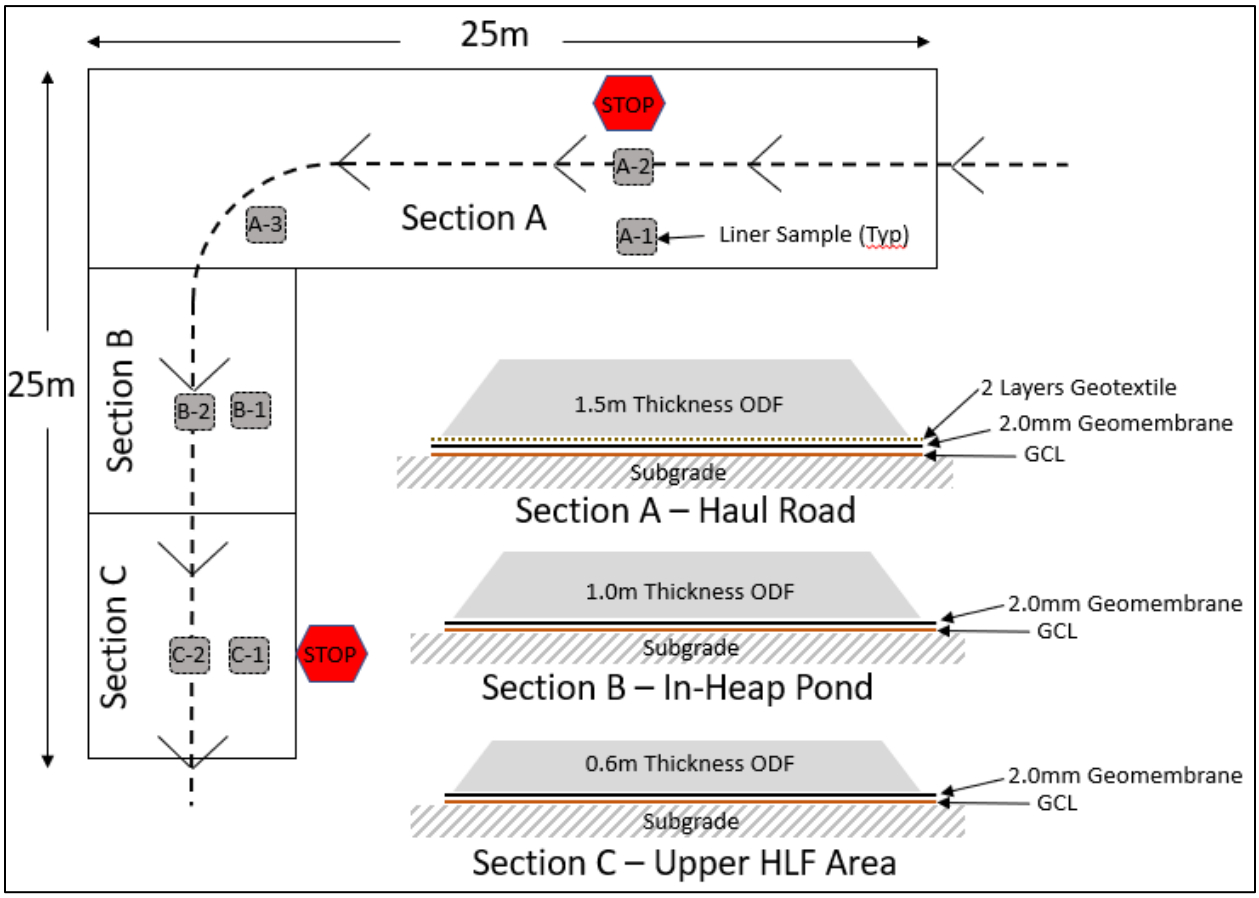

Figure 1: Liner test pad configuration and sampling locations.

Deployment of the geosynthetics was then performed (**Photos 3 through 9**), and the ODF thickness was checked by survey (**Photo 10**).

A loaded haul truck were then trafficked over the pad as shown in Figure 1 with speeds envisioned for actual construction (**Photo 12**). Two full stops and a turn with the loaded haul truck was incorporated in the Section A pad to simulate operations along the access road. A total of 10 passes were made over the pad with the loaded haul truck.

4.0 POST CONSTRUCTION EVALUATION AND TESTING

The loaded haul truck was able to traffic the surface without slipping or excessive rutting or ODF lateral displacement. After completion of the test pad trafficking, the surface of the ODF was visually inspected (**Photo 13**) and the liner was carefully uncovered with an excavator (**Photo 14**) with the last foot hand dug.

Photos 15 through 20 present the condition of the liner and subgrade. Light to moderate dimpling and scratching was observed on liner Sample C-1 (directly under truck tire track). All other

samples exhibited only light dimpling, which relaxed significantly within a few hours of uncovering. No deep scratches, gouges, abrasion, or holes were observed in any samples. No damage was observed in any of the GCL samples.

5.0 CONCLUSIONS AND RECOMMENDATIONS

The liner test pad results indicate that the proposed materials and equipment will result in a low risk of liner puncture damage during construction with placement of a single lift as thin as 0.6m. Cushioning from 2 layers of geotextile appears adequate for protecting the liner under repeated haul truck traffic at slow speeds.

The test pad did not simulate construction on slopes. Care must be tacked to avoid tearing the liner due to slippage on slopes. ODF must be placed from downhill to uphill. Haul truck speeds, braking and turning during drain cover fill placement must be strictly controlled to prevent damage to the underlying geomembrane and pipework. Turning equipment in place should be avoided.

The cover fill thickness should be increased to a minimum of 1.5m in concentrated traffic areas or across collection pipes, as required, to prevent damage to the geomembrane and pipework. Haul traffic on the cover fill surface shall be spread out as much as practical to prevent over-compaction of the cover fill in localized areas.

Data Sheets

PRODUCT DATA SHEET

GSE BentoLiner NWL-60 Geosynthetic Clay Liner

GSE BentoLiner "NWL-60" is a heavily needlepunched reinforced composite geosynthetic clay liner (GCL) comprised of a uniform layer of granular sodium bentonite encapsulated between a nonwoven and a scrim-nonwoven geotextile for dimensional stability. The product is intended for steep slopes and high load applications where increased internal shear strength is required.

[*]

AT THE CORE:

This composite clay liner is intended for steep slopes and high load applications where increased internal shear strength is required.

Product Specifications

Tested Property	Test Method	Frequency	VALUE
Geotextile Property			
Cap Nonwoven, Mass/Unit Area	ASTM D 5261	1/200,000 ft^2	6.0 oz/yd^2 MARV(1)
Carrier Scrim Nonwoven, Mass/Unit Area	ASTM D 5261	1/200,000 ft^2	6.0 oz/yd^2 MARV
Bentonite Property			
Swell Index	ASTM D 5890	1/100,000 lb	24 ml/2 g min

NOTES:

- (1)Minimum Average Roll Value.
- (2)At 0% moisture content.
- (3)Tested in machine direction.
- (4)Modified ASTM D 4632 to use a 4 in wide grip. The maximum peak of five specimens averaged in machine direction.
- (5)Deaired, deionized water @ 5 psi maximum effective confining stress and 2 psi head pressure.
- (6)Typical peak value for specimen hydrated for 24 hours and sheared under a 200 psf normal stress.
- (7)Roll widths and lengths have a tolerance of ±1%.

GSE is a leading manufacturer and marketer of geosynthetic lining products and services. We've built a reputation of reliability through our dedication to providing consistency of product, price and protection to our global customers.

Our commitment to innovation, our focus on quality and our industry expertise allow us the flexibility to collaborate with our clients to develop a custom, purpose-fit solution.

GEOTEX® BY PROPEX

Product Data
GEOTEX® 801

GEOTEX® 801 is a polypropylene, staple fiber, needlepunched nonwoven geotextile produced by Propex, and will meet the following Minimum Average Roll Values (MARV) when tested in accordance with the methods listed below. The fibers are needled to form a stable network that retains dimensional stability relative to each other. The geotextile is resistant to ultraviolet degradation and to biological and chemical environments normally found in soils.

GEOTEX 801 conforms to the property values listed below[1]. Propex performs internal Manufacturing Quality Control (MQC) tests that have been accredited by the Geosynthetic Accreditation Institute – Laboratory Accreditation Program (GAI-LAP). This product is NTPEP approved for AASHTO standards.

NOTES:
1. The property values listed above are effective 04/2011 and are subject to change without notice.
2. Values shown are in weaker principal direction. Minimum average roll values (MARV) are calculated as the typical minus two standard deviations. Statistically, it yields a 97.7% degree of confidence that any samples taken from quality assurance testing will exceed the value reported.
3. Maximum average roll value.

- Rated power occurs at 2,000 rpm.
- Maximum power occurs at 1,600 rpm.
- Net power advertised is the power available at the engine flywheel when the engine is equipped with a fan at maximum speed, air cleaner, muffler and alternator.
- No deratings required up to 2286 m (7,500 ft) automatic derating occurs.
- All non road Tier 4, Stage IIIB and IV, Japan 2011 and 2014 (Tier 4 Interim and Tier 4 Final) and Korea Tier 4 diesel engines are required to use only Ultra Low Sulfur Diesel (ULSD) fuels containing 15 ppm (mg/kg) sulfur or less. Biodiesel blends up to B20 (20% blend by volume) are acceptable when blended with 15 ppm (mg/kg) sulfur or less ULSD. B20 should meet ASTM D7467 specification (biodiesel blend stock should meet Cat biodiesel spec, ASTM D6751 or EN 14214). Cat DEO-ULS™ or oils that meet the Cat ECF-3, API CJ-4, and ACEA E9 specification are required. Consult your OMM for further machine specific fuel recommendations.
- Diesel Exhaust Fluid (DEF) used in Cat Selective Catalytic Reduction (SCR) systems must meet the requirements outlined in the International Organization for Standardization (ISO) standard 22241.

Standards

ROPS/FOPS	ROPS meets ISO 3471:2008, FOPS meets ISO 3449:2005 Level II
Brakes	Brakes meet the International Standard ISO 10265:2008
Cab	Meets appropriate standards as listed below

- The declared dynamic operator sound pressure level is 76 dB(A) when "ISO 6396:2008" is used to measure the value for an enclosed cab. The measurement was conducted at 70% of the maximum engine cooling fan speed. The sound level may vary at different engine cooling fan speeds. The cab was properly installed and maintained. The measurement was conducted with the cab doors and the cab windows closed. The cab was properly installed and maintained.
- **Sound Level Information for Machines in European Union Countries and in Countries that Adopt the "European Union Directives"** – The information below applies to only the machine configurations that have the "CE" mark on the Product Identification Plate.
- The declared dynamic operator sound pressure level is 75 dB(A) when "ISO 6396:2008" is used to measure the value for an enclosed cab. The measurement was conducted at 70% of the maximum engine cooling fan speed. The sound level may vary at different engine cooling fan speeds. The cab was properly installed and maintained. The measurement was conducted with the cab doors and the cab windows closed. The cab was properly installed and maintained.
- Hearing protection is recommended when operating with an open operator station and cab (when not properly maintained or doors/windows open) for extended periods or in noisy environment.
- The declared exterior sound power level is 111 dB(A) when the value is measured according to the dynamic test procedures and the conditions that are specified in "ISO 6395:2008." The measurement was conducted at 70% of the maximum engine cooling fan speed. The sound level may vary at different engine cooling fan speeds.

NOTES

1. Testing frequency based on standard roll dimension and one batch is approximately 180,000 lbs (or one railcar).
2. Machine Direction (MD) and Cross Machine Direction (XMD or TD) average values should be on the basis of 5 specimens each direction.
3. ASTM D7466 is identical to GRI-GM12.
8. Correlation table is available for ASTM D792 vs ASTM D1505. Both methods give the same results.
9. Correlation table is available for ASTM D1603 vs ASTM D4218. Both methods give the same results.

* All values are nominal test results, except when specified as minimum or maximum.
* The information contained herein is provided for reference purposes only and is not intended as a warranty of guarantee. Final determination of suitability for use contemplated is the sole responsability of the user. SOLMAX assumes no liability in connection with the use of this information.

Solmax is not a design professional and has not performed any design services to determine if Solmax's goods comply with any project plans or specifications, or with the application or use of Solmax's goods to any particular system, project, purpose, installation or specification.

Copied:	**Troy Meyer; Dan Granda**	**Record:**	**FM-08**

Re: Placement of Fill at the Event Pond During Winter Conditions

1.0 INTRODUCTION AND OBJECTIVE

Placement of fill in the Event Pond will continue into sub-zero temperatures. Additionally, snow, rain, and ice storms may be frequent. In this memorandum these are referred to as "Winter Conditions". Typically, construction using earth fills is more controlled or limited in these types of conditions. Proper compaction of any material during cold temperatures will require lower moisture to prevent soil cohesion and a significant increase in applied energy to achieve settlement. Unlike summer construction experienced during completion of the Embankment, winter activities may include ripping frozen soil crusts, breaking down frozen chunks of material, moving over surfaces or relatively low mobility, additional compaction effort, and other significant difficulties. This memorandum provides guidance on how to place fill material for the Phase 1 HLF project during winter months.

2.0 PROCEDURES FOR PLACEMENT OF FILL MATERIALS AT THE EVENT POND IN WINTER CONDITIONS

2.1. Material 1 – Site Grading Fill

2.1.1. Material Requirements and Placement Procedures per the Technical Specifications and/or Method Specs When Temperatures are over 0ºC

Material 1 has typically consisted of glacial till, alluvium, colluvium, and residual highly weathered bedrock. Material 1 can be used as fill in the Event Pond Berms or to achieve subgrade for liner placement.

Gradation Requirements	
ASTM Sieve Size	**Percent Passing**
150 mm	100
19 mm	70-100
Other Requirements: No gap grading	

Maximum Dry Density (per Proctor): 2,236 kg/m3
Optimum Moisture (per Proctor): 7.7%
Min compaction: 95% of max dry density (Standard Proctor)
Max loose lift thickness: 0.3 m
Minimum Vibratory Compactor Weight: 6 ton.
Minimum Number of Passes with Vibratory Compactor: 5

2.1.2. Additional Material Requirements and Placement Procedures for Winter Conditions

Gradation Requirements	
ASTM Sieve Size	**Percent Passing**
150 mm	100
19 mm	70-100
N 200 Sieve	0-15
Other Requirements: No gap grading	

Allowable moisture: <3%
Minimum Number of Passes with Vibratory Compactor: minimum 5 to 10 per the Engineer or as required to achieve 95% of max dry density (Standard Proctor).

Additional Measures:

- The use of Material 1 may not be possible once placed soil temperatures reach 0ºC, depending on placed moisture content. The Engineer will determine suitability based on achieved density and in-place moisture content as measured by Nuclear method.

2.2. Material 3 – Structural Fill

2.2.1. Material Requirements and Placement Procedures per the Technical Specifications and/or Method Specs When Temperatures are over 0ºC

Material 3 has consisted primarily of highly weathered bedrock. The methods used for placement of Material 3 has been developed and modified based on test fills conducted and observations during construction of the HLF embankment.

Gradation Requirements	
ASTM Sieve Size	**Percent Passing**
300 mm	100
19 mm	70-100
Other Requirements: No gap grading	

Maximum Dry Density (per Proctor): 2,270 kg/m3

Optimum Moisture (per Proctor): 6.1%
Min compaction: 95% of max dry density (Standard Proctor)
Max loose lift thickness: 0.45 m
Minimum Vibratory Compactor Weight: 9 ton.
Minimum Number of Passes with Vibratory Compactor: 4

2.2.2. Changes to Material Requirements and Placement Procedures for Winter Conditions

Gradation Requirements	
ASTM Sieve Size	**Percent Passing**
150 mm	100
19 mm	70-100
N 200 Sieve	0-15
Other Requirements: No gap grading	

Maximum Allowable Moisture: 3%
Minimum Number of Passes with Vibratory Compactor: 4 to 10 per the Engineer or as required to achieve 95% of max dry density (Standard Proctor).

Additional Measures:

- The Engineer may call for lift thicknesses to be reduced if density requirements are not being achieved.
- The use of Material 1 may not be possible once temperatures reach 0ºC, depending on placed moisture content. The Engineer will determine suitability based on achieved density and in-place moisture content as measured by Nuclear method

2.3. Material 7 – Compacted Rockfill

2.3.1. Material Requirements and Placement Procedures per the Technical Specifications and/or Method Specs When Temperatures are over 0ºC

Rockfill has mostly been generated from blasting of hard bedrock at the ADR East and West areas. The material has generally consisted of mostly quartzite rock occasionally with up to 30% phyllite rock. The material has mostly been well graded.

Gradation Requirements	
ASTM Sieve Size	**Percent Passing**
Two thirds loose lift thickness	100
19 mm	30
Other Requirements: No gap grading	

Maximum Dry Density (per Proctor): NA
Optimum Moisture (per method spec): 3.2 to 6%
Min compaction: Compaction requirements per test fill method spec based on settlement and density observations.
Max loose lift thickness: 0.9 m
Minimum Vibratory Compactor Weight: 9 ton.

Minimum Number of Passes with Vibratory Compactor: 4

2.3.2. Changes to Material Requirements and Placement Procedures for Winter Conditions

Gradation Requirements	
ASTM Sieve Size	**Percent Passing**
Two thirds loose lift thickness	100
19 mm	0-70
N 200 Sieve	0-10
Other Requirements: No gap grading	

Allowable Moisture: Dependent on test fill observations and the presence of moisture sensitive material. May range from 5% to less than3%.
Max loose lift thickness: Dependent on test fill observations. Less than 0.75m expected. Should not be greater than 0.95m.
Minimum Number of Passes with Vibratory Compactor: 4 to 10 per the Engineer or as required per temperature dependent test fill.

*Additional Measures:

- Since density and moisture cannot be accurately tracked using the nuclear density gauge additional test fills will be required once temperatures have consistently reached:
    - Between -0ºC and -20ºC.
    - Below -20ºC.
    - Additional test fills may be required by the Engineer if soil temperatures at the borrow source or placed material change significantly from what was measured during the above test fills.
- Density testing will be required for the test fills and may be required on compacted lifts per the Engineer. As water replacement testing in sub-zero temperatures may be problematic a method to use photo-surveying (provided by Underhill) should be finalized and used for density testing.
- The Engineer may increase or reduce lift thickness depending on results of test fills, field observations, and QC testing. Lifts should not be greater than 0.95m.
- The use of Material 7 may not be possible once placed material temperatures appear to be affecting the ability to compact. The Engineer will determine suitability based on observations of placement operations and test trenching results.

2.4. Material and Placement Procedures for Winter Conditions Applicable Regardless of which Material is Being Used

- Placement of material may be halted if moisture is above 3% for moisture sensitive materials. This will be dependent on field observations and QC testing.
- Placement of material may be halted if temperatures are consistently below 0ºC and there is significant precipitation (rain, snow, ice, ect). The Engineer should be consulted at the time but in general significant precipitation signifies events where precipitation can bring moisture content of moisture sensitive material above 3% or can accumulate on lift surfaces in significant enough quantity to form icy layers. This may be averted if moisture and frozen layers can be removed prior to placement of a new lift.
- Snow, ice or frozen layers on compacted lifts or spread material must be removed prior to compaction or placement of the next lift.

- Once temperatures are consistently below 0ºC compacted lifts should be scarified immediately before placement of the next lift if a frozen crust develops.
- Additional passes may be required when temperatures are consistently below 0ºC for more than a 24 hour period. The number of passes needed will be based on field testing and observations made by the Engineer.
- Phyllite material has shown a tendency to be moisture sensitive and frost susceptible. Therefore, phyllite material should be limited to less than 1/3 of any fill place at the Event Pond. Phyllite material should be well mixed with stronger materials such as quartzite if used in fill.
- Compaction should begin immediately after spreading to prevent soil cohesion due to frost and to prevent ice formation at the near surface.
- Compaction areas may be limited to no longer than 20m to limit surface freezing between passes. This will be dependent on observations made by the engineer and QC test results.
- Frozen crust and clumps on borrow surfaces should be excavated and wasted.
- Frozen clumps accidently delivered to the Event Pond or that formed while being delivered to the Event Pond should be removed and not compacted in the lift.
- BGC will monitor placement and compaction to determine additional measures needed.
- Test trenching of compacted lifts to inspect for frost and void space may be required by the Engineer periodically once placed material temperatures are consistently below 0ºC.
- Based on field testing results borrow, placement, spreading, and compacting sequencing may need to be modified to ensure that soil temperatures remain high enough to achieve sufficient compaction.

3.0 QC TRACKING AND REPORT

Standard QC tracking and reporting should continue as normal. Once temperatures are consistently below 0ºC for more than 24 hours the following information should also be tracked and reported during QC inspections.

- The presence of frost, water, snow, or ice accumulation on the surface of compacted lifts should be reported at a minimum of once per shift.
- The presence of frost, ice, or water observed in test trenches should be reported.
- The presence of frozen borrow surfaces and confirmation that frozen material was excavated and wasted should be documented at least once per shift.
- Soil temperatures for placed but uncompacted material should be reported at least twice per shift. The soil temperatures for compacted lifts should be collected immediately after compaction and reported at least twice per shift. Soil temperatures for compacted lifts that have been sitting should be collected twice per shift immediately before new material is placed over it.

.

From:	**Troy Meyer (BGC)**	**Date:**	**October 1, 2018**
Copied:	**Dan Granda; Roy Morlan (BGC)** **Steve Wilbur (StrataGold)**	**Record:**	**FM-009**

Re: 2018 HLF Instrumentation

Design drawings EGHLF XD-09-01 and 09-02 presents the HLF instrumentation plan. The system will be installed in 2019, however BGC recommends instruments be installed in the LDRS and PLS sumps in 2018 to allow monitoring of water levels and temperatures through this winter. The sumps should be pumped through the winter to minimize the water levels and frost accumulation.

The instrumentation system has been designed to allow a phased installation with two sets of piezometers installed in 2018 and the remainder of the system installed in 2019. The equipment list and costs for 2018 (Phase 1) is provided below. This equipment will allow monitoring of the PLS and LDRS sumps and will be integrated into the ultimate system to be installed in 2019.

Eagle Gold HLF

Instrumentation - Phase 1 (2018)

Quantity	U/M	Model	Description	Unit Price	Ext. Price
4	EA	4500S-350KPA	VW Piezometer, unvented, 350kPa (51psi)	$ 360.00	$ 1,440.00
1300	FT	02-250V6-E	Blue PVC Cable, 0.250", 2 twisted pairs *(325 ft on each VW Piezometer)*	$ 0.71	$ 923.00
1	EA	8800-3-2A	GeoNet Node, 1-CH, VW, 900 MHz 10-Pin Bulkhead, North America	$ 810.00	$ 810.00
1	EA	8032-5	Multiplexor Cable, standard length, 10' (3m)	$ 148.50	$ 148.50
1	EA	8800-8-1	8-CH MUX for GeoNet, VW+TH only 0.16" - 0.31" Strain Relief Cable Entries	$ 882.00	$ 882.00
1	EA	8800-4-1A	GeoNet Supervisor, RS-232, 900 MHz North America. Specify 8800-GNA Software	$ 972.00	$ 972.00
2	EA	BAT-202	Battery, D-Size, 3.6V Lithium, 17Ah	$ 27.00	$ 54.00
			Sub Total - US Dollars		**$ 5,229.50**

The instrumentation equipment costs were provided by quote from Geokon (Attachment A). The installation will also require PVC pipe to allow lowering the instruments to the bottom of the inclined casings. A total of 175 m of 1-inch diameter threaded PVC blank is required for the 2018 installations.

1" X 10' PVC RISER - S40 - 8TPI

HLF piezometer for inclined risers

General Information

All prices shown are FCA Lebanon, N.H., USA and are for merchandise packaged for shipment by domestic carrier within the continental limits of North America. Special packaging for export air or sea freights are extra-charged items. Freight charges will be prepaid by Geokon, Inc. and charges invoiced to the purchaser.

Terms

Domestic shipments are payable: net 30 days with approved accounts.

A monthly service charge of 1.5% (18% APR) will be added on all past due balances.

Export shipments will be made only:
1) After receipt of irrevocable letter of credit.
2) By payment in advance.
3) By special prior arrangement with Geokon, Inc.

Quotations

All Geokon, Inc. quotations are firm for 90 days. Thereafter, they are subject to change without notice.

Errors, Shortages, Complaints

All shipments should be opened immediately on delivery and the contents checked against the packing list sent with the shipment.
Geokon, Inc. exercises due care to avoid errors and shortages. However, where errors and shortages do occur, they should be reported within 10 days of receipt of the equipment. Where errors are the fault of Geokon, Inc., they will be rectified without delay.

Responsibility and Risk

Geokon, Inc.'s responsibility for merchandise damaged in transit ceases when the merchandise has been delivered to the carrier for shipment and a valid receipt obtained. Claims for damage in transit are to be made with the carrier, and damaged containers or other evidence of rough handling should be noted at the time of receipt, and the containers retained until the claim is resolved.

Returned Merchandise and Cancelled Orders

Equipment is not to be returned without first contacting Geokon, Inc. and obtaining its consent. All approved returns must be packaged to prevent damage, insured and returned prepaid. Returned equipment and cancelled orders are subject to a 25% restocking charge. Orders for custom products are not eligible for return or cancellation.

Taxes and Import Duties

All destination taxes, duties, importation fees and importation documentation expenses are to be paid by the purchaser, unless specific provisions to the contrary are made at the time the order is placed.

Custom Documentation

Orders requiring specialized documentation may be subject to a documentation fee.
This fee will be priced accordingly based on the customer requirements.

Changes and Improvements

All equipment described in Geokon, Inc. catalogs is subject to modification and improvement as may be dictated by subsequent developments. Accordingly, we reserve the right to change and improve items, to discontinue listings and to add new ones without notice.

Rental Policy

1) Rental charges are 25% of the purchase price for the first month, one month minimum, and 15% of the purchase price per month thereafter.
2) Rental period begins on the day of outgoing shipment and ends upon receipt of goods back at Geokon.
3) Orders cancelled after shipment are subject to a $165.00 processing fee (customer responsible for all freight charges incurred).

