Open Technical Concerns:

Date	Technical Concerns and Delays

Pending LEM codes:

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5" crush rock.

Quality Control Observations and Procedures:

HLF – Material 7 rockfill was placed and compacted in the construction of the HLF west liner surface. The rockfill was sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry
- Material 7 placed in HLF west
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12"; very little to no weak phyllite rock

HLF – Material 4 ODF is being placed over liner and PLS piping. Trucks are backing straight up the slopes at a slow and constant speed without turning or stops. The material is then spread with a CAT D6 dozer to a survey controlled minimum thickness of 1m above liner surface. The trucks are being spotted by the dozer operator to ensure the tires do not spin and are aligned properly. A spotter for the dozer is also present to ensure the equipment does not contact the liner and that the underlying PLS piping being buried has the correct alignment:

- 100mm ADS pipes have a minimum 1m section running parallel alongside the 250mm ADS pipes, with a minimum of 0.5m between the two pipes.

Quality Control Observations and Procedures:

HLF – Material 7 rockfill was placed and compacted in the construction of the HLF west liner surface. The rockfill was sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry
- Material 7 placed in HLF west
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

HLF – Material 4 ODF is being placed over liner and PLS piping. Trucks are backing straight up the slopes at a slow and constant speed without turning or stops. The material is then spread with a CAT D6 dozer to a survey controlled minimum thickness of 1m above liner surface. The trucks are being spotted by the dozer operator to ensure the tires do not spin and are aligned properly. A spotter for the dozer is also present to ensure the equipment does not contact the liner and that the underlying PLS piping being buried has the correct alignment:

- 100mm ADS pipes have a minimum 1m section running parallel alongside the 250mm ADS pipes, with a spacing of 0.5m between the two pipes.

Production:

WBS	Unit Type	Loads	Material Type	From Location	Destination
9000.13	40t ADT	3	Crush	Eagle Pup	Site Dump
24,000 Litre	CAT633		Water	Control Pond	Pelly Haul Roads

Open Technical Concerns:

Date	Technical Concerns and Delays
May 19, 2019	ODF on Eagle Road almost depleted, overland conveyor commissioning delayed

Pending LEM codes:

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5" crush rock.

Quality Control Observations and Procedures:

HLF – Material 7 rockfill was placed and compacted in the construction of the HLF west liner surface. The rockfill was sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry
- Material 7 placed in HLF west
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12"; very little to no weak phyllite rock

HLF – Material 4 ODF is being placed over liner and PLS piping. Trucks are backing straight up the slopes at a slow and constant speed without turning or stops. The material is then spread with a CAT D6 dozer to a survey controlled minimum thickness of 1m above liner surface. The trucks are being spotted by the dozer operator to ensure the tires do not spin and are aligned properly. A spotter for the dozer is also present to ensure the equipment does not contact the liner and that the underlying PLS piping being buried has the correct alignment:

- 100mm ADS pipes have a minimum 1m section running parallel alongside the 250mm ADS pipes, with a spacing of 0.5m between the two pipes.

9000.49	40t ADT	41	Rock	ADR Quarry	HLF West Berm
9000.49	40t ADT	1	Sand	ADR Quarry	HLF West Berm
4110.7.05	40t ADT	104	ODF	CV Pad	HLF
24,000 Litre	CAT633		Water	Control Pond	Pelly Haul Roads

Open Technical Concerns:

Date	Technical Concerns and Delays
June 2,2019	Concentrated flow in the PLS valley is washing down ODF placed earlier.
June 8,2019	PLS pipe position deviation from previous survey results, taking extra time for planning on pipe placement.

Pending LEM codes:

Date	Activities
Sept 30, 2018	Additional efforts at south event pond toe – excavating ice rich soils, and selective backfill using structural fill and 5” crush rock.

Quality Control Observations and Procedures:

HLF – Material 7 rockfill was placed and compacted in the construction of the HLF west liner surface. The rockfill was sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry
- Material 7 placed in HLF west
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

HLF – Material 4 ODF is being placed over liner and PLS piping. Trucks are backing straight up the slopes at a slow and constant speed without turning or stops. The material is then spread with a CAT D6 dozer to a survey controlled minimum thickness of 1m above liner surface. The trucks are being spotted by the dozer operator to ensure the tires do not spin and are aligned properly. A spotter for the dozer is also present to ensure the equipment does not contact the liner and that the underlying PLS piping being buried has the correct alignment:

- 100mm ADS pipes have a minimum 1m section running parallel alongside the 250mm ADS pipes, with a spacing of 0.5m between the two pipes.

HLF – Material 7 rockfill was placed and compacted in the construction of the HLF west liner surface. The rockfill was sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry
- Material 7 placed in HLF west
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

HLF – Material 4 ODF is being placed over liner and PLS piping. Trucks are backing straight up the slopes at a slow and constant speed without turning or stops. The material is then spread with a CAT D6 dozer to a survey controlled minimum thickness of 1m above liner surface. The trucks are being spotted by the dozer operator to ensure the tires do not spin and are aligned properly. A spotter for the dozer is also present to ensure the equipment does not contact the liner and that the underlying PLS piping being buried has the correct alignment:

- 100mm ADS pipes have a minimum 1m section running parallel alongside the 250mm ADS pipes, with a spacing of 0.5m between the two pipes.

HLF – Material 7 rockfill was placed and compacted in the construction of the HLF west liner surface. The rockfill was sourced from the ADR borrow blast rock, hauled to the destination in wiggle wagon haul trucks and spread with an excavator. The material is being spread immediately after being dumped to a survey controlled max. thickness of 0.9m. Once the material has been spread it is being compacted with a CAT 68B vibratory compactor. Material is not being left uncompacted for extended periods of time.

- Material 7 sourced from ADR Quarry
- Material 7 placed in HLF west
- Minimum 3 passes completed with 9-tonne vibratory packer
- No visible ice in the material; low moisture, Material is well graded
- Visual estimate of minimum 20% of material >12”; very little to no weak phyllite rock

HLF – Material 4 ODF is being placed over liner and PLS piping. Trucks are backing straight up the slopes at a slow and constant speed without turning or stops. The material is then spread with a CAT D6 dozer to a survey controlled minimum thickness of 1m above liner surface. The trucks are being spotted by the dozer operator to ensure the tires do not spin and are aligned properly. A spotter for the dozer is also present to ensure the equipment does not contact the liner and that the underlying PLS piping being buried has the correct alignment:

- 100mm ADS pipes have a minimum 1m section running parallel alongside the 250mm ADS pipes, with a spacing of 0.5m between the two pipes.

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work (Dayshift)
-	Cat D-10 Dozer	9	Placing structural fill at embankment
-	Hitachi 1200 Excavator	8	Loading Structural fill from ADR Stockpile
-	Cat 777 Haul Truck	8	Hauling structural fill to embankment
-	Cat 777 Haul Truck	8	Hauling structural fill to embankment
-	Cat 777 Haul Truck	8	Hauling structural fill to embankment
-	Volvo 40 tonne Rock Truck	10	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	10	Compacting structural fill at embankment
-	Link Belt 490 Excavator	0	Removing loose material at embankment

2.0 HEAP LEACH FACILITY

- Continuation of nightshift's lower embankment lift 9A (894.03m design elevation). Compaction started at 06:30 and finished at 07:15. Two passes was observed with sufficient speed and overlap. Loose lift finished at 07:00. Survey confirmed the average elevation to be 893.98 m, which calculates to be a 0.35m lift. The test area exceeded 95% of the standard proctor density of 2272 kg/m^3 at 100%. The moisture content was 3.8%, which does not comply with BGC requirements.

- Start of lower embankment lift 10A (894.38m design elevation) started at 07:15. Compaction started at 07:30 and finished at 09:30. Two passes was observed with sufficient speed and overlap. Loose lift finished at 08:45. Survey confirmed the average elevation to be 894.27 m, which calculates to be a 0.29m lift. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 97.5% to 97.6%. The moisture content was 3.5% to 3.8%, which does not comply with BGC requirements.

- Start of lower embankment lift 11A (894.67 m design elevation) started at 09:00. Compaction started at 10:30 and finished at 12:45. Two passes was observed with sufficient speed and overlap. Loose lift finished at 11:15. Survey confirmed the average elevation to be 894.62 m, which calculates to be a 0.35 m lift. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 97.8% to 100%. The moisture content was 3.8% to 5.0%, which does not comply with BGC requirements.

- Start of lower embankment lift 12A (895.02m design elevation). Nightshift to continue.

- Structural fill was coming from the ADR stockpile and the stockpile north of the embankment. Both are approved sources. Structural fill from the stockpile north of the embankment appears to have a moisture content of 5 to

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

8%, whereas the material from ADR stockpile has a moisture content of 3.5 to 5.0%. Material is slightly coarse, but still visually appeared to have less than 30% over 19 mm. Oversize boulders were removed from lift. This meets the BGC method specification requirement for structural fill.

- Approximately 68 777 haul truck loads and 30 wiggle haul truck loads were placed during shift. Assuming 36 m^3 per load for the 777 haul truck, and 16m^3 for the wiggle truck, a total of 2928 m^3 of structural fill was placed on the embankment during dayshift.

3.0 DISCUSSION/OTHER

- Embankment access road was temporarily closed to larger haul traffic due to unsafe driving conditions.

4.0 CLOSURE

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	Cat D-10 Dozer	12	Placing structural fill
	Cat D-6 Dozer	1	Build safety berms on embankment slope
	Hitachi 1200 Shovel	11.5	Loading Structural fill from ADR Stockpile
	Cat 777 Haul Truck	11.5	Hauling structural fill to embankment
	Cat 777 Haul Truck	11.5	Hauling structural fill to embankment
	Cat 777 Haul Truck	11.5	Hauling structural fill to embankment
	CAT CS 78 B Compactor	11	Compacting structural fill at embankment
	Water Truck	11.5	Moisture conditioning aggregates

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Placement of lift elevation 895.38 m started at 19:15. Placement was completed at 21:10. Compaction for this lift began at 19:45 and was completed by 11:00. Compaction and moisture testing as well as surveying was completed by 11:00 using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 96.0 % to 98.9 %. Moisture content ranged from 4.3 % MC to 5.2 % MC, two of which fell below the targeted BGC method specification requirements.
- Placement of lift elevation 895.77 m started at 21:10. Placement was completed at 3:30 hours. Compaction for this lift began at 23:00 hours and was completed by 04:00. Compaction and moisture testing was completed by 04:30. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 95.4 % to 99.4 %. Moisture content ranged from 3.9 % MC to 5.2 % MC, three of which fell below the targeted BGC method specification requirements.
- Placement of lift elevation 896.17 m started at 03:40. Placement was incomplete by the end of the shift. Compaction for this lift began at 04:10 will continue during next shift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material was fine, visually appeared to have less than 30 % over 19 mm and smaller than over 150 mm particle size. A larger quantity of oversized cobbles or boulders were noticed in the stockpile but were removed prior to loading and placement. Any oversized cobbles or boulders placed were removed prior to compaction. This meets the BGC method

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

specification requirement for structural fill. A water truck was used to moisture condition the structural fill stockpile prior to loading.

- Compaction was completed using two passes (back and forth) of the 13.4 tonne vibratory roller. Sufficient overlap and complete coverage meets the method specification requirements for 2 passes with a 13.4 tonne vibratory roller. This meets the BGC method specification requirement for structural fill.
- Each lift placed was benched into the existing side slope of the elevation 920 m raised lift. The uncompacted side slopes of the existing ramps to the 920 m raised lift were removed. Loose Type 3 Rock with visible voids present in the sidewall of the excavation was as also removed. This complies with the placement methodologies outlined by BGC.
- Ongoing grade checks during placement by contractor using laser level. Survey confirmed that the average surveyed elevation averaged approximately 0-1 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 86 loads were placed during shift. Assuming 36 m^3 per load, a total of 3,096 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Lift elevations 895.38 m and 895.77 m received additional compaction along south embankment side slope after disturbance of lift from improving side slope berm.

2.0 HEAP LEACH FACILITY

- Continuation of nightshift's lower embankment lift 15A (896.17 m design elevation). Compaction started at 06:45 and finished at 09:15. Two passes was observed with sufficient speed and overlap. Loose lift finished at 08:00. Survey confirmed the average elevation to be 896.05 m, which calculates to be a 0.28 m lift. The test area exceeded 95% of the standard proctor density of 2272 kg/m^3 at 99%. The moisture content was 3.0% to 4.8%, which does not comply with BGC requirements.

- Start of lower embankment lift 16A (896.45 m design elevation) started at 08:00. Compaction started at 09:30 and finished at 11:00. Two passes was observed with sufficient speed and overlap. Loose lift finished at 10:30. Survey confirmed the average elevation to be 896.40 m, which calculates to be a 0.35 m lift. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 96.3% to 100%. The moisture content was 5.1% to 5.4%, which complies with BGC requirements.

- Start of lower embankment lift 17A (897.80 m design elevation) started at 10:30. Compaction started at 12:15 and finished at 15:30. Two passes was observed with sufficient speed and overlap. Loose lift finished at 15:00. Survey confirmed the average elevation to be 897.80 m, which calculates to be a 0.40m lift. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 97.2% to 100%. The moisture content was 4.2% to 5.2%, which does not comply with BGC requirements.

- Start of lower embankment lift 18A (898.20 m design elevation). Nightshift to continue.

Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Structural fill from the ADR stockpile has a moisture content of 4.2 to 5.4%. Material is slightly coarse, but still visually appeared to have less than 30% over 19 mm. Oversize boulders were removed from lift. This meets the BGC method specification requirement for structural fill.
- Approximately 81 777 haul truck loads and 3 wiggle haul truck loads were placed during shift. Assuming 36 m^3 per load for the 777 haul truck, and 16 m^3 for the wiggle truck, a total of 2,964 m^3 of structural fill was placed on the embankment during dayshift.

3.0 DISCUSSION/OTHER

- Periodic delays due to refilling of the water truck, and resurfacing of the embankment access road with the grader.

4.0 CLOSURE

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	Cat D-10 Dozer	11	Placing structural fill
	Hitachi 1200 Shovel	9.5	Loading Structural fill from ADR Stockpile
	Cat 777 Haul Truck	9.5	Hauling structural fill to embankment
	Cat 777 Haul Truck	9.5	Hauling structural fill to embankment
	Cat 777 Haul Truck	9.5	Hauling structural fill to embankment
	CAT CS 78 B Compactor	11	Compacting structural fill at embankment
	Water Truck	9.5	Moisture conditioning aggregates

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Placement of lift elevation 897.16 m started at 19:00. Placement was completed at 20:00. Compaction for this lift began at 19:30 and was completed by 21:45. Compaction and moisture testing as well as surveying was completed by 10:45 using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 95.6 % to 100.3 %. Moisture content ranged from 3.2 % MC to 4.3 % MC, which is below the targeted BGC method specification requirements.
- Placement of lift elevation 897.56 m started at 20:10. Placement was completed at 3:30 hours. Compaction for this lift began at 22:45 and was completed by 02:45. Compaction and moisture testing was completed by 03:00. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 95.2 % to 100.5 %. Moisture content ranged from 4.0 % MC to 6.5 % MC, two of which fell below the targeted BGC method specification requirements.
- The next section of ODF trench on the raised lift section of the embankment was completed by 22:40. One small section near the trench required two lifts of structural fill to fill in low spots to tie into the existing raised lift section. Compaction for these small sections were completed by 04:20.
- Placement of lift elevation 902.82 m started at 04:15. Placement was incomplete by the end of the shift. Compaction for this lift began at 05:40 will continue during next shift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material was fine, visually appeared to have less than 30 % over 19 mm and smaller than over 150 mm particle size. Oversized cobbles or boulders were still present in the stockpile but were removed prior to loading and placement. Any oversized cobbles or

Tetra Tech Canada Inc.

Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

boulders placed were removed prior to compaction. This meets the BGC method specification requirement for structural fill. A water truck was used to moisture condition the structural fill stockpile prior to loading.

- Compaction was completed using two passes (back and forth) of the 13.4 tonne vibratory roller. Sufficient overlap and complete coverage meets the method specification requirements for 2 passes with a 13.4 tonne vibratory roller. This meets the BGC method specification requirement for structural fill.
- Each lift on the lower section was benched into the existing side slope of the elevation 920 m raised lift. The uncompacted side slopes of the existing ramps to the 920 m raised lift were removed. Loose Type 3 Rock with visible voids present in the sidewall of the excavation was as also removed. This complies with the placement methodologies outlined by BGC.
- Ongoing grade checks during placement by contractor using laser level. Survey confirmed that the average surveyed elevation averaged approximately 4 to 8 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 61 loads were placed during shift. Assuming 36 m^3 per load, a total of 2,196 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Rainfall prevented the access road to the embankment. Roughly 01:30 hours of haul time were lost due to road improvements. New access from ADR road entering onto embankment built to help facilitate truck hauls.

4.0 CLOSURE

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work (Dayshift)
-	CAT D-10 Dozer	7	Placing structural fill at embankment
-	Hitachi 1200 Excavator	5	Loading Structural fill from ADR Stockpile
-	CAT 777 Haul Truck	5	Hauling structural fill to embankment
-	CAT 777 Haul Truck	5	Hauling structural fill to embankment
-	CAT 777 Haul Truck	5	Hauling structural fill to embankment
-	Volvo 40 tonne Rock Truck	-	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	9	Compacting structural fill at embankment
-	Link Belt 490 Excavator	-	Removing loose material at embankment

2.0 HEAP LEACH FACILITY

- Oversaturated areas were found on nightshift's lift #35 during morning inspection. The areas were marked with spray paint and excavated. Roy Morlan (BGC) suggested to proof roll the lift using the CAT D-10 Dozer for further inspection. It was then recommended to remove the lift using the dozer, and blend the oversaturated material with drier material brought by the haul trucks. This took place from 07:00 to 11:30.
- Start #35 (903.22 m design elevation). Two passes was observed with sufficient speed and overlap. Survey confirmed the average elevation to be 903.10 m which calculates to be a 0.28 m lift. The test area exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 98.8% and 100%. The moisture content was 4.6% to 6.3%, which complies with BGC requirements.
- Start of lift #36 (903.50 m design elevation). Nightshift to continue.
- Structural fill from the ADR stockpile has a moisture content of 4.6 to 6.3%. Material is slightly coarse, but still visually appeared to have less than 30% over 19 mm. Oversize boulders were removed from lift. This meets the BGC method specification requirement for structural fill.
- Approximately 45 CAT 777 haul truck loads were placed during shift. Assuming 36 m^3 per load, a total of 1,620 m^3 of structural fill was placed on the embankment during dayshift.

3.0 DISCUSSION/OTHER

- Periodic delays due to refilling of the water truck, and grading of oversaturated surficial material after rainfall.

	CAT CS 78 B Compactor	12	Compacting structural fill at embankment
	Water Truck	10	Moisture conditioning aggregates

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Placement of lift elevation 903.36 m resumed at 19:20. Placement was completed at 22:20. Compaction for this lift began at 19:00 and was completed by 02:10. Compaction and moisture testing as well as surveying was completed by 02:15 using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 96.5 % to 100.1 %. Moisture content ranged from 4.6 % MC to 7.9 % MC. One of the five test fell below the targeted BGC method specification requirements and one was higher.
- Placement of lift elevation 903.76 m began at 23:30 and was not completed by the end of shift. Compaction for this lift began at 02:20 and was also incomplete by the end of the day. To prevent rain infiltration into the loose placed lift, Pelly decided to slow down the rate of haul truck placement to allow the Vibratory Compactor to keep up to the dozer. Compaction and moisture testing was conducted throughout placement to monitor lift quality. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 96.8 % to 97.0 %. Moisture content ranged from 6.0 % MC to 7.7 % MC, which is on the high limit of the targeted BGC method specification requirements.
- Visual assessment of lift 903.36 m and 903.76 m indicated that the excess moisture content was only in the top 10-25 mm of the lift. An additional pass with the CAT CS 78 B Vibratory Compactor was required to achieve compaction in sections exposed to the longest duration of rain while they were loose placed. Approximately 5 to 10 mm of deflection noted during compaction with 13.4 tonne CAT CS 78 B Compactor on the most recent placement of structural fill on lift elevation 903.36 m. This will be addressed during day shift.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Shovel loaded structural fill from the ADR stockpile previously approved. Material was fine, visually appeared to have less than 30 % over 19 mm and smaller than over 150 mm particle size. Oversized cobbles or boulders were still present in the stockpile but were removed prior to loading and placement. Any oversized cobbles or boulders placed were removed prior to compaction. This meets the BGC method specification requirement for structural fill. A water truck was used to moisture condition the structural fill stockpile prior to loading. Moisture conditioning with the water truck was reduced and eventually stopped, once the rain volume to increased and higher moisture contents were identified.
- Type 3 rock was also placed excavated from the Heap Leach area was loaded into semi-articulated haul trucks and placed in the embankment. These loads were spaced out and blended into the structural fill piles as per BGC method specification requirements for the embankment.
- Compaction was primarily completed using two passes (back and forth) of the 13.4 tonne vibratory roller. Some areas that experienced significant rainfall required additional compaction. Sufficient overlap and complete coverage was observed, which meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using laser level and GPS. Survey confirmed that the average surveyed elevation averaged approximately 14 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 51 loads were placed using CAT 777 haul trucks and 2 loads were placed using semi-articulated haul trucks during shift. Assuming 36 m^3 per load with the CAT 777 and 16 m^3 per load with the semi-articulated haul truck, a total of 1,868 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Heavy, prolonged rainfall required that additional attention was given to immediately compact the loose placed material to seal the surface. During shift, the dozer had to stop placement to accommodate the vibratory compactor who fell behind dozer placement. An additional vibratory compactor may be useful to seal the surface immediately behind the dozer. This vibratory compactor may not necessarily require to be over 9 tonnes as it would only be required to achieve surface compaction.