Rental with Option to Purchase

75% of the first month's fee will apply toward the purchase and 50% of the subsequent months' fees, up to a maximum of 50% of the purchase price.

Field Services

Field services to train client's personnel in assembly, installation and operation of the instruments is available.

The hourly rate of $120.00 per hour, or part thereof, will be charged as follows:
1) Time required for traveling from N.H. to the job site and return.
2) Time required for working on the job including time over 8 hours per day. Minimum charge is $960.00 per day.
3) Standby time at job site up to a maximum of 8 hours per day.
4) Time required for traveling between accommodation and job site in excess of 30 minutes each way.

Repairs

All items returned for repair, both warranty and non-warranty, must have an officially issued Return Authorization (RA) number and a Health and Safety Clearance form. Please contact Geokon directly for more information and to initiate the Return Authorization process. The hourly rate for non-warranty repair is $100 USD. Non-warranty repair should be accompanied by a purchase order to authorize the work. Geokon will not accept, nor work on, returns that are lacking Return Authorization numbers or unsigned Health and Safety Clearance forms. All returns for repair must be sent with shipping prepaid. All repairs are subject to the terms and conditions of the following warranty statement.

Warranty Policy

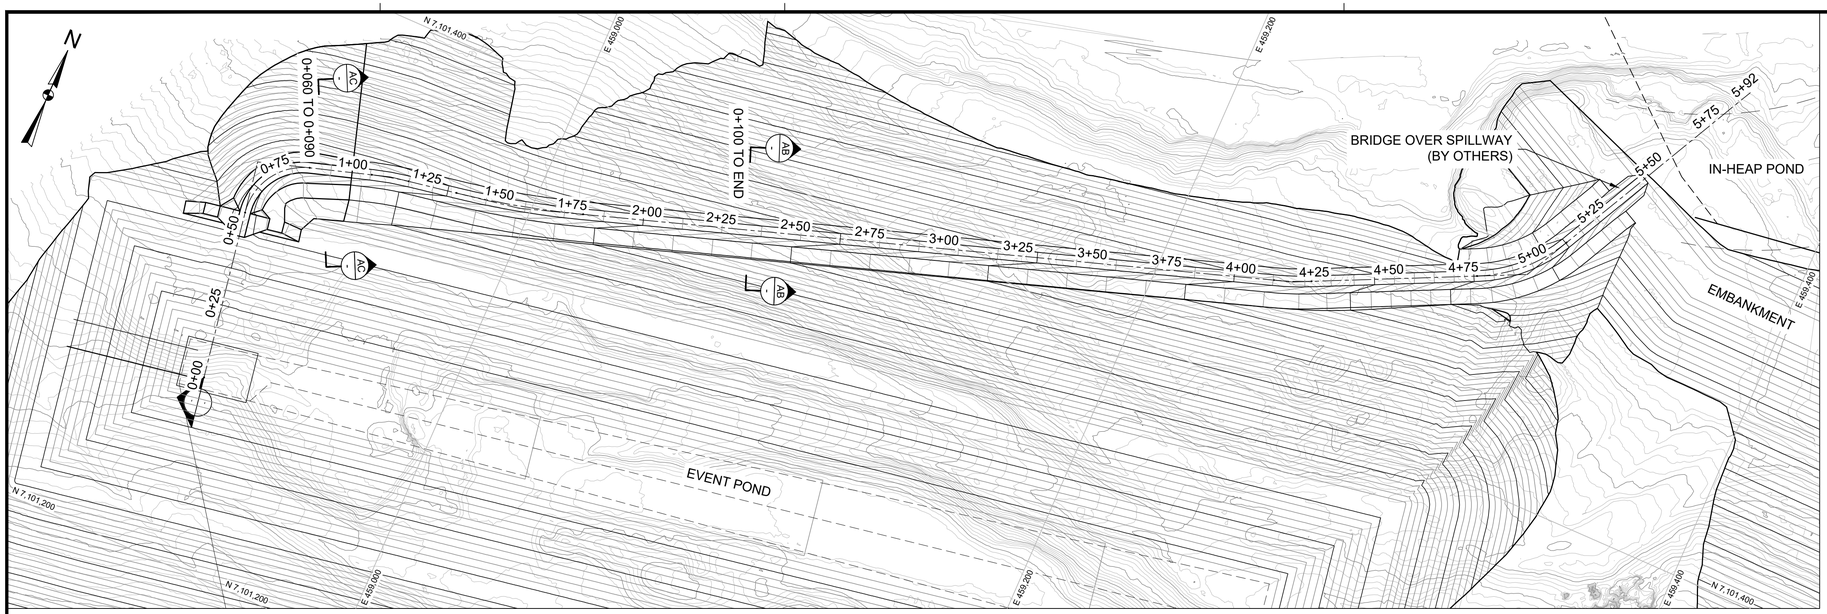
Re: Revetment Criteria

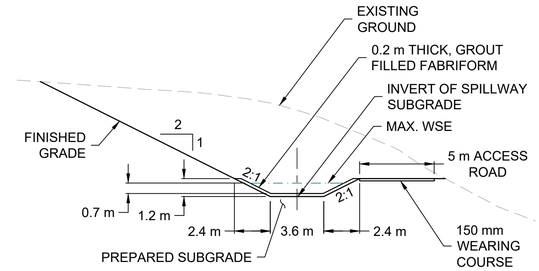
1.0 INTRODUCTION

Provided are spillway criteria for use by revetment subcontractors to perform analysis.

Hydraulic analysis is required using the parameters below to show acceptable factors of safety and required anchoring.



Variable	Value	Units	
Bottom Width	M	3.5	
Side Slope	m/m	2H:1V	
Channel Slope	m/m	Per Drawings	
Flow Rate	cms	10.8	
Flow Velocity	m/s	Calculated based on product Manning's value	
Permissible Shear	Pa	From Testing Per ASTM D6460	
Permissible Velocity	m/s	From Testing Per ASTM D6460	



Note: ASTM D6460 is the Standard Test Method for Determination of Rolled Erosion Control Product (RECP) Performance in Protecting Earthen Channels from Stormwater-Induced Erosion.

Two spillway areas are proposed to be lined. The first is a spillway between the embankment invert and event pond. The second is the emergency spillway leading downstream of the event pond. Drawings are included as ***Attachment 1*** and show the dimensions of both spillways.

Project Memorandum

To:	**File**	**Doc. No.:**	**FM-011**
Attention:	**Calvin Goldschmidt**	**cc:**	
From:	**Roy Morlan**	**Date:**	**December 14, 2018**
Subject:	**BGC December 2018 Demobilization**		
Project No.:	**0792021.02**		

1.0 INTROCUTION

The purpose of this memorandum is to provide a brief discussion of the status of select tasks and the recommendations for work performed between BGC's demobilization on December 15, 2018 and the resumption of work in the spring of 2019.

2.0 CONSTRUCTION ACTIVITIES

2.1. ADR Quarry as a Source for ODF Material

Task: JDS would like to investigate the use of the ADR quarry as a source for ODF. The ADR quarry is variable and consists of large areas of strong quartzite rock and thinner seems of very weak phyllite rock. Using this quarry may require sorting these materials during borrow. BGC requested that two samples be collected. One using the typical mix of approximately 70% quartzite/ 30% phyllite rock that is produced from this quarry. The second from a seem predominantly composed of phyllite. Roy Morlan (BGC) and Mike Blusson (JDS) identified the sources for these materials and the material was stockpiled at the Neuway crusher plant. This material will be processed by Neuway and a sample of each sent to Tetra Tech in Whitehorse for durability testing.

Recommendations: BGC will complete the Chain of Custody (COC) for Tetra Tech and coordinate the analysis. The phyllite rich sample should be labeled ADR-ODF-01 and the more representative quartzite rich sample should be labeled ADR-ODF-02. 4 buckets should be collected for each sample. The sample ID (ADR-ODF01 or ADR-ODF-02) should be written on the side of each bucket (not the lid). If the sampling is completed before December 20 they can be given to Richard Oswell with Tetra Tech who will drive them to Whitehorse.

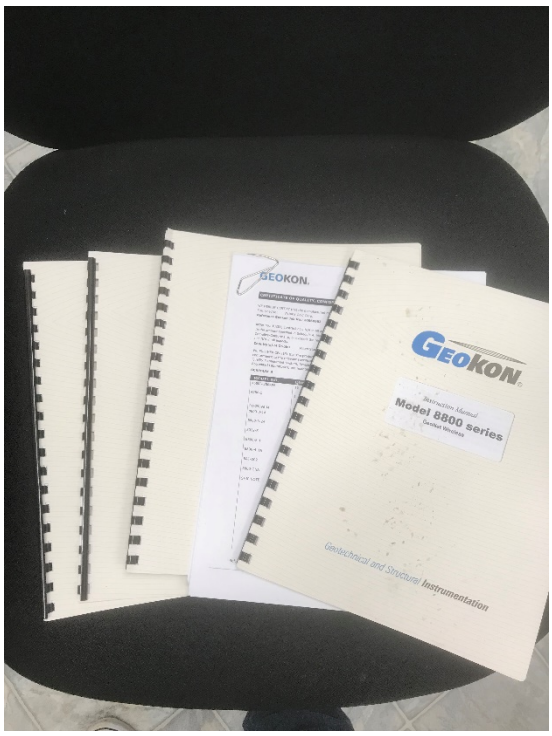
2.2. Instrumentation

Task: A piezometer, barometer, and the sensor and supervisor nodes for the instrument system were scheduled to be installed this season. These instruments are now either be installed in January or February 2019 or when the entire instrument program commences in 2019.

Recommendations: BGC has left the instruments in the BGC/Tetra Tech office. The inventory includes:

Sensor Node: Count 2

Supervisor Node: Count 1



Multiplexor: Count 1

Piezometers: Count 4 spools. Three shown, 1 in the cardboard box.

Barometer: Count 1 spool. In the cardboard box.

Manuals: Count 4.

All items as they are currently stored in the BGC/ Tetra Tech office.

Recommendations: These items should be kept together. BGC should be consulted before installation.

2.3. Liner Destructive Test Samples

Task: Tetra Tech has retained the destructive test samples for archiving. These are currently being stored in bags in the BGC/ Tetra Tech office.

Samples stored in bags in the BGC/ Tetra Tech office.

Recommendations: The samples should be stored in a location where they will not be lost.

2.4. Fill Placement

Task: Fill placement will be needed within the Phase 1 HL area and in limited areas of the Interceptor Ditch. Fill over the winter months will be completed using rockfill following the method specifications developed by BGC. QC for the fill placement will be completed by Pelly or Tetra Tech, depending on availability. BGC is not expected to be present during most of the fill placement.

Recommendations: BGC makes the following recommendations for fill placement:

- Placement should follow recommendations from the test fill documented in CTFM-05.
- The fill operation should be as tight as practical in terms of dump/spread/compact sequencing.
- The cold weather placement guidance document (FM18-020) should be followed.
- BGC should be informed in advance of material changes and should approve any new material before use.
- Proof rolling will be needed over the compacted fill over the areas where liner will be placed. Additional compaction of placed lifts may be needed in 2019 depending on proof rolling results.
- The following compaction information should be tracked and reported to BGC related to compaction of fill:
    - Photographs of the subgrade prior to fill placement.
    - Photographs of the fill placement and compaction.
    - Confirmation that the number of passes and roller size met the specifications.
    - Confirmation (visual) that the material meets the general gradation requirements for rockfill.
    - Confirmation that material predominately quartzite rock (ie less than 30% phyllite rock).
    - Confirmation that the lift thickness does not exceed 0.9m.
    - A daily recording of rockfill temperatures immediately before compaction.

2.5. Subgrade Approvals

Task: The Phase 1 heap area will be shaped to the design grade over the winter months.

Recommendations: BGC makes the following recommendations for subgrade shaping:

- As proof rolling to verify density is not possible in the current temperatures, final liner subgrade approval will be required before liner is placed in the spring.
- Excavation of frost jacked, wet, or loose subgrade may be needed in 2019 prior to liner placement.
- Additional compaction of loose subgrade may be needed in 2019 prior to liner placement.
- Final subgrade as-built drawings should be provided to BGC for review.

2.6. Underdrains

Task: The majority of the underdrains at the Event Pond will be complete prior to BGC demobilization on December 15. Lateral drains will be excavated in the 2019 winter. The underdrain header trench and at least portions of the lateral drains will be completed in the winter of 2019.

Recommendations: BGC makes the following recommendations for subgrade shaping:

- Underdrain and piping construction should always meet the requirements of the technical specifications and the design drawings.
- If underdrains are completed this season with piping and drain rock and liner subgrade in areas needs to be excavated deeper in 2019 this may require removal and reconstruction of some adjacent underdrains.
- Additional compaction of loose subgrade may be needed in 2019 prior to liner placement.
- The following drain construction information should be tracked and reported to BGC:
    - Photographs of drain subgrade.
    - Photographs of drain construction.
    - Confirmation that all materials (ie geotextile, drain fill, piping, cover) met the requirements of the technical specifications and the drawings.
    - Confirmation that all installation requirements from the technical specifications and design drawings were met. For example; geotextile overlap, connections between drain pipes, welds between header pipes, ect.
    - As-built drawings for the drain/lateral trench subgrade and final construction. Final subgrade as-built drawings should be provided to BGC for review

2.7. Interceptor Ditch and General Water Control

Task: Currently the alignment of the Interceptor Ditch is being cleared. In winter 2019 the interceptor ditch will be excavated and lined with geotextile and rip-rap. Other measures should be taken to ensure that spring melt does not flow to and beneath the installed liner, if needed.

Recommendations: BGC makes the following recommendations for subgrade shaping:

- The interceptor ditch should be completed prior to spring melt in 2019. As with the drains and subgrade construction should meet the requirements of the technical specifications and the design drawings. Photographs, material usage, construction methods, and as-builts should be tracked and reported to BGC for review.
- Some runoff will likely be directed to exposed underdrains. If so, precautions should be taken to ensure that sediment loads do not migrate into the drain rock. This can be done through the use of settling ponds, placing geotextile over the exposed drain rock, or other measures devised by the constructor. Methods to deal with runoff should be provided to BGC who will review it in the context of protecting finished construction.
- It is BGC's understanding that at the least all lateral drain trenches would be completed prior to spring runoff. This should help in diverting water away from the placed liner. If it is not possible to complete the lateral drain trenches before the spring runoff then alternative methods for capturing water should be discussed.

2.8. Snow Removal

Task: Snow will be removed prior to construction in March 2019 for access to help reduce runoff.

Recommendations: BGC will require that now removed over liner be done by hand. No metal equipment (such as shovels) should be used for removal.

2.9. GCL Inspection and Liner Leak Testing

Task: ODF have been placed only in the in-heap pond sump to support the PLS pipework. Remaining PLS pipework and ODF placement will occur in 2019.

Recommendations: Prior to placement of ODF, BGC will oversee an inspection program involving cutting openings in the primary and secondary geomembrane at locations on a spacing equivalent to approximately 5,000 square meters to allow a visual examination of the GCL. The GCL samples will be examined to determined that all of the above criteria are met. A final determination of compliance will be made upon consultation with the GCL manufacturer and Victoria Gold.

Following the GCL inspection program, a liner leak test will be performed based on guidance from ASTM D6747 and discussions with Layfield (liner installer) and Victoria Gold to determine the most suitable method(s). The methods may include vacuum (VALID) testing, electrical testing, water testing, or a combination thereof. Any located holes will be repaired and tested. BGC will oversee this program and subsequent placement of ODF.

Re: Observations at the Switchback 5 ODF Source

1.0 INTRODUCTION

JDS requested that BGC observe material that was blasted for the purpose of developing a quarry source for ODF material located near the Pit Road Switchback 5. BGC visited the location with JDS and Victoria Gold Engineering. The purpose of the visit was to develop a preliminary idea of any issues that may arise from producing ODF form this source based on previous experience producing ODF from similar sources on site. This observations summary was developed at JDS's request.

2.0 OBSERVATIONS AT THE LOWER BENCH

The lower bench contained mostly hard, strong, granodiorite material (W3- moderately weathered, R4- strong, H3- hard). Test runs of similar material performed in 2018 and 2017 produced ODF that met the Technical Specification gradation and permeability requirements. The material on the far west portion of the bench transitioned to a granodiorite weathered almost to soil (W5- weathered, R1- very weak, H5- moderately soft) and a portion of the bench was soil (colluvium).

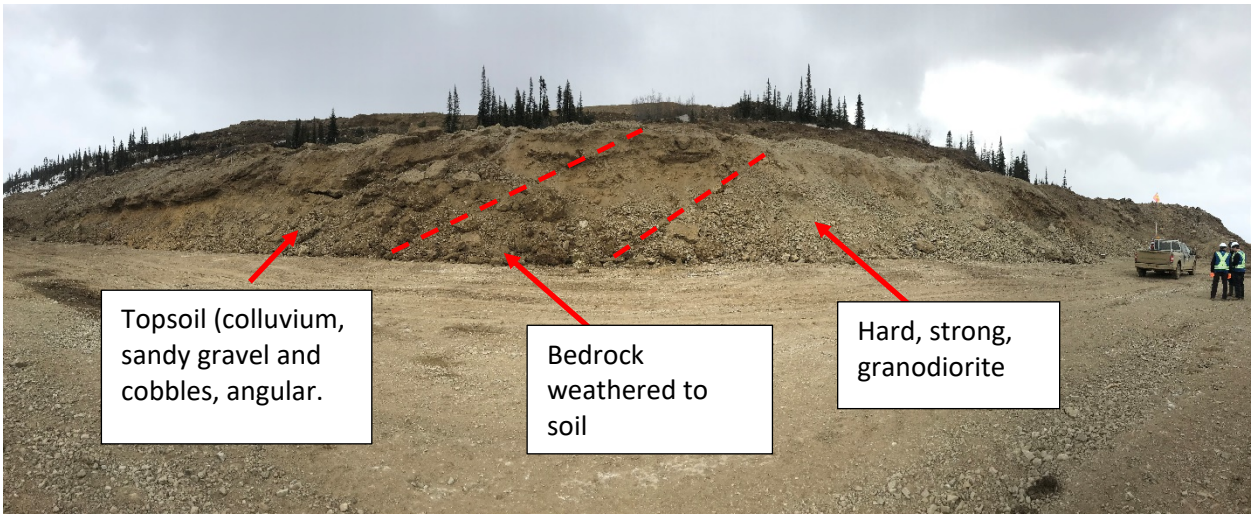

Photo 1: Panoramic photograph of lower bench.

Photo 2: Granodiorite source.

Photo 3: Granodiorite sample.

Photo 4: Highly weathered near surface bedrock.

Photo 5: Topsoil portion of bench.

3.0 OBSERVATIONS AT UPPER BENCH

The upper bench contained weaker metasediments material (W4- highly weathered, R3- moderately strong, H3 to h4 moderately hard to hard). Test runs of similar material performed in 2017 produced ODF with fines above the requirements in the technical specifications and lower permeability.

Photo 6: Panoramic photo of bench. Weak, highly fractured, metasediments.

Photo 7: Typical metasediments observed in upper bench.

4.0 CLOSURE

BGC Engineering Inc. (BGC) prepared this document for the account of JDS. The material in it reflects the judgment of BGC staff in light of the information available to BGC at the time of document preparation. Any use which a third party makes of this document or any reliance on decisions to be based on it is the responsibility of such third parties. BGC accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this document.

As a mutual protection to our client, the public, and ourselves, all documents and drawings are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents and drawings, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending BGC's written approval. If this document is issued in an electronic format, an original paper copy is on file at BGC and that copy is the primary reference with precedence over any electronic copy of the document, or any extracts from our documents published by others.

Project Memorandum

To:	**JDS Energy & Mining**	**Doc. No.:**	**FM-013**
Attention:	**Calvin Goldschmidt**	**cc:**	
From:	**Troy Meyer**	**Date:**	**April 27,2019**
Subject:	**HLF In-Heap Pond Liner Leak Test**		
Project No.:	**0792023.02**		

1.0 INTROCUTION

The purpose of this memorandum is to provide a summary of the liner leak testing and results for the Heap Leach Facility (HLF) In-Heap Pond. The liner system comprises two layers of LLDPE geomembrane liners with a leak detection and recovery system (LDRS). The leak test involves hydrostatic testing of the upper liner.

2.0 LDRS DESIGN AND CONSTRUCTION

The Leak Detection and Recovery System (LDRS) within the In-Heap Pond and Event Pond consists of a monitoring sump to be equipped with an automatic, fluid-level activated pump located between the top and bottom liners. The pump will be sized to sufficiently remove fluids to minimize head on the bottom liner. The LDRS sumps will remove fluids from potential leaks in the top liner via the geonet material located between the two geomembranes to allow fluid to the sump. Drawings EGHLF-XD-05-01 through EGHLF-XD-05-06 present the LDRS sump and pipework design details for the In-Heap Pond. Drawings EGHLF-XD-07-01 through EGHLF-XD-07-04 present the LDRS sump and pipework design details for the Event Pond. Appendix F of the design report (BGC 2018) presents the liner leakage and sump sizing calculations and establishes alert levels for operational monitoring of the LDRS flows.

The In-Heap pond sump, LDRS and PLS was modified from the design to accommodate the proposed construction methods. Figure 1 (attached) presents the modified section through the sump. The inclined LDRS pipes were installed with an invert elevation of 909.5m and the bottom of the PLS sump was constructed at elevation 911.5m. Overliner drain fill (ODF) has been placed to approximate elevation 915.5m to secure the PLS header and inclined riser pipes.

3.0 LINER LEAK TESTING PROCEDURE

In addition to the specified field seam testing of the geomembrane, the geomembrane installer is required to water test the top geomembrane installed in the ponds prior to acceptance by the engineer (BGC) and owner (StrataGold).

It is BGC's understanding that the normal PLS pump operational level will be 918m (approximately 5.5m above the bottom of the PLS riser pipe). Alert leakage levels for the ponds have been updated to reflect the as-built conditions. The low alert level (Alert Level 1, or AL1), is based on the small defect leakage rate, which is intended to represent the leakage rate expected from geomembranes installed with strict construction quality assurance. The AL rates vary with the pond level since the hydraulic head dictates the rate of leakage through a hole or seam defect. Tables 1 presents the alert levels calculated for a range of pond elevations.

Alert Level 1 (AL1) will be used as a threshold for the leak testing. The appropriate threshold is determined based on the actual pond level. For an In-Heap Pond level of 918m, a threshold leakage rate of 3,954 L/day was selected.

The proposed procedure involved monitoring via pumping out the pond's leak detection system (LDRS) over a period of time. However, the procedure was modified to rely mainly on monitoring the LDRS sump head levels due issues encountered with the pump safety cutoff causing unreliable flow volume monitoring. A Solinst Levelogger transducer (accurate to 1mm) was installed in the inclined LDRS riser pipe to measure changes in head level during the leak test. This data was used to estimate the leakage rate by converting head changes to leak volume based on the as-built size of the sump and the lab-tested porosity of ODF drainage gravel in the sump.

The following information was recorded to document the liner leak testing:

- Surveyed pond water level at start and end of test period
- Water elevation and head pressure levels in the LDRS sump

BGC measured the LDRS sump head level via the transducer at 30-minute intervals over a 24-hour period. The LDRS sump was not pumped out during this period. PLS pond level survey data was provided by JDS.

4.0 LINER LEAK TESTING RESULTS

The leak test was started on April 14, 2019 with the PLS pond level at 918m. The initial tests failed with leak rates much higher than the allowable rate. The PLS pond was then lowered to inspect for holes and damage. Two damaged areas were identified:

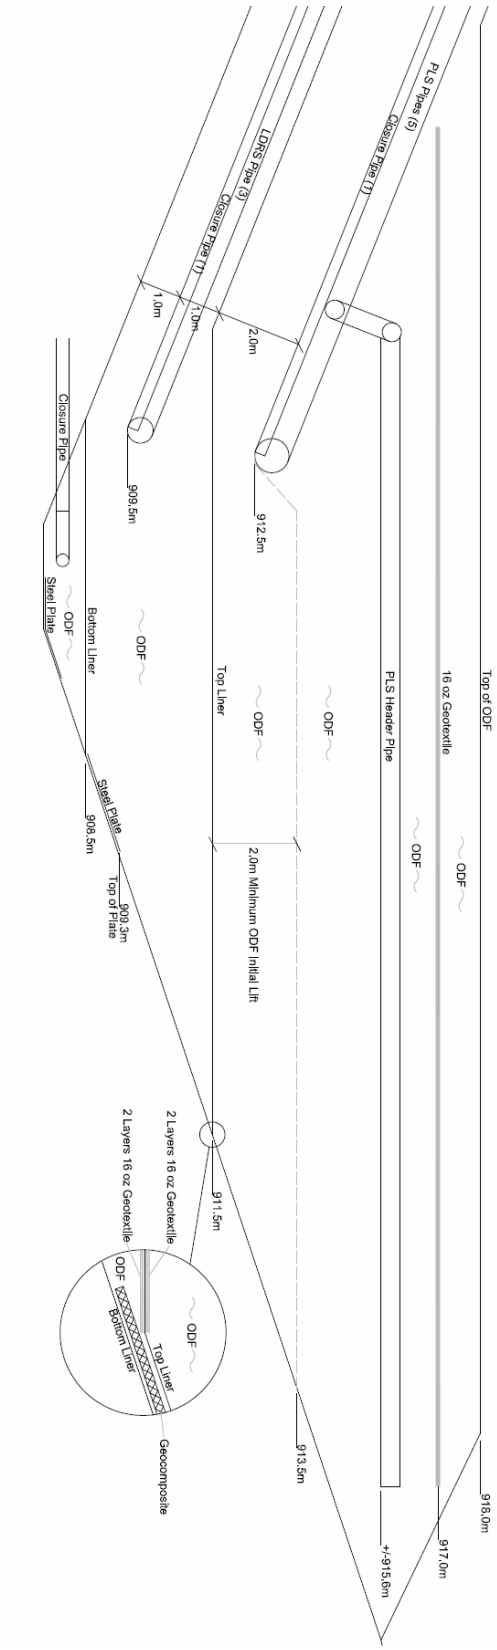
- Elevation 916.5m damage – apparent welder burnout and cut. ***Photo 1*** shows damage and ***Photo 2*** shows repair.
- Elevation 915.5m damage – apparent equipment damage. ***Photo 3*** shows damage and ***Photo 4*** shows repair.