4.0 CLOSURE

-	Volvo 40 tonne Rock Truck	-	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	8.5	Compacting structural fill at embankment
-	Link Belt 490 Excavator	-	Removing loose material at embankment

2.0 HEAP LEACH FACILITY

- Start of lift #37 (903.76 m design elevation). Two passes was observed with sufficient speed and overlap. Survey confirmed the average elevation to be 903.72 m which calculates to be a 0.36 m lift. The test area exceeded 95% of the standard proctor density of 2272 kg/m3 ranging from 97.1% and 97.7%. The moisture content was 5.5% to 7.0%, which complies with BGC requirements.
- During inspection, areas of lift #37 (903.76 m) had softened due to excess moisture in the lift. A proof roll was conducted using a CAT CS 78 B Compactor to identify the depth and severity of the water penetration into the lift. After noting significant deflection, Roy Morlan (BGC) suggested that the lift be removed, replaced, and recompacted with drier structural fill. This took place from 13:30 to 15:00.
- Start of lift #38 (904.12 m design elevation) at 17:30. Nightshift to continue.
- Structural fill from the ADR stockpile has a moisture content of 5.5% to 7.0%. Material is slightly coarse, but still visually appeared to have less than 30% over 19 mm. Oversize boulders were removed from lift. This meets the BGC method specification requirement for structural fill.

Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

3.0 DISCUSSION/OTHER

- Embankment access road maintenance took place from 09:00 to 13:00. No CAT 777 haul trucks were allowed down to the embankment during this time.
- CAT D-10 Dozer was replaced at 16:15 due to low engine oil. This resulted in an approximate 00:30 hour delay.
- Large areas of ponding water were pushed off the embankment using the grader at the end of shift to prepare surface for nightshift.

4.0 CLOSURE

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-10 Dozer	12	Placing structural fill
	Hitachi 1200 Shovel	8	Loading Structural fill from ADR Stockpile
	CAT 777 Haul Truck	8	Hauling structural fill to embankment
	CAT 777 Haul Truck	8	Hauling structural fill to embankment
	CAT 777 Haul Truck	8	Hauling structural fill to embankment
	CAT CS 78 B Compactor	12	Compacting structural fill at embankment
	CAT 16G Grader	4	Removing wet soil and standing water
	Water Truck	6	Moisture conditioning aggregates

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Prior to placement of structural fill, a grader was used to remove wet, softened material from the previous lift.
- Placement of lift elevation 904.08 m (as built average elevation) resumed at 19:20. Placement was completed at 05:30. Compaction for this lift also began at 19:20 and was incomplete by the end of shift. Load placement was sequenced to allow enough time for the vibratory compactor to seal the surface of placed fill and to have minimum area loose placed after dozing left exposed.
- Compaction and moisture testing as conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 99.0 % to 100.5 %. Moisture content ranged from 3.2 % MC to 3.5 % MC. This is below the targeted BGC method specification requirements and one was higher.
- Compaction was primarily completed using at least two passes (back and forth) of the 13.4 tonne vibratory roller. One area exhibited deflection during compaction using the CAT CS 78 B Compactor near the center of the lift. After confirming the deflection using a CAT 16G grader, a test hole was dug using the edge of the grader blade. The test hole identified that the 40-50 cm placed lift did not contain excess moisture. The deflection was mitigated with additional compaction. Sufficient overlap and complete coverage was observed, which meets the BGC method specification requirement for structural fill.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- The north tie-in of lift elevation 904.08 m with the existing north slope also exhibited excess rutting from surface moisture accumulation during the previous shift. A grader was used to remove the softened wet material and pushed off the lift.
- On the north east corner of the abutment, a third soft spot was noticed at the end of shift. This will be addressed during day shift.
- Placement of lift elevation 904.48 m (design elevation) began at 05:35. Placement was incomplete by the end of shift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material was slightly coarse, but visually appeared to have less than 30 % over 19 mm and smaller than over 150 mm particle size. Oversized cobbles or boulders were still present in the stockpile but were removed prior to loading and placement. Any oversized cobbles or boulders placed were removed prior to compaction. This meets the BGC method specification requirement for structural fill. A water truck was periodically used to moisture condition the structural fill stockpile prior to loading based on moisture contents of placed material.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation averaged approximately 4 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 63 loads were placed using CAT 777 haul trucks during shift. Assuming 36 m^3 per load, a total of 2,268 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Embankment road access repairs continued from day shift. This significantly delayed hauling to the embankment throughout the shift.
- Soil softening and water accumulation between the placed structural fill and the bedding sand placed on the north slope drainage trench could be avoided if subsequent lifts were built with positive drainage away from the trench (north to south).

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work (Dayshift)
-	CAT D-10 Dozer	9	Placing structural fill at embankment
-	Hitachi 1200 Excavator	8	Loading Structural fill from ADR Stockpile
-	CAT 777 Haul Truck	8	Hauling structural fill to embankment
-	CAT 777 Haul Truck	8	Hauling structural fill to embankment
-	CAT 777 Haul Truck	8	Hauling structural fill to embankment
-	Volvo 40 tonne Rock Truck	-	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	8.5	Compacting structural fill at embankment
-	Link Belt 490 Excavator	5	Removing areas softened by excessive moisture

2.0 HEAP LEACH FACILITY

- Areas softened by excessive moisture were identified at 80 to 100 cm below lift elevation 904.43 m along the east abutment during and inspection with BGC. These areas were excavated and replaced with structural fill, which was compacted in two lifts using the CAT CS 78 B Compactor from 07:00 to 10:00
- Areas softened by excess moisture were also identified along the north embankment. This fill was removed using Link Belt 490 Excavator..
- Start of lift #39 (904.43 m design elevation) at 07:00. A notable amount of deflection was observed after witnessing compaction with the CAT CS 78 B Compactor. The Southeast portion of the lift was removed using the CAT D-10 Dozer until minimal deflection was observed as instructed by Roy Morlan (BGC) from 14:00 to 15:30.
- Moisture content testing was conducted using a nuclear densometer to assess the depth of water penetration. Tests were conducted at various depths into the lift ranging from 0 to 300 mm. Test results ranged from 3.1 % to 4.2 % M/C which could indicate that the lift was placed dry of the optimum moisture content of 6.2% as determined from standard proctor.
- Once significant remediation had been complete, BGC decided to continue placing new lifts of structural fill on top of the remaining soft spots on the lift. The remaining soft areas in this lift would be bridged in the upcoming placement of drier, sound structural fill.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Structural fill from the ADR stockpile had a moisture content of 7.0% to 8.0%. Material was slightly coarse, but still visually appeared to have less than 30% over 19 mm. Oversize boulders were removed from lift. This does not meet the BGC method specification requirement for structural fill for moisture content.
- Nightshift to continue lift #39 (904.46 m design elevation).

3.0 DISCUSSION/OTHER

- Structural fill material brought to the embankment had high moisture content. Elliot (BGC) was assigned to observe the structural fill material being loaded by the excavator.

4.0 CLOSURE

Client:	JDS		High 8°C
File:	ENG.WARC03235-02.005		Low 4°C

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-10 Dozer	11	Placing structural fill
	Hitachi 1200 Shovel	10	Loading Structural fill from ADR Stockpile
	CAT 777 Haul Truck	10	Hauling structural fill to embankment
	CAT 777 Haul Truck	10	Hauling structural fill to embankment
	CAT 777 Haul Truck	10	Hauling structural fill to embankment
	CAT CS 78 B Compactor	10	Compacting structural fill at embankment
	Water Truck	0	Moisture conditioning aggregates

2.0 HEAP LEACH FACILITY

- Shift change for the Pelly crew.
- Continued placement of structural fill at Heap Leach Facility Embankment.
- Placement of lift elevation 904.43 m (as built average elevation) resumed at 19:35. Placement was completed at 21:45. Compaction for this lift began at 19:300 and was completed by 23:30. Compaction and moisture testing as conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 96.1 % to 99.6 %. Moisture content ranged from 3.1 % MC to 5.7 % MC. This is below the targeted BGC method specification requirements for moisture content.
- Compaction was primarily completed using at least two passes (back and forth) of the 13.4 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Placement of lift elevation 904.83 m (design elevation) began at 22:15. Placement was incomplete by the end of shift. Due to spreading and grading methodology, compaction did not start until 02:00. Compaction for this lift was incomplete by the end of shift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material is becoming coarser, but visually appeared to have less than 30 % over 19 mm and smaller than over 150 mm particle size. Oversized cobbles or boulders were still present in the stockpile but were removed prior to loading and placement. Any oversized cobbles or boulders placed were removed prior to compaction. This meets the BGC method specification requirement for structural fill. A water truck was not used to moisture condition the structural fill

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

stockpile due to previous rain events. Shovel attempted to blend the wet surface material with the drier core of the stockpile to moisture condition the pile.

- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation averaged approximately 4 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 69 loads were placed using CAT 777 haul trucks during shift. Assuming 36 m^3 per load, a total of 2,484 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Placement of lift 904.83 m (design elevation) was spread using a fanning spread pattern, causing a delay in the vibratory compactor sealing the lift. Future lift placement may benefit from single width straight line placement, which may mitigate rain damage to the loose, uncompacted lift.
- The most recent placement of drier structural fill in lift 904.83 m (design elevation) appeared to help bridge the areas where deflections had been noted in previous lifts.

4.0 CLOSURE

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work (Dayshift)
-	CAT D-10 Dozer	10	Placing structural fill at embankment
-	Hitachi 1200 Excavator	9	Loading Structural fill from ADR Stockpile
-	CAT 777 Haul Truck	9	Hauling structural fill to embankment
-	CAT 777 Haul Truck	9	Hauling structural fill to embankment
-	CAT 777 Haul Truck	9	Hauling structural fill to embankment
-	Volvo 40 tonne Rock Truck	-	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	10.5	Compacting structural fill at embankment
-	Link Belt 490 Excavator	-	Removing areas softened by excessive moisture

2.0 HEAP LEACH FACILITY

- Start of lift #40 (904.83 m design elevation) started at 07:00. Compaction started at 07:00 and finished at 09:00. Two passes was observed with sufficient speed and overlap. Loose lift finished at 08:30. Survey confirmed the average elevation to be 904.86 m, which calculates to be a 0.43 m lift. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m3 ranging from 96.4% to 98.2%. The moisture content was 4.5% to 6.4%, which complies with BGC requirements.
- Structural fill from in the overbuilt south side slope of lift #39 used placed in lift #41.
- Start of lift #41 (905.26 m design elevation) started at 08:30. Compaction started at 10:00 and finished at 16:30. Two passes was observed with sufficient speed and overlap. Loose lift finished at 16:00. Survey confirmed the average elevation to be 905.26 m, which calculates to be a 0.40 m lift. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m3 ranging from 97.3% to 100%. The moisture content was 3.8% to 5.5%, which complies with BGC requirements.
- Structural fill from the ADR stockpile is slightly coarse, but still visually appeared to have less than 30% over 19 mm. Oversize boulders were removed from lift. This meets the BGC method specification requirement for structural fill.
- Structural fill from the stockpile north of the embankment is slightly coarse, but still visually appeared to have less than 30% over 19 mm. This meets the BGC method specification requirement for structural fill.
- Nightshift to continue lift #42 (905.66 m design elevation).

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-10 Dozer	11.5	Placing structural fill
	Hitachi 1200 Shovel	10	Loading Structural fill from ADR Stockpile
	CAT 777 Haul Truck	10	Hauling structural fill to embankment
	CAT 777 Haul Truck	10	Hauling structural fill to embankment
	CAT 777 Haul Truck	10	Hauling structural fill to embankment
	CAT CS 78 B Compactor	10	Compacting structural fill at embankment
	Water Truck	0	Moisture conditioning aggregates

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Placement of lift elevation 905.54 m (as built average elevation) resumed at 19:30. Placement was completed at 02:15. Compaction for this lift began at 19:15 and was completed by 3:45. Compaction and moisture testing as conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 95.3 % to 97.0 %. Moisture content ranged from 2.9 % MC to 5.3 % MC. This is below the targeted BGC method specification requirements for moisture content.
- Compaction was primarily completed using at least two passes (back and forth) of the 13.4 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Placement of lift elevation 905.94 m (design elevation) began at 03:15. Placement was incomplete by the end of shift. Compaction for this lift had not begun by the end of shift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material was coarse, and it is difficult to visually assess if less than 30 % over 19 mm with material smaller under 150 mm particle size near the end of shift. Oversized cobbles or boulders were still present in the stockpile but were removed prior to loading and placement. Any oversized cobbles or boulders placed were removed prior to compaction. The ADR structural fill stockpile A water truck was not used to moisture condition the structural fill stockpile due to previous rain events. Shovel blended wet surface material with the drier core of the stockpile to moisture condition the pile.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation averaged approximately 12 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 66 loads were placed using CAT 777 haul trucks during shift. Assuming 36 m^3 per load, a total of 2,376 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Placement of both lifts were placed using a fanning spread pattern, causing a delay in the vibratory compactor accessing and sealing the lift. It was discussed with Pelly operators that lift placement may benefit from single width straight line placement, which could mitigate rain damage to the loose, uncompacted lift.
- After starting to place lift 905.96 m, there may only be enough room to place 2-3 more lifts until structural fill placement catches up to drainage trench installation.

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work (Dayshift)
-	CAT D-10 Dozer	10	Placing structural fill at embankment
-	Hitachi 1200 Excavator	9.5	Loading Structural fill from ADR Stockpile
-	CAT 777 Haul Truck	9.5	Hauling structural fill to embankment
-	CAT 777 Haul Truck	9.5	Hauling structural fill to embankment
-	CAT 777 Haul Truck	9.5	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	10.5	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Start of lift #43 (905.94 m design elevation) started at 07:00. Loose lift was placed at 11:30. Compaction started at 07:00 and was completed at 12:00. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 95% to 100%. The moisture content was 2.6% to 5.6%. This is below the targeted BGC method specification requirements for moisture content.
- Start of lift #44 (906.33 m design elevation) started at 11:45. Nightshift to continue.
- Structural fill from the ADR West stockpile visually appeared to have less than 30% over 19 mm. Oversize boulders were removed from lift. This meets the BGC method specification requirement for structural fill. A water truck was used to moisture condition the structural fill stockpile prior to loading.
- Structural fill from the Material 3 Stockpile 1 visually appeared to have less than 30% over 19 mm. Oversize boulders and organic material were removed from lift. This meets the BGC method specification requirement for structural fill. BGC approved use of this material prior to its use.
- Three passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation averaged approximately 1 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.

File:	ENG.WARC03235-02.005		Low 8°C

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-10 Dozer	11.5	Placing structural fill
	Hitachi 1200 Shovel	9.5	Loading Structural fill from Stockpile 1
	CAT 777 Haul Truck	9.5	Hauling structural fill to embankment
	CAT 777 Haul Truck	9.5	Hauling structural fill to embankment
	CAT 777 Haul Truck	9.5	Hauling structural fill to embankment
	CAT CS 78 B Compactor	11	Compacting structural fill at embankment
	Water Truck	0	Moisture conditioning aggregates

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Staking of placed fill along slope at start of shift revealed that lift elevation 906.30 m was overbuilt.
- Placement of lift elevation 906.30 m (as built average elevation) resumed at 19:30. Placement was completed at 22:30. Compaction for this lift began at 19:15 and was completed by 23:15. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 96.3 % to 100.1 %. Moisture content ranged from 3.3 % MC to 5.3 % MC. This is below the targeted BGC method specification requirements for moisture content.
- Stockpiled sand and drain rock on north tie in for trench was cleaned from surface prior to completion of placement of structural fill for lift elevation 906.30 m.
- Compaction was completed using at least two passes (back and forth) of the 13.4 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Placement of lift elevation 906.70 m (design elevation) began at 23:20. Placement was incomplete by the end of shift. Compaction for this lift began at 00:00 and was incomplete by the end of shift.
- Structural fill was pushed on top of the finger drain on north west corner of lift prior to placement of bedding sand. This material was removed by hand until sand was visible. No damage to filter cloth was observed. Contamination of drain rock was not observed.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Shovel loaded structural fill from the Material 3 Stockpile 1 which has been previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. Trace rootlets were noted in the structural fill, and any load with higher proportions were picked out. The low quantity has previously been approved by BGC. Roots, oversized cobbles or boulders were present in the stockpile but were removed prior to loading and placement. Any roots, oversized cobbles or boulders placed were removed prior to compaction.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation averaged approximately 3 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 90 loads were placed using CAT 777 haul trucks during shift. Assuming 36 m^3 per load, a total of 3,240 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Placement of structural fill followed a single width straight line placement methodology, which allowed for very little delay in sealing the fill with vibratory compaction as noted in the smaller time delay between lift compaction.
- Ramp access to the raised lift was improved to provide adequate grading for haul truck access.

-	Volvo 40 tonne Rock Truck	-	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	10.5	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Start of lift #46 (907.07 m design elevation) started at 07:30. Loose lift was placed at 07:30. Compaction started at 09:30 and was completed at 14:00. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 97.0% to 99.2%. The moisture content was 5.1% to 6.4%. This meets the BGC method specification requirement for structural fill.
- Start of lift #47 (907.44 m design elevation) started at 12:30. Nightshift to continue.
- Structural fill from the Material 3 Stockpile 1 stockpile visually appeared finer, having less than 30% over 19 mm. Oversize boulders and organic material were removed from lift. This meets the BGC method specification requirement for structural fill.
- Type 3 bedrock hauled from the north of the embankment beside the underdrains visually appeared slightly coarse, but has less than 30% over 19 mm. The bedrock was blended using the CAT D-10 Dozer with the finer structural fill coming from the Material 3 Stockpile 1 prior to compaction. Oversize boulders and organic material were removed from lift. This meets the BGC method specification requirement for structural fill. BGC approved use of this material prior to its use.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation averaged approximately 3 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Placement of lift elevation 907.27 m (as built average elevation) resumed at 19:15. Placement was completed at 19:45. Compaction for this lift began at 19:30 and was completed by 21:30. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 95.8 % to 99.9 %. Moisture content ranged from 5.4 % MC to 6.3 % MC. This meets the targeted BGC method specification requirements for moisture content.
- Staking of placed fill along slope at start of shift revealed that lift elevation 906.30 m was underbuilt approximately 3 meters. Berm was extended out.
- Two small lifts were required to tie into the north end of the embankment. These lifts were placed and compacted in accordance with BGC method specification requirements.
- Two small lifts were also required to tie into the south end of the embankment near the access ramp. These lifts were individually placed and compacted in accordance with BGC method specification requirements.
- Compaction was completed using at least two passes (back and forth) of the 13.4 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Placement of lift elevation 907.67 m (design elevation) began at 22:15. Placement was incomplete by the end of shift. Compaction for this lift began at 00:15 and was incomplete by the end of shift.
- Bedding sand for the finger drain on north west corner of lift was compacted with a plate tamper. As-built survey to be conducted before placement of successive lifts. To be completed on day shift.
- Shovel loaded structural fill from the Material 3 Stockpile 1 which has been previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. Roots, oversized cobbles or boulders were present in the stockpile but were removed prior to loading and placement. Oversized cobbles or boulders placed were removed prior to compaction.
- Type 3 bedrock was also placed excavated from the Heap Leach area was loaded into semi-articulated haul trucks and placed in the embankment. These loads were spaced out and blended into the structural fill piles as per BGC method specification requirements for the embankment.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation averaged approximately 17 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 90 loads were placed using CAT 777 haul trucks and approximately 5 loads with the semi-articulating haul truck during shift. Assuming 36 m^3 per load with the CAT 777 and 16 m^3 with the semi-articulating haul truck, a total of 3,420 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Ramp access to the raised lift was improved to provide adequate grading for haul truck access.

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work (Dayshift)
-	CAT D-10 Dozer	11	Placing structural fill at embankment
-	Hitachi 1200 Excavator	9	Loading Structural fill from ADR Stockpile
-	CAT 777 Haul Truck	9	Hauling structural fill to embankment
-	CAT 777 Haul Truck	9	Hauling structural fill to embankment
-	CAT 777 Haul Truck	9	Hauling structural fill to embankment
-	Volvo 40 tonne Rock Truck	-	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	10.5	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Continuation of lift #48 (907.67 m design elevation) started at 07:00. Loose lift was placed at 09:00. Compaction started at 07:00 and was completed at 10:00. Compaction and moisture content testing was conducted on nightshift on compacted sections using a nuclear densometer.
- Start of lift #49 (908.08 m design elevation) loose lift started at 09:00. Nightshift to continue.
- Structural fill from the Material 3 Stockpile 1 stockpile visually appeared finer, but still has less than 30% over 19 mm. Oversize boulders and organic material were removed from lift. This meets the BGC method specification requirement for structural fill.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation averaged approximately 1 cm above target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses
- Approximately 69 loads were placed using CAT 777 haul trucks during shift. Assuming 36 m^3 per load, a total of 2,484 m^3 of structural fill was placed on the embankment during nightshift.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

3.0 DISCUSSION/OTHER

- Pelly's lightning management protocol was implemented during afternoon thunder showers from 15:00 to 16:00. All work on the embankment stopped during this time.
- Delays caused by regrading of the embankment ramp using the CAT D-10 Dozer. There were two instances where the CAT 777 Haul Trucks were unable to drive onto the upper embankment pad and had to reverse back down to the lower pad. This was caused by a combination of the steepness of the ramp and heavy rain.

the standard proctor density of 2272 kg/m^3 ranging from 97.0 % to 98.1 %. Moisture content ranged from 6.4 % MC to 7.7 % MC. This meets the targeted BGC method specification requirements for moisture content.

- Placement of lift elevation 908.79 m (design elevation) began at 03:50. Placement was incomplete by end of shift. Compaction for this lift began at 04:00 and was not complete by the end of shift.
- Shovel loaded structural fill from the Material 3 Stockpile 1 which has been previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. Oversized cobbles or boulders were present in the stockpile but were removed prior to loading and placement. Oversized cobbles or boulders placed were removed prior to compaction.
- Structural fill was also excavated from a stockpile at the Heap Leach Embankment base area was loaded into semi-articulated haul trucks and placed in the embankment. which has been previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size.
- Ongoing grade checks during placement by contractor using GPS and laser level. Survey confirmed that the average surveyed elevation averaged approximately 6 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 70 loads were placed using CAT 777 haul trucks and approximately 78 loads with the semi-articulating haul truck during shift. Assuming 36 m^3 per load with the CAT 777 and 16 m^3 with the semi-articulating haul truck, a total of 3,768 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- CAT Dozer D10 and CAT Dozer D6 were both used to place structural fill. D10 was primarily used for initial placement of loads, and the D6 was able to provide placement in tight areas and provide fine grade assistance.

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Placement of lift elevation 909.15 m (as built average elevation) resumed at 19:15. Placement was completed at 20:20. Compaction for this lift began at 19:15 and was completed by 20:30. This lift was placed and compacted in accordance with BGC method specification requirements.
- One small lift was required to tie into the north end of the embankment. This lift was placed and compacted in accordance with BGC method specification requirements.
- Placement of lift elevation 909.50 m (as built average elevation) began at 20:30. Placement was completed at 03:00. Compaction for this lift began at 20:40 and was completed by 03:30. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 96.9 % to 99.6 %. Moisture content ranged from 4.9 % MC to 5.4 % MC. One of which, falls below the targeted BGC method specification requirements for moisture content.
- Compaction was completed using at least two passes (back and forth) of either 11 tonne or the 13.4 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.

Tetra Tech Canada Inc.

- Placement of lift elevation 909.90 m (design elevation) began at 02:50. Placement was incomplete by end of shift. Compaction for this lift began at 03:00 and was not complete by the end of shift.
- Shovel loaded structural fill from the ADR stockpile which has been previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. Oversized cobbles or boulders were present in the stockpile but were removed prior to loading and placement. Oversized cobbles or boulders placed were removed prior to compaction.
- Type 3 bedrock excavated at the Heap Leach Embankment area was loaded into semi-articulated haul trucks and placed in the embankment. which has been previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size.
- Ongoing grade checks during placement by contractor using GPS and laser level. Survey confirmed that the average surveyed elevation averaged approximately 0-5 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- East drain trench installation continued for day shift. The trench was excavated 1.0 m into competent bedrock, geo-fabric was placed and overlapped with positive drainage. After placement 0.7 m of drain rock, the trench was wrapped with geo-fabric, and 0.3 m of bedding sand was placed over top. Both top and bottom of trench as well as the top of drainage rock was surveyed by GPS.
- Approximately 105 loads were placed using CAT 777 haul trucks and approximately 60 loads with the semi-articulating haul truck during shift. Assuming 36 m^3 per load with the CAT 777 and 16 m^3 with the semi-articulating haul truck, a total of 4,740 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Overbuilt material from side slope of the embankment was removed with excavator, mixed, and stockpiled. This material is expected to be used on successive lifts.

	Volvo SD160 Compactor	11	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Completed compaction of lift #54 (909.9 m design elevation) which was started on previous shift ended at 12:15. Compaction and moisture content testing was conducted on nightshift on compacted sections using a nuclear densometer.
- Start of lift #55 (910.3 m design elevation) loose lift placement started on nightshift. Placement finished at 18:00. Compaction incomplete by end of shift.
- Started to place material for lift 56 (design 910.7 m) but was incomplete by end of shift.
- Structural fill was hauled from ADR stockpile. Type 3 bedrock was excavated from heap leach pond excavation on north end of embankment and used along with Structural Fill. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. Oversize boulders and organic material were removed from lift. This meets the BGC method specification requirement for structural fill.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses
- Trench activities: Excavated 1.0 m min into bedrock (surveyed), geo fabric properly lapped (min 0.75 m overlap) and upstream over downstream, 0.70 m minimum of drain rock placed (concrete stone) (surveyed) and wrapped

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

with geo fabric, Approx. 0.3 m of sand placement (surveyed), compacted with 2 passes of CATS56 Smooth drum with no vibration. Drainage trench was extended to the end of the current embankment excavation limit.

3.0 DISCUSSION/OTHER

- South west access ramp onto embankment is becoming steeper after successive lift placement. Lift placement in this and surrounding areas will extend and tie into the current lift such that loose lift thickness of 50 cm will not be exceeded.

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Compaction for lift elevation 910.31 m (as built average elevation) resumed at 19:15 and was completed by 12:15. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 96.6 % to 97.7 %. Moisture content ranged from 4.5 % MC to 5.2 % MC. One of which, falls below the targeted BGC method specification requirements for moisture content.
- Placement of lift elevation 910.66 m (as built average elevation) began at 19:15. Placement was completed at 23:30. Compaction for this lift began at 19:30 and was completed by 02:15. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 96.9 % to 99.6 %. Moisture content ranged from 4.9 % MC to 5.4 % MC. One of which, falls below the targeted BGC method specification requirements for moisture content.
- Placement of lift elevation 911.06 m (design elevation) began at 23:30. Placement was incomplete by end of shift. Compaction for this lift began at 02:45 and was not complete by the end of shift.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Compaction for the west embankment was completed using at least two passes (back and forth) of either 11 tonne or the 13.4 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Excavators loaded structural fill from the ADR stockpile, Material 3 Stockpile 1 and Heap Leach Embankment which has been previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. Oversized cobbles or boulders were present in the stockpile but were removed prior to loading and placement. Oversized cobbles or boulders that were placed were removed prior to compaction.
- Stockpiled overbuilt structural fill off the toe of the embankment was loaded into 40 tonne semi-articulated haul trucks and placed on the new lifts.
- Ongoing grade checks during placement by contractor using GPS and laser level. Survey confirmed that the average surveyed elevation averaged approximately 0-5 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Two lifts of structural fill were placed over the drainage trench on the east embankment. These lifts were placed in 40 cm thickness above the bedding sand along the vertical alignment of the trench. The first lift was packed using 3 passes with the CS 68B vibratory compactor. The tested areas on the first lift exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 98.4 % to 99.3 %. Moisture content were approximately 6.7 % MC, which meets the targeted BGC method specification requirements for moisture content. Successive lifts are expected to be completed with the CS 78B.
- Approximately 105 loads were placed using CAT 777 haul trucks and approximately 68 loads with the semi-articulating haul truck during shift. Assuming 36 m^3 per load with the CAT 777, 35 m^3 with the CAT 773 and 16 m^3 with the 40 tonne semi-articulating haul truck, a total of 6,128 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Oversized rock observed in sump trench next to drain pipe. Discussed with Pelly the importance of not damaging the section of exposed pipe. Rock to be removed.

2.0 HEAP LEACH FACILITY

- Completed compaction of lift #57 (911.06 m design elevation) which was started on previous shift ended at 12:15. Compaction and moisture content testing was conducted at 9:30 on compacted sections using a nuclear densometer. 2 tests performed and achieved a compaction of 98.0% and 100.0% with 5.2% and 5.1% moisture respectively. Surveyed elevation came in .03 m short, at 911.03 m.
- Start of lift #58 (911.46 m design elevation) loose lift placement started at 7am. Placement finished at 17:45. Testing to be completed by next shift.
- Placed material on ramp onto embankment and lifted the SW corner adjacent to ramp which had fallen well below grade of current lift. Material in corner placed in lifts no bigger than 50 mm.
- Structural fill was hauled from ADR stockpile and stockpile 1. Type 3 bedrock was excavated from heap leach pond excavation on north end of embankment and used along with Structural Fill. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. Oversize boulders and organic material were removed from lift. This meets the BGC method specification requirement for structural fill.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor. This meets the BGC method specification requirement for structural fill.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses
- Trench activities: Excavated 1.0 m min into bedrock (surveyed), geo fabric properly lapped (min 0.75m overlap) and upstream over downstream, 0.70 m minimum of drain rock placed (concrete stone) (surveyed) and wrapped with geo fabric, Approx. 0.3 m of sand placed (surveyed), compacted with 2 passes of CATS56 Smooth drum with no vibration. Trench was excavated, and drainage rock placed with geo fabric to the edge of Dublin gulch road. Sand placement and compaction ongoing from previous shift.
- Structural fill placed over trench on previous shift compacted with CAT CS 68 B Compactor and Volvo SD160 Compactor. Material placed on the bottom of steep incline in order to make grade manageable for CAT 777 Haul Trucks.

3.0 DISCUSSION/OTHER

- South west access ramp, and area of lift adjacent to ramp were too low to fill with 1 lift. After initial placement of material for lift #58 hauling to lift was stopped and area adjacent to ramp focused and brought up in various lifts, not exceeding 50mm to current working elevation. Ramp to the embankment also raised to achieve lower grade for haul trucks.
- Trench excavation did not run into colluvial deposit as expected. Base of trench encountered bedrock throughout construction (to Dublin gulch road). East side of trench had less of a colluvial deposit with bedrock foundation exposed, leading to uneven profile on either side of the trench. Type 3 bedrock material that was pulled away from sides adjacent to trench approved to be used as rock fill on the first couple lifts overtop of the trench.
- Previous nightshift placed material on a 1-1.7 m offset to the previous lift's toe, along the east side of the lift. This was widened to 2m and material removed was placed back onto the next lift.

	CAT CS 68 B Compactor	11	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Began placement of structural fill on the lower E half of the embankment. Five correction lifts of 40 cm or less (asbuilt by survey) were placed and compacted. Then lifts of 40 cm placed at 886.86, 887.26, 887.1 and 888.1 were placed.
- Placement of lift elevation 911.81 m began on dayshift. Placement was completed at 00:45. Compaction for this lift was completed by 02:oo. Compaction and moisture content testing was conducted on compacted sections using a nuclear densometer. The tested area exceeded 97 % of the standard proctor density of 2272 kg/m^3 · Moisture content was 4.5 % MC.
- Placement of lift elevation 912.21 m (design elevation) began at 01:15. Placement was incomplete by end of shift. Compaction for this lift began at 02:45 and was not complete by the end of shift.
- Compaction for the west embankment was completed using at least two passes (back and forth) of either 13.4 tonne or the 11 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Compaction for the east embankment was completed using at least two passes (back and forth) o the 9 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Excavators loaded structural fill from the ADR stockpile, Material 3 Stockpile 1 and Material Stockpile 2 which were previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. Oversized cobbles or boulders were present in the stockpile but were removed prior to loading and placement. Oversized cobbles or boulders that were placed were removed prior to compaction.
- Ongoing grade checks during placement by contractor using GPS and laser level. Survey confirmed that the average surveyed elevation averaged approximately 0-5 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Approximately 70 loads were placed using CAT 777 haul trucks and approximately 117 loads with the semi-articulating haul truck during shift. Assuming 36 m^3 per load with the CAT 777 and 16 m^3 with the 40 tonne semi-articulating haul truck, a total of 4,392 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- None

	Link Belt 490x4 Excavator	12	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR stockpile and, for the start of the day, stockpile 1. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. Material from stock pile 1 was rejected due to oversize and organic material and material was removed from lift. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was drying out and moisture conditioning was started at approx. 3:00 pm.

- Completed compaction of lift #60 (911.21 m Target elevation) which was started on previous shift and ended at 9:00. Compaction and moisture content testing was conducted at 9:05 on compacted sections using a nuclear densometer. 2 tests performed and achieved a compaction of 98.8% and 100.2% with 5.8% and 4.8% moisture respectively. Surveyed elevation came in .02 m short, at 912.18 m.

- Completed compaction of lift #61 (912.58 m Target elevation) which was started 6:30 am and ended at 3:00. Compaction and moisture content testing was conducted at 2:35 on compacted sections using a nuclear densometer. Test performed and achieved a compaction of 99.1% with 2.8% moisture. Surveyed elevation came in .02 m high, at 912.60 m.

- Started lift #62 (913.00 m design elevation) loose lift placement started at 12:30pm. Placement, compaction and testing to be completed by next shift.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Completed compaction of trench lift #6 (888.10 m Target elevation) which was started on previous shift and ended at 6:40. Compaction and moisture content testing was conducted at 9:05 on compacted section using a nuclear densometer. Test performed and achieved a compaction of 97.0% with 5.3% moisture. Surveyed elevation came in .03 m high, at 888.13 m.
- Completed placement and compaction of lift #7 (888.53 m Target elevation) which was started at 6:40am and ended at 11:10 am. Surveyed elevation came in .03 m high, at 888.56 m.
- Completed placement and compaction of lift #8 (888.96 m Target elevation) which was started at 11:10am and ended at 1:00pm. Surveyed elevation came in on target.
- Completed placement and compaction of lift #9 (889.36 m Target elevation) which was started at 1:00pm and ended at 2:40pm. Test performed and achieved a compaction of 101.7% with 3.3% moisture. Surveyed elevation came in .02 m high, at 889.38 m.
- Completed placement and compaction of lift #10 (889.78 m Target elevation) which was started at 2:40pm and ended at 6:00pm. Test performed and achieved a compaction of 101.7% with 3.3% moisture. Surveyed elevation came in .03 m low, at 889.75 m.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.

.

3.0 DISCUSSION/OTHER

- Stockpile 1 was contaminated by discard pile with oversize and organics. This was noticed in the morning and some material placed at the trench was removed. The contaminated material was pulled away from the main stock pile.
- Structural fill moisture content was noticed to be low, 2.5-3.0, and moisture conditioning was conducted on the stockpile. Testing after moisture conditioning provided a moisture content of 5.6%.
- No more lifts will be placed at the top of embankment (913.0m) until bottom, where trench constructed, is brought up.
- Excavator working on cleaning up slopes at north side of embankment pump area.
- Lift at 888.96m had low areas where there was up to 0.60 m of fill needed. These areas were filled with a small layer and compacted before the entire lift was placed in order to maintain maximum uncompacted material placement of .50 m.
-

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-6 Dozer	9	Placing structural fill
	CAT D-6 Dozer	9.5	Placing structural fill, east embankment
	Hitachi 1200 Shovel	8	Loading Structural fill from Stockpile 1
	3 x CAT 777 Haul Truck	8	Hauling structural fill to embankment
	CAT CS 78 B Compactor	7	Compacting structural fill at embankment
	CAT CS 68 B Compactor	4	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill on the lower E half of the embankment. Lifts 890.15 and 890.55 were placed and compacted. Both lifts were tested for compaction and moisture content. Compaction exceeded 97 % and the moisture for the first lift was 3.9 %. As a result, instructed contractor to moisture condition the stockpile. The second lift had a moisture content of 5.0 %.
- A third lift was placed but was incomplete by end of shift. The west half of the lift (elev. 890.98) was completed and compacted and asbuilt.
- The loose Type 3 material on the East slope was removed by the dozers and pushed on to the existing lifts to be blended in with the structural fill and used for backfill. By end of shift the removal of all loose material on the slope was almost complete.
- Compaction for the east embankment was completed using at least two passes (back and forth) of the 9 tonne or 13.4 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Placement of the final lift 913.0 on the west side was half completed at the end of day shift. Some placement occurred on night shift but the lift was still incomplete.
- Excavators loaded structural fill from the ADR stockpile, Material 3 Stockpile 1 which was previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. Oversized cobbles or boulders were present in the stockpile but were removed prior to loading and placement. Oversized cobbles or boulders that were placed were removed prior to compaction.

Tetra Tech Canada Inc.

Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Ongoing grade checks during placement by contractor using GPS and laser level. Survey confirmed that the average surveyed elevation averaged approximately 0-5 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Approximately 54 loads were placed using CAT 777 haul trucks during shift. Assuming 36 m^3 per load with the CAT 777, a total of 1,944 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Once contractor began pushing the loose material from the slope, it was decided the entire slope had to be cleared back to OG.

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. Material from stock pile 1 was rejected due to oversize and organic material and material was removed from lift. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned throughout the day.
- Type 3 bedrock, from east bank of lower trench area used as fill material. Material was mixed with structural fill from ADR.
- Completed compaction of lift #13E-b (890.98 m Target elevation) which was started on previous shift and ended at 8:45am. Lift had been completed in two parts to move excess type 3 rock material from one side to the other during compaction. Discussed in previous nightshift. Compaction and moisture content testing was conducted at 8:50 on compacted section using a nuclear densometer. Test performed and achieved a compaction of 97.5% with 6.3% moisture. Surveyed elevation came in on target.
- Completed compaction of lift #14E (891.38 m Target elevation) which was started 8:45 am and ended at 10:00am. Compaction and moisture content testing was conducted at 8:50am on compacted section using a nuclear densometer. Test performed and achieved a compaction of 98.3% with 4.3% moisture. Surveyed elevation came in .03 m high, at 891.41 m.
- Completed compaction of lift #15E (891.81 m Target elevation) which was started 10:00am and ended at 1:20pm. Compaction and moisture content testing was conducted at 12:45pm on compacted section using a

Tetra Tech Canada Inc.

nuclear densometer. Test performed and achieved a compaction of 97.0% with 4.3% moisture. Surveyed elevation came in .03 m high, at 891.84 m.

- Completed compaction of lift #16E (892.21 m Target elevation) which was started 1:20am and ended at 4:15pm. Compaction and moisture content testing was conducted at 4:15pm on compacted section using a nuclear densometer. Test performed and achieved a compaction of 100.2% with 3.8% moisture. Surveyed elevation came in on target.
- Started placement and compaction of trench lift #17E (892.21 m Target elevation) which was started 4:15pm and to be finished by night.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.

.

3.0 DISCUSSION/OTHER

- Structural fill from ADR stockpile was moisture conditioned, result of density testing showed material to be at 3.8 to 4.3. Weather conditions are quickly drying out the material.
- Excavator working on cleaning up slopes at north side of embankment pump area.
- Lift at 892.21 was showing deflection at the toe, SW corner of lift. This area was excavated. Material pulled out was high in moisture and contained organics. Plan to fill in with rock and compact in lifts back to elevation with rest of area.