Photo 1: Liner damage at elevation 916.5m

Photo 2: Liner repair at elevation 916.5m

Photo 3: Liner repair at elevation 915.5m

Photo 4: Liner repair at elevation 915.5m



An unofficial 5-hour duration leak test was performed at PLS pond elevation 915m and “passed” (see Attachment A for data). The liner surface between 915 and 918m was also washed and re-inspected for damage. A few small dents and scratches were found and repaired but no additional holes in the liner were found. The PLS pond was raised to elevation 918m for an official leak test. The results indicated a calculated leak rate of 2,648 L/day measured over a 24-hour period. This rate is below the allowable rate of 3,954 L/day (see Table 1) based on the established Alert Level 1 rate for pond elevation of 918.0m.

The full set of results for the leak test is presented in Attachment A.

Table 1 – In-Heap Pond Alert Levels

Elevation	Contour Area	Incremental Volume	Cumulative Volume	Alert Level 1
m	m2	m3	m3	L/day
911.5	360	0	0	-

Project Memorandum

To:	**JDS**	**Doc. No.:**	**FM-014**
Attention:	**Calvin Goldschmidt**	**cc:**	
From:	**Troy Meyer/Roy Morlan**	**Date:**	**May 5, 2019**
Subject:	**Field Screening Procedure for ODF Source**		
Project No.:	**0792023.02**		

1.0 INTRODUCTION

The purpose of this memorandum is to provide a field screening procedure to help guide the selection of source material from the Eagle Pit for processing as Overliner Drain Fill (ODF) for use at the Heap Leach Facility (HLF).

2.0 ODF SPECIFICATIONS AND TESTING

The Overliner Drain Fill (ODF) for the leach pad liner cover fill shall consist of free-draining granular material with 38-mm maximum particle size and a maximum of 5 percent fines passing the No. 200 ASTM sieve size (0.075-mm). The ODF shall have an operational permeability of 2x10-4 m/sec or higher. Material durability testing was performed on ODF to determine if additional breakdown of material during stockpiling, hauling, and placement is possible. Such breakdown of material could result in lower ODF permeability and/or excess generation of fines that could result in localized zones of higher pore pressure. The ODF sources were tested for durability using the following laboratory methods:

- LA Abrasion ASTM C131.
- Relative Density and Absorption of Aggregate ASTM C127/ASTM C128.
- Sieve ASTM C136/C117
- Slake testing ASTM D4644.

The acceptable range for LA Abrasion Results for aggregate is <40% mass loss for concrete use per ASTM C33. For slake testing results categorizing the material as Type I is typically most favorable as this classification is the least susceptible to slaking.

QC gradation testing per the technical specifications requires a minimum of 1 sampler per 5,000 m3 produced with additional gradation tests being performed at QA request.

ODF produced to date has been sourced from surface weathered matasediments and surface weathered intrusive. These rock types are also expected from the Eagle Pit source, although, with varying degrees of silicification. A description of rock types mapped at the Eagle Pit are included in ***Section 3***.

3.0 DESCRIPTION OF EAGLE PIT ROCK

The following descriptions were taken from the Feasibility Study Open Pit Slope Design report submitted by BGC and dated January 2012.

3.1. Metasediments and Surface Weathered Metasediments

The metasediments observed in the EGZ range in composition from quartzites to phyllites. The quartzites are generally strongly foliated and consist of pure quartz to quartz-feldspar, with laminations of muscovite and sericite. Grain sizes are typically 1 mm to 2 mm, with individual quartzite beds ranging from centimeters to several meters in thickness. The phyllites are generally strongly foliated and contain compact aggregates of biotite and sericite intercalated with irregular lenses of quartz. Surface weathered sediments are present from 30 m to 100 m below ground. The intact fresh metasedimentary rocks have a median (design) UCS of 83 MPa classifying it as "strong", with a lower (25th) percentile UCS value of 45 MPa and an upper (75th) percentile UCS value of 143 MPa. The intact surface weathered metasedimentary rock has a median (design) UCS of 76 MPa, classifying it as "strong" with a lower (25th) percentile UCS value of 34 MPa and an upper (75th) percentile UCS value of 106 MPa.

3.2. Intrusives and Surface Weathered Intrusives

The granodiorites of the Dublin Gulch Stock are medium grey coloured, medium to coarse grained and equi-granular with up to 15 percent biotite. Surface weathered intrusives are present from 30 m to 100 m below ground. The intact non surface weathered intrusive rocks have a median (design) UCS of 135 MPa, classifying it as 'very strong", with a lower (25th) percentile UCS value of 57 MPa and an upper (75th) percentile UCS value of 213 MPa. The intact surface weathered intrusive rocks have a median (design) UCS of 135 MPa, classifying it as 'very strong' with a lower (25th) percentile UCS value of 53 MPa and an upper (75th) percentile UCS value of 214 MPa.

3.3. Clay Altered Intrusive

A weaker subunit of the intrusive was observed in drillholes GTH2a, GTH3, GTH4, GTH-07, and GTH-08. Based on Victoria Gold's geologic interpretations, this unit shows clay alteration which results in lower intact strengths. The intact clay altered intrusive rocks have a median (design) UCS of 51 MPa classifying it as "strong" with a lower (25th) percentile UCS value of 14 MPa and an upper (75th) percentile UCS value of 108 MPa.

3.4. Rock Strength Estimates

Field estimates of intact rock strength, based on BGC's 2009, 2010 and 2011 geotechnical drilling programs from standard field tests and observations were made in the field using strength grades developed by the International Society of Rock Mechanics (ISRM, 1978). Based upon the penetration of the hammer pick and effect of the pocket knife blade on the rock, a classification was assigned to the rock according to Table A-1.

On average the metasedimentary units have a lower strength grade than the intrusive units, with median values of about R3.5 for the surface weathered medasedimentary unit, and R4 for the unweathered/unaltered intrusive unit, the surface weathered intrusive, and the fresh metasedimentary unit. Where the clay altered intrusive was broken out from the other intrusive units, the average strength grade for this sub-unit was slightly lower at R3.5.

Table A-1: Rock Strength Grades (ISRM, 1978)

Grade	Description	Field Identification	UCS (MPa)	Point Load Index (MPa)
R6	Extremely Strong	Specimen can only be chipped with flat end geological hammer.	> 250	> 10
R5	Very Strong	Specimen requires many blows with flat end geological hammer to fracture.	100-250	4-10
R4	Strong	Specimen requires more than one blow of flat end geological hammer to fracture.	50-100	2-4
R3	Medium Strong	Cannot be scraped or peeled with pocket knife; can be fractured with single firm blow of flat end geological hammer.	25-50	1-2
R2	Weak	Can be peeled by a pocket knife with difficulty; shallow indentation made by firm blow with point geologic hammer.	5-25	-
R1	Very Weak	Crumbles under firm blows with point of geological hammer.	1-5	-
R0	Extremely Weak	Indented by thumbnail.	< 1	-

4.0 SCREENING PROCEDURE

4.1. Gradation, Permeability, and Slake Testing

BGC will visit any new sources to make a preliminary opinion on if the material appears competent enough to produce ODF. A small batch of ODF should be produced from the new bench. The gradation of this batch should be determined by Tetra Tech's on-site field laboratory. The results should be compared the gradation requirement in the Technical Specifications and the range of gradations produced in 2018. Additionally, the amount of waste being produced will be noted by BGC.

If gradations are within the band of previously produced and tested (***Figure 1***) then laboratory or field permeability testing will not be needed. If the gradation is significantly higher in sand or finer material then a field or laboratory permeability test may be needed. This determination will be made by the BGC engineer/geologist in the field. Typically a field permeability test will be performed by BGC and if the results are within an order of magnitude of the design minimum BGC will send a sample to an offsite laboratory to confirm. If the permeability measured in the field is greater than an order of magnitude of the design requirements a laboratory test will not be needed.

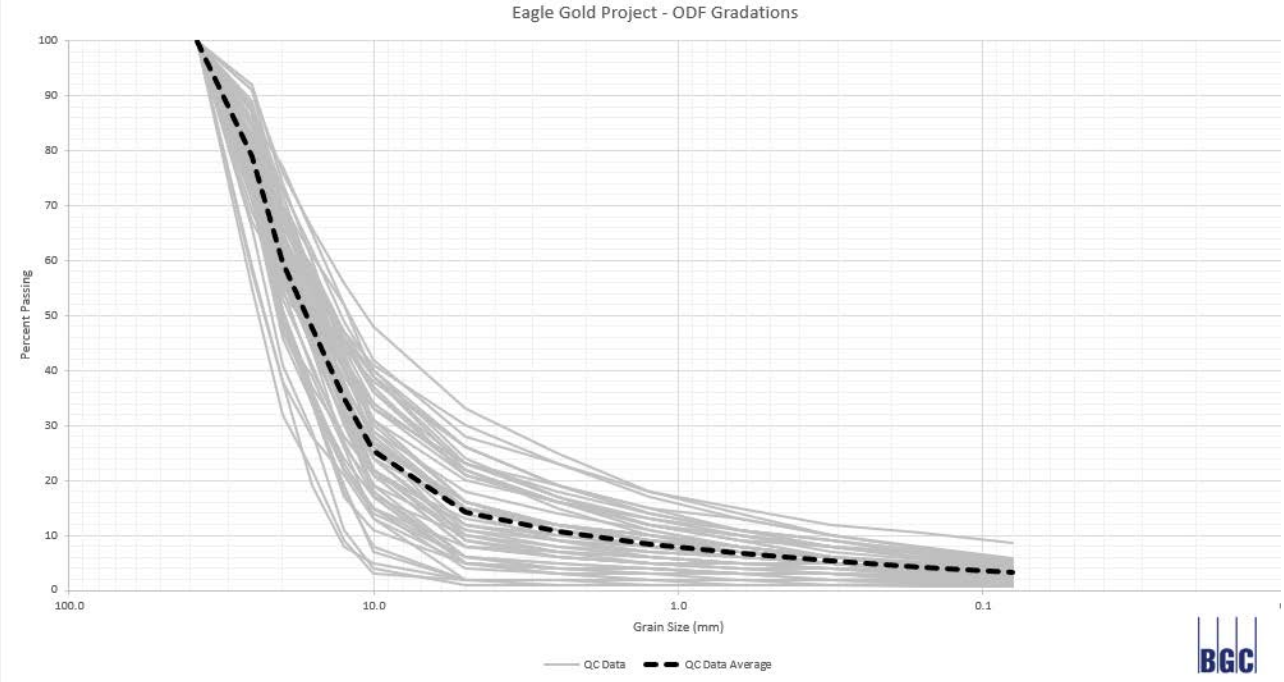

Figure 1: Gradation of ODF produced in 2018.

After a batch is produced BGC will inspect the material again for hardness and strength. A field slaking test (Jar Slake Test) will also be performed if the material appears more porous or has significant bedding. Determination if a sample should be sent off-site for slake testing will be made based on how similar the material is to rock that has already been tested for this project and observations made during the Jar Slake Test. Results from testing performed on ODF material to date has shown that the sources previously used were not susceptible to slaking.

4.2. Impact and Scratch Test

BGC will perform hardness and strength field testing using the standard International Society for Rock Mechanics (ISRM) guidance. Observations will be made of both the source rock and produced ODF at the crushing facility. Samples will be graded with a strength of R1 (extremely weak) through R6 (extremely strong) and a hardness of H1 (extremely hard) to H7 (very soft). Where the rock is observed to vary significantly, a minimum of five samples shall be taken. To obtain a classification for these variable areas in the borrow source areas, four out of five samples shall have the same or higher classification. I.E., if one sample is R3, three samples are R2 and one sample is R1, this would result in an R2 classification.

LA Abrasion results for all samples previously tested reported mass loss of 35% or less. Field hardness and tests correlating to these samples reported R3 (Moderately Strong) to R5 (Very Strong) with hardness reported as H3 (Hard) to H4 (Moderately Hard). Field results that show strength of R3 or greater and hardness between H1 and H4 will not be sent for laboratory testing for LA Abrasion.

5.0 RECORD KEEPING AND RECOMMENDATIONS FOR FURTHER TESTING

5.1. Reporting and Tracking

BGC will maintain a record of the field testing and observations made for ODF production. BGC anticipates to produce an observations record each day that ODF is produced to begin with. The frequency for these records may decrease based on observations. The tracking report will consist of:

- The Eagle Gold Grade Block name and centroid coordinates (provided by Victoria Gold Geology).
- Rock type description and log collected from the Pit or the crusher stockpile.
- Estimated percent of waste being generated (provided by Nueway).
- Field testing results (hardness, strength, slake).
- Percent fines generated and verification that the material is within the required gradation spectrum once the Tetra Tech QC reports are made available.
- Additional field testing, such as permeability, if needed.
- Recommendations, if needed.
- Photographs of the material.

5.2. When Further Lab Testing is Required

Rock types mapped in the area of the Eagle Pit appear to be similar to the sources previously used to produce ODF. Therefore, it is anticipated that the field testing will be sufficient for the remaining ODF production. However, additional laboratory testing will be needed if the following conditions are encountered:

- If gradation testing shows a significant increase in sand and finer fractions of material when compared to previously tested batches of ODF then field and/or laboratory permeability testing will be required.
- Laboratory strength testing including LA Abrasion, Relative Density and Absorption of Aggregate, and Slake Testing may be required if there are indications that the material has the potential to breakdown to extent where it may reduce ODF permeability below the required minimum. Conditions where laboratory durability testing would be required include:
    - Field strength testing results are reported as R1 or R2.
    - Field hardness testing results are reported between H5 and H7.
    - The material appears to be susceptible to slaking.
    - The rock type is significantly different than that already tested for this project.

Project Memorandum

To:	**JDS Energy & Mining**	**Doc. No.:**	**FM-015**
Attention:	**Calvin Goldschmidt**	**cc:**	
From:	**Troy Meyer**	**Date:**	**May 2, 2019**
Subject:	**Event Pond Liner Leak Test**		
Project No.:	**0792023.02**		

1.0 INTROCUTION

The purpose of this memorandum is to provide a summary of the liner leak testing and results for the Heap Leach Facility (HLF) Event Pond. The liner system comprises two layers of LLDPE geomembrane liners with a leak detection and recovery system (LDRS). The leak test involves hydrostatic testing of the upper liner.

2.0 LDRS DESIGN AND CONSTRUCTION

The Leak Detection and Recovery System (LDRS) within the Event Pond consists of a monitoring sump to be equipped with an automatic, fluid-level activated pump located between the top and bottom liners. The pump will be sized to sufficiently remove fluids to minimize head on the bottom liner. The LDRS sumps will remove fluids from potential leaks in the top liner via the geonet material located between the two geomembranes to allow fluid to the sump. Drawings EGHLF-XD-07-01 through EGHLF-XD-07-04 present the LDRS sump and pipework design details for the Event Pond. Appendix F of the design report (BGC 2018) presents the liner leakage and sump sizing calculations and establishes alert levels for operational monitoring of the LDRS flows.

3.0 LINER LEAK TESTING PROCEDURE

In addition to the specified field seam testing of the geomembrane, the geomembrane installer is required to water test the top geomembrane installed in the ponds prior to acceptance by the engineer (BGC) and owner (StrataGold).

Alert leakage levels for the ponds have been updated to reflect the as-built conditions. The low alert level (Alert Level 1, or AL1), is based on the small defect leakage rate, which is intended to represent the leakage rate expected from geomembranes installed with strict construction quality assurance. The AL rates vary with the pond level since the hydraulic head dictates the rate of leakage through a hole or seam defect. Tables 1 presents the alert levels calculated for a range of pond elevations.

Alert Level 1 (AL1) will be used as a threshold for the leak testing. The appropriate threshold is determined based on the actual pond level. The project specifications require the Event Pond to

be hydrotested to 3m above the LDRS level which is elevation 882.5. For an Event Pond level of 882.5m, a threshold leakage rate of 3,339 L/day was selected.

The proposed procedure involved monitoring via pumping out the pond's leak detection system (LDRS) over a period of time. However, the procedure was modified to rely mainly on monitoring the LDRS sump head levels due issues encountered with the pump safety cutoff causing unreliable flow volume monitoring. A Geokon vibrating wire piezometer (accurate to 1mm) was installed in the inclined LDRS riser pipe to measure changes in head level during the leak test. This data was used to estimate the leakage rate by converting head changes to leak volume based on the as-built size of the sump and the lab-tested porosity of ODF drainage gravel in the sump.

The following information was recorded to document the liner leak testing:

- Surveyed pond water level at start and end of test period
- Water elevation and head pressure levels in the LDRS sump

BGC measured the LDRS sump head level via the transducer at 10-minute intervals over a 24-hour period. The LDRS sump was not pumped out during this period. Event Pond level survey data was provided by JDS.

4.0 LINER LEAK TESTING RESULTS

The leak test was started on April 30, 2019 with the pond level at 882.48m. The results indicated a calculated leak rate of 625 L/day measured over a 24-hour period. This rate is below the allowable rate of 3,339 L/day (see Table 1) based on the established Alert Level 1 rate for pond elevation of 882.5m. The full set of results for the leak test is presented in Attachment A.

Table 1 – Event Pond Alert Levels

Elevation	Contour Area	Incremental Volume	Cumulative Volume	Alert Level 1
m	m2	m3	m3	L/day
882	10125	0	0	-
882.5	11142.5	5317	5317	3,339
883	12160	5826	11143	4,721
883.5	13202.5	6341	17483	5,783
884	14245	6862	24345	7,822
884.5	15312.5	7389	31734	8,745
885	16380	7923	39658	11,016
885.5	17472.5	8463	48121	11,898

Project Memorandum

To:	**Strat Gold**	**Doc. No.:**	**FM-016**
Attention:	**Mark Ayranto**	**cc:**	
From:	**Roy Morlan**	**Date:**	**May 18, 2019**
Subject:	**Liner Leak Test**		
Project No.:	**0792023.02**		

1.0 INTROCUTION

The purpose of this memorandum is to provide a summary of the liner leak testing and results for the Heap Leach Facility (HLF) In-Heap Pond and Event Pond. The liner system comprises two layers of LLDPE geomembrane liners with a leak detection and recovery system (LDRS) between the liners to convey any leakage flows to a low point (sump) for monitoring and removal. The leak test involved hydrostatic testing of the upper liner with water while monitoring the LDRS sump.

2.0 LINER LEAK TESTING PROCEDURE

Field quality assurance / quality control (QA/QC) testing of the geomembrane are required throughout installation on a frequency established in the project Technical Specifications. Additionally, the geomembrane installer is required to water test the top geomembrane installed in the ponds prior to acceptance by the engineer (BGC) and owner (StrataGold).

A monitoring alert level was developed for the In-heap Pond and Event Pond based on the estimated small defect leakage rate through the top liner, which is intended to represent the leakage rate expected from geomembranes installed with strict construction quality assurance. This allows the operator to compare leakage rates during operations to a threshold which is considered acceptable. The appropriate alert level threshold is determined based on the actual pond level.

The procedure involved pumping water into the pond and monitoring the LDRS sump head levels. A vibrating wire piezometer or a transducer was used in the inclined LDRS riser pipes to measure changes in head level during the leak tests. This data was used to estimate the leakage rate by converting head changes to leak volume based on the as-built size of the sump and the lab-tested porosity of ODF drainage gravel in the sump.

3.0 LINER LEAK TESTING RESULTS

The In-Heap Pond leak test was started on April 14, 2019 with the In-Heap pond level at 918m. The initial tests were above the alert level threshold. The In-Heap pond was then lowered to inspect for holes and damage. Two damaged areas were identified and repaired:

- Elevation 916.5m damage – apparent welder burnout and cut.
- Elevation 915.5m damage – apparent equipment damage.

These issues were repaired and QC testing was performed on the repairs per the Technical Specifications. An unofficial 5-hour duration leak test was performed at In-Heap pond elevation 915m and results were below the alert level threshold. The liner surface between 915 and 918m was also washed and re-inspected for damage. A few small dents and scratches were found and repaired but no additional holes in the liner were found. The PLS pond was raised to elevation 918m for an official leak test. The results were below the alert level resulting in a passing test.

The Event Pond liner leak testing began on April 30. Before testing the liner was inspected and minor scratches and dents were repaired. The water level in the Event Pond was raised to elevation 882.5m for an official leak test. The results were below the alert level resulting in a passing test.

Re: In-Heap Pond and Event Pond Spillways

Design drawings EGHLF XD-07-04 through XD-07-06 and XD-08-01 through 08-03 presents the HLF and Event Pond spillway plans and details. The design incorporates concrete box culverts to convey flows from the HLF in-heap pond to the spillway leading to the event pond and an emergency spillway from the event pond to environment. This memo presents the hydraulic analysis to support alternate materials for the culverts and spillway lining.

The project EPCM (JDS) requested evaluation of an alternate conveyance to replace the concrete box culverts and alternate spillway lining to replace the Fabriform liner. BGC evaluated corrugated metal pipe (CMP) culverts and high-density polyethylene (HDPE) culverts of varying shapes (round, arched, etc). The preference from a construction standpoint was round HDPE as it allows a sealed connection to the geomembrane liner and from an engineering standpoint for the lower Manning's value. The round culverts were evaluated using HY-8 hydraulic software for the design peak PMF flow rate of 14.2 cubic meters per second (cms). The results indicate five (5) HDPE culverts of 1200mm diameter would carry the flow with 0.5m residual freeboard with a pipe invert of Elevation 937.5m. The design invert for the box culvert was 938.0m. The lower invert elevation was discussed with StrataGold and approved by Mark Ayranto. Details for liner tie-in and transition to the spillway will be provided in a separate submittal. A Manning's value of 0.012 was used for the HDPE pipe. Figure 1 presents the culvert hydraulic analysis graphical results and Figure 2 present the tabular output.

The construction drawings for the HLF indicate Fabriform lining of the HLF and event pond spillways. However, the design report provided a technical evaluation of alternate lining materials for the spillways, including concrete cloth. The evaluation concluded that concrete cloth would be a suitable alternative if properly anchored. A preliminary anchoring design was provided. This memo presents further analysis of concrete cloth to optimize the channel dimensions of the spillways. A Manning's value of 0.011 was used for the concrete cloth, per the manufacturer's recommendations. Attachment A presents the spillway hydraulic analysis results from the HY-8

model for the in-heap pond and event pond spillways. Peak flow rates of 14.2 cms and 5.4 cms were used for the in-heap pond spillway and event pond spillway, respectively, based on the design criteria from the BGC design report. Attachment B presents the selected concrete cloth information. Based on calculations by the manufacturer representative, the CC8 (8mm thick) material was required for the in-heap spillway and CC13 (13mm thick) material was required for the emergency spillway and on the drivable swales. The above referenced design drawings were revised to reflect these changes and are included in Attachment C.

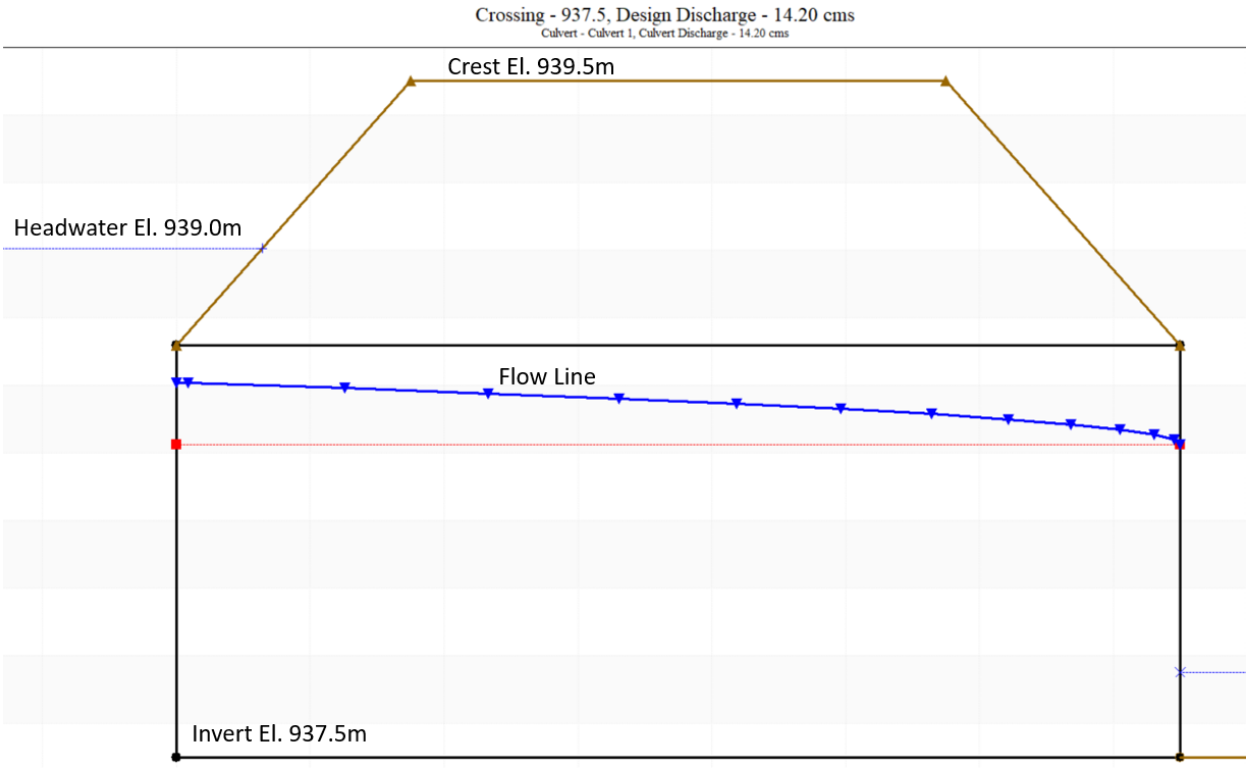

Figure 1 – Culvert Hydraulic Model Results

CONCRETE CLOTH INFORMATION

Milliken Infrastructure Solutions

Concrete Cloth™

Geosynthetic Cementitious Composite Mat

STORM + SANITARY | BRIDGES + ROADWAYS | OIL, GAS + INDUSTRIAL

The Concrete Cloth™ material is a three-dimensional flexible cement impregnated fabric that hardens after hydration to form a durable concrete layer. Classified as a Geosynthetic Cementitious Composite Mat (GCCM), it is used in a variety of civil infrastructure markets including: transportation, oil & gas, stormwater, landfill, mining, and erosion control. Typical applications for use are ditch lining, slope stabilization, shoreline armor, secondary berm protection, culvert invert protection, and geosynthetic liner protection.