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-10 Dozer	9	Placing structural fill
	CAT D-6 Dozer	9.5	Placing structural fill, east embankment
	Hitachi 1200 Shovel	8	Loading Structural fill from Stockpile 1
	3 x CAT 777 Haul Truck	8	Hauling structural fill to embankment
	CAT CS 78 B Compactor	7	Compacting structural fill at embankment
	CAT CS 68 B Compactor	4	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill on the lower E half of the embankment. Lift 892.61was completed and compacted. Lifts 892.98 and 893.35 were placed and compacted. Lifts were tested for compaction and moisture content. Compaction exceeded 96 % and the moistures were 4.6 and 4.8 %. The stockpile was being moisture conditioned.
- A fourth lift was placed but was incomplete by end of shift.
- Compaction for the east embankment was completed using at least two passes (back and forth) of the 9 tonne or 13.4 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Excavators loaded structural fill from the ADR stockpile, Material 3 Stockpile 1 which was previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. Oversized cobbles or boulders were present in the stockpile but were removed prior to loading and placement. Oversized cobbles or boulders that were placed were removed prior to compaction.
- Ongoing grade checks during placement by contractor using GPS and laser level. Survey confirmed that the average surveyed elevation averaged approximately 0-5 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Approximately 70 loads were placed using CAT 777 haul trucks during shift. Assuming 36 m^3 per load with the CAT 777, a total of 2,520 m^3 of structural fill was placed on the embankment during nightshift.

Tetra Tech Canada Inc.

	Link Belt 425x4 Excavator	12	Compacting structural fill at embankment
	Link Belt 490x4 Excavator	12	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned throughout the day.
- Type 3 bedrock, from east bank of lower embankment used as fill material. Material was mixed with structural fill from ADR.
- Completed compaction of lift #21E (893.76 m Target elevation) which was started on previous shift and ended at 9:20am. Compaction and moisture content testing was conducted at 9:40 on compacted section using a nuclear densometer. Test performed and achieved a compaction of 100.5% with 4.7% moisture. Surveyed elevation came in .01 m low, at 893.75 m.
- Completed compaction of lift #22E (894.15 m Target elevation) which was started 9:20 am and ended at 12:30pm. Compaction and moisture content testing was conducted at 12:30am on compacted section using a nuclear densometer. Test performed and achieved a compaction of 100.5% with 6.3% moisture. Surveyed elevation came in .02 m low, at 894.13 m.
- Placement completed, with partial compaction of lift #23E (894.53 m Target elevation) which was started 12:30am and continued ongoing into nightshift. Compaction and moisture content testing was conducted at 5:45pm on compacted section using a nuclear densometer. Test performed and achieved a compaction of 99.2% with 4.8% moisture. Survey to be completed on night shift

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Placement of lift #24E started on top of compacted part of lift #23E to be worked on and surveyed during night shift.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with Volvo SD160 Compactor as required. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.

.

3.0 DISCUSSION/OTHER

- Water infiltration from bedrock, pouring out north of the lift from upper east bank, began at nightshift. Water came from a hose which was not placed in proper drainage. The lift had been packed where water was pooling to slow infiltration of water onto the lift. The top material, and a load of structural fill, was then used to dam off the incoming water. A sump was dug north of the lift and pumped into drainage trench. The material for dam and surface layer which was well above optimum moisture was removed from lift.
- Drainage trench excavated and cleaned out, geo fabric and, in .10 m lift, drainage rock placed. Pipes to be installed on top of rock, covered with additional drainage rock and wrapped with geo fabric.

File:	ENG.WARC03235-02.005		Low 10°C

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-10 Dozer	10.5	Placing structural fill
	CAT D-6 Dozer	10	Placing structural fill, east embankment
	Hitachi 1200 Shovel	9	Loading Structural fill from Stockpile 1
	4 x CAT 777 Haul Truck	9	Hauling structural fill to embankment
	Volvo Compactor	8	Compacting structural fill at embankment
	CAT CS 68 B Compactor	7	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill on the lower E half of the embankment. Lift 894.93 was completed and compacted. Lifts 895.32, 895.75 and 896.16 were placed and compacted. Lifts were tested for compaction and moisture content. Compaction exceeded 96 % and the moistures were 6.0, 5.4 and 4.9 %. The stockpile was being moisture conditioned.
- Lift 896.60 was placed but was incomplete by end of shift.
- Compaction for the east embankment was completed using at least three passes (back and forth) of the 9 tonne or two passes with the 11 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Excavators loaded structural fill from the ADR stockpile, Material 3 Stockpile 1 which was previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. Oversized cobbles or boulders were present in the stockpile but were removed prior to loading and placement. Oversized cobbles or boulders that were placed were removed prior to compaction.
- Ongoing grade checks during placement by contractor using GPS and laser level. Survey confirmed that the average surveyed elevation averaged approximately -5 to +5 cm cm of target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Approximately 123 loads were placed using CAT 777 haul trucks during shift. Assuming 36 m^3 per load with the CAT 777, a total of 4,500 m^3 of structural fill was placed on the embankment during nightshift.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

3.0 DISCUSSION/OTHER

- The average elevation for two of the lifts exceeded the target elevation. This meant some areas were close to 10 cm above grade, meaning the 50 cm maximum lift thickness was getting close. Contractor was advised to keep a tighter control on grades and to maintain an average below target to ensure less than 50 cm being placed.

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR. Structural fill from Event Pond also used for the latter half of lift 32. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned throughout the day.
- Type 3 bedrock was used from east bank of lower embankment as well as north side of upper embankment (drain trench excavation). Type 3 bedrock was used as fill material. Material was mixed with structural fill from ADR.
- Completed compaction of lift #28E (896.60 m Target elevation) which was started on previous shift and ended at 7:20am. Surveyed elevation came in .05 m high, at 896.65 m.
- Completed compaction of lift #29E (897.05 m Target elevation) which was started 7:00am and ended at 9:30pm. Compaction and moisture content testing was conducted at 9:00am on compacted section using a nuclear densometer. Test performed and achieved a compaction of 100.1% with 5.0% moisture. Surveyed elevation came in .02 m high, at 897.07 m.
- Completed compaction of lift #30E (897.47 m Target elevation) which was started 9:00am and ended at 11:30pm. Compaction and moisture content testing was conducted at 11:00am on compacted section using a

Tetra Tech Canada Inc.

p. 780.451.2121 f. 780.454.5688

nuclear densometer. Test performed and achieved a compaction of 99.2% with 4.6% moisture. Surveyed elevation came in .02 m high, at 897.40 m.

- Completed compaction of lift #31E (897.80 m Target elevation) which was started 11:00am and ended at 6:00pm. Compaction and moisture content testing was conducted at 1:00pm on compacted section using a nuclear densometer. Test performed and achieved a compaction of 101.2% with 4.1% moisture. Surveyed elevation came in .03 m low, at 897.77 m. Lift #31E extended to lower west side of embankment, which was previously labelled as “A” section. Moving forward “E” sections will rise level across embankment.
- Placement completed with partial compaction of lift #32E (898.17 m Target elevation) which was started 3:30am and continued ongoing into nightshift. Compaction and moisture content testing was conducted at 5:30pm on compacted section using a nuclear densometer. Test performed and achieved a compaction of 96.8% with 4.5% moisture. Survey to be completed on night shift.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill. One pass with loaded rock truck observed on west side of lift, this BGC method after performing test area.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.

.

3.0 DISCUSSION/OTHER

- Test strips conducted on material from the Event Pond; density tests from control strip were lower than the structural fill from ADR. When mixing these materials, the higher proctor of 2270 will be used. Material sampled for proctor and sieve testing.
- Test strip on ADR material, with CAT 777 Haul Truck. 1 pass with rock truck achieved necessary compaction. Using CAT 777 Haul Truck to pack material is a viable option. Compactors still required around edges. Tire tracks need to encompass the entire area being packed. Engineer on site can ask for additional compaction as required.

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned throughout the day.
- Type 3 bedrock was used from east bank of lower embankment as well as north side of upper embankment (drain trench excavation). Type 3 bedrock was used as structural fill material.
- Fill from ADR, Event pond and Type 3 bedrock placed together and mixed through the grading process.
- Completed compaction of lift #35E (899.34 m Target elevation) which was started on previous shift and ended at 7:20am. Compaction and moisture content testing was conducted at 7:20am on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 97.9% and 100.3% with moisture of 4.9% and 4.6 respectively. Surveyed elevation came in .01 m high, at 899.35 m.
- Completed compaction of lift #36E (899.75 m Target elevation) which was started 7:00 am and ended at 11:00am. Compaction and moisture content testing was conducted at 9:00am and 10:30am on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 97.7% and 97.6% with moisture of 7.2% and 4.5% respectively. Surveyed elevation came in .06 m Low, at 899.69 m.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Completed compaction of lift #37E (900.09 m Target elevation) which was started 11:00am and ended at 2:00pm. Compaction and moisture content testing was conducted at 11:00am on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 98.0% and 98.2% with moisture of 3.8% and 3.7 respectively. Surveyed elevation came in .02 m low, at 900.07 m.
- Completed compaction of lift #38E (900.47 m Target elevation) which was started 11:00am and ended at 6:00pm. Compaction and moisture content testing was conducted at 5:50pm on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 96.7% and 99.1% with moisture of 6.2% and 2.5% respectively. To be surveyed at nightshift
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with Volvo SD160 Compactor as required. This meets the BGC method specification requirement for structural fill. One pass with loaded rock truck observed on west side of lift, this BGC method after performing test area.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.

.

3.0 DISCUSSION/OTHER

- Some clumps of clay observed present at event pond excavation. These could bring material out of spec.
- Truck distribution was 3 CAT 777 Haul Trucks, and a CAT 773 Haul Truck at the ADR. 2 CAT 777 Haul Trucks and 2 Volvo 40 Tonne Haul Trucks at the Event pond.

	Water Truck	8	Moisture Conditioning ADR stockpile
	Water Truck	8	Moisture Conditioning ADR stockpile

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill on of the embankment. Lift 900.87 was completed and compacted. Lift 901.15 was placed and compacted. Lifts were tested for compaction and moisture content. Compaction exceeded 96 % and the moistures ranged from 3.3 to 7.0 %. Both stockpile were being moisture conditioned.
- Lift 901.5 was placed but was incomplete by end of shift.
- Compaction for the east embankment was completed using at least three passes (back and forth) of the 9 tonne or two passes with the 11 tonne and 13.4 tonne vibratory rollers. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Excavators loaded structural fill from the upper and lower ADR stockpiles which were previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. Oversized cobbles or boulders were present in the stockpile but were removed prior to loading and placement. Oversized cobbles or boulders that were placed were removed prior to compaction.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Ongoing grade checks during placement by contractor using GPS and laser level. Survey confirmed that the average surveyed elevation averaged approximately 0 to 5 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Approximately xxx loads were placed using CAT 777 haul trucks during shift. Assuming 36 m^3 per load with the CAT 777, a total of xxx m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Some frozen material was encountered at the end of day shift from the event pond. The material was removed and loading from the event pond was stopped.
- Steady rain started at 0400 hrs. Moisture conditioning was stopped and an effort to quickly seal the placed material with the packers was done. Hauling was stopped temporarily until the acces ramp from the ADR was graded.

	CAT D-10 Dozer	12	Pushing material to ADR stockpile

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned throughout the day.
- Type 3 bedrock was used from east bank of lower embankment as well as north side of upper embankment (drain trench excavation). Type 3 bedrock was used as structural fill material.
- Completed compaction of lift #40E (901.15 m Target elevation) which was started on previous shift and ended at 6:30am. Surveyed elevation came in .05 m low, at 901.10 m.
- Completed compaction of lift #41E (901.5 m Target elevation) which was started on previous shift and ended at 7:20am. Surveyed elevation came in .05 m Low, at 901.45 m.
- Completed compaction of lift #42E (901.85 m Target elevation) which was started 7:50am and ended at 2:15pm. Compaction and moisture content testing was conducted at 2:00pm on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 99.3% and 98.2% with moisture of 3.8% and 4.8% respectively. Surveyed elevation came in .08 m low, at 901.77 m.
- Completed compaction for lift #43E (902.17 m Target elevation) which was started 11:30am and ended at 2:25pm. Surveyed elevation came in .04 m low, at 902.13 m.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Placement and compaction ongoing for lift #44E (902.53 m Target elevation) which was started 2:30pm and to be finished during next shift. To be surveyed at nightshift
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill. One pass with loaded rock truck observed in areas with heavy traffic, this BGC method after performing test strip.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 170 loads using CAT 777 Haul Trucks, 37 loads using CAT 773 Haul Trucks and 32 loads using CAT 740 Haul Trucks were placed during shift. Assuming 36 m^3, 22 m^3, and 16 m^3 per load respectively, a total of 7446 m^3 of structural fill was placed on the embankment during shift.

.

3.0 DISCUSSION/OTHER

- CAT 777 Haul Truck tire blew on the lift, and work around the truck had to stop until it was repaired. Lifts continued to be placed and when truck was repaired the low areas were brought up in lifts no greater than 50mm.

4.0 CLOSURE

File:	ENG.WARC03235-02.005		Low 3°C

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-10 Dozer	12	Placing structural fill
	CAT D-6 Dozer With GPS	12	Placing structural fill
	CAT 992G Loader	12	Loading Structural fill from ADR Stockpile
	5 x CAT 777 Haul Truck	12	Hauling structural fill to embankment
	Volvo SD160 Compactor	6	Compacting structural fill at embankment
	CAT CS 78 B Compactor	12	Compacting structural fill at embankment
	CAT CS 68 B Compactor	12	Compacting structural fill at embankment
	Hitachi 1200 Shovel	10	Loading Structural fill from Stockpile 1
	CAT D-10 Dozer	12	Pushing material to ADR stockpile

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR and Stockpile 1. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned for part of the day but was stopped at 10pm.
- Completed compaction of lift #44E (902.53 m Target elevation) which was started on previous shift and ended at 11:00pm. Compaction and moisture content testing was conducted at 9:00pm and 11:00 pm on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 97.6%, 97.8 and 98.2% with moisture of 3.6%, 8.2 and 4.2% respectively. Surveyed elevation came in .08 m low, at 902.45 m.
- Completed compaction of lift #45E (902.85 m Target elevation) which was started at 10:00pm and ended at 3:30am. Compaction and moisture conten8t testing was conducted at 1:00am and 2:00 am on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 97.5% and 97.0% with moisture of 7.2% on both tests. Surveyed elevation came in .05 m Low, at 902.8 m.
- Placement and compaction of lift #46E (903.2 m Target elevation) ongoing to next shift. Lift was started 2:00am. Compaction and moisture content testing was conducted at 5:45am on compacted section using a nuclear densometer. Test performed and achieved a compaction of 98.7% with moisture of 4.2%. Surveyed elevation to be completed during next shift.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill. Minimum one pass with loaded rock truck over high traffic area, this BGC method after performing test strip.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 174 loads using CAT 777 Haul Trucks, 66 loads using CAT 773 Haul Trucks were placed during shift. Assuming 36 m^3, and 22 m^3 per load respectively, a total of 7716 m^3 of structural fill was placed on the embankment during shift.

.

3.0 DISCUSSION/OTHER

- Moisture conditioning of stock pile was stopped at the end of lift #44E. Testing showed a moisture of 8.2% in areas with moisture conditioning and 4.3% in areas without. On following lifts, testing showed moistures of 7.2%. Material did not show major deflections or pumping as compactors or haul trucks ran on it.

4.0 CLOSURE

	Link Belt 425x4 Excavator	10	Excavating at drainage trench
	CAT D-10 Dozer	12	Pushing material to ADR stockpile

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned throughout the day.
- Type 3 bedrock was used from east bank of lower embankment as well as north side of upper embankment (drain trench excavation). Type 3 bedrock was used as structural fill material.
- Completed compaction of lift #47W (903.13 m Target elevation) which was started on previous shift and ended at 1:00pm.
- Embankment fill material started being placed at 2:00pm from the Event Pond. Permafrost was observed coming from the Event Pond and one load on east embankment had to be hauled out.
- Structural fill was observed to be getting dry in midafternoon. Pelly Construction began watering stockpile 1 at 3:10pm.
- Completed compaction of lift #48E (903.88 m Target elevation) which was started at 12:00pm and ended at 3:45pm. Surveyed elevation came in .05 m Low, at 903.83 m.
- Placement and compaction ongoing for lift #49E (904.28 m Target elevation) which was started 3:45pm and to be finished during next shift. To be surveyed at nightshift

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with Volvo SD160 Compactor as required. This meets the BGC method specification requirement for structural fill. One pass with loaded rock truck observed in west side of lift, this BGC method after performing test area.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 165 loads using CAT 777 Haul Trucks, 55 loads using CAT 773 Haul Trucks and 39 loads using CAT 740 Haul Trucks were placed during shift. Assuming 36 m^3, 22 m^3, and 16 m^3 per load respectively, a total of 7774 m^3 of structural fill was placed on the embankment during shift.

.

3.0 DISCUSSION/OTHER

- Triple 7 hauling material from the Event Pond was observed to have permafrost in the material. The material was hauled out of east embankment with an excavator.

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR and Event Pond. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned from 1am until end of shift.
- Completed placement and compaction of lift #49E (904.28 m Target elevation) which was started on previous shift and ended at 1:30am. Compaction and moisture content testing was conducted at 10:00pm and 1:00am on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 97.1%, and 95.8% with moisture of 4.2%, and 6.0% respectively. Surveyed elevation came in .05 m low, at 904.23 m.
- Completed placement, compaction ongoing, for lift #50E (904.68 m Target elevation) which was started at 1:00am and continued into next shift. Compaction and moisture conten8t testing was conducted at 5:15am on compacted section using a nuclear densometer. Test performed and achieved a compaction of 96.7% with moisture of 3.8% on both tests. Surveyed elevation came in .06 m Low, at 904.62 m.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using CAT D-10 Dozer equipped with GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Approximately 175 loads using CAT 777 Haul Trucks. Assuming 36 m^3 per load, a total of 6300 m^3 of structural fill was placed on the embankment during shift.

3.0 DISCUSSION/OTHER

- Previously dug sump required the edge of lift to be pulled back to remove areas where packers were not able to access. CAT D-10 Dozer used to key into wall and create a manageable edge. Link Belt 425x4 Excavator then used to clean off edge and place excess loose material up onto bank. During this process the area where sump was previously located was noticed to be oversaturated. Material removed, and water started seeping onto lift. Additional ADR structural fill brought in, placed and packed. After 3 hours, water was pooling on surface directly north of replaced material. Additional material removed from lift, dry material placed and compacted.

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned throughout the day.
- Type 3 bedrock was used from east bank of lower embankment as well as north side of upper embankment (drain trench excavation). Type 3 bedrock was used as structural fill material.
- Completed compaction of lift #51E & 51W (905.07 m Target elevation) which was started on previous shift and ended at 1:30pm. Compaction and moisture content testing was conducted at 1:05pm and 1:15pm on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 95.1% and 97.5% with moisture of 7.4% and 4.7% respectively. Surveyed elevation came in .05 m low, at 907.02 m.
- Structural fill was observed to be getting dry in midafternoon. Material still able to reach design compaction.
- Completed compaction of lift #52E & 52W (905.47 m Target elevation) which was started at 1:30pm and ended at 6:15pm. Compaction and moisture content testing was conducted at 5:05pm and 6:15pm on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 96.3% and 100.0% with moisture of 5.3% and 3.0% respectively. Surveyed elevation came in .03 m Low, at 905.44 m.
- Started placement, and compaction for lift #53E (905.83 m Target elevation) which was started at 5:45pm and continued into next shift. Survey to be completed during next shift.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Structural fill being hauled from Event Pond was observed to have permafrost at 5:30pm. Excavator was brought over and dug out material with permafrost from embankment.
- ADR road just before ramp into embankment has a large puddle of water. Excavator and grader spent majority of the day blading water off to the side of ADR road.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill. One pass with loaded rock truck observed in west side of lift, this BGC method after performing test area.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 184 loads using CAT 777 Haul Trucks, 40 loads using CAT 773 Haul Trucks and 46 loads using CAT 740 Haul Trucks were placed during shift. Assuming 36 m^3, 22 m^3, and 16 m^3 per load respectively, a total of 8240 m^3 of structural fill was placed on the embankment during shift.

.

3.0 DISCUSSION/OTHER

- CAT 777 Haul Trucks hauling material from the Event Pond was observed to have permafrost in the material. The material was hauled out of west embankment with an excavator.

	Hitachi 1200 Shovel	12	Loading Structural fill from Event Pond
	CAT D-6 Dozer	12	Placing structural fill

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR and Event Pond. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Event Pond material had higher moisture than ADR. Material was mixed during placement; no moisture conditioning used.
- Completed compaction of lift #52E (905.47 m Target elevation) which was started on previous shift and ended at 7:00pm. Surveyed elevation came in .03 m low, at 905.44 m.
- Completed placement, and compaction for lift #53E (905.89 m Target elevation) which was started at 6:00pm and ended at 12:00pm. Compaction and moisture content testing was conducted at 9:30pm on compacted section using a nuclear densometer. Test performed and achieved a compaction of 96.8% with moisture of 7.5%. Surveyed elevation came in .06 m Low, at 904.62 m.
- Completed placement, and compaction for lift #54E (905.89 m Target elevation) which was started at 11:00pm and ended at 6:00am. Compaction and moisture content testing was conducted at 2:30pm on compacted section using a nuclear densometer. Test performed and achieved a compaction of 95.7%, and 96.3% with moisture of 5.2% on both lifts. Surveyed elevation came in .06 m Low, at 905.82 m.
- Placement, and compaction started for lift #53E (906.27 m Target elevation) which was started at 5:00am and continued onto next shift. Survey to be completed during next shift.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using CAT D-10 Dozer equipped with GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 209 loads using CAT 777 Haul Trucks. Assuming 36 m^3 per load, a total of 7524 m^3 of structural fill was placed on the embankment during shift.

3.0 DISCUSSION/OTHER

- Pooling water at the NE corner of lift left surface material over saturated. Oversaturated Material pushed off the lift with CAT D-10 Dozer, leaving a 0.32 cut on the lift. Cut was filled with structural fill and packed with Volvo SD160 Compactor.
- Organics present on east bank, scooped out with Link Belt 425x4 Excavator and removed from area.

- Structural fill being hauled from Event Pond was observed to have permafrost at 12:50pm. Link-Belt 245 excavator was brought over and dug out material with permafrost from embankment.
- ADR road just before ramp into embankment has a large puddle of water. Excavator and grader spent majority of the day blading water off to the side of ADR road.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill. One pass with loaded rock truck observed in west side of lift, this BGC method after performing test area.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 184 loads using CAT 777 Haul Trucks, 40 loads using CAT 773 Haul Trucks and 46 loads using CAT 740 Haul Trucks were placed during shift. Assuming 36 m^3, 22 m^3, and 16 m^3 per load respectively, a total of 10342 m^3 of structural fill was placed on the embankment during shift.

.

3.0 DISCUSSION/OTHER

- Triple 7 hauling material from the Event Pond was observed to have permafrost in the material. The material was hauled out of east embankment with an excavator.
- ADR road just before embankment ramp has a large puddle in front. Pelly Construction used a Link-Belt 245 Excavator to bail out water to make it safer for heavy vehicles to get onto the embankment.

4.0 CLOSURE

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-10 Dozer	12	Placing structural fill
	CAT D-6 Dozer With GPS	12	Placing structural fill
	CAT 992G Loader	12	Loading Structural fill from ADR Stockpile
	5 x CAT 777 Haul Truck	12	Hauling structural fill to embankment
	Volvo SD160 Compactor	12	Compacting structural fill at embankment
	CAT CS 78 B Compactor	12	Compacting structural fill at embankment
	CAT CS 68 B Compactor	12	Compacting structural fill at embankment
	Hitachi 1200 Shovel	12	Loading Structural fill from Event Pond
	CAT D-6 Dozer	12	Placing structural fill
	CAT D-10 Dozer	12	Pushing material to ADR stockpile

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR and Event Pond. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned from 1am until end of shift.
- Completed placement and compaction of lift #57E (907.48 m Target elevation) which was started on previous shift and ended at 9:30pm. Compaction and moisture content testing was conducted at 7:30pm and 9:00pm on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 95.6% and 97.3% with moisture of 6.2% and 6.7% respectively. Surveyed elevation came in .02 m low, at 907.46 m.
- Completed placement, and compaction for lift #58E (907.91 m Target elevation) which was started at 8:30am and ended at 5:00am. Compaction and moisture content testing was conducted at 3:00am and 5:45am on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 96.5% and 99.2% with moisture of 4.7% and 4.9%. Surveyed elevation came in .04 m Low, at 907.87 m.
- Started placement, and compaction for lift #59E (908.32 m Target elevation) which was started at 4:00am and continued into next shift. Survey to be completed during next shift.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill.

- Ongoing grade checks during placement by contractor using CAT D-10 Dozer equipped with GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 219 loads using CAT 777 Haul Trucks. Assuming 36 m^3 per load, a total of 7884 m^3 of structural fill was placed on the embankment during shift.

3.0 DISCUSSION/OTHER

- Two sections of lift 58E, in close proximity to each other, were oversaturated and showing heavy deflection. Material removed with Link Belt 490x4 Excavator, and hauled off the lift. Structural material placed and compacted in lift no greater than 0.50 m.

specification requirement for structural fill. One pass with loaded rock truck observed in west side of lift, this BGC method after performing test area.

- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 227 loads using CAT 777 Haul Trucks, 32 loads using CAT 773 Haul Trucks and 17 loads using CAT 740 Haul Trucks were placed during shift. Assuming 36 m^3, 22 m^3, and 16 m^3 per load respectively, a total of 9148 m^3 of structural fill was placed on the embankment during shift.

.

3.0 DISCUSSION/OTHER

- CAT D-10 Dozer cut out a soft spot of structural fill on embankment. More structural fill was brought over with a CAT 777 Haul Truck.
- ADR road just before embankment ramp has a large puddle in front. Pelly Construction used a Link Belt 425x4 Excavator to bail out water to make it safer for heavy vehicles to get onto the embankment.
- CAT 777 Haul Trucks were dumping structural fill on the ramp entering the Heap Leach embankment. CAT D-10 Dozer was spreading structural fill too decrease the grade on ramp so vehicles were able to get up.

	Volvo 40 Tonne Haul Truck	12	Placing structural fill

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR and Event Pond. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned from 1am until end of shift.
- Type 3 bedrock was used from east bank of lower embankment as well as north side of upper embankment (drain trench excavation). Type 3 bedrock was used as fill material. Material was mixed with structural fill from ADR.
- Completed placement and compaction of lift #61E (909.12 m Target elevation) which was started on previous shift and ended at 11:00pm. Compaction and moisture content testing was conducted at 7:30pm and 11:30pm on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 99.6% and 98.9% with moisture of 4.3% and 6.9% respectively. Surveyed elevation came in .06 m low, at 909.06 m.
- Completed placement, and compaction for lift #62E (909.51 m Target elevation) which was started at 10:00pm and ended at 5:00am. Compaction and moisture content testing was conducted at 2:00am and 5:15am on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 97.3% and 95.5% with moisture of 6.8% and 7.2%. Surveyed elevation came in .08 m Low, at 909.43 m.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Started placement, and compaction for lift #59E (909.88 m Target elevation) which was started at 4:00am and continued into next shift. Survey to be completed during next shift.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 219 loads using CAT 777 Haul Trucks. Assuming 36 m^3 per load, a total of 7884 m^3 of structural fill was placed on the embankment during shift.

3.0 DISCUSSION/OTHER

- Areas where new lift are meeting old lift need to be keyed into. Slopes of previously placed material could have loose material which has been exposed to rain for previous week, leaving over saturated pockets. Material can be spread out onto lift to spread out wet material and mix it with structural fill.

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR and Event Pond. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned from 1am until end of shift.
- Type 3 bedrock was used from east bank of lower embankment as well as north side of upper embankment (drain trench excavation). Type 3 bedrock was used as fill material. Material was mixed with structural fill from ADR.
- Completed placement and compaction of lift #65E (910.66 m Target elevation) which was started on previous shift and ended at 9:00pm. Surveyed elevation came in .06 m low, at 910.60 m.
- Completed placement, and compaction for lift #66E (911.05 m Target elevation) which was started at 8:00pm and ended at 5:00am. Compaction and moisture content testing was conducted at 8:00pm on compacted section using a nuclear densometer. Test performed and achieved a compaction of 96.6% with moisture of 6.8%. Surveyed elevation came in .09 m Low, at 910.96 m.
- Started placement, and compaction for lift #67E (911.41 m Target elevation) which was started at 4:00am and continued into next shift. Survey to be completed during next shift.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 239 loads using CAT 777 Haul Trucks. Assuming 36 m^3 per load, a total of 8604 m^3 of structural fill was placed on the embankment during shift.

3.0 DISCUSSION/OTHER

- Foundation on east bank not previously approved, due to uncompacted material covering bedrock. East bank cleared of loose material, exposing bedrock, using Link Belt 490x4 Excavator. Type 3 bedrock used as structural fill in lift #66.
- North end of lift was not completely uncovered due to large amount of material, and lack of survey data. Lift did not extend into loose material, to be looked at by next shift.
- Heap of loose material previously placed from upper embankment down and extended into current lifts. Loose structural fill removed and placed within lift #67.

Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 218 loads using CAT 777 Haul Trucks, 72 loads using CAT 773 Haul Trucks and 0 loads using CAT 740 Haul Trucks were placed during shift. Assuming 36 m^3, 22 m^3, and 16 m^3 per load respectively, a total of 9432 m^3 of structural fill was placed on the embankment during shift.

.

3.0 DISCUSSION/OTHER

- Link Belt 490x4 Excavator loading structural fill from East wall on east embankment. CAT 773 Haul Truck would haul from North East corner and place structural fill on embankment.
- ADR road just before embankment ramp has a large puddle in front. Pelly Construction used a Link Belt 425x4 Excavator to bail out water to make it safer for heavy vehicles to get onto the embankment.
- Three large rocks, two from the west embankment on lift #68 and one on the east embankment on lift #69 need to be removed. Will be excavated on next shift.

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-10 Dozer	12	Placing structural fill
	CAT D-6 Dozer With GPS	12	Placing structural fill
	CAT 992G Loader	12	Loading Structural fill from ADR Stockpile
	5 x CAT 777 Haul Truck	12	Hauling structural fill to embankment
	Volvo SD160 Compactor	12	Compacting structural fill at embankment
	CAT CS 78 B Compactor	12	Compacting structural fill at embankment
	Link Belt 750 x4 Excavator	12	Loading Structural fill from Event Pond
	CAT D-10 Dozer	12	Pushing material to ADR stockpile
	Link Belt 490x4 Excavator	12	Loading Type 3 BR from embankment
	Volvo 40 Tonne Haul Truck	12	Placing structural fill

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR and Event Pond. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned from 1am until end of shift.
- Type 3 bedrock was used from east bank of lower embankment as well as north side of upper embankment (drain trench excavation). Type 3 bedrock was used as fill material. Material was mixed with structural fill from ADR.
- Removed boulders, filled in holes and completed compaction of lift #68E. Surveyed elevation came in at 911.76 m.
- Completed placement and compaction of lift #69E (912.21 m Target elevation) which was started on previous shift and ended at 12:00am. Compaction and moisture content testing was conducted at 10:00pm and 1:00am on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 96.5% and 97.1% with moisture of 7.6% and 7.2% respectively. Surveyed elevation came in .06 m low, at 912.15 m.
- Completed placement, and compaction for lift #70E (912.60 m Target elevation) which was started at 11:00pm and ended at 6:00am. Compaction and moisture content testing was conducted at 5:15am on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 97.1%, 95.2% and 96.2% with moisture of 4.3%, 5.5%, and 5.1%. Surveyed elevation came in .05 m Low, at 912.55 m.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Started placement, and compaction for lift #71E (913.00 m Target elevation) which was started at 5:00am and continued into next shift. Survey to be completed during next shift.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 242 loads using CAT 777 Haul Trucks and 66 loads using CAT 773 Haul Truck. Assuming 36 m^3 and 22 m^3 per load respectively, a total of 10164 m^3 of structural fill was placed on the embankment during shift.

3.0 DISCUSSION/OTHER

- Foundation on east bank had uncompacted material covering bedrock. East bank keyed into, exposing bedrock, using CAT D-6 Dozer. Type 3 bedrock used as structural fill in lift #69E.
- Heap of loose material previously placed from upper embankment down and extended into current lifts. Loose structural fill pushed with CAT D-10 Dozer into lifts #69E and #70E.
- Initial compaction test in NE corner of lift #70 did not meet specification. Surrounding areas tested, with compaction above 95%, as per specification. Observed loaded haul truck doing 1 pass of failed area, which was retested and achieved specified compaction.

	Hitachi 1200 Shovel	12	Loading Structural fill from Event Pond
	CAT D-10 Dozer	12	Pushing material to ADR stockpile

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned throughout the day.
- Completed compaction of lift #71E & 71W (913.00 m Target elevation) which was started on the pervious shift and ended at 12:05pm. Compaction and moisture content testing was conducted at 10:05am and 1:00pm on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 98.0% and 95.2% with moisture of 4.1% and 7.3% respectively. Surveyed elevation came in .08m Low, at 912.92 m.
- Structural fill was observed to be getting dry in midafternoon. Material still able to reach design compaction.
- Completed compaction of lift #72 (913.37 m Target elevation) which was started at 12:05pm and will end on next shift. Compaction and moisture content testing was conducted at 5:30pm compacted section using a nuclear densometer. Test performed and achieved a compaction of 99.4% with a moisture of 4.0%.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill. One pass with loaded rock truck observed in west side of lift, this BGC method after performing test area.

p. 780.451.2121 f. 780.454.5688

- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 200 loads using CAT 777 Haul Trucks, 53 loads using CAT 773 Haul Trucks and 6 loads using CAT 740 Haul Trucks were placed during shift. Assuming 36 m^3, 22 m^3, and 16 m^3 per load respectively, a total of 8462 m^3 of structural fill was placed on the embankment during shift.

.

3.0 DISCUSSION/OTHER

- Link Belt 490x4 Excavator loading structural fill from East wall on east embankment. CAT 773 Haul Truck would haul from North East corner and place structural fill on embankment.
- A new ramp off the ADR road is being built. The current ramp is getting to steep for CAT 777 Haul Trucks to go up. New ramp should be in operation next shift.
- Due to heavy rains on night shift a standing water and a soft spot of structural fill was observed on the top layer of embankment before first full lift was placed.
- Organics were observed coming from ADR stockpile. BGC recommend that CAT D-10 Dozer stay clear of ADR stockpile while removing topsoil from ADR slide slopes.

specification requirement for structural fill. One pass with loaded rock truck observed in west side of lift, this BGC method after performing test area.

- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 230 loads using CAT 777 Haul Trucks, 51 loads using CAT 773 Haul Trucks and 8 loads using CAT 740 Haul Trucks were placed during shift. Assuming 36 m^3, 22 m^3, and 16 m^3 per load respectively, a total of 9530 m^3 of structural fill was placed on the embankment during shift.

.

3.0 DISCUSSION/OTHER

- Link Belt 490x4 Excavator loading structural fill from East wall on east embankment. CAT 773 Haul Truck would haul from North East corner and place structural fill on embankment.
- A new ramp off the ADR road was in operation on night shift, old ramp has been sealed off with a berm.
- Link Belt 490x4 Excavator cleared loose structural fill from east embankment wall. Fill was than spread out using CAT D-10 Dozer on next lift.
- Permafrost was observed in haul trucks coming from Event Pond. Link Belt 490x4 Excavator removed large clumps of permafrost from embankment.

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR and Event Pond. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned from 1am until end of shift.
- Type 3 bedrock was used from east bank. Type 3 bedrock was used as fill material. Material was mixed with structural fill from ADR and Event Pond.
- Completed compaction of lift #74 (914.14 m Target elevation) which was started on previous shift and ended at 8:00pm. Compaction and moisture content testing was conducted at 7:30pm on compacted section using a nuclear densometer. Test performed and achieved a compaction of 99.6% with moisture of 5.6%. Surveyed elevation came in .05m low, at 914.09 m.
- Completed placement, and compaction for lift #75 (914.54 m Target elevation) which was started at 6:30pm and continued onto next shift. Compaction and moisture content testing was conducted at 12:00am and 3:00am on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 97.3%, 95.9% and 97.7% with moisture of 6.8%, 5.5%, and 4.7%. Surveyed elevation came in .06 m Low, at 914.49 m.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Started placement, and compaction for lift #76 (914.94 m Target elevation) which was started at 3:00am and continued into next shift. Survey to be completed during next shift.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 249 loads using CAT 777 Haul Trucks and 71 loads using CAT 773 Haul Truck. Assuming 36 m^3 and 22 m^3 per load respectively, a total of 10526 m^3 of structural fill was placed on the embankment during shift.

3.0 DISCUSSION/OTHER

- Foundation on east bank had uncompacted material covering bedrock. CAT D-10 Dozer used to push material down south half of east embankment onto lift. Material piled onto lift was spread out onto compacted lifts and used in succeeding lifts. North half of embankment had larger piles of material. Attempted to key into lift to expose bedrock, using CAT D-6 Dozer and were not able to get to bedrock. Used Link Belt 490x4 Excavator to load material onto CAT 773 Haul Truck and place into succeeding lifts. Removal of material from east bank carried onto following shift.
- 2 rocks protruding lift at south east corner. Next lift to remove them and fill void.
- Very south east corner of lift not extended to boundary between toe and east bank. Next shift to fill low area and compact.

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR and Event Pond. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned from 1am until end of shift.
- Type 3 bedrock was used from bank north east of the embankment. Type 3 bedrock was used as fill material. Material was mixed with structural fill from ADR and Event Pond.
- Completed compaction of lift #77E (915.31 m Target elevation) which was started on previous shift and ended at 10:00pm. Compaction and moisture content testing was conducted at 7:30pm and 10:00pm on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 97.3% and 98.5 with moisture of 4.2% and 5.7%, respectively. Surveyed elevation came in .06m low, at 915.25 m.
- Started placement, and compaction for lift #78E (915.70 m Target elevation) which was started at 9:30pm and continued onto next shift. Compaction and moisture content testing was conducted at 12:00am and 3:00am on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 95.2%, 96.3% and 98.7% with moisture of 5.0%, 4.5%, and 3.7%. Surveyed elevation came in .05 m Low, at 915.65 m.
- Started placement, and compaction for lift #79E (916.10 m Target elevation) which was started at 4:00am and continued into next shift. Survey to be completed during next shift.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 243 loads using CAT 777 Haul Trucks and 129 loads using CAT 773 Haul Truck. Assuming 36 m^3 and 22 m^3 per load respectively, a total of 11586 m^3 of structural fill was placed on the embankment during shift.

3.0 DISCUSSION/OTHER

- West bank had a test pit dug into face. Structural fill placed and compacted with lifts. Packers drove directly into dug out area when packing.
- Haul truck broke down on top of lift #77, completion of lift 78 delayed until next shift. Truck needed be removed before material could be placed and compacted.

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-10 Dozer	12	Placing structural fill
	CAT D-6 Dozer With GPS	12	Placing structural fill
	CAT 992G Loader	12	Loading Structural fill from ADR Stockpile
	8 x CAT 777 Haul Truck	12	Hauling structural fill to embankment
	Volvo SD160 Compactor	12	Compacting structural fill at embankment
	CAT CS 78 B Compactor	12	Compacting structural fill at embankment
	Hitachi 1200 Shovel	12	Loading Structural fill from Event Pond
	CAT 773 Haul Truck	12	Placing structural fill/type 3 BR
	Link Belt 490x4 Excavator	12	Loading Type 3 BR from embankment

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR and Event Pond. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned from 1am until end of shift.
- Type 3 bedrock was used from bank north east of the embankment. Type 3 bedrock was used as fill material. Material was mixed with structural fill from ADR and Event Pond.
- Completed compaction of lift #77E (915.31 m Target elevation) which was started on previous shift and ended at 10:00pm. Compaction and moisture content testing was conducted at 7:30pm and 10:00pm on compacted sections using a nuclear densometer. 	CAT D-10 Dozer	12	Pushing material to ADR stockpile

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned throughout the day.
- Completed compaction of lift #78 (915.70 m Target elevation) which started and ended on pervious shift. Compaction and moisture content testing was conducted at 9:00am, on compacted sections using a nuclear densometer. Test performed and achieved a compaction of 95.6% with moisture of 4.3 %. Surveyed elevation came in .05m Low, at 915.65 m.
- Structural fill was observed to be getting dry in midafternoon. Material still able to reach design compaction.
- Completed compaction of lift #79 (916.10 m Target elevation) which was started on the pervious shift and end at 1:00pm. Compaction and moisture content testing was conducted at 9:30am, 2:50pm, 3:00pm and 3:10pm on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 97.9%, 96.5%, 96.6% and 95.7% with a moisture of 6.0%, 4.3% 5.4% and 4.9% respectfully. Surveyed elevation came in .05m Low, at 916.05 m.
- Completed compaction of lift #80 (916.50 m Target elevation) which was started 1:00pm and will end on the next shift. Compaction and moisture content testing was conducted at 5:50pm and 6:00pm on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 96.5% and 97.0% with a moisture of 4.9% and 4.7% respectfully.