CC13 has also passed ASTM G-13 (Impact Resistance of Pipeline Coatings).

Permeability

- Coefficient of Permeability 2x10-11 m/s (CC8)

  Permeability of joints will vary dependent on the jointing method, consult Milliken Infrastructure Solutions or your distributor for more information.

Set Time: ASTM C-807

- Initial Set: 120 min
- Final Set: 240 min

  CC will achieve ~70% strength 24hr after hydration. Working Time 1-2 hrs after hydration.

Flex Strength: ASTM C-1185

- 7 Day Minimum: 475 psi (3.3 MPa)
- 7 Day Modulus Minimum: 26,000 psi (180 MPa)

Compressive Strength of Cement: ASTM C-109

- 3 Day Minimum: 4000 psi (27 MPa)

Taber Abrasion: ASTM C-1353

- Approximately 7.5x Greater than 2500 psi OPC

Freeze Thaw: ASTM C-1185

- 200 Cycles - Pass

Flame Resistance: MSHA ASTP-5011

- Vertical and Horizontal Certification

Manning's n Value: ASTM D-6460

- n=0.011

Permissible Shear & Velocity CC5: ASTM D-6460

- Shear <25 lb/ft2 (1200 Pa)
- Velocity <35 ft/sec (10.7 m/s)

Product Exceeded Large Scale Testing Capabilities and was not tested to failure.

To actually achieve these permissible values, the CC material must be properly anchored with a system designed to meet or exceed these values.

Milliken® Infrastructure Solutions

Concrete Cloth™

Geosynthetic Cementitious Composite Mat

STORM + SANITARY

BRIDGES + ROADWAYS

OIL, GAS + INDUSTRIAL

Composition

Concrete Cloth GCCM is a three-dimensional flexible cement impregnated fabric that hardens after hydration. The material has a top surface fabric through which water will penetrate during hydration and a bottom surface consisting of a PVC membrane that acts as permeable barrier.

Characteristics

The dry density of the product before hydration is approximately 95 lbs/ft3 (1500 kg/m3). Upon complete hydration the density increases between 30-35% to approximately 125 lbs/ft3 (2000 kg/m3). The exact density will depend slightly on the thickness of material and the relative proportion of PVC membrane to cement.

Storage & Handling

Concrete Cloth matting is sold in three (3) thickness. Standard roll sizes referred to as Bulk or Batch rolls are noted in the product table on the proceeding page. Bulk rolls will be shipped a single roll to a pallet, Batch or Custom rolls maybe shipped multiple stacked rolls to a pallet.

It is important to check the wrapping when the Concrete Cloth rolls arrive on the jobsite. Unopened packages can be stored in a dry location, off the ground, and away from moisture for up to one year. Any damage to the packaging should be repaired prior to storage using plastic wrap and tape to protect the Concrete Cloth GCCM from premature hydration.

Batch rolls are designed to be able to lift by two (2) persons. Bulk rolls will require additional handling equipment rated for the weight of the rolls. Use of a load rated spreader bar is recommended.

Subgrade Preparation

Concrete Cloth matting will generally take the shape and structure of the surface to which it is applied and imperfections in the subgrade will be visible. It is necessary that a compact and smooth subgrade be prepared to engineering specifications prior to placement. Subgrade should be prepared to the lines and tolerances of the engineering drawings for the installation. It should be clear of surface vegetation and debris. To the extent possible Concrete Cloth materials should be in direct contact with the subgrade to which it is being applied.

Installation

Concrete Cloth matting is often overlapped to create joints so installation will typically begin at the lowest point of the project and proceed up the grade. A shingled installation overlapping the rolls is used to reduce any water seepage between the overlapped rolls.

The Concrete Cloth material is designed such that the PVC back of the material will be against the subgrade in most applications. This side is water resistant and will not allow subsequent hydration if the material is installed upside down. The PVC back side is identifiable as the side with a continuous film. It is packaged such that the PVC back will be on the outside of the roll. For this reason it is important when placing Concrete Cloth materials to let the fabric off from the bottom side of the roll.

Temporary anchoring may be used on the leading edge of roll to prevent unrolling. In applications where long lengths will be let off the roll, it is good practice to allow several feet of extra material on the down-slope side of the install to allow for migration of the material in the direction of equipment movement.

After installation of the first roll or cut piece, the leading edge of the second roll or cut piece will typically be shingled over the first. If shingling is not possible, other jointing can be used. Please consult the detailed Concrete Cloth Installation Guide for further details.

Cutting

Concrete Cloth matting is designed to be cut with commonly available cutting tools. A box cutter or razor knife is generally acceptable and rotary cutters are more efficient. Always cut the material from the fabric (top) side down to minimize tearing of the PVC membrane. When possible, use a straight edge. Always wear proper hand PPE when working with cutting tools.

Overlap and Jointing

Four (4) inch overlap is typically recommended for shingling. The most common joint is an overlapped screw joint. A stainless steel #12 screw (coarse threads) is recommended 4-18 inch (typical 6) on center at least 1 inch from the overlap edge. Consult the Installation Guide for additional jointing recommendations.

Anchoring

Along all exterior edges (top, bottom & sides) of the Concrete Cloth installation, it is recommended to install a toe-in trench (minimum of 6 inches in depth) to resist migration of surface water between the Concrete Cloth material and the subgrade. The trench may vary based on the recommendation of a certified design engineer.

Some slopes, soil types and applications may require anchors or nails to stabilize the underling soil mass against internal instability. Concrete Cloth matting may be used as the non-structural facing treatment when internal anchorage conditions are required. Anchors may be installed first or the anchors can be inserted through the cloth.

Hydration

Complete hydration is critical to optimal performance. The Concrete Cloth product cannot be over hydrated and over watering is recommended. Any water source is acceptable in most circumstances.

Saturate the top surface. This will take multiple passes of a moderate spray of water from a garden hose or other source. More water will be needed as the slope of the install increases.

Insure that the material has been saturated by means of the “thumb test”, by pressing a thumb to observe water pooling at the indention.

Wait 30-60 minutes and then put a final dose of water on the material to ensure complete hydration.

The material can also be hydrated by submersion for 5-10 minutes but will only have a 1-2 hour working time after hydration.

Do not jet high pressure water directly onto the surface. Do not hydrate if temperature is likely to fall below 25F (-4C) within 24hrs of initial hydration. Do not install on frozen ground. Consult the Installation Guide for additional details and pictures.

Health & Safety

The material contains cement powder which is alkaline and may cause skin irritation. Always wear proper PPE and consult the SDS for additional information.

1.0 Brief

Concrete Canvas Ltd was requested by Nuna Innovations Inc to use our in-house hydraulic analysis to provide recommendations/advice on the requirement for intermediate fixings to resist hydraulic shear forces for the proposed Concrete Canvas (CC) channel lining works at the Eagle Gold Mine, Yukon, Canada.

2.0 Information Received

- Email from Ron Drewry (Nuna) to Phill Greer (CC Ltd) 28/02/19 containing spreadsheet '20190221-R3-Spillway Concrete Cloth Takeoff'

This spreadsheet contains the following information:

- Tables with information on the channel and spillway lengths and CC material takeoffs
- BGC cross sections
- Channel plan drawings from chainages 0+51.5m to 0+534m and the emergency spillway.

The email correspondence includes comments from Matt Coverdale (JDS Energy & Mining Inc) :

- The cross-section from Station 1+00 to the end has a maximum water level of 0.8m and from Station 0+60 to 0+90 has a maximum water level of 0.5 m. I am assuming that station 1+00 to the end is the 7.5% slope and Station 0+60 to 0+90 is the 15% slope, is that correct? If so, the relative shear force in English units for Station 1+00 to the end is 12 lbs/ft2 and the other section is 15.0 lbs/ft2. Their would be an energy jump causing more turbulence which I think you might be over stressing CC-8. I would suggest CC-13 if the budget allows it to protect this situation and provide additional abrasion strength and last longer and is more forgiving to other potential issues such as weak soils that Concrete Cloth will be deployed directly on. Let me know if you need any other assistance. I would suggest if percussion anchors are to be used (which I would strongly recommend) to have the washer seal that seals up the slit caused by the installation of the anchor head.

Note: not data has been provided for the emergency spillway so this has not been included in the analysis.

YUKON	Hydraulic Loading	1903-NA-YUKON	LKC		13/03/19	0

3.0 Analysis Parameters

Parameters determined from Information provided:

- Slope gradients from station 0+60 to 0+90 is 7.5% and for station 1+00 to the end is 15% (From correspondence)
- Water depth from station 0+60 to0+90 is 0.5m and for station 1+00 to the end is 0.8m (From correspondence)
- Invert width is 1.5m (from BCG sections)
- Channel side slopes to be 2(H):1(V) (from BCG sections)
- Radius of Curvature is 21m for station 0+60 to 0+90 and 42m for 0+416 to 0+534 (inferred from channel plan drawings), all others are straight
- Options for CC8 for a 7.5% slope and CC13 material for a 15% slope.

Assumptions by CC Ltd:

- CC Installation Layup: Transverse
- Anchor Type: Earth Percussion Anchors with minimum 100mm diameter anchor plate
- CC to be placed on low shear strength soils with an angle of internal friction (Phi) of 20°
- 0.5m water depth for all other channels

The designer must ensure that all assumptions and parameters comply with those found on site. Please report any discrepancies and CC Ltd can review the analysis

YUKON	Hydraulic Loading	1903-NA-YUKON	LKC		13/03/19	0

4.0 Analysis

Channel sections were analysed using CC Ltd's in house Hydraulic Calculator.

The active forces of CC self-weight and hydraulic shear due to the head of water is compared with the frictional shearing resistance between the CC and the underlying soil substrate. The results are used to determine if any hydraulic fixings are required, and if so, the density that is needed to resist the shear forces based on a specified anchor plate diameter.

The following table is a summary of the analysis results:

Run	Slope	CC type	RoC used (m)	Required Shear Stress by Fixings (Hydraulic shear minus Frictional shear) (kN/m^2)	Required min. Fixing Density ($number/m^2$)
0+51.5 to 0+60, **0+90 to 0+100**, **0+100 to 0+416** and **1+00 to END**	7.5%	CC8	No Curvature	**-0.621**	**Not Required**
	15%	CC13	No Curvature	**-0.231**	**Not Required**
0+60 to 0+90	7.5%	CC8	21	**-0.472**	**Not Required**
	15%	CC13	21	**+0.068**	**0.065**
0+416 to 0+534	7.5%	CC8	42	**-0.603**	**Not Required**
	15%	CC13	42	**-0.194**	**Not Required**

*Please note that turbulent flow is not considered in the analysis. Additional shear resistance may be required to resist turbulent flow conditions.

YUKON	Hydraulic Loading	1903-NA-YUKON	LKC		13/03/19	0

5.0 Summary

The analysis demonstrates that based on the input parameters considered and under uniform flow conditions, the majority of the proposed channel should not require additional anchorage to resist the hydraulic conditions, with the exception of station 0+60 to 0+90 for CC13 used on slopes of 15%, which will require earth percussion anchor fixings at a density of 0.065 per square metre.

It is recommended to install earth percussion anchors through overlap joints, which are at 1m centres when CC8 and CC13 material is installed in a transverse layup.

Assuming the channel length is in the x direction and cross channel width is in the y direction, if a fixing is installed in every overlap joint (x=1) the number of anchors required per overlap joint is calculated as follows:

Y=1/(x*Min. Required Fixing Density)
Y=1/(1*0.065) =15m

For the channel at station 0+60 to 0+90, the total wetted cross channel width is 1.1mx1.5mx1.1m=3.7m which is less than 15m.

Therefore, one fixing through every overlap joint will be sufficient to resist the forces calculated in the analysis and provide a factor of safety of approximately 4 (15/3.7).

If the designer considers this factor of safety to be too conservative, the spacing of the earth percussion anchors can be rationalised to reduce the quantity that need to be installed. By specifying an anchor through every other overlap joint (x = 2m) the resulting a factor of safety for anchor density is approximately 2.

The two options considered above are summarised in Figure 1. The fixing spacing can be economised further, but CC Ltd recommend a maximum fixing spacing in the x direction of 4m to prevent a build-up of shear force between fixings.

6.0 Additional Considerations

6.1 Reliability of Information

This analysis report has been produced using the methodology detailed above. However, it should be noted that it has been generated from information provided to CC Ltd which has not been independently verified and may contain assumptions and inaccuracies regarding hydraulic and other parameters. This report is provided to assist the designer in considering the requirement for fixings to resist hydraulic forces. The designer should satisfy themselves on the fixings required and specify these under their indemnity insurance.

6.2 Anchor Trenches

As with all erosion control mats, in order to prevent water ingress and undermining of the CC material, the edges need to be buried in anchor trenches. All perimeter edges should be buried to prevent water ingress and undermining. This is typically in 300mmx300mm anchor trenches which are concrete backfilled.

6.3 Check Slots

Concrete Canvas acts as an impermeable erosion control layer, channelling flowing water along the surface of the material. A fundamental design consideration is that water is cannot flow beneath the material, which would create dynamic loading and potentially displace CC layers. Water flow beneath the CC can typically be prevented by burying all perimeter edges in backfilled anchor trenches as detailed above and shingling overlapped layers in the direction of water flow to prevent ingress. However, conditions may occur where the water can flow beneath the CC layer, for example if the material is damaged by puncture due to debris impact. Channels may be located alongside stockpiles of large boulders, which may become dislodged and fall into the channel. If this occurs, it may be possible for large impacts to punch a hole through the CC (although it should be noted that CC has a far superior puncture resistance compared to other geomembranes). A hole in a CC layer could allow water ingress, cause dynamic loading and uplift, unzipping the CC layers. The likelihood of occurrence is dependent on the amount of debris that could enter the channel and the impact energy. If the likelihood of severe debris impact or the consequence of unzipping is high, a client may wish to limit the extent by which an unzipping can occur (and therefore commercial risk to repair) by introducing check slots into a channel. A check slot is essentially a mid channel concrete filled anchor trench which divides the channel into smaller sections, such that if a dynamic failure were to occur the quantity of material damaged is limited to an acceptable commercial value as determined by the client.

Project:	Calculations For:	Project No:	Created By:	Checked By:	Date:	Rev.:
YUKON	Hydraulic Loading	1903-NA-YUKON	LKC		13/03/19	0

Section of channel at risk of boulder impact and potential damage

Check slot being installed in channel

The client they may wish to limit the potential for unzipping as a result of future dynamic failure in high risk sections of channel, such as for steep hydraulic gradient sections of channel or sections with a radius of curvature. If check slots are incorporated, the spacing should be determined by the client as a balance between an increase in the initial installation cost and reduction of potential future repair cost if unzipping were to occur. In an example case study at Myra Falls check slots were installed at 30m centres as the likelihood of trees or boulders falling from the mountainside was high, but for other projects the check slots were spaced to limit potential risk to one full roll of CC material.

Client:	JDS		High 11°C
File:	ENG.WARC03235-02.005		Low 4°C

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work (Dayshift)
-	CAT D-10 Dozer	9	Placing structural fill at embankment
-	Hitachi 1200 Excavator	8	Loading Structural fill from ADR Stockpile
-	CAT 777 Haul Truck	8	Hauling structural fill to embankment
-	CAT 777 Haul Truck	8	Hauling structural fill to embankment
-	CAT 777 Haul Truck	8	Hauling structural fill to embankment
-	Volvo 40 tonne Rock Truck	-	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	8.5	Compacting structural fill at embankment
-	Link Belt 490 Excavator	5	Removing areas softened by excessive moisture

2.0 HEAP LEACH FACILITY

- Areas softened by excessive moisture were identified at 80 to 100 cm below lift elevation 904.43 m along the east abutment during and inspection with BGC. These areas were excavated and replaced with structural fill, which was compacted in two lifts using the CAT CS 78 B Compactor from 07:00 to 10:00
- Areas softened by excess moisture were also identified along the north embankment. This fill was removed using Link Belt 490 Excavator..
- Start of lift #39 (904.43 m design elevation) at 07:00. A notable amount of deflection was observed after witnessing compaction with the CAT CS 78 B Compactor. The Southeast portion of the lift was removed using the CAT D-10 Dozer until minimal deflection was observed as instructed by Roy Morlan (BGC) from 14:00 to 15:30.
- Moisture content testing was conducted using a nuclear densometer to assess the depth of water penetration. Tests were conducted at various depths into the lift ranging from 0 to 300 mm. Test results ranged from 3.1 % to 4.2 % M/C which could indicate that the lift was placed dry of the optimum moisture content of 6.2% as determined from standard proctor.
- Once significant remediation had been complete, BGC decided to continue placing new lifts of structural fill on top of the remaining soft spots on the lift. The remaining soft areas in this lift would be bridged in the upcoming placement of drier, sound structural fill.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Structural fill from the ADR stockpile had a moisture content of 7.0% to 8.0%. Material was slightly coarse, but still visually appeared to have less than 30% over 19 mm. Oversize boulders were removed from lift. This does not meet the BGC method specification requirement for structural fill for moisture content.
- Nightshift to continue lift #39 (904.46 m design elevation).

3.0 DISCUSSION/OTHER

- Structural fill material brought to the embankment had high moisture content. Elliot (BGC) was assigned to observe the structural fill material being loaded by the excavator.

4.0 CLOSURE

File:	ENG.WARC03235-02.005		Low 4°C

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-10 Dozer	11	Placing structural fill
	Hitachi 1200 Shovel	10	Loading Structural fill from ADR Stockpile
	CAT 777 Haul Truck	10	Hauling structural fill to embankment
	CAT 777 Haul Truck	10	Hauling structural fill to embankment
	CAT 777 Haul Truck	10	Hauling structural fill to embankment
	CAT CS 78 B Compactor	10	Compacting structural fill at embankment
	Water Truck	0	Moisture conditioning aggregates

2.0 HEAP LEACH FACILITY

- Shift change for the Pelly crew.
- Continued placement of structural fill at Heap Leach Facility Embankment.
- Placement of lift elevation 904.43 m (as built average elevation) resumed at 19:35. Placement was completed at 21:45. Compaction for this lift began at 19:300 and was completed by 23:30. Compaction and moisture testing as conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 96.1 % to 99.6 %. Moisture content ranged from 3.1 % MC to 5.7 % MC. This is below the targeted BGC method specification requirements for moisture content.
- Compaction was primarily completed using at least two passes (back and forth) of the 13.4 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Placement of lift elevation 904.83 m (design elevation) began at 22:15. Placement was incomplete by the end of shift. Due to spreading and grading methodology, compaction did not start until 02:00. Compaction for this lift was incomplete by the end of shift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material is becoming coarser, but visually appeared to have less than 30 % over 19 mm and smaller than over 150 mm particle size. Oversized cobbles or boulders were still present in the stockpile but were removed prior to loading and placement. Any oversized cobbles or boulders placed were removed prior to compaction. This meets the BGC method specification requirement for structural fill. A water truck was not used to moisture condition the structural fill

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

stockpile due to previous rain events. Shovel attempted to blend the wet surface material with the drier core of the stockpile to moisture condition the pile.

- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation averaged approximately 4 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 69 loads were placed using CAT 777 haul trucks during shift. Assuming 36 m^3 per load, a total of 2,484 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Placement of lift 904.83 m (design elevation) was spread using a fanning spread pattern, causing a delay in the vibratory compactor sealing the lift. Future lift placement may benefit from single width straight line placement, which may mitigate rain damage to the loose, uncompacted lift.
- The most recent placement of drier structural fill in lift 904.83 m (design elevation) appeared to help bridge the areas where deflections had been noted in previous lifts.

4.0 CLOSURE

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work (Day Shift)
-	Cat D-10 Dozer	10.5	Placing structural fill
-	Hitachi 1200 Excavator	9	Loading Structural fill from ADR Stockpile
-	Cat 777 Haul Truck	10	Hauling structural fill to embankment
-	Cat 777 Haul Truck	10	Hauling structural fill to embankment
-	Cat 777 Haul Truck	10	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	11	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Density tests were completed on nightshift's structural lift. Nightshift's lift met BGC structural fill specifications.
- Start of lift #1 (899.05m design elevation) started at 07:00. Compactor started at 09:00 and finished at 11:30. Two passes was observed with sufficient speed and overlap. Loose lift finished at 10:40. Survey confirmed the average elevation to be 898.97m, which calculates to be a 0.32m lift. Moisture content was between 4.2 to 6.4%.
- Structural fill was coming from stockpile #3-1 (near Clark) and the stockpile north of the embankment. Both are approved sources. Structural fill from the stockpile north of the embankment appears to have a moisture content of 5 to 6%, whereas the material from stockpile #3-1 has a moisture content of 4 to 5%. Material was fine, visually appeared to have less than 30% over 19 mm. This meets the BGC method specification requirement for structural fill.
- Start of lift #2 (899.37m design elevation) started at 10:40. Compactor started at 11:30 and finished at 14:50. Two passes was observed with sufficient speed and overlap. Loose lift finished at 14:00. Survey confirmed the average elevation to be 899.32m, which calculates to be a 0.35m lift. Moisture content was between 4.1 to 6.1%.
- Start of lift #3 (899.72m design elevation) started at 14:00. Compactor started at 14:50 and finished at 17:30. Two passes was observed with sufficient speed and overlap. Loose lift finished at 17:00. Survey confirmed the average elevation to be 899.68m, which calculates to be a 0.36m lift. Moisture content was between 3.4 to 5.6%.
- Density tests were completed on the embankment and complied with BGC's compaction specifications for structural fill.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

3.0 DISCUSSION/OTHER

- 1200 Excavator was seen to be loading 777 Haul trucks at stockpile #3-1 (near Clark) at 12:30 with no moisture conditioning.

4.0 CLOSURE

We trust that the information provided herein is accurate and complete. Please contact the undersigned if you require additional information or have any concerns.

Client:	JDS		High 22°C
File:	ENG.WARC03235-02.005		Low 15°C

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	Cat D-10 Dozer	12	Placing structural fill
	Hitachi 1200 Shovel	11	Loading Structural fill from ADR Stockpile
	Cat 777 Haul Truck	11	Hauling structural fill to embankment
	Cat 777 Haul Truck	11	Hauling structural fill to embankment
	Cat 777 Haul Truck	11	Hauling structural fill to embankment
	CAT CS 78 B Compactor	11	Compacting structural fill at embankment
	Water Truck	9.5	Moisture conditioning aggregates

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment, Elevation lift 900.05 m from day shift. Placement of fill completed by 20:10 hours. Compaction for this lift began at 19:00 hours and was completed by 21:20 hours. Compaction and moisture testing and final survey completed at 21:30 hours.
- Placement of Elevation lift 900.45 m started at 20:15 hours. Placement was completed at 01:00 hours. Compaction for this lift began at 21:45 hours and was completed by 03:00 hours. Compaction and moisture testing and final survey completed at 03:20 hours.
- Elevation lift 900.84 m was started at 02:10 hours. Placement was incomplete by end of shift. Compaction was also incomplete and will be finished on dayshift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material was slightly coarser than yesterday, but still visually appeared to have less than 30 % over 19 mm and smaller than over 150 mm particle size. If oversized cobbles or boulders were noticed in the lift, they were removed prior to compaction. This meets the BGC method specification requirement for structural fill.
- The moisture content of the structural fill source was visually lower than previous days. This was later confirmed via moisture content testing via nuclear densometer to be below 3 %. A water truck was used to precondition the stockpile prior to placement. During the evening, Pelly discovered that the hydraulic pump was beginning to overheat and could no longer condition the structural fill at the stockpile. Pelly elected to use the gravity fed end discharge of the water truck to moisture condition the embankment surface.
- All compaction was done with two passes (back and forth) of the 13.4 tonne vibratory roller. Sufficient overlap and complete coverage meets the method specification requirements for 2 passes with a 13.4 tonne vibratory

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

roller. Eleven compaction tests, using the nuclear densometer, were completed. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 95.6 % to 99.7 %. Moisture content ranged from 3.0 % MC to 5.2 % MC this is below the targeted BGC method specification requirements. Further moisture conditioning was held off until the extent of the rain event was to be determined.

- Ongoing grade checks during placement by contractor using laser level. Survey confirmed that the average surveyed elevation averaged around 3 cm below target design elevation of 40 cm lift thickness. This also satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 88 loads were placed during shift. Assuming 36 m^3 per load, a total of 3,168 m^3 of structural fill was placed on the embankment during nightshift. Haul trucks experienced difficulty completing loads during the rain event as inclined roadways became increasingly difficult to traverse. Additional work to ramps and haul roads carried out to improve route.

3.0 DISCUSSION/OTHER

- Moisture conditioning of structural fill after placement is more evenly distributed throughout the lift when preformed at the borrow source. If moisture conditioning is required after placement. The lift may be scarified and bladed to promote complete mixing.

4.0 CLOSURE

Placement and compaction of lift elevation 900.05 m.

Checking grades during placement of lift elevation 900.42 m.

Typical gradation of structural fill with slightly more coarse aggregate.

ADS stockpile being moisture conditioned via watertruck.

Water truck moisture conditioning a placed and compacted lift elevation 900.45 m.

Water truck moisture conditioning a placed and uncompacted lift elevation 900.85 m.