Tetra Tech Canada Inc.
14940 - 123 Avenue

p. 780.451.2121 f. 780.454.5688

- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill. One pass with loaded rock truck observed in west side of lift, this BGC method after performing test area.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 259 loads using CAT 777 Haul Trucks, 138 loads using CAT 773 Haul Trucks and 0 loads using CAT 740 Haul Trucks were placed during shift. Assuming 36 m^3, 22 m^3, and 16 m^3 per load respectively, a total of 12072 m^3 of structural fill was placed on the embankment during shift.

.

3.0 DISCUSSION/OTHER

- Link Belt 490x4 Excavator loading structural fill from East wall on east embankment. CAT 773 Haul Truck would haul from North East corner and place structural fill on embankment.
- Link Belt 490x4 Excavator cleared loose structural fill from east embankment wall. Fill was than spread out using CAT D-10 Dozer on next lift.
- A CAT 777 Hual Truck had a leak on night shift and spilled oil on the embankment. Day shift cleaned up the spill using Link Belt 245x4 Excavator. Structural fill was brought over from east wall abutment and compacted.

- Ongoing grade checks during placement by contractor using CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 255 loads using CAT 777 Haul Trucks and 90 loads using CAT 773 Haul Truck. Assuming. 36 m^3 and 22 m^3 per load respectively, a total of 11160 m^3 of structural fill was placed on the embankment during shift.

3.0 DISCUSSION/OTHER

- CAT D-10 Dozer North used key into edges along east bank. Material spread out onto compacted lift and used in succeeding lifts. North half of embankment had larger piles of material. Used Link Belt 490x4 Excavator to load material onto CAT 773 Haul Truck and place into succeeding lifts. Removal of material from east bank carried onto following shift.
- Link Belt 490x4 Excavator hit, and damaged liner in a drainage trench north of the embankment. Work in area stopped. Assessment and repair to be completed by next shift.

- Structural fill was hauled from ADR. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned throughout the day.
- Completed compaction of lift #84 (918.06 m Target elevation) which started and ended at 4:30pm. Compaction and moisture content testing was conducted at 10:40am, 11:00am, 11:40 am and 4:15pm, on compacted sections using a nuclear densometer. Test performed and achieved a compaction of 96.6%, 100.1%, 98.3% and 95.9% with moisture of 4.1 %, 5.2%, 4.3% and 3.9% respectfully. Surveyed elevation came in .06m Low, at 918.00 m.
- Permafrost was observed in embankment pad on Lift #84 from night shift. Pelly Construction cut out sections of permafrost from embankment pad with Link Belt 490x4 Excavator and CAT D-6R and brought in new structural fill from ADR and Event Pond. Compactors rolled over sections with 3 additional passes.
- Completed compaction of lift #85 (918.45 m Target elevation) which was started at 9:30am and end at 6:30pm. Compaction and moisture content testing was conducted at 4:45pm and 4:55pm on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 98.8% and 96.5% with a moisture of 4.6% and 3.9% respectfully. Surveyed elevation came in .05m Low, at 918.40 m.
- Lift #86 (918.85 m Target elevation) started at 6:30pm and it will end next shift.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill. One pass with loaded rock truck observed in west side of lift, this BGC method after performing test area.
- Ongoing grade checks during placement by contractor using GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 223 loads using CAT 777 Haul Trucks, 19 loads using CAT 773 Haul Trucks and 0 loads using CAT 740 Haul Trucks were placed during shift. Assuming 36 m^3, 22 m^3, and 16 m^3 per load respectively, a total of 8446 m^3 of structural fill was placed on the embankment during shift.

3.0 DISCUSSION/OTHER

- Link Belt 490x4 Excavator loading structural fill from East wall on east embankment. CAT 773 Haul Truck would haul from North East corner and place structural fill on embankment pad.
- Permafrost was observed to be in structural fill on lift #84 from night shift. Pelly Construction informed BGC and Tetra Tech that night shift Hitachi 1200 Shovel Excavator operator was digging in the wrong location at the Event Pond. Sections of embankment that had permafrost have been cut out and hauled off the embankment pad. Structural fill was than brought from ADR which was placed in cut sections and compacted. Tests were performed and achieve compaction of 95% or higher.

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-10 Dozer	12	Placing structural fill
	CAT D-6 Dozer With GPS	12	Placing structural fill
	CAT 992G Loader	12	Loading Structural fill from ADR Stockpile
	6 x CAT 777 Haul Truck	12	Hauling structural fill to embankment
	Volvo SD160 Compactor	12	Compacting structural fill at embankment
	CAT CS 78 B Compactor	12	Compacting structural fill at embankment
	Hitachi 1200 Shovel	12	Loading Structural fill from Event Pond
	2 x CAT 773 Haul Truck	12	Hauling structural fill/type 3 BR
	Link Belt 490x4 Excavator	12	Loading Type 3 BR from embankment

2.0 HEAP LEACH FACILITY

- Structural fill was hauled from ADR and Event Pond. Placed structural fill visually appeared fine, with less than 30% over 19 mm and with material under 150 mm. This meets the BGC method specification requirement for structural fill. Material from ADR stockpile was moisture conditioned from 1am until end of shift.
- Type 3 bedrock was used from bank north east of the embankment. Type 3 bedrock was used as fill material. Material was mixed with structural fill from ADR and Event Pond.
- Completed placement, and compaction for lift #85 (918.45 m Target elevation) which was started on previous shift and ended at 8:15 am. Surveyed elevation came in .05 m low, at 918.40 m.
- Started placement, and compaction for lift #86E (918.85 m Target elevation) which was started at 2:00am and continued into next shift. Compaction and moisture content testing was conducted at 10:30pm, 1am and 3:30am on compacted sections using a nuclear densometer. Tests performed and achieved a compaction of 98.1%, 98.7%, and 97.5% with moisture of 4.2%, 3.8%, and 4.7%. Survey to be completed during next shift.
- Two passes were observed with sufficient speed and overlap using the CAT CS 78 B Compactor or Volvo SD160 Compactor. Observed 3 passes with CAT CS 68 B Compactor as required. This meets the BGC method specification requirement for structural fill.

14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Ongoing grade checks during placement by contractor using CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed elevation was placed at approximately target design elevation of 45 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 242 loads using CAT 777 Haul Trucks and 141 loads using CAT 773 Haul Truck. Assuming. 36 m^3 and 22 m^3 per load respectively, a total of 11814 m^3 of structural fill was placed on the embankment during shift.

3.0 DISCUSSION/OTHER

- Compaction and moisture content testing was conducted on test pad constructed during previous shift using a nuclear densometer. Test performed and achieved a dry density of 2190 kg/m³ with moisture of 3.5%.
- Previous shift had to remove frozen material from lift placed during nightshift. Material coming from event pond was periodically checked. Minimal evidence of frost was found in 1 load, operator at event pond notified. following loads did not have any frozen material.

2.0 HEAP LEACH FACILITY

- Cross shift arrival on site approximately 23:45 during night shift.
- Continued placement of structural fill at Heap Leach Facility Embankment.
- Compaction for lift elevation 919.62 m (design elevation) ongoing from start of night shift and was completed by 00:50. Compaction was completed by 01:15. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 95.8 % to 99.5 %. Moisture content ranged from 4.5 % MC to 6.2 % MC. One of which, falls below the targeted BGC method specification requirements for moisture content. As built average elevation of lift surveyed 0.07 m below the design elevation at 919.55 m.
- Placement of lift elevation 920.0 m (design elevation) began at 00:45. Placement was incomplete by the end of shift. Compaction for this lift began at 02:45 and was incomplete by the end of shift. Compaction and moisture content testing was conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 95.7 % to 95.9%. Moisture content ranged from 4.4 % MC to 6.0 % MC. One of which, falls below the targeted BGC method specification requirements for moisture content. As built average elevation of lift surveyed 0.07 m below the design elevation at 919.93 m.
- Compaction for the embankment was completed using at least two passes (back and forth) of either 11 tonne or the 13.4 tonne vibratory roller or using three passes with the 9 tonne vibratory roller. Each pass was

Tetra Tech Canada Inc.

p. 780.451.2121 f. 780.454.5688

conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.

- Excavators loaded structural fill from both upper and lower ADR stockpiles which have been previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. Oversized cobbles or boulders were present in the stockpile but were removed prior to loading and placement. Oversized cobbles or boulders that were placed were removed prior to compaction.
- Ongoing grade checks during placement by contractor using a CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed lift elevation was placed at approximately 45 cm loose lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Approximately 175 loads using CAT 777 haul trucks and approximately 140 loads using CAT 773 haul trucks were placed during shift. Assuming 36 m^3 and 22 m^3 respectively, a total of 9,380 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Placement of lift elevation 920.38 m (design elevation) completed during day shift. Compaction was completed by 19:00. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The remaining tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 achieved 96.9 % with a moisture content 5.9 % MC. This satisfies the targeted BGC method specification requirements for moisture content. As built average elevation of lift surveyed 0.05 m below the design elevation at 920.32 m.
- Placement of lift elevation 920.77 m (design elevation) continued from day shift at 19:25. Placement was completed by 05:20. Compaction for this lift began at 20:10 and was completed by 05:25. Compaction and moisture content testing was conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 95.2 % to 98.6%. Moisture content ranged from 3.5 % MC to 5.9 % MC. One of which, falls below the targeted BGC method specification requirements for moisture content. As built average elevation of lift surveyed 0.07 m below the design elevation at 920.70 m.
- Placement of lift elevation 921.15 m (design elevation) began at 04:15 and was incomplete by the end of shift. Compaction for this lift began at 6:10 and was incomplete by the end of shift.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Compaction for the embankment was completed using at least two passes (back and forth) of either 11 tonne or the 13.4 tonne vibratory roller or using three passes with the 9 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Excavators loaded structural fill from both upper and lower ADR stockpiles which have been previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. Oversized cobbles or boulders were present in the stockpile but were removed prior to loading and placement. Oversized cobbles or boulders that were placed were removed prior to compaction.
- Ongoing grade checks during placement by contractor using a CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed lift elevation was placed at approximately 45 cm loose lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Sand was placed over finger drain on north slope of heap leach pad. Sand was packed using static compaction using CAT CS 68 B smooth drum compactor and captured by survey.
- Approximately 273 loads using CAT 777 haul trucks were placed during shift. Assuming 36 m^3 per load, a total of 9,828 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- After day shift rain event, grading and mud removal of embankment road was conducted. This delayed commencing of hauling.
- Volvo 9 tonne vibratory compactor was removed from service at 21:15 for repairs. Not used for remainder of shift.

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Placement of lift elevation 921.52 m (design elevation) continued from day shift at 18:45 and was completed by 03:15. Compaction for this lift resumed at 18:45 and was completed by 03:50. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The remaining tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 95.4 % to 100.4 %. Moisture contents ranged from 3.4 % to 6.5 % MC. One of which falls below the targeted BGC method specification requirements for moisture content. As built average elevation of lift surveyed 0.07 m below the design elevation at 921.45 m.
- Placement of lift elevation 921.90 m (design elevation) began at 02:30 and was incomplete by the end of shift. Compaction for this lift began at 05:30 and was incomplete by the end of shift.
- Compaction for the embankment was completed using at least two passes (back and forth) of either 11 tonne or the 13.4 tonne vibratory roller or using three passes with the 9 tonne vibratory roller. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Excavators loaded structural fill from both upper and lower ADR stockpiles which have been previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. Oversized cobbles or boulders were present in the stockpile but were removed prior to loading and placement. Oversized cobbles or boulders that were placed were removed prior to compaction.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Ongoing grade checks during placement by contractor using a CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed lift elevation was placed at approximately 45 cm loose lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Structural fill was placed in lifts along the north slope of the heap leach area. Two lifts were compacted and surveyed as per BGC recommendations. Placement of third lift ongoing.
- Approximately 236 loads using CAT 777 haul trucks were placed during shift. Assuming 36 m^3 per load, a total of 8,496 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Due to manpower limitations during shift change, the Volvo 11 tonne vibratory compactor and the CAT CS 68 B was operated by dayshift crew until 20:20. Only one compactor was used for the rest of shift.
- During placement of structural fill in the south east corner of the embankment, approximately an additional hour was spent regrading this area after an excessively thick lift was rough placed by the CAT D10 Dozer.

4.0 CLOSURE

	CAT CS 78 B Compactor	10	Compacting structural fill at embankment
	CAT CS 68 B Compactor	8	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Placement of lift elevation 922.23 m (design elevation) was nearly completed at day shift. Final tie in to the access ramp completed at 22:00. Compaction for this lift resumed at 18:45 and was completed by 22:47. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The remaining tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 97.2 % to 99.0 %. Additional compaction was required in some areas to achieve above 95 %. Moisture contents achieved was 4.0 % MC. This falls below the targeted BGC method specification requirements for moisture content. As built average elevation of lift surveyed 0.08 m below the design elevation at 922.15 m.
- Placement of lift elevation 922.60 m (design elevation) began at 18:50 and was completed at 04:00. Compaction for this lift began at 21:00 and was incomplete at the end of the shift. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The remaining tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 95.1 % to 98.0 %. Moisture contents ranged from 3.8 % to 4.6 % MC. This falls below the targeted BGC method specification requirements for moisture content. As built average elevation of lift surveyed 0.06 m below the design elevation at 922.54 m.
- Placement of lift elevation 922.99 m (design elevation) began at 03:10 and was incomplete by the end of shift. Compaction for this lift was incomplete by the end of shift.
- Compaction for the embankment was completed using at least two passes (back and forth) of the 13.4 tonne vibratory roller or using three passes with the 9 tonne vibratory roller. Each pass was conducted with sufficient

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.

- Excavators loaded structural fill from both upper and lower ADR stockpiles which have been previously approved by BGC. Material from the upper ADR stock pile was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. During the shift the lower ADR stockpile was yielding coarser, drier material. Oversized cobbles or boulders that were placed were removed prior to compaction. The Hitachi 1200 Shovel moved from the lower ADR stockpile to the Event Pond at about 22:00 for the remainder of the shift. This material had less oversized boulders.
- Ongoing grade checks during placement by contractor using a CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed lift elevation was placed at approximately 45 cm loose lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Grader profiled the 3:1 (H:V) slopes of the Heap Leach Facility area and was subsequently packed with a CS 54 B 6 tonne vibratory smooth compactor.
- Structural fill was placed in the base of the Heap Leach Facility area. Two lifts were placed at 0.45 m loose lift thickness. Each lift was compacted and surveyed as per BGC recommendations. A small amount of water seepage from the bedrock was noted to have collected on the surface of the bottom lift but did not soften the structural fill by end of shift.
- Approximately 290 loads using CAT 777 haul trucks and 20 loads were placed using CAT 773 during the shift. Assuming 36 m^3 and 22 m^3 per load respectively, a total of 10,880 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Next lift 922.99 m will extend out beyond the Cobalt access road near west abutment. Tie in method to be determined.
- Due to manpower limitations during shift change, the CAT CS 68 B was operated for approximately 8 hours. Only one compactor was used for the rest of shift. This did not significantly impede production of fill placement.
- Ramp to embankment required placement of structural fill to improve access for haul trucks.

4.0 CLOSURE

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Placement of lift elevation 923.40 m (design elevation) began at 7:30 and was completed at 01:30. Compaction for this lift resumed at 18:45 and was completed by 03:45. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The remaining tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 97.0 % to 100.6 %. Moisture content ranged from 4.2% to 5.6 % MC. One of which falls below the targeted BGC method specification requirements for moisture content. As built average elevation of lift surveyed 0.10 m below the design elevation at 922.30 m.
- Placement of lift elevation 923.75 m (design elevation) began at 12:10 and was incomplete by the end of shift. Compaction for this lift began at 03:50 and was incomplete by the end of shift. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 97.6 % to 99.3 %, though one area required additional compaction to achieve above 95 %. Moisture content ranged from 3.7 % to 4.6 % MC. One of which falls below the targeted BGC method specification requirements for moisture content.
- Compaction for the embankment was completed using at least two passes (back and forth) of the 13.4 tonne and the 11 tonne vibratory roller or using three passes with the 9 tonne vibratory roller. Each pass was

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.

- Excavators loaded structural fill from the upper ADR as well the Event Pond which have been previously approved by BGC. Material was fine, with less than 30 % over 19 mm and with material smaller under 150 mm particle size. During the shift the lower ADR stockpile was yielding coarser, drier material. Oversized cobbles or boulders that were placed were removed prior to compaction.
- Ongoing grade checks during placement by contractor using a CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed lift elevation was placed at approximately 45 cm loose lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Structural fill was placed in the “In-Sump” Heap Leach Facility area. Three lifts were placed at 0.45 m loose lift thickness. The first lift was placed at 45 cm lift thickness and was therefore compacted with 2 passes with the 13.4 tonne vibratory compactor. Successive lifts were placed at 30 cm and were compacted with 4 passes with the 6 tonne CAT 54 B vibratory compactor. One compaction test at elevation 915.88 m was conducted. The tested location exceeded 95 % of the standard proctor density of 2272 kg/m^3 at 97.0 %. Moisture content ranged from 4.1%.
- Structural fill was placed in the “940 Bench” of the Heap Leach Facility area. One lift was placed at 30 cm and was also compacted using the 6 tonne CAT 54 B vibratory compactor.
- Structural fill was placed in 2 lifts directly adjacent to the east abutment to tie in the embankment over the Cobalt Road. Each lift was compacted using either the 13.4 or 11 tonne vibratory compactor and was captured by survey. Additional loads were required to blend in the existing roadway to allow for Cobalt hauling. Future lifts may also require to be built out to accommodate the 2.5:1 (H:V) slope of the embankment.
- Approximately 234 loads using CAT 777 haul trucks during the shift. Assuming 36 m^3 per load, a total of 8,424 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- None.

2.0 HEAP LEACH FACILITY

- Placement of lift elevation 937.58 m (design elevation) resumed at the start of shift and was completed by 20:00. Compaction for this lift resumed at the beginning of shift and was completed by 21:00. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The remaining tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 98.0 % to 100.6 %. Moisture content ranged from 3.7 % to 5.6 % MC. As built average elevation of lift surveyed 0.12 m below the design elevation at 937.46 m.

- Placement of lift elevation 937.91 m (design elevation) began at 20:00 and was completed by 23:50. Compaction for this lift began at 21:30 and was completed by 00:30. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The remaining tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 96.5 % to 99.5 %. Moisture content ranged from 4.3 % to 4.7 % MC. As built average elevation of lift surveyed 0.03 m below the design elevation at 937.88 m.

- Placement of lift elevation 938.33 m (design elevation) began at 23:50 and was completed by 03:45. Compaction for this lift began at 02:00 and was completed by 04:30. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The remaining tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 96.9 % to 98.7 %. Moisture content ranged from 4.4 % to 4.6 % MC. As built average elevation of lift surveyed 0.04 m below the design elevation at 938.29 m.

- Placement of lift elevation 938.74 m (design elevation) began at 03:45 and was incomplete by the end of shift. Compaction for this lift began around 06:00 and was incomplete by the end of shift.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Excavators loaded structural fill from the upper ADR which has been previously assessed by BGC.
- Material from this location appeared to have less than 30 % over 19 mm and are under 150 mm particle size. Oversized cobbles or boulders that were placed were removed prior to compaction.
- Compaction for the embankment was completed using at least two passes (back and forth) of the 13.4 tonne and 11 tonne or using three passes with the 9 tonne vibratory roller for lifts using structural fill from the ADR and Event Pond. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using a CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed lift elevation was placed at approximately 45 cm for lifts containing only ADR material. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.