COMPACTION DENSITY TEST SUMMARY REPORT

ASTM Designation D6938

Project: Eagle Gold Project | **Test Apparatus:** Nuclear | **Troxler No:** 60841

QC Inspection & Testing | **Specified Compaction:** 95 % Std. Proctor Max. Dry Density

Project No.: WARC.03235-05 | **Specified Moisture** (MC)**:** As Below

Client: JDS Energy & Mining/BGC | **Temperature** **Air:** 13 ºC **Soil:** ºC

Attention: R.Morlan/D. Granda | **Date Tested:** 8/11/2018 **By:** M. Estrada

Contractor: Pelly Construction | **Construction Period:** DAYSHIFT

Soil Description: Test Pad - Type 3 Structural Fill

Material Usage/Zone: Method Spec Test Pad at Event Pond

Date yyyy/mm/dd	**Test No.** / Probe (mm)	**Location:**	Depth to Grade (m)	Dry Density (kg/m³)	MC %	Max. Dry Density	Opt. MC %	Comp % SPD
8/11/2018	**1** / 300	Method Spec Test Fill - 6 pass cycles, beside plate #3	Gr	2233	3.7	2175	8.2	**102.7**
8/11/2018	**2** / 300	Method Spec Test Fill - 6 pass cycles, between plate #2 and #3	Gr	2274	3.6	2175	8.2	**104.6**
8/11/2018	**3** / 300	Method Spec Test Fill - 6 pass cycles, between plate #2 and #3	0.13	2096	5.5	2175	8.2	**96.4**

Remarks: Densities provided under supervision of Roy Morlan.

COMPACTION DENSITY TEST SUMMARY REPORT

ASTM Designation D6938

Project: Eagle Gold Project | **Test Apparatus:** Nuclear | **Troxler No:** 60841

QC Inspection & Testing | **Specified Compaction:** 95 % Mod. Proctor Max. Dry Density

Project No.: WARC.03235-05 | **Specified Moisture** (MC)**:** As Below

Client: JDS Energy & Mining/BGC | **Temperature** **Air:** 13 ºC **Soil:** ºC

Attention: R.Morlan/D. Granda | **Date Tested:** 8/11/2018 **By:** M. Estrada

Contractor: Pelly Construction | **Construction Period:** DAYSHIFT

Soil Description: SAND & GRAVEL (Colluvium), silty

Material Usage/Zone: Type 3 Structural Fill

Date yyyy/mm/dd	**Test No.** Probe (mm)	**Location:**	Depth to Grade (m)	Dry Density (kg/m³)	MC %	Max. Dry Density	Opt. MC %	Comp % MPD
8/11/2018	**1** 300	Structural Fill - North of embankment	905.93	2284	2.9	2270	6.7	**100.6**
8/11/2018	**2** 300	Structural Fill - Center of embankment	905.93	2218	2.6	2270	6.7	**97.7**
8/11/2018	**3** 300	Structural Fill - Southwest corner of embankment	905.93	2194	3.8	2270	6.7	**96.7**
8/11/2018	**4** 300	Structural Fill - Center of toe of embankment	905.93	2184	5.6	2270	6.7	**96.2**
8/11/2018	**5** 300	Structural Fill - Center of East abutment of embankment	905.93	2157	4.0	2270	6.7	**95.0**

Remarks: Testing completed with BGC present. Compacted with CS 78 13.4 tonne vibratory smooth drum roller. Issued for Review. Page 1 of 1.

COMPACTION DENSITY TEST SUMMARY REPORT

ASTM Designation D6938

Project: Eagle Gold Project | **Test Apparatus:** Nuclear | **Troxler No:** 60841

QC Inspection & Testing | **Specified Compaction:** 95 % Std. Proctor Max. Dry Density

Project No.: WARC.03235-05 | **Specified Moisture** (MC)**:** As Below

Client: JDS Energy & Mining/BGC | **Temperature** **Air:** 8 ºC **Soil:** ºC

Attention: R.Morlan/D. Granda | **Date Tested:** 9/6/2018 **By:** RTO

Contractor: Pelly Construction | **Construction Period:** Nightshift

Soil Description: Structural Fill

Material Usage/Zone: Heap Leach Facility (HLF) Embankment

Date yyyy/mm/dd	**Test No.** / Probe (mm)	**Location:**	Elevation (m)	Dry Density (kg/m³)	MC %	Max. Dry Density	Opt. MC %	Comp % SPD
9/6/2018	**1** / 300	HLF Embankment - North west section of lift	921.45	2278	4.9	2270	6.7	**100.4**
9/6/2018	**2** / 300	HLF Embankment - North east section of lift	921.45	2166	6.5	2270	6.7	**95.4**
9/6/2018	**3** / 300	HLF Embankment - South east section of lift	921.45	2256	4.5	2270	6.7	**99.4**
9/6/2018	**4** / 300	HLF Embankment - South west section of lift	921.45	2199	3.4	2270	6.7	**96.9**

Remarks: Compacted using CS78 13.4 tonne, Volvo SD160 11 tonne, and CS68 9 tonne vibratory smooth drum roller. Page 1/1.

COMPACTION DENSITY TEST SUMMARY REPORT

ASTM Designation D6938

Project: Eagle Gold Project | **Test Apparatus:** Nuclear | **Troxler No:** 60841

QC Inspection & Testing | **Specified Compaction:** 95 % Std. Proctor Max. Dry Density

Project No.: WARC.03235-05 | **Specified Moisture** (MC)**:** As Below

Client: JDS Energy & Mining/BGC | **Temperature** **Air:** -1.0 ºC **Soil:** 3.2 ºC

Attention: R.Morlan/D. Granda | **Date Tested:** 9/22/2018 **By:** A. Schoepp

Contractor: Pelly Construction | **Construction Period:** Nightshift

Soil Description: Structural Fill

Material Usage/Zone: Heap Leach Facility (HLF) Embankment

Date yyyy/mm/dd	**Test No.** Probe (mm)	**Location:**	Elevation (m)	Dry Density (kg/m³)	MC %	Max. Dry Density	Opt. MC %	Comp % SPD
9/22/2018	**1** 300	HLF Embankment - West lift	928.75	2164	4.6	2270	6.7	**95.3**

Remarks: Compacted using CS78 13.4 tonne, Volvo 11 tonne and CS68 9 tonne vibratory compactor.

COMPACTION DENSITY TEST SUMMARY REPORT

ASTM Designation D6938

Project: Eagle Gold Project | **Test Apparatus:** Nuclear | **Troxler No:** 60841

QC Inspection & Testing | **Specified Compaction:** 95 % Mod. Proctor Max. Dry Density

Project No.: WARC.03235-05 | **Specified Moisture** (MC)**:** As Below

Client: JDS Energy & Mining/BGC | **Temperature** **Air:** 7 ºC **Soil:** ºC

Attention: R.Morlan/D. Granda | **Date Tested:** 8/24/2018 **By:** JRC

Contractor: Pelly Construction | **Construction Period:** DAYSHIFT

Soil Description: SAND & GRAVEL (Colluvium), silty

Material Usage/Zone: Type 3 Structural Fill

Date yyyy/mm/dd	**Test No.** / Probe (mm)	**Location:**	Depth to Grade (m)	Dry Density (kg/m³)	MC %	Max. Dry Density	Opt. MC %	Comp % MPD
2018/08/24	1 / 300	Structural Fill - 20m North of toe from Station 0+310	905.02	2159	7.4	2270	6.7	**95.1**
2018/08/24	2 / 300	Structural Fill - 40m North of toe from Station 0+280	905.02	2213	4.7	2270	6.7	**97.5**
2018/08/24	3 / 300	Structural Fill - 20m North of toe from Station 0+315	905.44	2185	5.3	2270	6.7	**96.3**
2018/08/24	4 / 300	Structural Fill - 30m North of toe from Station 0+281	905.44	2272	3.0	2270	6.7	**100.1**

Remarks: Testing completed with BGC present. Compacted with CS 78 13.4 tonne vibratory smooth drum roller. Issued for Review. Page 1 of 1.

COMPACTION DENSITY TEST SUMMARY REPORT

ASTM Designation D6938

Project: Eagle Gold Project | **Test Apparatus:** Nuclear | **Troxler No:** 60841

QC Inspection & Testing | **Specified Compaction:** 95 % Mod. Proctor Max. Dry Density

Project No.: WARC.03235-05 | **Specified Moisture** (MC)**:** As Below

Client: JDS Energy & Mining/BGC | **Temperature** **Air:** 4 ºC **Soil:** ºC

Attention: R.Morlan/D. Granda | **Date Tested:** 8/30/2018 **By:** JRC

Contractor: Pelly Construction | **Construction Period:** DAYSHIFT

Soil Description: SAND & GRAVEL (Colluvium), silty

Material Usage/Zone: Type 3 Structural Fill

Date yyyy/mm/dd	**Test No.** / Probe (mm)	**Location:**	Depth to Grade (m)	Dry Density (kg/m³)	MC %	Max. Dry Density	Opt. MC %	Comp % MPD
2018/08/30	1 / 300	Structural Fill - 40m North of toe from Station 0+150	913.69	2261	4.2	2270	6.7	**99.6**
2018/08/30	2 / 300	Structural Fill - 40m North of toe from Station 0+185	913.69	2205	4.0	2270	6.7	**97.1**
2018/08/30	3 / 300	Structural Fill - 80m North of toe from Station 0+320	914.09	2207	3.3	2270	6.7	**97.2**
2018/08/30	4 / 300	Structural Fill - 30m North of toe from Station 0+300	914.09	2165	5.3	2270	6.7	**95.4**
2018/08/30	5 / 300	Structural Fill - 20m North of toe from Station 0+255	914.09	2160	6.7	2270	6.7	**95.2**

Remarks: Testing completed with BGC present. Compacted with CS 78 13.4 tonne vibratory smooth drum roller. Issued for Review. Page 1 of 1.

COMPACTION DENSITY TEST SUMMARY REPORT

ASTM Designation D6938

Project: Eagle Gold Project | **Test Apparatus:** Nuclear | **Troxler No:** 60841

QC Inspection & Testing | **Specified Compaction:** 95 % Mod. Proctor Max. Dry Density

Project No.: WARC.03235-05 | **Specified Moisture** (MC)**:** As Below

Client: JDS Energy & Mining/BGC | **Temperature** **Air:** 28 ºC **Soil:** ºC

Attention: R.Morlan/D. Granda | **Date Tested:** 2018-07-29 **By:** M. Estrada

Contractor: Pelly Construction | **Construction Period:** DAYSHIFT

Soil Description: SAND & GRAVEL (Colluvium), silty

Material Usage/Zone: Type 3 Structural Fill

Date yyyy/mm/dd	**Test No.** / Probe (mm)	**Location:**	Depth to Grade (m)	Dry Density (kg/m³)	MC %	Max. Dry Density (kg/m³)	Opt. MC %	Comp % MPD
2018-07-30	**23** / 300	Structural Fill - Centre	894.4	2222	4.5	2270	6.7	**97.9**
2018-07-30	**24** / 300	Structural Fill - West Toe	894.4	2273	4.7	2270	6.7	**100.1**
2018-07-30	**25** / 300	Structural Fill - East toe	894.4	2199	5.3	2270	6.7	**96.9**
2018-07-30	**26** / 300	Structural Fill - Centre of East abutment	894.4	2222	4.9	2270	6.7	**97.9**
2018-07-30	**27** / 300	Structural Fill - NE corner	894.4	2248	4.0	2270	6.7	**99.0**
2018-07-30	**28** / 300	Structural Fill - Moisture content check on first load next lift	894.9	2106	5.2	2270	6.7	
2018-07-30	**29** / 300	Structural Test Fill - prepass data	894.9	2088	5.2	2270	6.7

COMPACTION DENSITY TEST SUMMARY REPORT

ASTM Designation D6938

Project: Eagle Gold Project | **Test Apparatus:** Nuclear | **Troxler No:** 60841

QC Inspection & Testing | **Specified Compaction:** 95 % Mod. Proctor Max. Dry Density

Project No.: WARC.03235-05 | **Specified Moisture** (MC)**:** As Below

Client: JDS Energy & Mining/BGC | **Temperature** **Air:** 19 ºC **Soil:** ºC

Attention: R.Morlan/D. Granda | **Date Tested:** 8/4/2018 **By:** M. Estrada

Contractor: Pelly Construction | **Construction Period:** DAYSHIFT

Soil Description: SAND & GRAVEL (Colluvium), silty

Material Usage/Zone: Type 3 Structural Fill

Date yyyy/mm/dd	**Test No.** / Probe (mm)	**Location:**	Depth to Grade (m)	Dry Density (kg/m³)	MC %	Max. Dry Density	Opt. MC %	Comp % MPD
8/4/2018	**1** / 300	Structural Fill - Lower embankment, center	892.15	2332	2.9	2270	6.7	**102.7**
8/4/2018	**2** / 300	Structural Fill - Lower embankment, East near ramp	892.60	2253	4.0	2270	6.7	**99.3**
8/4/2018	**3** / 300	Structural Fill - Lower embankment, Slightly East of center	892.60	2217	4.3	2270	6.7	**97.7**
8/4/2018	**4** / 300	Structural Fill - Lower embankment, center near toe	892.60	2184	3.0	2270	6.7	**96.2**
8/4/2018	**5** / 300	Structural Fill - Lower embankment, East near access road	892.93	2271	3.6	2270	6.7	**100.0**
8/4/2018	**6** / 300	Structural Fill - Lower embankment, slightly East of center	892.93	2196	3.8	2270	6.7	**96.7**
8/4/2018	**7** / 300	Structural Fill - Lower embankment, center of toe	892.93	2189	3.1	2270	6.7	**96.4**
8/4/2018	**8** / 300	Structural Fill - Lower embankment, East of center	892.93	2108	3.9	2270	6.7	**92.9**
8/4/2018	**9** / 300	Structural Fill - Lower embankment, East of center, retest	892.93	2286	3.2	2270	6.7	**100.7**
8/4/2018	**10** / 250	Structural Fill - Lower embankment, moisture check on loose lift	893.30	-	4.1	2270	6.7	**-**
8/4/2018	**11** / 250	Structural Fill - Lower embankment, center of toe	893.30	2252	4.4	2270	6.7	**99.2**

Remarks: Testing completed with BGC present. Compacted with CS 78 13.4 tonne vibratory smooth drum roller. Issued for Review. Page 1 of 2.

COMPACTION DENSITY TEST SUMMARY REPORT

ASTM Designation D6938

Project: Eagle Gold Project | **Test Apparatus:** Nuclear | **Troxler No:** 60841

QC Inspection & Testing | **Specified Compaction:** 95 % Std. Proctor Max. Dry Density

Project No.: WARC.03235-05 | **Specified Moisture** (MC)**:** As Below

Client: JDS Energy & Mining/BGC | **Temperature** **Air:** 19 ºC **Soil:** ºC

Attention: R.Morlan/D. Granda | **Date Tested:** 7/30/2018 **By:** SD

Contractor: Pelly Construction | **Construction Period:** Nightshift

Soil Description: Structural Fill

Material Usage/Zone: Heap Leach Facility (HLF) Embankment

Date yyyy/mm/dd	**Test No.** / Probe (mm)	**Location:**	Elevation (m)	Dry Density (kg/m³)	MC %	Max. Dry Density	Opt. MC %	Comp % SPD
7/30/2018	**13** / 250	HLF Embankment	896.35	2246	3.3	2272		**98.9**
7/30/2018	**14** / 250	HLF Embankment	896.35	2238	4.3	2272		**98.5**
7/30/2018	**15** / 250	HLF Embankment	896.35	2215	3.9	2272		**97.5**
7/30/2018	**16** / 250	HLF Embankment	896.35	2218	4.1	2272		**97.6**

Remarks: Material compacted with CS 78 13.4 tonne vibratory smooth drum roller.

SIEVE ANALYSIS REPORT

ASTM C136 & C117

Project:	Dublin Gulch Project	Sample Number:	SA03 - 10:30 hrs
Project No.:	704-ENG.WARC03532-05	Date Sampled:	November 27, 2018
Client:	JDS	Sampled By:	SD Tested By: SD
Attention:	Chris Copley	Specification:	See Remarks
Description:	38 mm Minus screened Drain Rock	Fracture (2 faces):	
Location:	Crusher area stockpile	Moisture Content:	2.9%

Aggregate Gradation (% Passing)

Sieve Size (*um*)	50000	40000	25000	20000	16000	12500	10000	5000	2500	1250	630	315	160	80
Upper Limit		100						20						5
Lower Limit		100						0.1						0.1
Test Result	**100**	**100**	**67.7**	**26.1**	**17.0**	**3.1**	**2.5**	**1.9**	**1.7**	**1.5**	**1.3**	**1.1**	**0.6**	**0.4**

Remarks: 100% Passing 38mm: Less than 20% Passing No 4; Less than 5% Passing No. 200

Reviewed By: C.E.T.

SIEVE ANALYSIS REPORT

ASTM C136 & C117

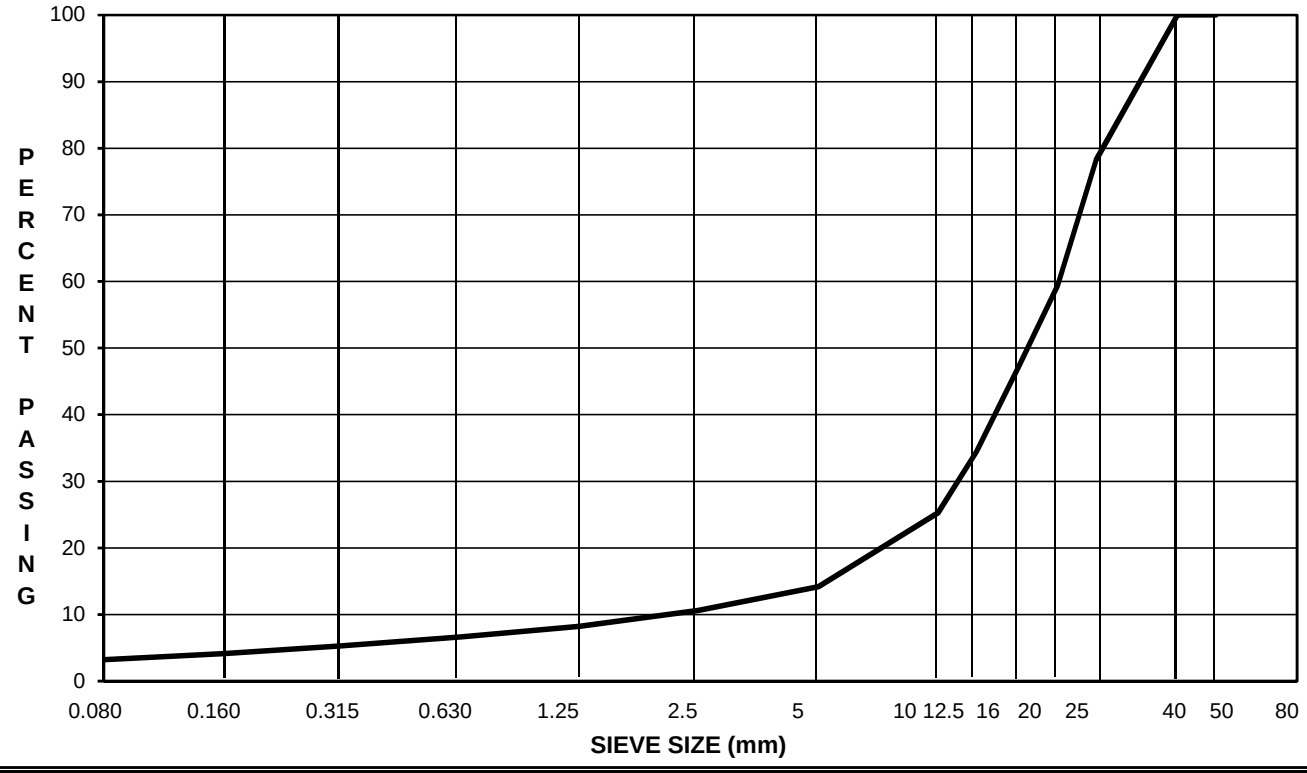
Project:	Eagle Gold Project	Sample Number:	**SA04 to S85 AVERAGE**
Project No.:	704-ENG.WARC03532-01	Date Sampled:	June 8 to Aug 6, 2018
Client:	JDS Energy & Mining	Sampled By:	JP/JB Tested By: JP/JB
Attention:	Clint Abel / Roman Bilobrowka	Specification:	See remarks
Description:	38 mm Minus Drain Rock	Fracture (2 faces):	N/A
Location:	Crusher Discharge Belt	Moisture Content:	2.2%



Aggregate Gradation (% Passing)

Sieve Size (*um*)	50000	40000	25000	20000	16000	12500	10000	5000	2500	1250	630	315	160	80
Upper Limit														
Lower Limit														
Test Result	**100**	**100**	**78**	**59**	**47**	**34**	**25**	**14**	**11**	**8**	**7**	**5**	**4.2**	**3.2**

Remarks: 100% passing 38 mm

5% max passing No, 200 (080)

Summary - Grainsize Analysis

Project:	Eagle Gold Project	Dates:	June 8 - Aug 6, 2018
Services:	2018 Geotechnical QC Services	Sampled From:	Stop belt sample Surge Bin (unless*)
Client:	Victoria Gold (Strata Gold, JDS Energy and Mining)	Contractor:	Nuway Crushing Ltd.
Aggregate Type:	38 mm Minus Overliner Drain Rock	Tested By:	JP/JB/RO/ME

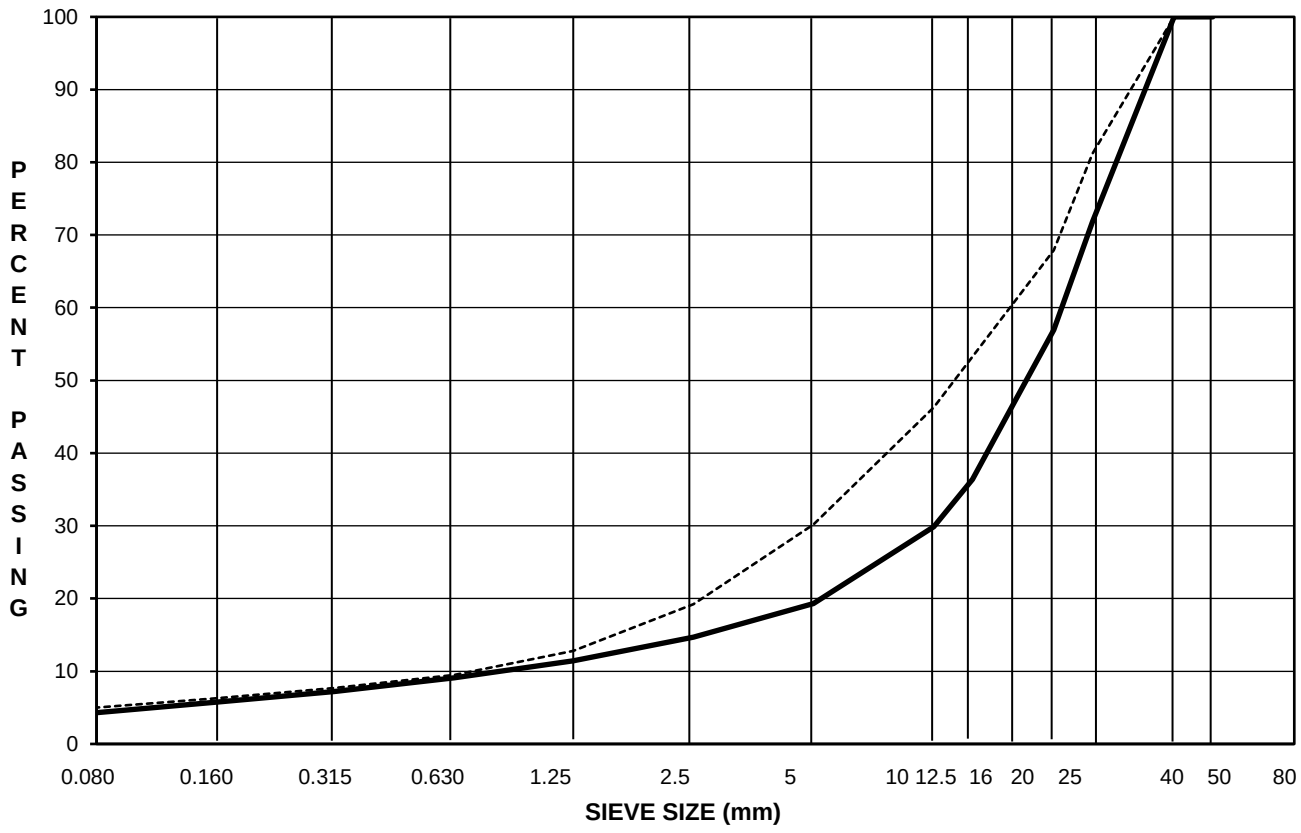
SIEVE ANALYSIS REPORT

ASTM C136 & C117

Project:	Eagle Gold Project	Sample Number:	PLS Sump - 150 mm below grade
Project No.:	704-ENG.WARC03235-07	Date Sampled:	June 10, 2019
Client:	JDS	Sampled By:	AS Tested By: AS
Attention:	Mike Blusson & Calvin Goldschmidt	Specification:	See remarks
Description:	38 mm minus Overliner Drain Rock	Fracture (2 faces):	N/A
Location:	PLS Sump - 150 mm deep (SW corner)	Moisture Content:	2.2%

Aggregate Gradation (% Passing)



Sieve Size (*um*)	50000	40000	25000	20000	16000	12500	10000	5000	2500	1250	630	315	160	80
Upper Limit	100	100	81.2	67.9			46.3	30.2	19.2	12.8	9.5	7.7	6.3	**5**
Lower Limit														**0**
Test Result	**100**	**100**	**72**	**57**	**47**	**36**	**30**	**19**	**15**	**11**	**9**	**7**	**5.7**	**4.3**

Remarks: 100% passing 38 mm

5% max passing No, 200 (080)

Upper limit is based off of permability

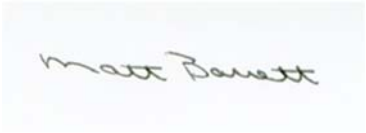
Attention: Mr. Richard Boehnke

RE: LABORATORY TEST RESULTS FOR JDS ENERGY & MINING INC. PROJECT – VICTORIA GOLD

Dear Mr. Boehnke:



Golder Associates Inc. (Golder) has prepared this report to present the results of geotechnical laboratory testing conducted on samples submitted by the SGS for JDS Energy & Mining Inc. The samples were tested at Golder's Geotechnical Laboratory in Lakewood, Colorado. This report presents the results of Compression-Permeability testing on the Samples "Victoria Gold Comp 1" and "Victoria Gold Comp 2".

All assigned laboratory testing has been completed. Thank you for the opportunity to provide these laboratory testing services and we look forward to assisting you on future projects.

Should you have any questions or comments, please do not hesitate to call.

Sincerely,

GOLDER ASSOCIATES INC.

Matthew Barrett
Geotechnical Lab Manager

APPENDIX 5
QA Approvals

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	1406006
Client:	Victoria Gold	**Date:**	Sept. 21, 2017
Construction:	JDS Mining	**Inspection Number:**	FND01
BGC Personnel:	Tony Monasterio	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 1, and 2, Survey drawings attached.
Approval/Rejection Observations and Recommendations:
BGC requested additional excavation in select areas suspected to not be Type 3 bedrock in both Sections 1 and 2. Upon further excavation, parent rock fabric was observed and the area was approved. Some discontinuous areas of ice remain, and are impractical to remove. Sections 1 and 2 have been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	☐ Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	

PHOTOGRAPHS

Photo 1: North area of Section 1 approved under FND01

Photo 2: North half of Section 2 approved under FND01. The area uphill of approximately the red line was approved. Note that in areas of stronger rock, the slope cannot be cleaned as easily as soft rock and initially appears to not be excavated to bedrock. These areas were investigated and were found to be sufficient.

Client:	Victoria Gold	**Date:**	Sept. 23, 2017
Construction:	JDS Mining	**Inspection Number:**	FND02
BGC Personnel:	Tony Monasterio	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 3, Survey drawings attached.
Approval/Rejection Observations and Recommendations:
BGC requested additional excavation in select areas suspected to not be Type 3 bedrock in both Sections 2 and 3. Excavation continued until parent rock fabric was observed and the area was approved. There is less ground ice in Section 3 than previously encountered, and mostly on the north side of the section. Section 3 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	☐ Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	

PHOTOGRAPHS

BGC Personnel:	Tony Monasterio	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 4, Survey drawing attached.
Approval/Rejection Observations and Recommendations:
BGC requested additional excavation in select areas suspected to not be Type 3 bedrock. Excavation continued until parent rock fabric was observed and the area was approved. Again, ground ice was limited to the north third of the section. Ground temperatures in the north were -3 to 0°C; the south was much warmer, ranging from +2 to +5°C. Section 4 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	☐ Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)

BGC Personnel:	Tony Monasterio, Roy Morlan	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 5, Survey drawing attached.
Approval/Rejection Observations and Recommendations:
BGC approved a portion of the west side of the ridge running down the center of Ann Gulch. Small areas which require additional cleaning or excavation near the bottom of the slope were excluded from this approval and will be attended to by Pelly and included in the next approval.
Ground ice was not encountered on the slope.
Section 4 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Summary and Observations

Pelly area(s) approved by this document: Section 8, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- Ground ice was encountered on the northern ¼ of the approved area. It was removed to hard, competent bedrock. Ground temperature measurements are included in Ground Temperature Measurement Log Sec08-01.
- As with all other approved sections, Section 8 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Section 8 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

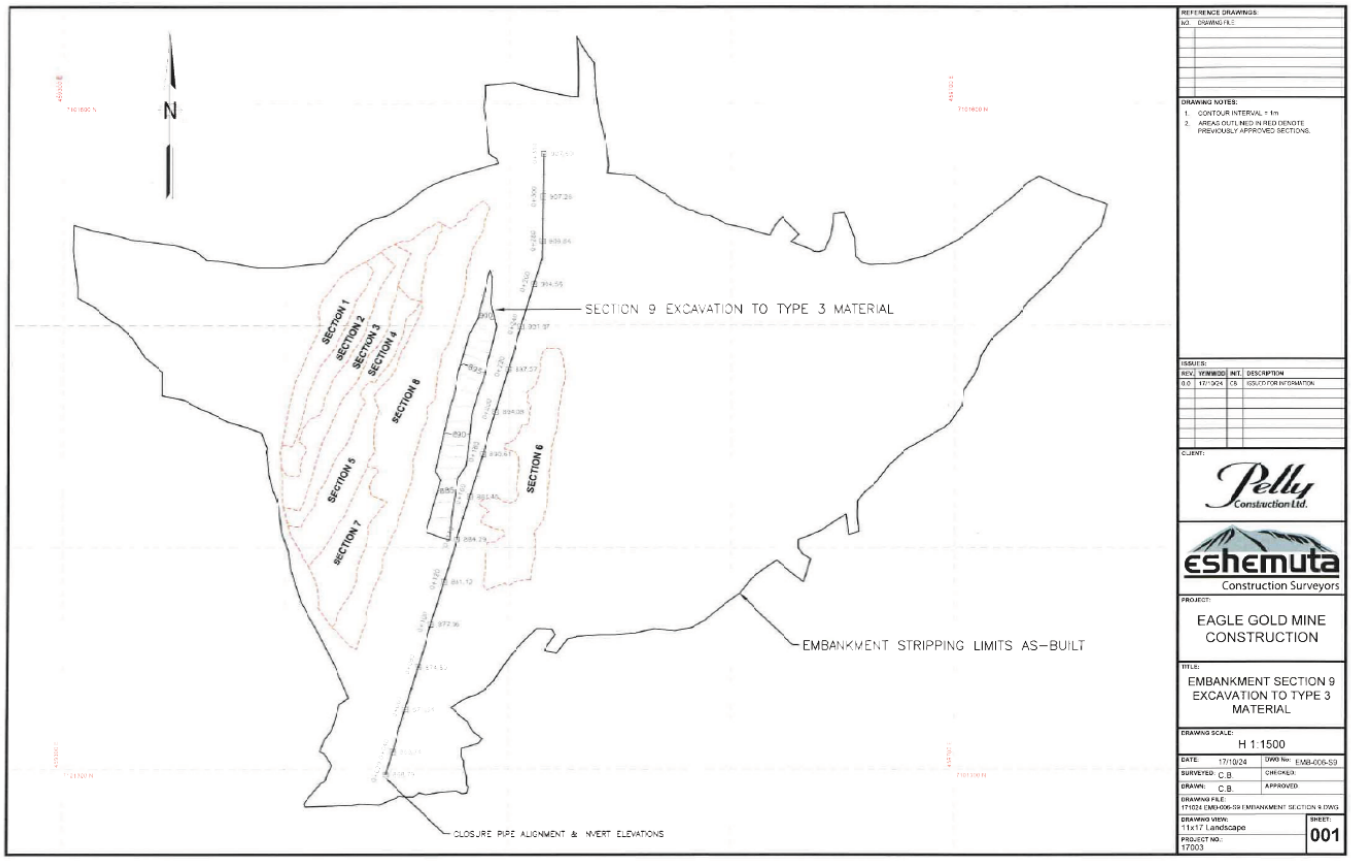
Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date:**	April 26, 2018
Construction:	JDS Mining	**Inspection Number:**	FND09
BGC Personnel:	Tony Monasterio	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 09, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- Areas was cleared in October 2017. However, BGC was demobilized before approval could be signed. BGC has inspected this area on April 26 and has approved it.
- Section 09 will require surface cleaning as ice removal activities in April 2018 has generated mud from pulverization of the upper portion (5 to 20 cm) of type 3 foundation.
- Section 09 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.



Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	
☐	☐

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date:**	May 2, 2018
Construction:	JDS Mining	**Inspection Number:**	FND10
BGC Personnel:	Roy Morlan	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 10, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- Ground ice was encountered through most of the area. Foundation was over excavated in some areas between 30 to 50 cm as loose material at the surface was frozen to stronger material below and all material would be dislodged in one large frozen chunk. Type 3 foundation rock left had visible ice between joints in some sections. Ground temperature was measured between -1 C to 2C in Section 10.
- Frozen areas of type 3 will be inspected again after thaw to ensure that they did not lose strength. If frozen foundation has become loose after thaw it will have to be removed.
- As with all other approved sections, Section 10 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Section 10 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	
☐	☐

PHOTOGRAPHS

Photo 1: Foundation excavation spoils.

Photo 2: Example of type 3 foundation with ice between the joints. In place strength will need to be re-evaluated after ice has thawed. Area may need additional cleaning of loose material after ice has thawed.

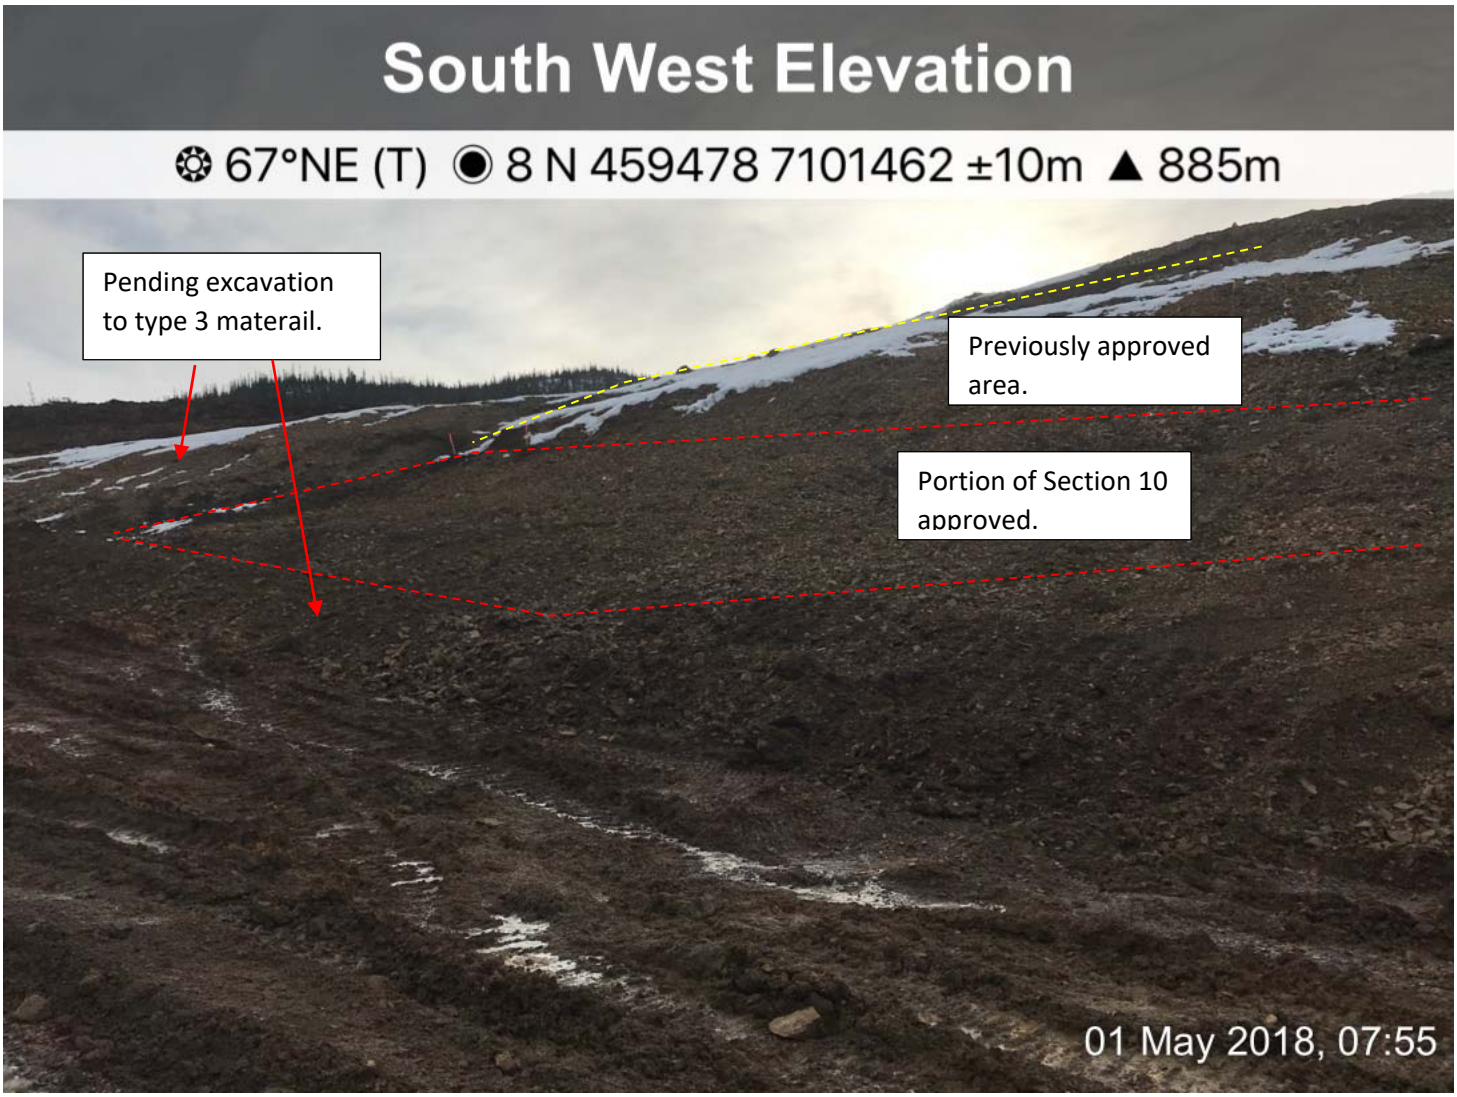

Photo 3: Portion of the area where type 3 foundation was approved in Section 10.

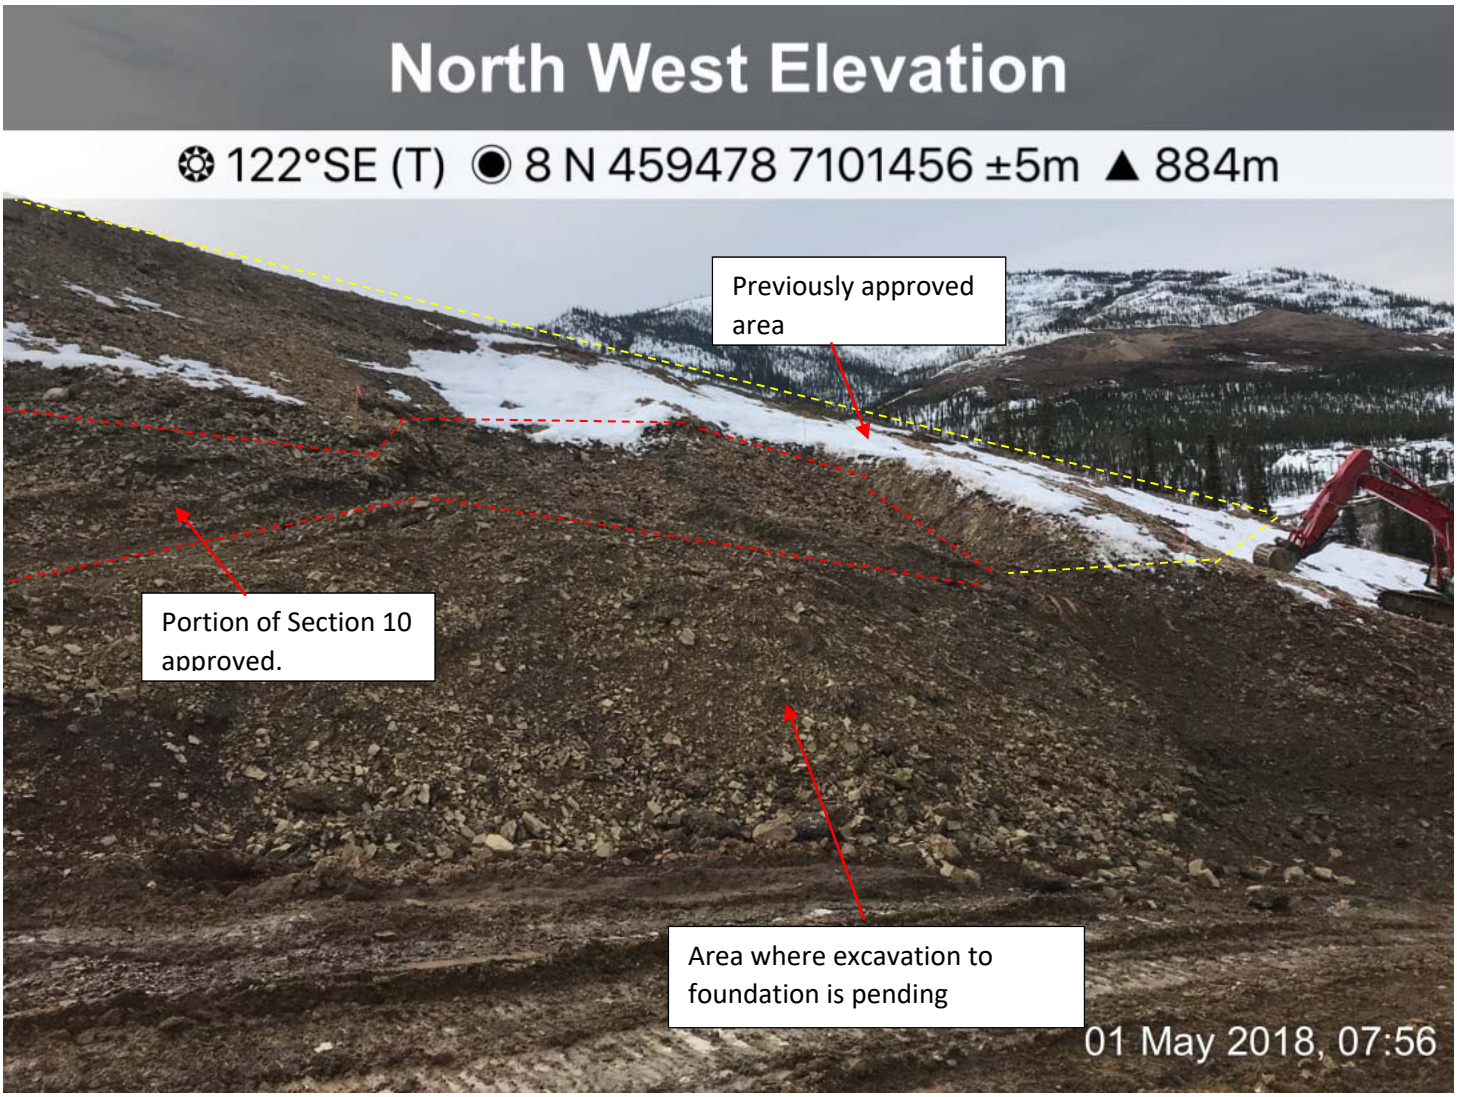

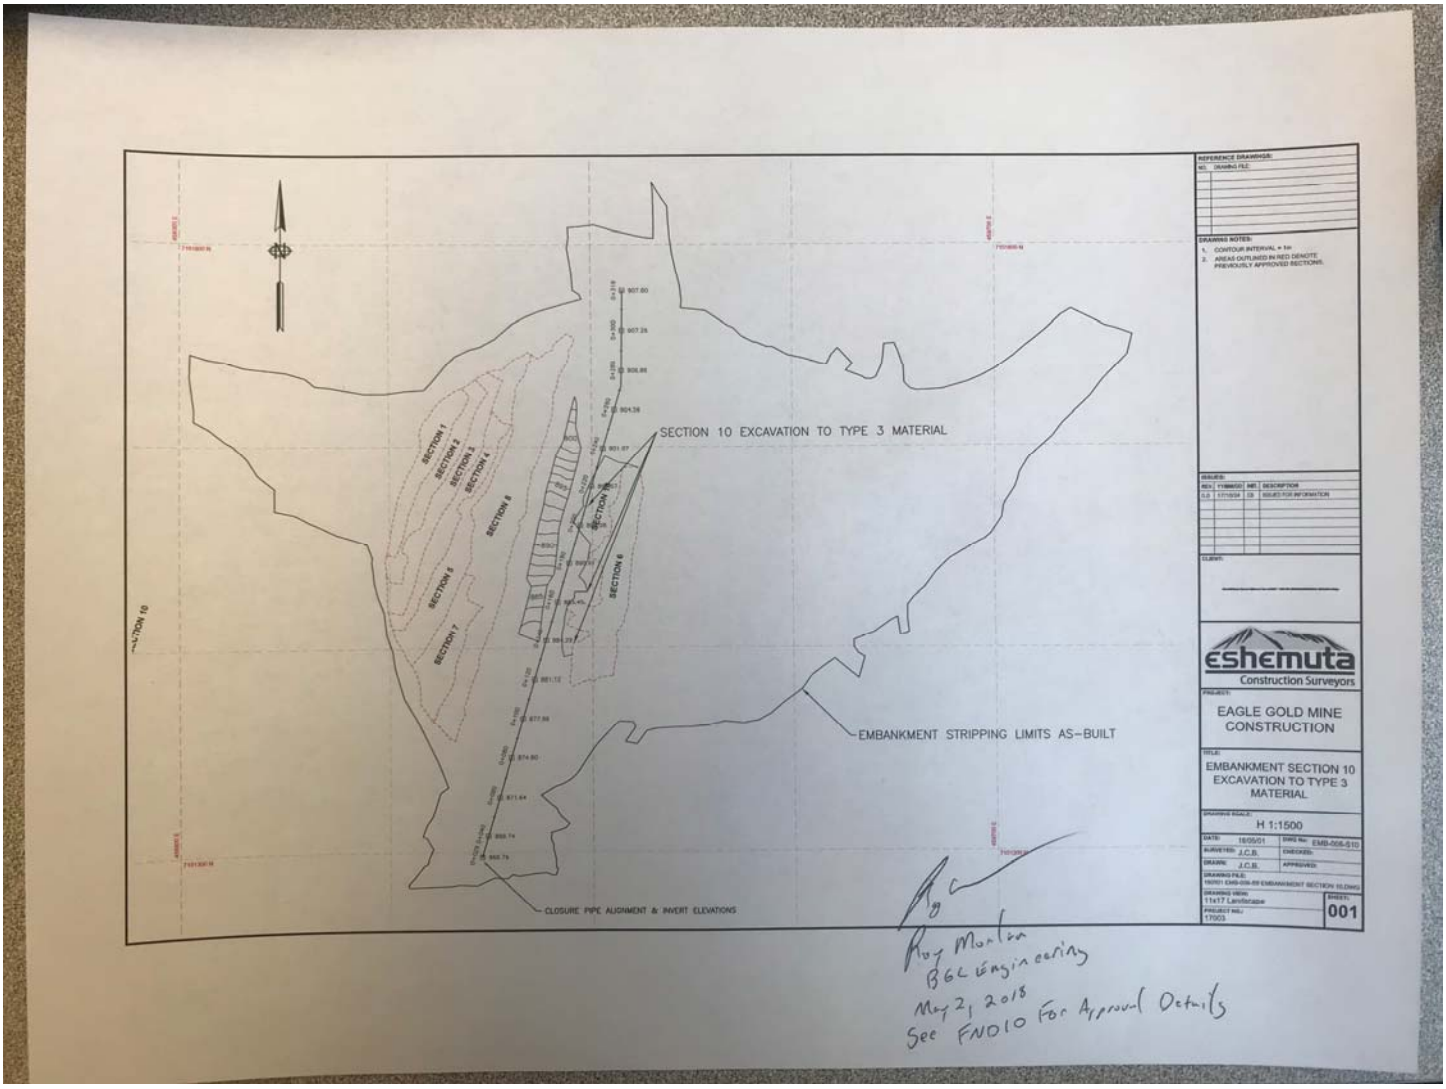

Photo 4: Remaining portion of Section 10 foundation approval.