3.0 DISCUSSION/OTHER

- Periodic soil temperatures of loose placed material ranged from 1.9°C to 4.9°C.
- Small lifts were placed to elevations 923.20, 923.65, 924.06, and 924.49 m at the far west end of the embankment, with ADR material. Lift thickness was approximately 45 cm, which satisfies the BGC method specification requirements of 50 cm maximum loose lift thickness.

4.0 CLOSURE

We trust that the information provided herein is accurate and complete. Please contact the undersigned if you require additional information or have any concerns.

2.0 HEAP LEACH FACILITY

- Placement of lift elevation 925.66 m (design elevation) resumed at the start of shift and was completed by 20:30. Compaction for this lift resumed at the beginning of shift and was completed by 21:00. As built average elevation of lift surveyed 0.05 m below the design elevation at 925.61 m.

- Placement of lift elevation 926.06 m (design elevation) began at 20:30 and was completed by 23:00. Compaction for this lift began at 21:30 and was completed by 00:00. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2272 kg/m^3 at 98.2 %. Moisture content at 4.1 % MC. As built average elevation of lift surveyed 0.06 m below the design elevation at 926.00 m.

- Placement of lift elevation 926.45 m (design elevation) began at 23:00 and was completed by 01:30. Compaction for this lift began at 00:30 and was completed by 02:30. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2272 kg/m^3 at 98.0 %. Moisture content at 4.5 % MC. As built average elevation of lift surveyed 0.14 m below the design elevation at 926.31 m.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Placement of lift elevation 926.76 m (design elevation) began at 01:30 and was completed by 04:20. Compaction for this lift began at 03:00 and was completed by 04:40. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2272 kg/m^3 at 98.7 %. Moisture content at 4.0 % MC. As built average elevation of lift surveyed 0.04 m below the design elevation at 926.72 m.
- Placement of lift elevation 927.14 m (design elevation) began at 04:20 and was incomplete by the end of shift.
- Excavators loaded structural fill from the upper ADR which has been previously assessed by BGC.
- Material from this location appeared to have less than 30 % over 19 mm and are under 150 mm particle size. Oversized cobbles or boulders that were placed were removed prior to compaction.
- Compaction for the embankment was completed using at least two passes (back and forth) of the 13.4 tonne and 11 tonne or using three passes with the 9 tonne vibratory roller for lifts using structural fill from the ADR. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using a CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed lift elevation was placed at approximately 45 cm for lifts containing only ADR material. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Undesirable material was removed from the spillway tie-in area using three excavators throughout the shift.

3.0 DISCUSSION/OTHER

- Periodic soil temperatures of loose placed material ranged from 3.2°C to 4.3°C.
- Construction steps for tying into the existing embankment on the west side was discussed with BGC and Pelly. The dozer is required to cut into the existing embankment slope 2.5 m every two lifts, to ensure proper tie-in.
- Ensuring that no structural fill is placed on water puddles or ice was discussed with Pelly. If water or ice is found during construction, they must be removed, before construction can continue.

2.0 HEAP LEACH FACILITY

- Placement of lift elevation 929.55 m (design elevation) resumed at the start of shift and was completed by 21:30. Compaction for this lift resumed at the beginning of shift and was completed by 22:45. As built average elevation of lift surveyed 0.06 m below the design elevation at 929.51 m.
- Placement of lift elevation 929.96 m (design elevation) resumed at the start of shift and was completed by 00:30. Compaction for this lift resumed at the beginning of shift and was completed by 01:45. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2272 kg/m^3 at 96.0 %. Moisture content was at 3.9 % MC. As built average elevation of lift surveyed 0.06 m below the design elevation at 929.90 m.
- Placement of lift elevation 930.35 m (design elevation) began at 00:30 and was completed by 06:00. Compaction for this lift began at 23:15 and was incomplete by the end of shift. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2272 kg/m^3 at 99.3 %. Moisture content was at 4.4 % MC. As built average elevation of lift surveyed 0.04 m below the design elevation at 930.31 m.
- Excavators loaded structural fill from the upper ADR which have both been previously assessed by BGC.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Material from this location appeared to have less than 30 % over 19 mm and are under 150 mm particle size. Oversized cobbles or boulders that were placed were removed prior to compaction.
- Compaction for the embankment was completed using at least two passes (back and forth) of the 13.4 tonne and 11 tonne or using three passes with the 9 tonne vibratory roller for lifts using structural fill from the ADR. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using a CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed lift elevation was placed at approximately 45 cm for lifts containing only ADR material. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Undesirable material was removed from the spillway tie-in area using two excavators throughout the shift.

3.0 DISCUSSION/OTHER

- Periodic soil temperatures of loose placed material ranged from 3.6°C to 4.6°C.

4.0 CLOSURE

We trust that the information provided herein is accurate and complete. Please contact the undersigned if you require additional information or have any concerns.

File:	ENG.WARC03235-05.003		Low -1°C

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D-10 Dozer	11	Placing fill - Embankment
	CAT D-6 Dozer with GPS	11	Placing fill - Embankment
	Hitachi 1200 Shovel	11	Loading Structural fill from upper Stockpile
	Hitachi 1200 Shovel	10	Loading undesirable material
	Linkbelt 490	1	Moving undesirable material
	6 x CAT 777 Haul Truck	11	Hauling structural fill to the embankment
	CAT 773 Haul Truck	11	Hauling structural fill to the embankment
	CAT CS 78 B Compactor	11	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Compaction of lift elevation 931.14 resumed at the beginning of shift and was completed by 22:45.
- Placement of lift elevation 931.59 m (design elevation) resumed at the start of shift and was completed by 22:00. Compaction for this lift resumed at the beginning of shift and was completed by 23:45. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging between 96.5 to 98.3 %. Moisture content ranged between 3.7 to 4.0 % MC. As built average elevation of lift surveyed 0.04 m below the design elevation at 931.55 m.
- Placement of lift elevation 932.00 m (design elevation) began at 22:00 and was completed by 03:30. Compaction for this lift began at 23:15 and was completed by 05:15. Compaction and moisture content testing as conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2272 kg/m^3 at 100.3 %. Moisture content was at 3.9 % MC. As built average elevation of lift surveyed 0.04 m below the design elevation at 931.96 m.
- Placement of lift elevation 932.00 m (design elevation) began at 3:30 and was incompleted by the end of shift. Compaction for this lift began at 5:15 and was incomplete by the end of shift.
- Excavators loaded structural fill from the upper ADR and in-leach heap which have both been previously assessed by BGC.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Material from this location appeared to have less than 30 % over 19 mm and are under 150 mm particle size. Oversized cobbles or boulders that were placed were removed prior to compaction.
- Compaction for the embankment was completed using at least two passes (back and forth) of the 13.4 tonne and 11 tonne or using three passes with the 9 tonne vibratory roller for lifts using structural fill from the ADR and in-leach heap. Each pass was conducted with sufficient overlap and complete coverage over the compacted area, which meets the BGC method specification requirement for structural fill.
- Ongoing grade checks during placement by contractor using a CAT D-6 Dozer equipped with GPS. Survey confirmed that the average surveyed lift elevation was placed at approximately 45 cm for lifts containing only ADR material. This satisfies the BGC method specification requirements of 50 cm maximum loose lift thicknesses.
- Undesirable material was removed from the spillway tie-in area using an excavator throughout the shift.

3.0 DISCUSSION/OTHER

- Periodic soil temperatures of loose placed material ranged from 3.7°C to 5.7°C.

4.0 CLOSURE

Lift built out to toe stakes	☑	☐	☐	Speed roughly under 4 km/hr	☑	☐	☐
Lift placed on approved bedrock/suitable	☑	☐	☐	Sufficient overlap between passes	☑	☐	☐
Access/Egres ramps built out	☑	☐	☐	Soft spots identified/removed if required	☐	☐	☑
Survey as-built lift	☑	☐	☐	Compaction tests on lift(s):	☑	☐	☐

Remarks/Comments
Tetra Tech on site for spot checks only.
BGC present for construction monitoring throughout the day.
Event Pond:
Compaction and moisture content testing was conducted on compacted section using a nuclear densometer.
1 test performed and achieved a compaction of 102.0% with 4.7% moisture at lift 23.

Remarks/Comments
Tetra Tech on site for spot checks only.
BGC on site for construction monitoring spot checks throughout the day.
Some boulders were observed in the material and were removed from the lift. Material appeared coarse.
Test fills was completed on Upper ADR blast borrow material and on HLF borrow material. Compaction tests
were completed on each of the materials after 4+ passes with the CAT CS54B, and then with 4+ passes with
the CAT CS68B compactor.
Completed lift #91 (876.3 m elevation) placed and compacted. Started lift #92 (876.6 m elevation).
Lift #91 was scraped approximately 15 cm down from surface to remove frozen layer and then compacted.
Density test results were below 95% compaction with a 2270kg/m3 proctor. Placement stopped by BGC
until further notice.

	CAT CS 78B Compactor	10	Compacting material 2 fill at the event pond

2.0 EVENT POND

- Continued placement of site grading fill along the south east downstream toe of the event pond embankment. Tetra Tech provided periodic site visits throughout the shift.
- Lifts were placed at thicknesses not exceeding 30 cm for the south east downstream toe of the event pond embankment.
- Placement and compaction of previously placed lift 28B at elevation 861.00 m (design elevation) was completed during shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2230 kg/m^3 at 95.6. Moisture content was 46 % MC.
- Placement and compaction of east event pond lift 29B at elevation 861.30 m (design elevation) was completed during shift.
- Placement and compaction of east event pond lift 30B at elevation 861.6 m (design elevation) was completed during shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2230 kg/m^3 at 96.8% with a moisture content was 4.7 %.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Placement and compaction of east event pond lift 31B elevation 861.90 m was completed during shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2230 kg/m^3 at 97.0% with a moisture content was 4.6 %.
- Placement and compaction of east event pond lift 32B elevation 860.10 m was started during shift and was not completed before the end of shift.
- Type 2 bedrock, locally sourced from the north event pond area, was hauled and placed along the south east downstream toe of the event pond embankment. This fill has been previously approved for use in the event pond as Site Grading Fill.
- Compaction for the event pond was completed using at least using two passes (back and forth) with a 13.4 tonne vibratory compactor for lifts using site grading fill from the event pond. Each pass was conducted with sufficient overlap and complete coverage over the compacted area.
- Periodic soil temperatures of loose placed material ranged from 0.1°C to 1.0°C.
- Structural fill placed in 45 cm loose lift thickness in the West HLF downstream spillway. Compaction for the event pond was completed using at least using three passes (back and forth) with a 9 tonne vibratory compactor. Each pass was conducted with sufficient overlap and complete coverage over the compacted area.
- Five lifts placed at elevations 928.30 m, 928.75 m, 929.20 m, 929.65 m, and 930.10 m (design elevations) were placed during shift.
- Compaction and moisture content testing were conducted on compacted sections of lifts 1, 2, and 3 using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2270 kg/m^3 ranging from 95.1 % to 100.5 % with moisture contents ranging from 4.6 % to 4.7% MC.

3.0 DISCUSSION/OTHER

- Observed fill material coming from event pond area. Larger quantities of oversized material found in areas of the source. Smaller coarse aggregates were blended into suitable material, while excessive oversized were pulverized by dozer or sorted out of the source.

4.0 CLOSURE

	2 x CAT 777 Haul Tucks	11	Hauling material 2 fill to the event pond
	CAT CS 78B Compactor	10	Compacting material 2 fill at the event pond

2.0 EVENT POND

- Continued placement of site grading fill along the south east downstream toe of the event pond embankment. Tetra Tech provided periodic site visits throughout the shift.
- Lifts were placed at thicknesses not exceeding 30 cm for the south east downstream toe of the event pond embankment.
- Placement and compaction of previously placed lift 35B at elevation 863.10 m (design elevation) was completed during shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2230 kg/m^3 at 100.6. Moisture content was 4.4 % MC.
- Placement and compaction of east event pond lift 36B at elevation 863.40 m (design elevation) was completed during shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2230 kg/m^3 at 95.0 % with a moisture content was 5.0 %.
- Placement and compaction of east event pond lift 37B at elevation 863.70 m (design elevation) was completed during shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2230 kg/m^3 at 100.1 % with a moisture content was 4.6 %.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Placement and compaction of east event pond lift 38B elevation 864.00 m was started during shift and was not completed before the end of shift.
- Lift number 49 (863.65 m) which previously failed, was removed throughout the shift. After failing a shallow 100 mm compaction test using nuclear densometer, the remaining half of the lift was also removed. The material for the exposed lift 48 (863.20 m) was recompacted and tested above 95%. Negligible to marginal (approximately 5 mm) was noted during proof rolling with 13.4 tonne vibratory compactor.
- Type 2 rock, locally sourced from the north event pond area, was hauled and placed along the south east downstream toe of the event pond embankment. This fill has been previously approved for use in the event pond as Site Grading Fill.
- Compaction for the event pond was completed using at least using two passes (back and forth) with a 13.4 tonne vibratory compactor and using at least using three passes with a 9 tonne vibratory compactor for lifts using site grading fill from the event pond. Each pass was conducted with sufficient overlap and complete coverage over the compacted area.
- Periodic soil temperatures of loose placed material ranged from 0.9°C to 2.7°C.

3.0 HLF DOWNSTREAM SPILLWAY

- Structural fill placed in 45 cm loose lift thickness in the West HLF downstream spillway. Compaction for the event pond was completed using at least using three passes (back and forth) with a 9 tonne vibratory compactor. Each pass was conducted with sufficient overlap and complete coverage over the compacted area.
- Three lifts placed at elevations 932.10 m, 9932.55 m, and 933.00 m (design elevations) were placed during shift.
- Compaction and moisture content testing were conducted on compacted sections of lifts 1, 2, and 3 using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2270 kg/m^3 ranging from 97.3 % to 99.3 % with moisture contents ranging from 4.4 % to 5.7 % MC.

4.0 DISCUSSION/OTHER

- Observed fill material coming from event pond area. Tetra Tech asked to observe borrow area. Material from this area looked more fine than previous days with clumps of fine that appeared partially frozen. This was not used in the event pond.
- Snowfall accumulating on the pad was removed multiple times throughout the shift.

5.0 CLOSURE

2.0 EVENT POND

- Continued placement of site grading fill along the south east downstream toe of the event pond embankment. Tetra Tech provided periodic site visits throughout the shift.
- Lifts were placed at thicknesses not exceeding 30 cm for the south east downstream toe of the event pond embankment.
- Placement and compaction of previously placed lift elevation 864.00 m (design elevation) was completed during shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2230 kg/m^3 at 96.8 %. Moisture content was 3.5 % MC.
- Placement and compaction of east event pond lift elevation 864.30 m (design elevation) was completed during shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2230 kg/m^3 at 95.3 % with a moisture content was 5.0 %.
- Placement and compaction of east event pond lift elevation 864.60 m (design elevation) was completed during shift.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Placement and compaction of east event pond lift elevation 864.90 m (design elevation) was completed during shift.
- Placement and compaction of east event pond lift elevation 865.20 m (design elevation) was started during shift and was not completed before the end of shift.
- Type 2 rock, locally sourced from the north event pond area, was hauled and placed along the south east downstream toe of the event pond embankment. This fill has been previously approved for use in the event pond as Site Grading Fill. As instructed by BGC, quartzite dominant fill was mixed with the less suitable phyllite dominant fill material. For marginal quality phyllite dominant fill, every load of fill may be mixed with two loads of quartzite dominant fill.
- Compaction for the event pond was completed using at least using two passes (back and forth) with a 13.4 tonne vibratory compactor, three passes with a 9 tonne vibratory compactor, and 4 passes with the 5.9 tonne vibratory compactor for lifts using site grading fill from the event pond. Each pass was conducted with sufficient overlap and complete coverage over the compacted area.
- Periodic soil temperatures of loose placed material were approximately 1.9°C.

3.0 HLF DOWNSTREAM SPILLWAY

- Structural fill placed in 45 cm loose lift thickness in the West HLF downstream spillway. Compaction for the event pond was completed using at least using three passes (back and forth) with a 9 tonne vibratory compactor. Each pass was conducted with sufficient overlap and complete coverage over the compacted area.
- Compaction and moisture content testing were conducted on compacted sections of lift elevation 934.50 m using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2270 kg/m^3 at 96.4 % with a moisture content of 5.4 % MC.

4.0 DISCUSSION/OTHER

1.0 EVENT POND CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D6 GPS Dozer	11	Placing fill – event pond
	Linkbelt 490 Excavator	11	Loading fill from event pond
	4 x CAT 777 Haul Tucks	11	Hauling fill to the event pond
	CAT CS 68B Compactor	10	Compacting fill at the event pond
	CAT CS 54B Compactor	10	Compacting fill at event pond

2.0 EVENT POND

- Continued placement of site grading fill along the south east downstream toe of the event pond embankment. Tetra Tech provided periodic site visits throughout the shift.
- Lifts were placed at thicknesses not exceeding 30 cm for the south east downstream toe of the event pond embankment.
- Placement and compaction of previously placed lift elevation 866.10 m (design elevation) was completed during shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2270 kg/m^3 at 100.1 %. Moisture content was 4.1 % MC.
- Placement and compaction of east event pond lift elevation 866.40 m (design elevation) was completed during shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2270 kg/m^3 at 99.4 % with a moisture content was 5.0 %.
- Placement and compaction of east event pond lift elevation 866.70 m (design elevation) was completed during shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested area exceeded 95 % of the standard proctor density of 2230 kg/m^3 at 99.1 % with a moisture content was 3.4 %.
- Placement and compaction of east event pond lift elevation 867.00 m (design elevation) was started during shift and was not completed before the end of shift.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Type 2 structural fill rock, locally sourced from the north event pond area, was hauled and placed along the south east downstream toe of the event pond embankment. This fill has been previously approved for use in the event pond as Site Grading Fill. Quartzite dominant fill was mixed with phyllite dominant fill as per previous BGC recommendations.
- Compaction for the event pond was completed using at least using three passes with a 9 tonne vibratory compactor, and 5 passes with the 5.9 tonne vibratory compactor for lifts using site grading fill from the event pond. Each pass was conducted with sufficient overlap and complete coverage over the compacted area.
- Periodic soil temperatures of loose placed material ranged from 2.0°C to 2.4°C.

3.0 HLF DOWNSTREAM SPILLWAY

- No material placed.

4.0 DISCUSSION/OTHER

- Event pond access and borrow source access was reconfigured to improve production, causing delays in hauling.
- Frozen and unsuitable material was removed from the north side slope of the south embankment for foundation preparation on the east end of the lift. Further removal to be conducted prior to approval from BGC.

5.0 CLOSURE

1.0 EVENT POND CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	CAT D6 GPS Dozer	11	Placing fill – event pond
	Linkbelt 490 Excavator	11	Loading fill from event pond
	2 x CAT 777 Haul Tucks	11	Hauling fill to the event pond
	CAT CS 68B Compactor	9	Compacting fill at the event pond

2.0 EVENT POND

- Continued placement of site grading fill along the south east downstream toe of the event pond embankment. Tetra Tech provided periodic site visits throughout the shift.
- Lifts were placed at thicknesses not exceeding 30 cm for the south east downstream toe of the event pond embankment.
- Placement and compaction of previously started lift elevation 867.90 m (design elevation) was not completed during shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2270 kg/m^3 ranged from 96.1 % to 100.1 %. Moisture content ranged from 4.6 % to 6.0 % MC.
- Type 2 structural fill rock, locally sourced from the north event pond area, was hauled and placed along the south east downstream toe of the event pond embankment. This fill has been previously approved for use in the event pond as Site Grading Fill. Fill placed in lift looked slightly fine. Contractor notified and remined to mix with coarser material when possible.
- Compaction for the event pond was completed using at least using three passes with a 9 tonne vibratory compactor for lifts using site grading fill from the event pond. Each pass was conducted with sufficient overlap and complete coverage over the compacted area.
- Periodic soil temperatures of loose placed material ranged from 1.4°C to 1.7°C.

3.0 HLF DOWNSTREAM SPILLWAY

- No material placed.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

4.0 DISCUSSION/OTHER

- This lift required 1 pass of additional compaction after the initial tests for this lift were marginally low. After additional compaction, the results above were obtained.
- Event pond access roads improved throughout shift. Other haul trucks removing material from event pond.