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date:**	May 8, 2018
Construction:	JDS Mining	**Inspection Number:**	FND11
BGC Personnel:	Roy Morlan	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 11, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- Ground ice was encountered through most of the area. Some Type 3 foundation rock left had visible ice between joints in some sections.
- Frozen areas of type 3 will be inspected again after thaw to ensure that they did not lose strength. If frozen foundation has become loose after thaw it will have to be removed.
- As with all other approved sections, Section 11 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Section 11 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible

Client:	Victoria Gold	**Date:**	May 9, 2018
Construction:	JDS Mining	**Inspection Number:**	FND12
BGC Personnel:	Roy Morlan	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 12, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- Ground ice was encountered through most of the area. Some Type 3 foundation rock left had visible ice between joints in some sections.
- Frozen areas of type 3 will be inspected again after thaw to ensure that they did not lose strength. If frozen foundation has become loose after thaw it will have to be removed.
- As with all other approved sections, Section 12 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Section 12 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date:**	May 15, 2018
Construction:	JDS Mining	**Inspection Number:**	FND13
BGC Personnel:	Roy Morlan	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 13, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- As with all other approved sections, Section 13 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Section 13 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)

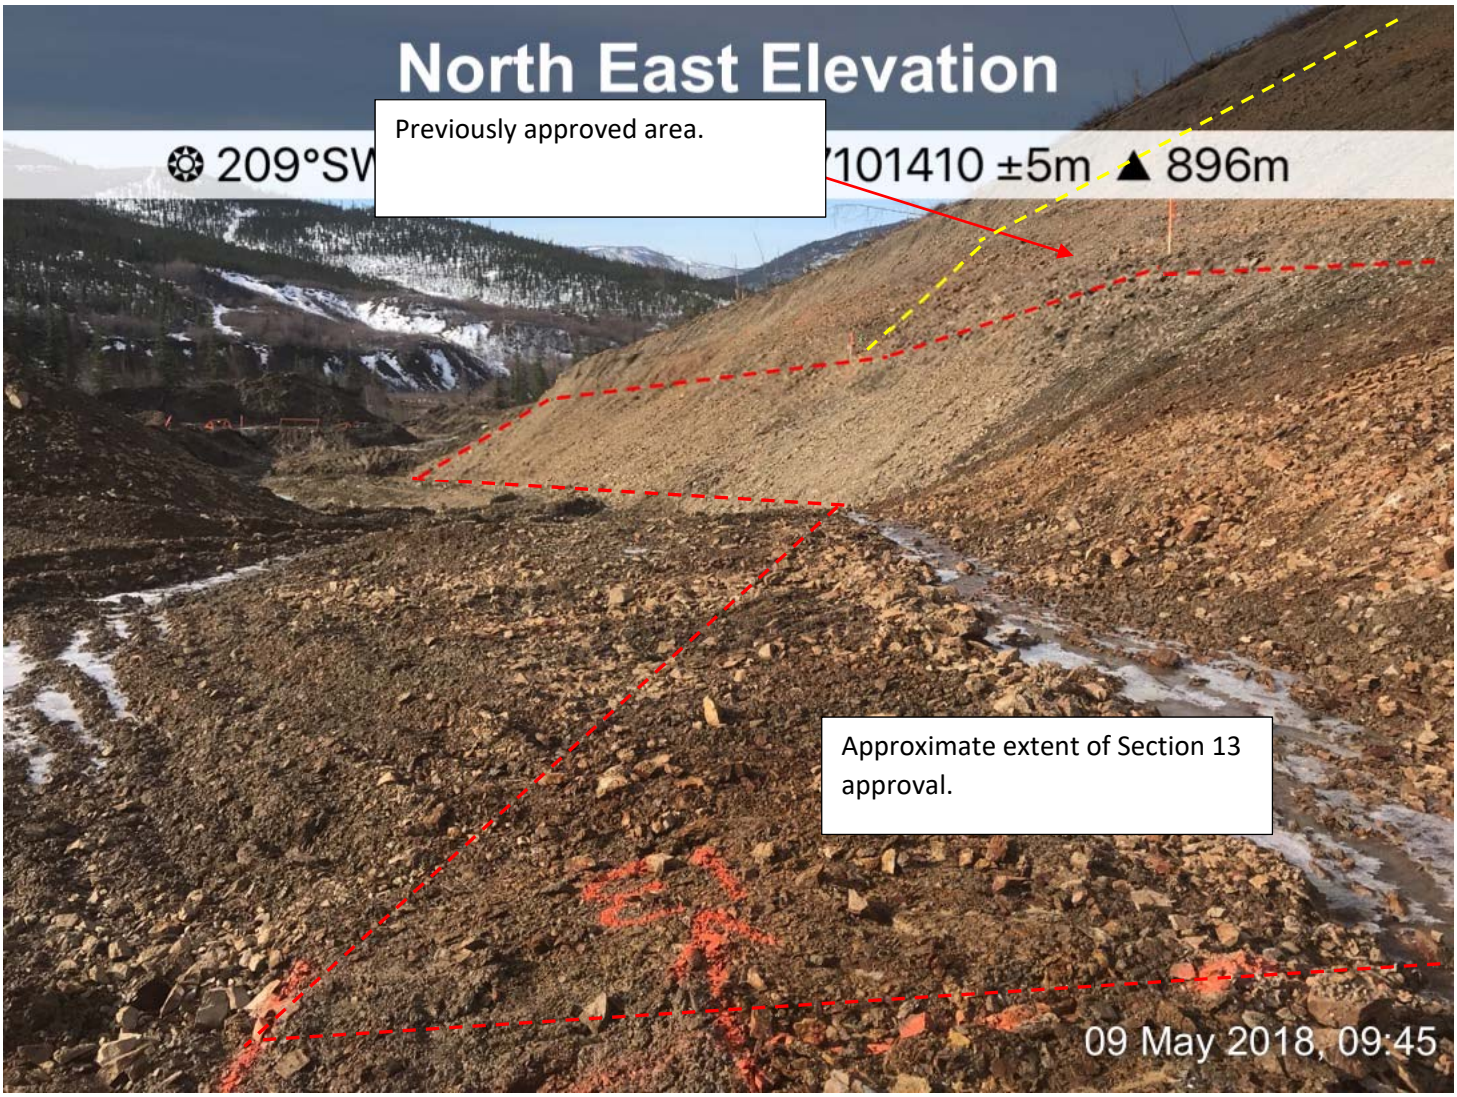

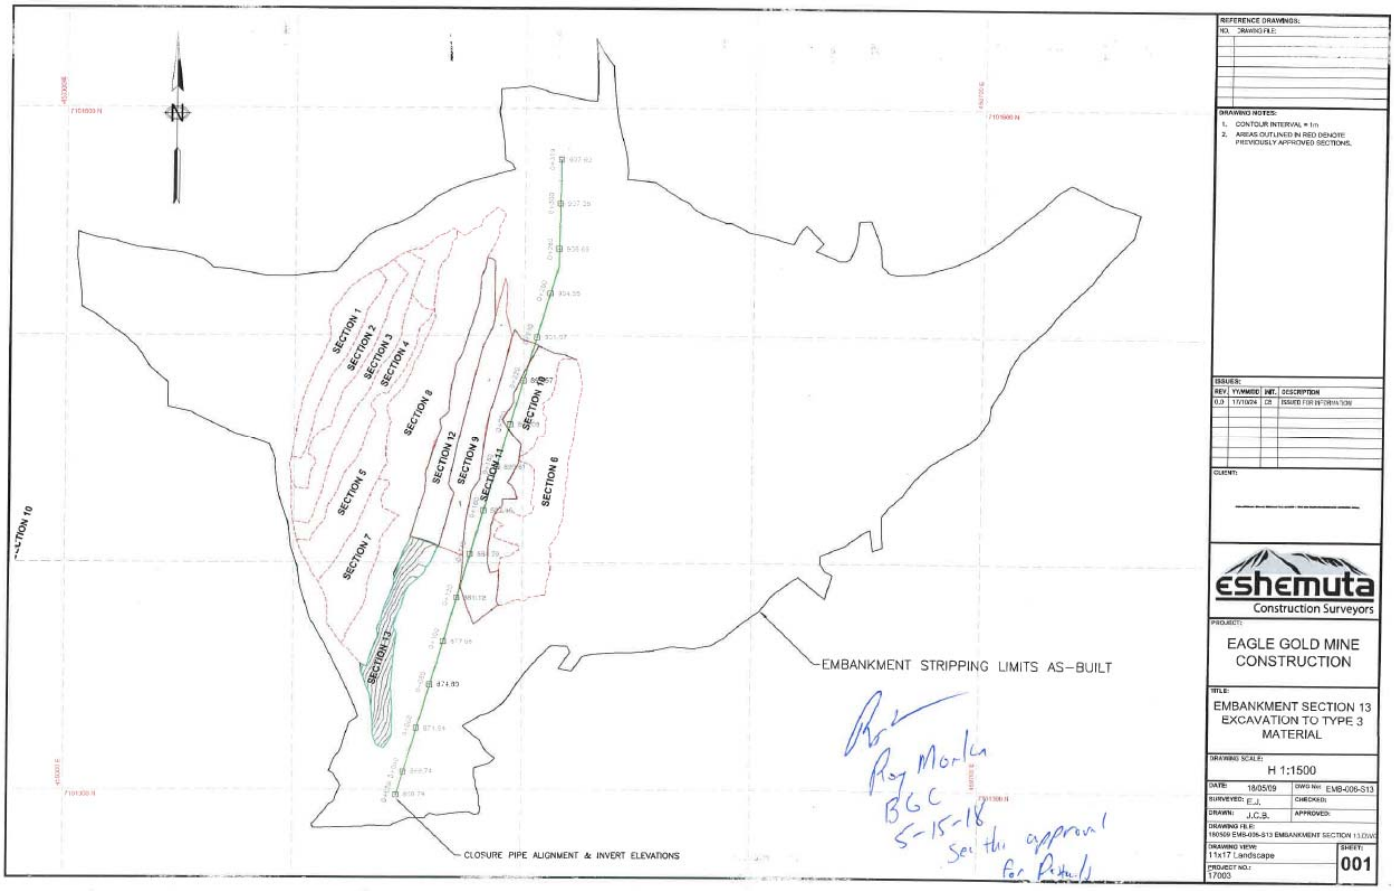

Photo 1: Photograph of a portion of Section 13.

Photo 2: Example of type 3 bedrock or better in Section 13.

Photo 3: Example of type 3 bedrock just below a thin layer of softer material (in this case sluff from overhead excavation). Area is approved but soft, loose material will have to be removed prior to placement of embankment fill.

Section 13 Foundation Approval Limits

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date:**	May 15, 2018
Construction:	JDS Mining	**Inspection Number:**	FND14
BGC Personnel:	Roy Morlan	**Approved:**	Y / N

Summary and Observations

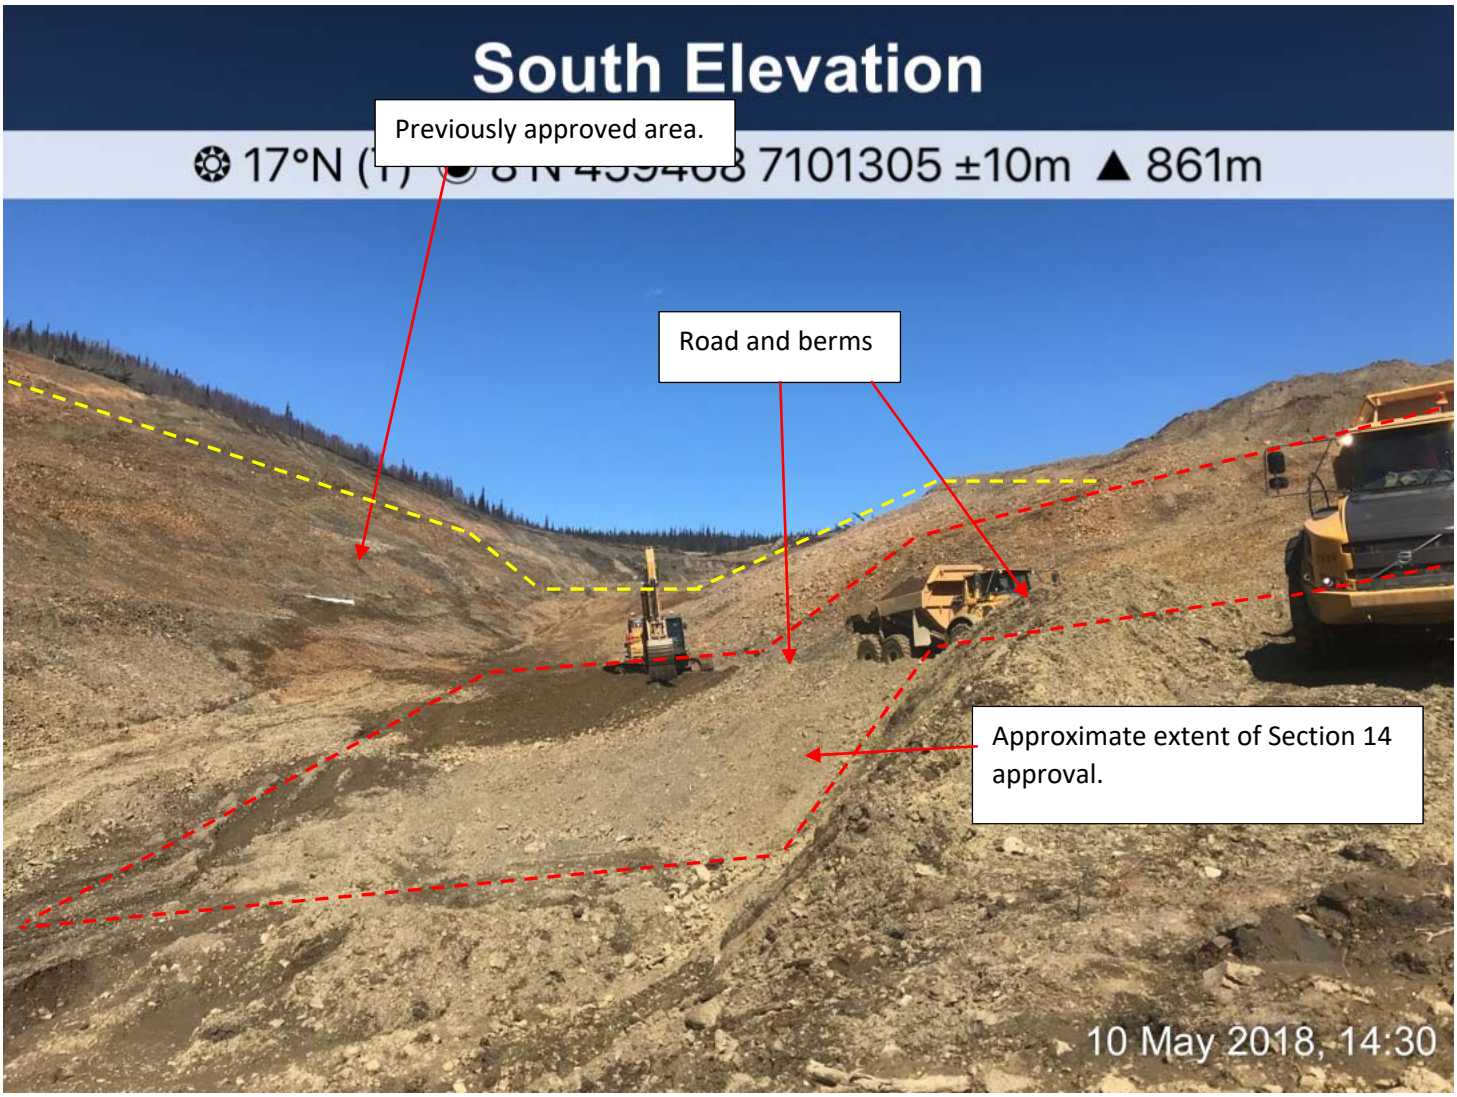
Pelly area(s) approved by this document: Section 14, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- As with all other approved sections, Section 14 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Portions of this section are approved on the condition that access roads and berms will be excavated prior to placement of embankment fill. Portions of the roads built directly into type 3 rock do not have to be removed. These structures were left in place by Pelly to allow access to the valley for transport of material.
- Section 14 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	
☐	☐

PHOTOGRAPHS



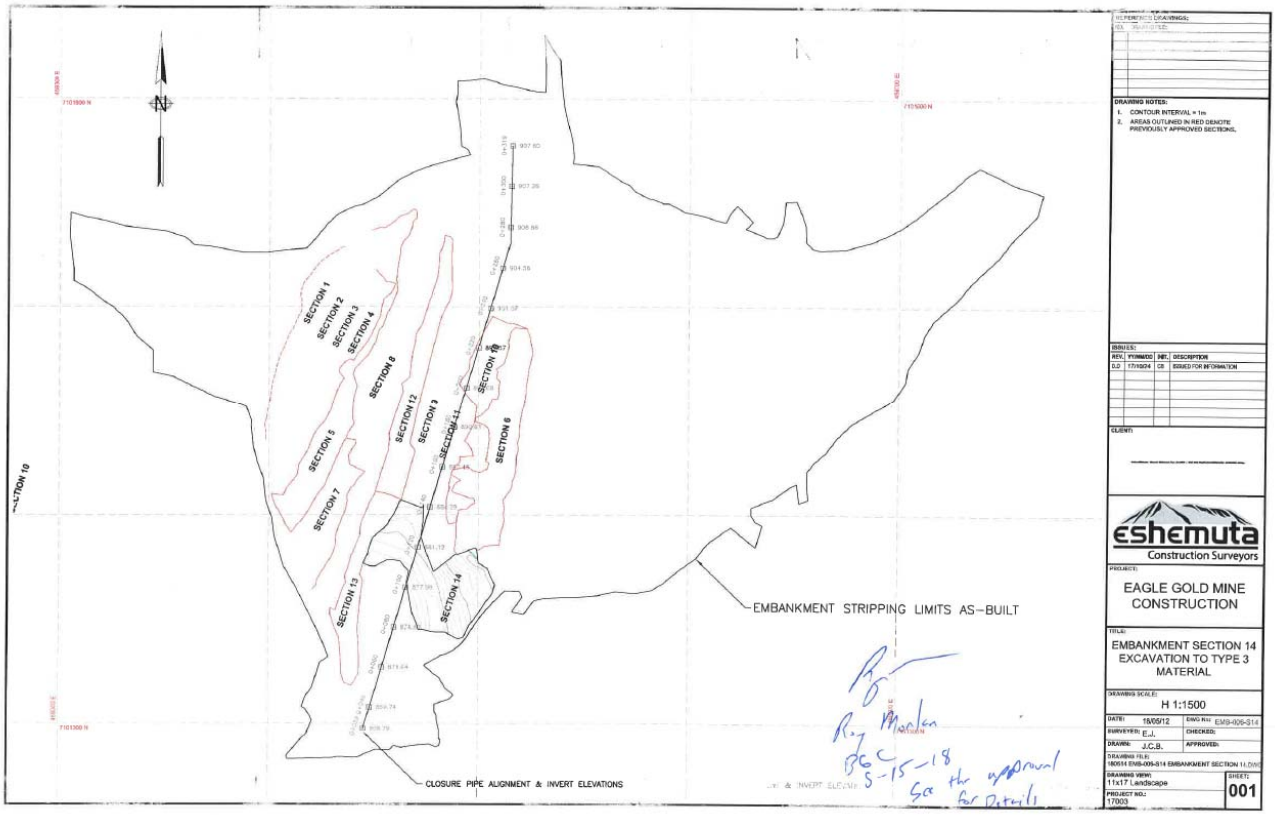


Photo 1: Photograph of Section 14 approved. Road and berms will have to be removed prior to placement of embankment fill.

Photo 2: Example of type 3 bedrock or better in Section 14.

Photo 3: Example of type 3 bedrock or better in Section 14.

Section 14 Foundation Approval Limits

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date:**	May 15, 2018
Construction:	JDS Mining	**Inspection Number:**	FND15
BGC Personnel:	Roy Morlan	**Approved:**	Y / N

Summary and Observations

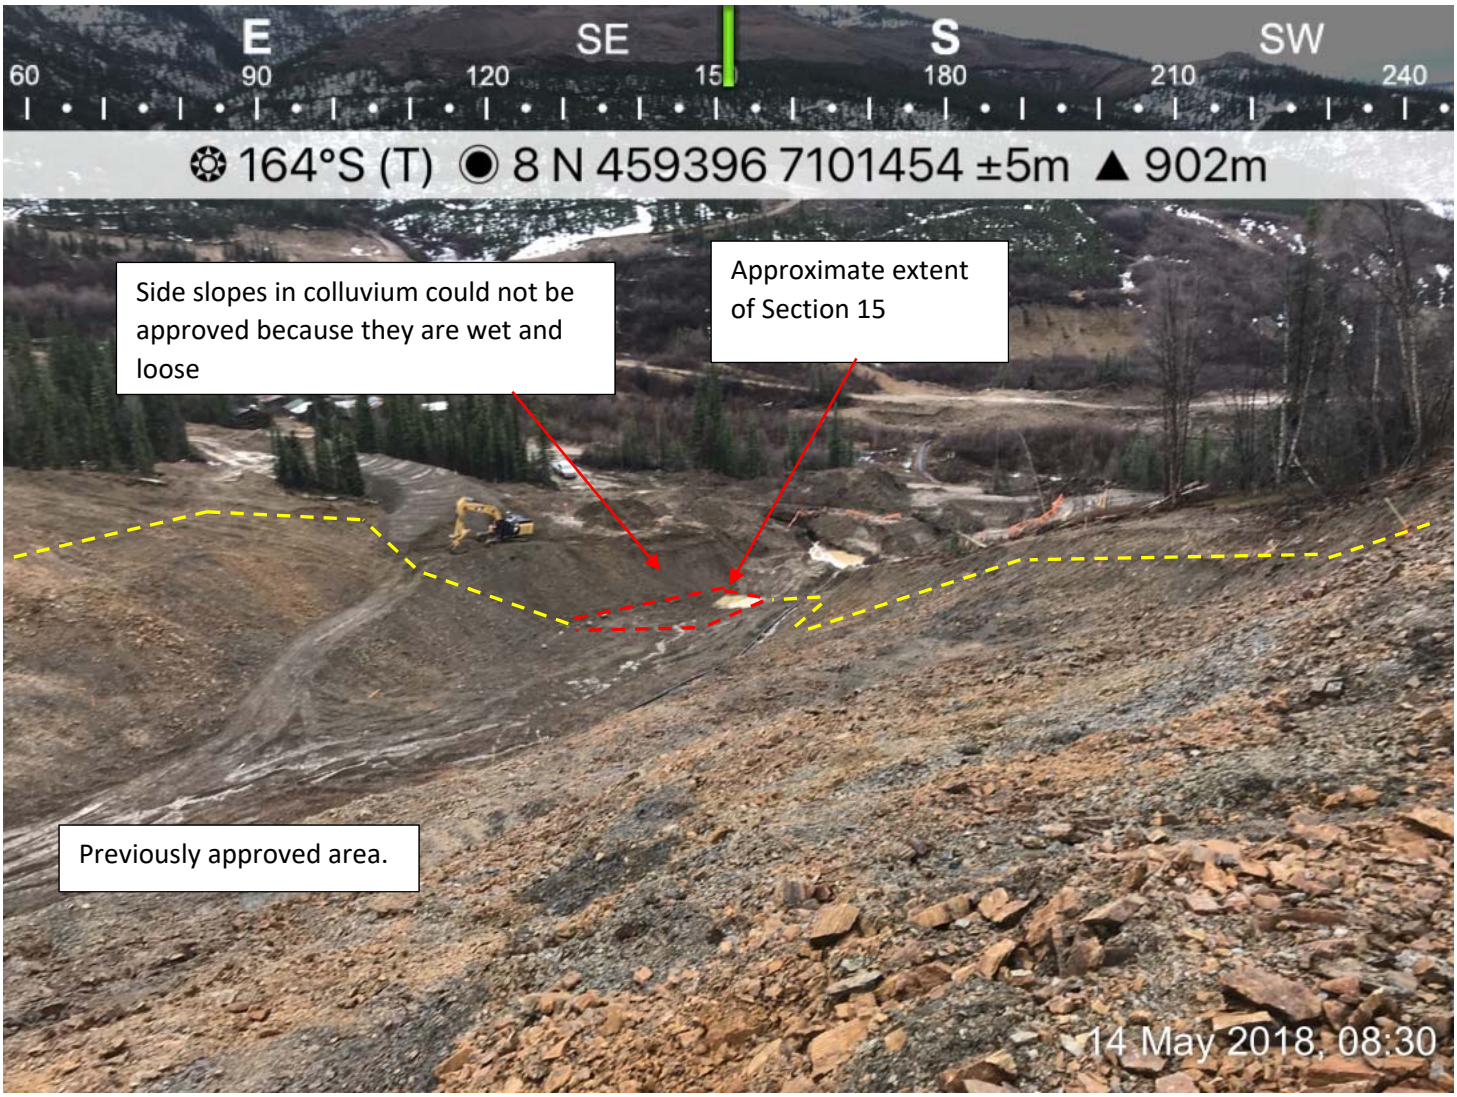
Pelly area(s) approved by this document: Section 15, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- As with all other approved sections, Section 15 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Slopes built in colluvium to key in the embankment toe were wet and loose and, therefore, could not be approved. Further excavation likely would not have resulted in drier, denser material because of the amount of water reporting to this area. Once water has been controlled in this areas the slopes can be re-inspected and determination of foundation treatment can be evaluated.
- Section 15 has been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	
☐	☐

PHOTOGRAPHS



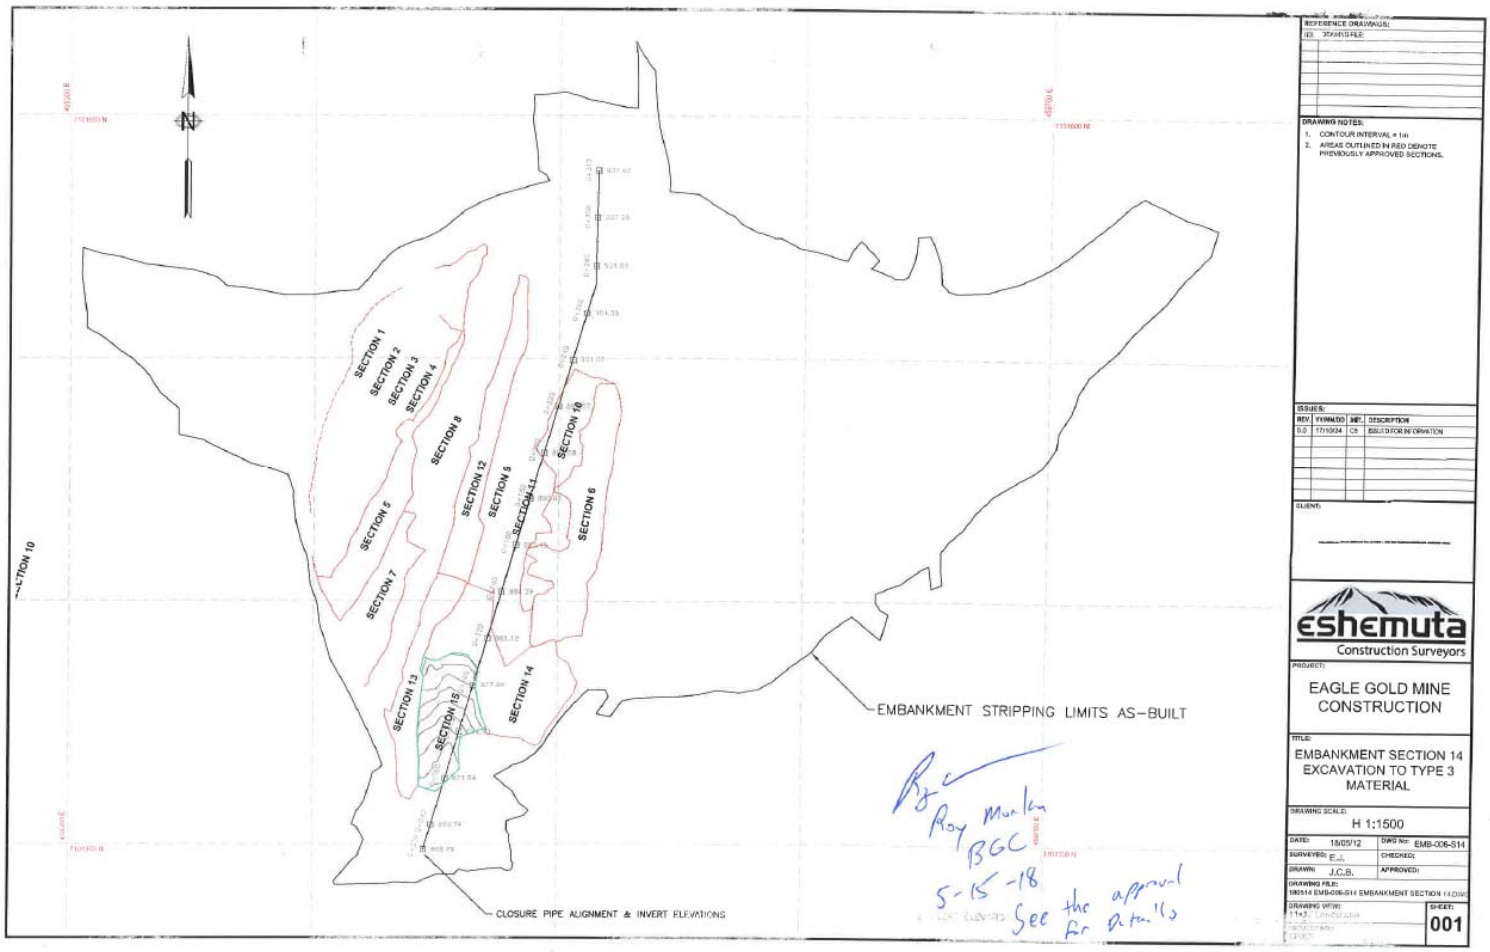


Photo 1: Photograph of Section 15 approved. Side slopes in colluvium were wet and loose. They could not be approved.

Photo 2: Example of type 3 bedrock being pulled apart by excavator at the bottom of Section 15.

Section 15 Foundation Approval Limits

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Project Name:	Eagle Gold Construction Support	**Project No.:**	0792021
Client:	Victoria Gold	**Date:**	September 4, 2018
Construction:	JDS Mining	**Inspection Number:**	FND16 trough FND25
BGC Personnel:	Roy Morlan	**Approved:**	Y / N

Summary and Observations

Pelly area(s) approved by this document: Section 16 through Section 25, Survey drawing attached.
Approval/Rejection Observations and Recommendations:

- As with all other approved sections, Sections 16 through 25 will require minor cleaning of loose material and possibly benching/lift keying prior to construction.
- Drains built in the foundation will be included in sperate approvals.
- Sections 16 through 25 have been excavated to the top of Type 3 bedrock or deeper, as required in the Technical Specifications.

Inspection Items

☐ Culverts/ trenches	☐ Foundation Treatment needed
☐ Clearing and grubbing complete	☐ Unusable material segregated
☐ Excavation beyond design limits	X Excavation to Type 3 bedrock
☐ Backfill compacted to spec	☐ Ruts backfilled and compacted
☐ Ice identified	☐ No geosynthetics stress points visible
☐ Ice extent delineated and removed (including method)	

PHOTOGRAPHS

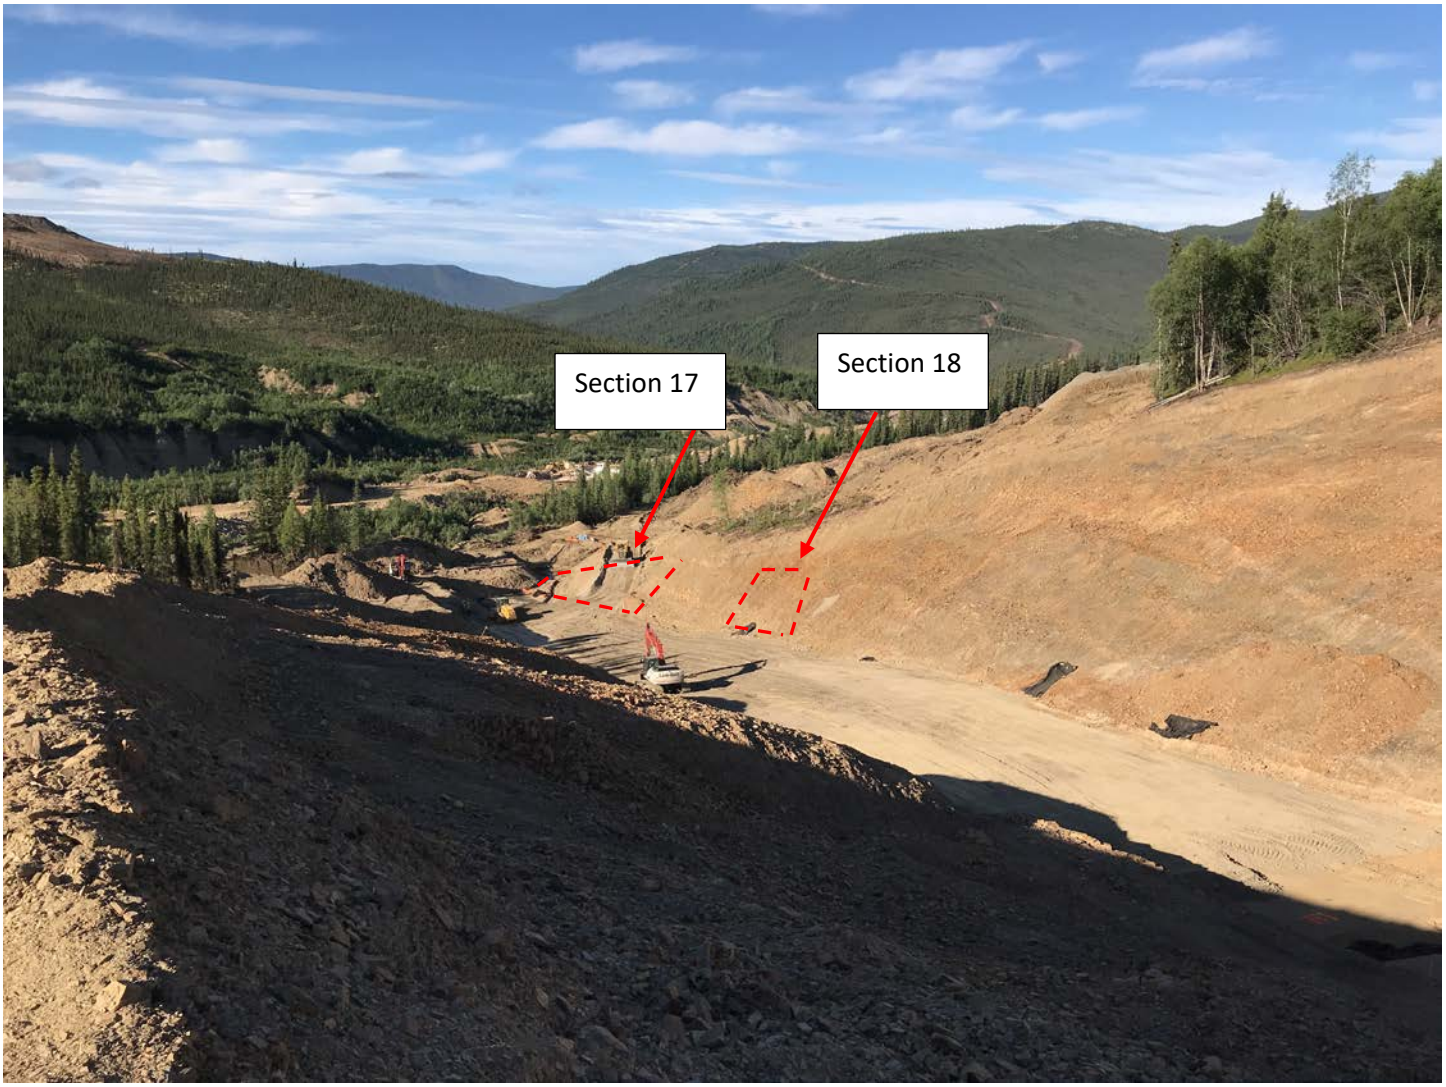

Photo 1: Photograph of Section 17 and 18 approved.

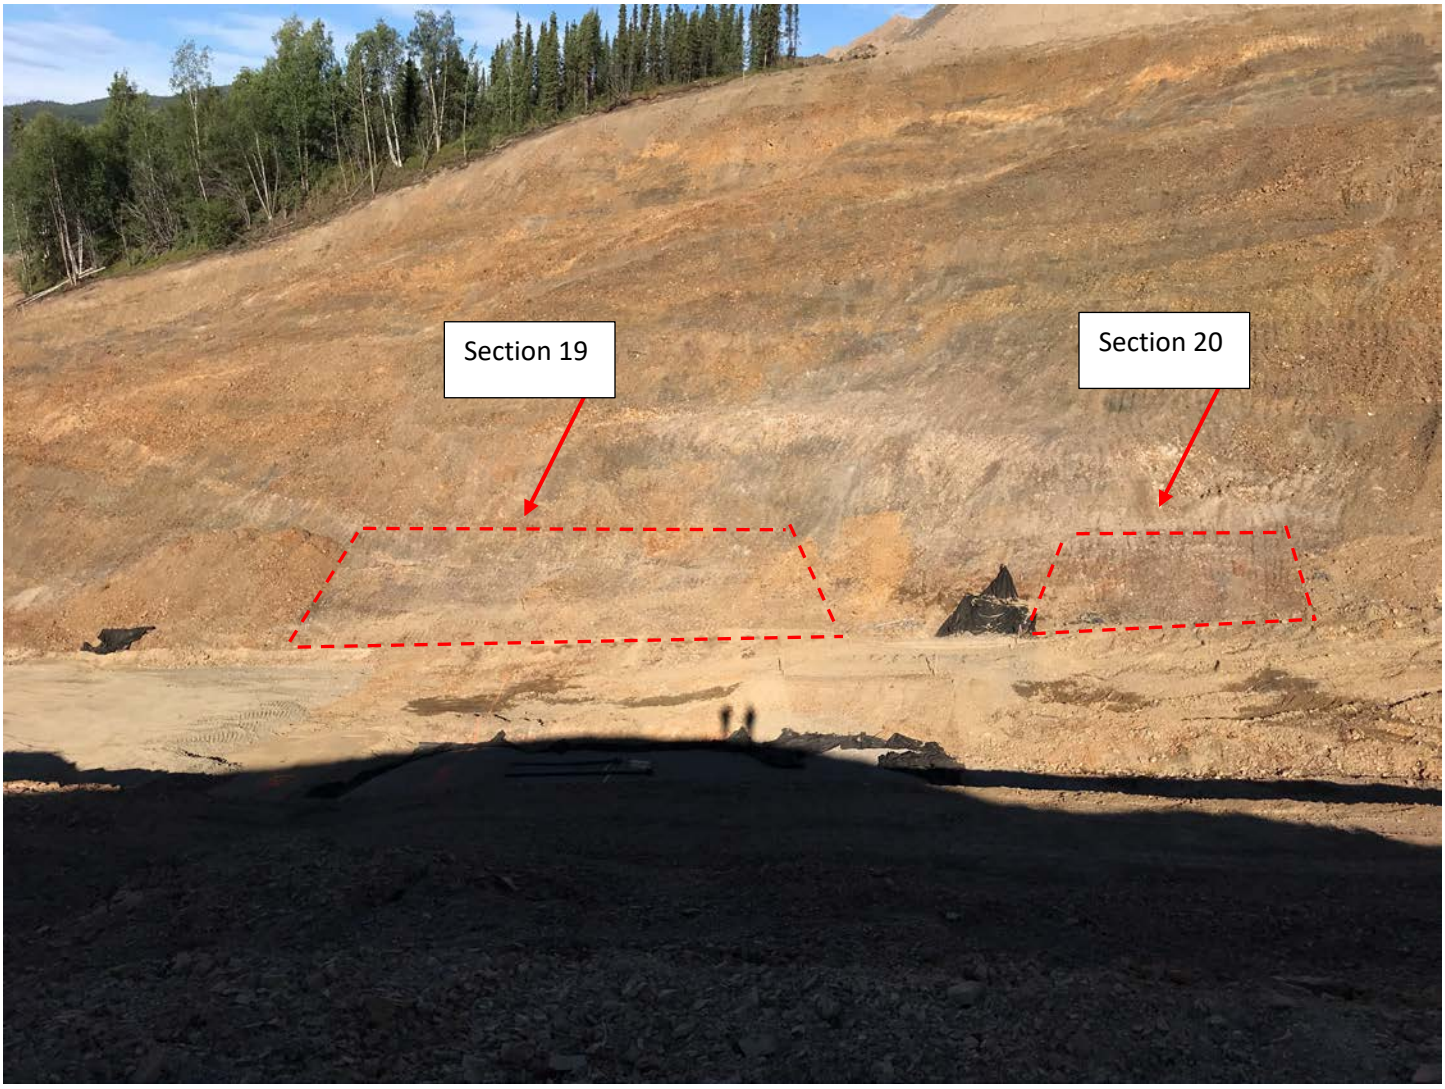

Photo 2: Photograph of Section 15 approved. Side slopes in colluvium were wet and loose. They could not be approved.

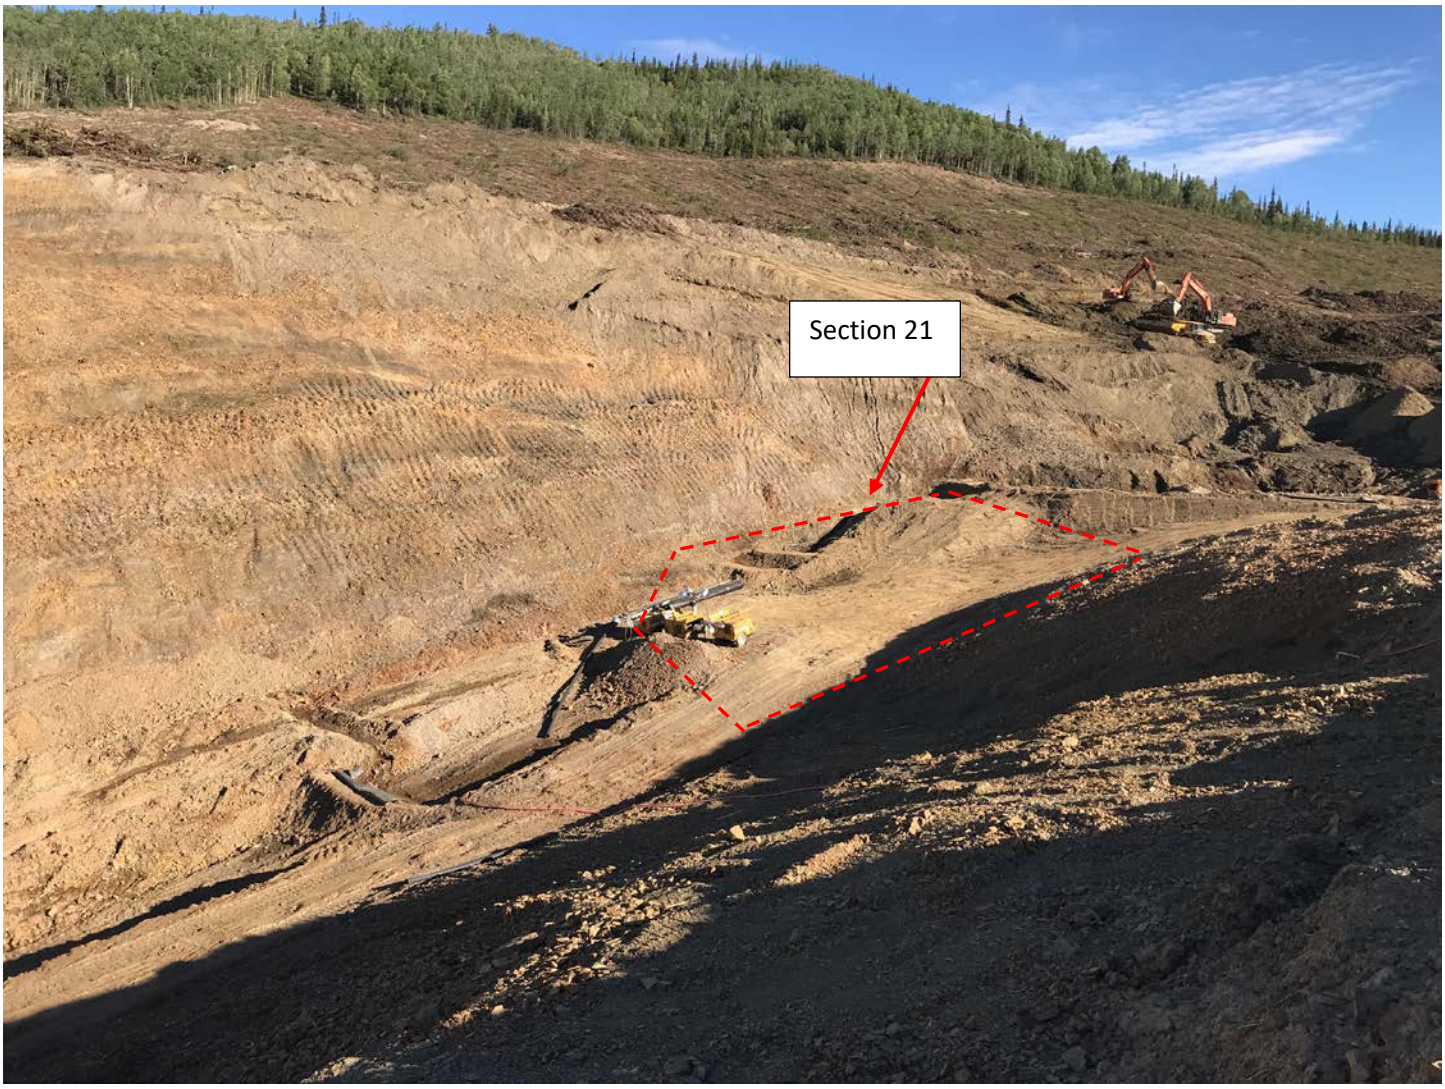

Photo 3: Photograph of Section 15 approved. Side slopes in colluvium were wet and loose. They could not be approved.

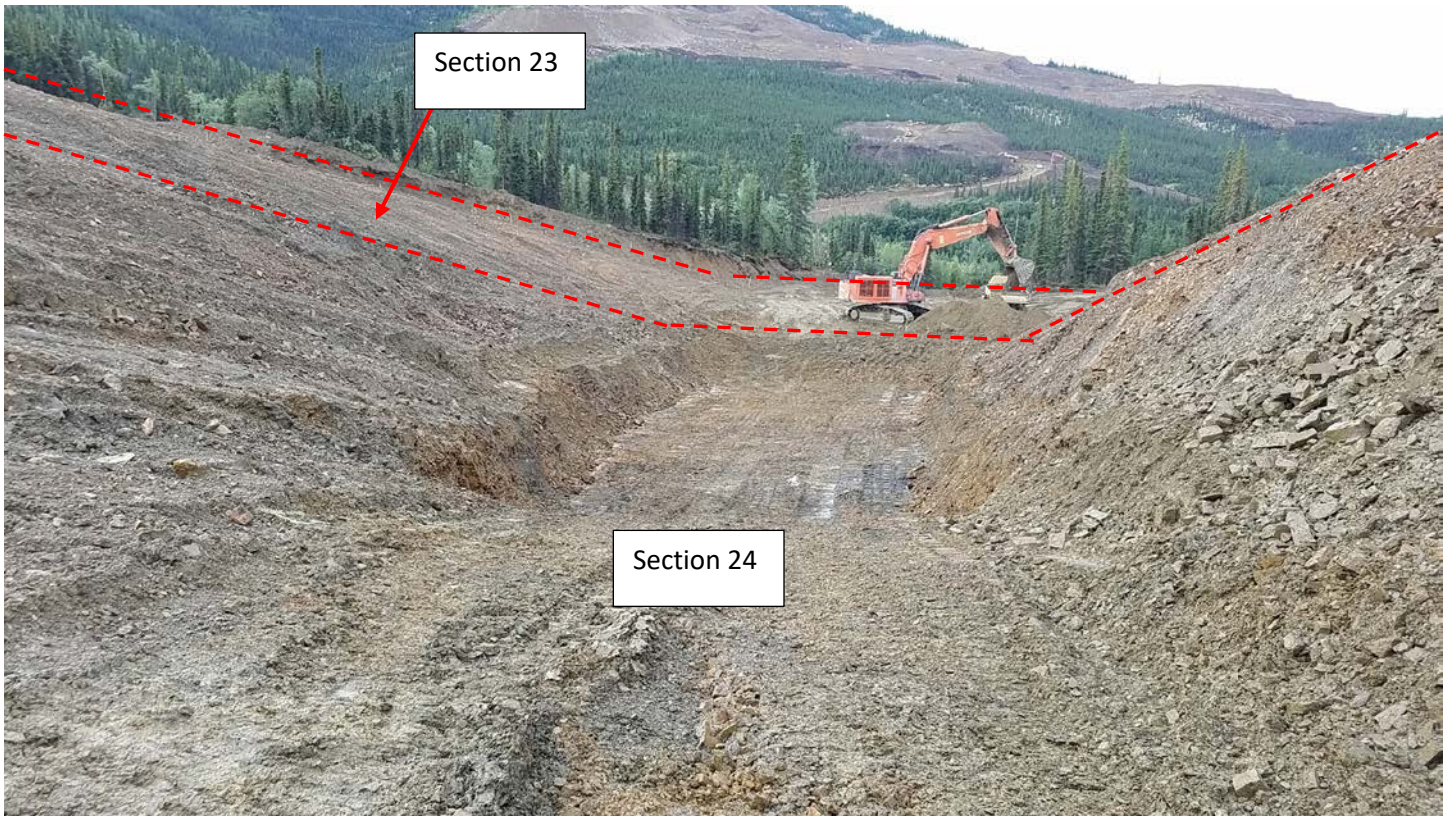

Photo 4: Section 23 and 24.

I NO.	TASK DESCRIPTION	ACTIVITIES AND ACCEPTANCE CRITERIA	PARTY RESPONSIBLE	VERIFICATION DOCUMENT OR FORM	CONTRACTOR REP INITIALS	CONTRACTOR REP DATE	CLIENT REP INITIALS	CLIENT REP DATE	COMMENTS
I.1	ITP review and approval	Client approval	Client	This approved ITP document bearing signatures	D.S.	01/12/18		12-2-18	
I.2	Request for information log	Maintain and update	Contractor	Held by Contractor	D.S.	01/12/18		12-2-18	
I.3	RFI's	Obtain RFI response to close request	Client	Client RFI forms	D.S.	01/12/18		12-2-18	
I.4	Closure pipe and underdrain pipe drawings are IFC	Verify all related piping drawings are IFC	Contractor/Client	Drawings reviewed	D.S.	01/12/18		12-2-18	
I.5	Material receiving log	Verify materials received throughout the project	Contractor	Log kept by Contractor	D.S.	01/12/18		12-2-18	
.6	Quality of materials	Verify materials received meet all requirements	Contractor/Client	Material specification sheet and quality/inspection certificates	D.S.	01/12/18	D. G	10/14/18	
.7	Fusing technicians are qualified	Verify qualification	Contractor	Certification	D.S.	01/12/18		12-2-18	
.8	All pipe fusing is tracked and logged	Log each fuse completed	Contractor	Data logger records held by Contractor	D.S.	01/12/18		12-2-18	
.9	Engineers approval of nonwoven geotextile installation	Install geotextile as per IFC's and design engineers correspondence	Contractor/Client	Engineers written approval of geotextile installation	D.S.	01/12/18		12-2-18	
10	Receipt of approval of quality control for select drain fill and pipe trench backfill	Conduct quality control test and meet BGC Project Technical Specifications	Client	Documentation of test results and approval	D.S.	01/12/18		12-2-18	
11	Place client supplied select drain fill and pipe trench backfill	Place fill to design specifications in IFC and RFI-004	Contractor	Survey asbuilt and density test by method spec	D.S.	01/12/18		12-2-18	
~~12~~	~~Method spec test log~~	Log the number of compaction passes	~~Contractor/Client~~	~~Sign off Log by Client~~	N/A	N/A	N/A	N/A	
13	Manufacturer's recommendation for maximum deflection of HDPE piping	Manufacturer's documentation outlining maximum deflection for piping	Contractor	Receipt of manufacturer's documentation	D.S.	01/12/18		12-2-18	
14	Install preassembled closure and underdrain pipes	Install pipes to design specifications in IFC and design engineers correspondence	Contractor	Survey asbuilt	D.S.	01/12/18	D. G	10/14/18	
15	Receipt of approval of quality control underdrain pipe cover material specified by Engineer	Conduct quality control test and meet BGC Project Technical Specifications	Client	Documentation of test results and approval	D.S.	01/12/18	D. G	10/14/18	
16	Prepare completed installation of pipes for interim construction period	Place suitable fill covering installed pipes	Contractor	Survey asbuilt and photos	D.S.	01/12/18	D. G	10/14/18	
17	Quality records complete and in turnover package	To be updated throughout the project	Contractor	As per documentation outlined in this ITP	D.S.	01/12/18		12-2-18	
18	All items in this ITP are signed off	Verify all documents are signed off	Contractor/Client	Contractor ITP	D.S.	01/12/18		12-2-18	

BGC Agreed w/ this ITP

EXTRAS:

Lift 71 last one of "East" lifts - ties into old lift at this elevation

Lift 72 first "full" lift (continuing numbering system)

Lift 78 - Mostly completed by Night Shift, did not sign due to small area where haul truck broke down

Started 79 already