5.0 CLOSURE

2.0 EVENT POND

- Continued placement of site grading fill along the south east downstream toe of the event pond embankment. Tetra Tech provided periodic site visits throughout the shift.
- Lifts were placed at thicknesses not exceeding 30 cm for the south east downstream toe of the event pond embankment.
- Placement and compaction of previously started lift elevation 868.50 m (design elevation) was completed during previous shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2270 kg/m^3 was 96.6 %. Moisture content was 6.0 % MC.
- Placement and compaction of event pond lift elevation 868.80 m was started during shift and was not completed before the end of shift.
- Type 2 structural fill rock, locally sourced from the north event pond area, was hauled and placed along the south east downstream toe of the event pond embankment. This fill has been previously approved for use in the event pond as Site Grading Fill. Fill placed in lift looked slightly fine.
- Compaction for the event pond was completed using at least using three passes using a 13.4 tonne vibratory compactor for lifts using site grading fill from the event pond. Each pass was conducted with sufficient overlap and complete coverage over the compacted area.
- Periodic soil temperatures of loose placed material ranged from 1.3°C to 1.9°C.

Client:	JDS		High 4°C
File:	ENG.WARC03235-05.005		Low 1°C

1.0 EVENT POND CONSTRUCTION SUMMARY

Equipment	Earthworks Hours Worked	Work(Nightshift)
CAT D6 GPS Dozer	10	Placing fill – event pond
Linkbelt 490 Excavator	9	Loading fill from event pond
2 x CAT 777 Haul Tucks	9	Hauling fill to the event pond
CAT CS 78B Compactor	10	Compacting fill at the event pond

2.0 EVENT POND

- Continued placement of site grading fill along the south east downstream toe of the event pond embankment. Tetra Tech provided periodic site visits throughout the shift.
- Lifts were placed at thicknesses not exceeding 30 cm for the south east downstream toe of the event pond embankment.
- Placement and compaction of previously started lift elevation 869.10 m (design elevation) was not completed before the end of shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2270 kg/m^3 was 95.1 %. Moisture content was 3.1 % MC.
- Lifts of site grading fill placed for a pad for the Discharge Pipe located in the event pond. A total of ten small lifts were placed during shift. Starting elevation was approximately at elevation 874.23 m. Compaction and moisture content testing were conducted on four of the ten lifts of the compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2270 kg/m^3 was 95.1 %. Moisture content was 3.1 % MC.
- Type 2 structural fill rock, locally sourced from the north event pond area, was hauled and placed along the south east downstream toe of the event pond embankment. This fill has been previously approved for use in the event pond as Site Grading Fill. Fill placed in lift looked slightly fine.
- Sample of fill from event pond spillway borrow, stockpiled during placement of lift elevation 869.10 m, was obtained for particle size distribution test (sieve gradation).

Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Compaction for the event pond was completed using at least using three passes using a 13.4 tonne vibratory compactor for lifts using site grading fill from the event pond. Each pass was conducted with sufficient overlap and complete coverage over the compacted area.
- Periodic soil temperatures of loose placed material were approximately 1.6°C.

3.0 HLF DOWNSTREAM SPILLWAY

- No material placed.

4.0 DISCUSSION/OTHER

- Event pond access road improvement continued throughout shift. Other haul trucks dedicated to removing material from event pond.
- South east end of the Discharge Pipe Pad had a ramp feathered out. This material was not placed in controlled 30 cm lifts and was left uncompacted as it was on an inclined slope. Survey staked the appropriate cuts/fills to outline the elevation of 30 cm above the approved foundation (i.e. 1 lift). This material may be cut down to this elevation and compacted or remove the entire sloped ramp area.
- Some areas of the Discharge Pipe Pad may be outside of the approved foundation survey picked up.

2.0 EVENT POND

- Continued placement of site grading fill along the south east downstream toe of the event pond embankment. Tetra Tech provided periodic site visits throughout the shift.
- Lifts were placed at thicknesses not exceeding 30 cm for the south east downstream toe of the event pond embankment.
- Placement and compaction of previously started lift elevation 870.90 m (design elevation) was completed before the end of shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2270 kg/m^3 ranged from 95.9 % to 99.0 %. Moisture content ranged from 4.4 % to 5.5 % MC.
- Placement and compaction of lift elevation 871.20 m (design elevation) was completed before the end of shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2270 kg/m^3 of 98.4 %. Moisture content was 5.4 % MC.
- Placement and compaction of lift elevation 871.50 m (design elevation) was incomplete by the end of shift.
- Type 2 structural fill rock, locally sourced from three areas: North event pond area near HLF, Event Pond Spillway, and the south embankment access ramp. This material was hauled and placed along the south east downstream toe of the event pond embankment. This fill has been previously approved for use in the event

Tetra Tech Canada Inc.

pond as Site Grading Fill. Fill placed in lift looked slightly fine from the spillway and south access ramp borrows, and coarser at the event pond HLF borrow.

- Sample of fill from event pond spillway borrow, stockpiled during placement of lift elevation 872.70 m, was obtained for particle size distribution test (sieve gradation).
- Sample of fill from event pond HLF borrow, stockpiled during placement of lift elevation 871.20 m, was obtained for particle size distribution test (sieve gradation).
- Three areas along the north abutment of the embankment pad were observed to have severe deflection and rutting from softened material which may have resulted from rainfall during the previous shift. These soft areas were excavated with the D6 dozer until more suitable material was observed. The excavated surface was recompacted prior to replacement of removed material. Sub-cut area was backfilled and compacted as per BGC method specifications.
- Compaction along the edges of the event pond was completed using at least using three passes using a 9 tonne vibratory compactor or 5 passes using a 6.4 tonne vibratory compactor for lifts using site grading fill from the event pond. The center of the lift was compacted using one pass with a CAT 777 allowing for sufficient tire overlap and followed by 2 passes with either the 9 tonne or 6.4 tonne vibratory compactor. Although it was relayed to Pelly that this was not an approved method of compaction, it was observed that each pass was conducted with sufficient overlap and complete coverage over the compacted area.
- Periodic soil temperatures of loose placed material were approximately 1.3°C.

3.0 HLF DOWNSTREAM SPILLWAY

- No material placed.

4.0 DISCUSSION/OTHER

- Fill placement outpaced spreading and compaction resulting in compaction falling behind leaving large areas uncompacted for long periods of time and incomplete key-ins to the abutment.
- Pelly used a CAT 777 to assist the compaction equipment. Tetra Tech informed Pelly that wheel packing was not an approved method for compaction. Pelly proceeded using the CAT 777, so Tetra Tech conducted additional compaction testing for lift elevation 870.90 m and witnessed the compaction that the CAT 777 overlapped the wheel path with successive passes.
- Multiple areas along the north abutment were observed to have softened zones, possibly due to rainfall from the previous shift. Care should be given to remove access water from lift prior to placement of successive lifts. Wet material that has softened on the side slope of the north abutment should be removed to avoid a soft zone when lift is keyed into the slope or directly adjacent to the lift.
- Metal on metal equipment incident resulted in time loss in placement on the event pond embankment. Incident reported by Pelly.

2.0 EVENT POND

- Continued placement of site grading fill along the south east downstream toe of the event pond embankment. Tetra Tech provided periodic site visits throughout the shift.
- Lifts were placed at thicknesses not exceeding 30 cm for the south east downstream toe of the event pond embankment.
- Placement and compaction of previously started lift elevation 872.10 m (design elevation) was completed before the end of shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2270 kg/m^3 ranged from 95.3 % to 97.9 %. Moisture content ranged from 4.3 % to 5.7 % MC.
- Placement and compaction of lift elevation 872.40 m (design elevation) was completed before the end of shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2270 kg/m^3 ranged from 96.9 % to 97.1 %. Moisture content ranged from 4.7 % to 4.8 % MC.
- Placement and compaction of lift elevation 872.70 m (design elevation) was incomplete by the end of shift. Compaction and moisture content testing were conducted on compacted sections using a nuclear densometer. The tested areas exceeded 95 % of the standard proctor density of 2270 kg/m^3 was 98.2 %. Moisture content was 4.5 % MC.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- During placement of lift elevation 872.70 m, additional passes of the D6 dozer were completed to properly key into the abutment slope to aid in compaction near the abutment and avoid loose fill at the edge of the lift.
- Type 2 structural fill rock, locally sourced from three areas: North event pond area near HLF, Event Pond Spillway, and the south embankment access ramp. This material was hauled and placed along the south east downstream toe of the event pond embankment. This fill has been previously approved for use in the event pond as Site Grading Fill. Fill placed in lift looked slightly fine from the spillway and south access ramp borrows, and more coarse at the event pond HLF borrow.
- Compaction along the edges of the event pond was completed using at least using three passes using a 9 tonne vibratory compactor or 5 passes using one of the 6 tonne vibratory compactors for lifts using site grading fill from the event pond. Each pass was conducted with sufficient overlap and complete coverage over the compacted area.
- Periodic soil temperatures of loose placed material were approximately 2.6°C.

3.0 HLF DOWNSTREAM SPILLWAY

- No material placed.

4.0 DISCUSSION/OTHER

- To avoid equipment and vehicles encountering loose material near the south crest of the embankment, the lift may be overbuilt at the crest and safety berms may be constructed to appropriate height. This would prevent equipment from encountering loose material near the edge.

5.0 CLOSURE

We trust that the information provided herein is accurate and complete. Please contact the undersigned if you require additional information or have any concerns.

File:	ENG.WARC03235-02.005		Low 12°C

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work (Dayshift)
-	Cat D-10 Dozer	10	Placing structural fill at embankment
-	Hitachi 1200 Excavator	8.5	Loading Structural fill from ADR Stockpile
-	Cat 777 Haul Truck	8.5	Hauling structural fill to embankment
-	Cat 777 Haul Truck	8.5	Hauling structural fill to embankment
-	Cat 777 Haul Truck	8.5	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	10.5	Compacting structural fill at embankment
-	Link Belt 490 Excavator	1.5	Removing loose material at embankment

2.0 HEAP LEACH FACILITY

- Continuation of nightshift's lower embankment lift (892.18 m design elevation), compactor started at 06:30 and finished at 07:30. Two passes were observed with sufficient speed and overlap. Loose lift finished at 07:00. Survey confirmed the average elevation to be 892.15 m, which calculates to be a 0.37 m lift. The test area exceeded 95% of the standard proctor density of 2272 kg/m^3 at 100%. The moisture content was 2.9%, which does not comply with BGC requirements.

- Start of lower embankment lift 5A (892.55m design elevation) started at 07:00. Compactor started at 08:15 and finished at 10:00. Two passes were observed with sufficient speed and overlap. Loose lift finished at 09:40. Survey confirmed the average elevation to be 892.60 m, which calculates to be a 0.45 m lift. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 96.2% to 99.3%. The moisture content was 3.0% to 4.3%, which does not comply with BGC requirements.

- Start of lower embankment lift 6A (893.0m design elevation) started at 09:45. Compactor started at 10:30 and finished at 14:00. Two passes were observed with sufficient speed and overlap. Loose lift finished at 13:00. Survey confirmed the average elevation to be 892.93 m, which calculates to be a 0.33 m lift. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 96.4% to 100%. The moisture content was 3.1% to 3.9%, which does not comply with BGC requirements.

- Start of lower embankment lift 7A (893.33 m design elevation) started at 13:30. Compactor started at 14:30. Nightshift to continue.

- Structural fill was coming from the ADR stockpile and the stockpile north of the embankment. Both are approved sources. Structural fill from the stockpile north of the embankment appears to have a moisture content of 5 to

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

8%, whereas the material from ADR stockpile has a moisture content of 3 to 4%. Material was slightly coarser than yesterday, but still visually appeared to have less than 30% over 19 mm. Oversize boulders were removed from lift. This meets the BGC method specification requirement for structural fill.

- Approximately 81 777 haul truck loads and 30 wiggle haul truck loads were placed during shift. Assuming 36 m^3 per load for the 777 haul truck, and 16 m^3 for the wiggle truck, a total of 3,396 m^3 of structural fill was placed on the embankment during dayshift.

3.0 DISCUSSION/OTHER

- Excavators are to load haul trucks with structural fill material only when water conditioning is present.

4.0 CLOSURE

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	Cat D-10 Dozer	12.5	Placing structural fill
	Hitachi 1200 Shovel	11.5	Loading Structural fill from ADR Stockpile
	Cat 777 Haul Truck	11.5	Hauling structural fill to embankment
	Cat 777 Haul Truck	11.5	Hauling structural fill to embankment
	Cat 777 Haul Truck	11.5	Hauling structural fill to embankment
	CAT CS 78 B Compactor	11	Compacting structural fill at embankment
	Water Truck	11.5	Moisture conditioning aggregates
	Link Belt 250 Excavator	2	Placing structural fill

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment.
- Placement of lift elevation 893.63 m started at 7:15 hours. Placement was completed at 00:10 hours. Compaction for this lift began at 20:00 hours and was completed by 00:50. Compaction and moisture testing was completed by 01:10. Survey was completed by 01:30.
- Placement of lift elevation 893.98 m started at 00:20 hours. Placement was completed at 05:30 hours. Compaction for this lift began at 01:40 hours should be completed by day shift.
- Placement of lift elevation 894.38 m started at 00:20 hours. Placement was incomplete by the end of the shift. Compaction for this lift will begin during next shift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material was fine, visually appeared to have less than 30 % over 19 mm and smaller than over 150 mm particle size, though more oversized material was required to be removed later in the shift. If oversized cobbles or boulders were noticed in the lift, they were removed prior to compaction. This meets the BGC method specification requirement for structural fill. A water truck was used to moisture condition the structural fill stockpile prior to loading.
- All compaction was done with two passes (back and forth) of the 13.4 tonne vibratory roller. Sufficient overlap and complete coverage meets the method specification requirements for 2 passes with a 13.4 tonne vibratory roller. Six compaction tests, using the nuclear densometer, were completed. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 97.0 % to 99.6 %. Moisture content ranged from 3.6 % MC to 4.7 % MC, which is below the targeted BGC method specification requirements.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Each lift placed was benched into the existing side slope of the elevation 920 m raised lift. The uncompacted side slopes of the existing ramps to the 920 m raised lift were removed. Loose Type 3 Rock with visible voids present in the sidewall of the excavation was as also removed. This complies with the placement methodologies outlined by BGC.
- Ongoing grade checks during placement by contractor using laser level. Survey confirmed that the average surveyed elevation averaged approximately 5 to 7 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 66 loads were placed during shift. Assuming 36 m^3 per load, a total of 2,376 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Placement of fill on lower embankment slope may be expedited if one or more ramps to the upper 920 m raised lift were removed.

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	Cat D-6 Dozer	10.5	Placing Rockfill at Embankment
	Cat 345 Excavator	10.5	Loading Rockfill from ADR Stockpile
	Volvo 40 tonne Rock Truck	10.5	Hauling Rockfill to embankment
	Volvo 40 tonne Rock Truck	10.5	Hauling Rockfill to embankment
	Volvo 40 tonne Rock Truck	10.5	Hauling Rockfill to embankment
	CAT CS 68 B Compactor	0.5	Compacting Rockfill at embankment/ Down for repair

2.0 HEAP LEACH FACILITY

- Completed placement of elev. 881.2 lift at 1815 hours. Completed compacting lift at 1830 hours. Survey completed and lift approved at 1900 hours.
- Began placement of elev. 881.95 lift at 1940 hours. Started compaction at 2100 hours. Compactor broke down at 2130 hrs. Placement of the rockfill was completed at 0630 hours.
- BGC design spec requires that the 9 tonne compactor be used for compaction. As a result, the lift was not compacted and cannot be completed until the compactor is repaired.
- Excavator loading out rockfill from the ADR stockpile # 2. This stockpile will be depleted soon.
- Ongoing grade checks during placement by contractor using laser level.
- The load count was 81 loads placed. Assuming 16 m^3 per load, a total of 1,296 m^3 of rockfill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- A new source of rockfill is needed to allow the HLF backfill operation to continue.

	Volvo 40 tonne Rock Truck	7.75	Hauling Rockfill to embankment
	John Deere 40 tonne Rock Truck	7.75	Hauling Rockfill to embankment
	CAT CS 78 B Compactor	6.5	Compacting Rockfill at embankment

2.0 HEAP LEACH FACILITY

- Completed placement of elev. 888.3 lift at 2340 hours. Completed compacting lift at 0225 hours. Survey completed at 0300 hrs.
- Placement of elev. 888.9 lift started at 0300 and was incomplete by end of shift. Compaction was incomplete by end of shift and will be completed on dayshift.
- Excavator continuing to load rockfill from the ADR stockpile # 2. Material for the 888.3 lift was coming from the upslope and was finer, all minus 200 mm but still met the rockfill specs. Material for the 888.9 lift came from the downslope portion and was coarser with more boulders in the 300mm to 500 mm range.
- Ongoing grade checks during placement by contractor using laser level.
- All compaction was done with four passes (back and forth) of the 13.4 tonne vibratory roller.
- The load count was 124 loads placed. Assuming 16 m^3 per load, a total of 1,984 m^3 of rockfill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Note the 3 hour delay between completion of lift placement, compaction and final survey.
- Contractor has suggested bringing in a second packer to speed up compaction and reduce stand-by time. The second packer must be the 9 tonne packer, nothing smaller is acceptable.
- Discussed with BGC the option of possibly reducing the number of passes required for the 13.4 tonne packer. They will do a test strip to determine if the number of passes can be reduced.

2.0 HEAP LEACH FACILITY

- Completed placement of elev. 888.9 lift at end of dayshift. Completed compacting lift at end of dayshift. Survey completed at 2055 hrs.
- Placement of elev. 889.6 lift started at 2100 and was incomplete by end of shift. Compaction was incomplete by end of shift and will be completed on dayshift. Placement was slow due to limited material left at the stockpile.
- Excavator continuing to load rockfill from the ADR stockpile # 2. Material for the 888.9 lift was finer, mostly minus 200 mm but still met the rockfill specs of plus 30 % greater than 19 mm. The excavator was hitting natural ground and encountering some organics and silty material. Excavator operator maintained grade above natural ground elevation to avoid the organics and silty material. Very little material left by end of nightshift.
- Ongoing grade checks during placement by contractor using laser level.
- All compaction was done with four passes (back and forth) of the 13.4 tonne vibratory roller.
- The load count was 123 loads placed. Assuming 16 m^3 per load, a total of 1,968 m^3 of rockfill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Discussed with BGC developing a QC checklist to be followed. Issued a draft version for BGC's review.
- Contractor brought in second packer, if needed, to speed up compaction and avoid undue delay.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Spent time at start of dayshift with TetraTech QC to show him the inspection procedures and requirements.

	CAT CS 78 B Compactor	0	Stand-by

2.0 HEAP LEACH FACILITY

- Completed placement of elev. 890.3 lift at end of nightshiftshift. Compaction was incomplete by end of shift and will be completed on dayshift.
- Excavator loaded rockfill from the new ADR stockpile. Material for the 890.3 lift was finer, mostly minus 200 mm but still met the rockfill specs of plus 30 % greater than 19 mm. The water truck continually sprayed water into the loading face of the stockpile. Please note that the water truck had to leave two or three times for less than 30 minutes to refill.
- Three samples of the rockfill were taken for moisture content. Two came from loads that had been moisture conditioned and one came from a load not moisture conditioned.
- Ongoing grade checks during placement by contractor using laser level.
- All compaction was done with four passes (back and forth) of the 13.4 tonne vibratory roller.
- The load count was 135 loads placed. Assuming 16 m^3 per load, a total of 2,160 m^3 of rockfill was placed on the embankment during nightshift. Please note that contractor placed all night with only one 45 minute delay for dozer repair.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

3.0 DISCUSSION/OTHER

- Contractor's placement procedure allowed the packer to keep close behind. Lilkely less than an hour of compaction remaining when placement complete.

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work (Day Shift)
-	Cat D-6 Dozer	-	Placing Rockfill at Embankment/Test pit
-	Link Belt 490 Excavator	-	Loading Rockfill from ADR Stockpile
-	Volvo 40 tonne Rock Truck	-	Hauling Rockfill to embankment
-	Volvo 40 tonne Rock Truck	-	Hauling Rockfill to embankment
-	John Deere 40 tonne Rock Truck	-	Hauling Rockfill to embankment
-	CAT CS 78 B Compactor	-	Compacting Rockfill at embankment
-	CAT CS 78 B Compactor	-	Stand-by

2.0 HEAP LEACH FACILITY

- Excavator was refueling and undergoing maintenance in the morning from 07:30 to 10:00. Production was at a standstill.
- Compaction started at 07:00 and stopped at 08:30 due to the absence of a safety berm at the toe of the embankment. Compactor operator had 09:00 orientation with no replacement operator.
- First haul truck arrived at the embankment at 09:00. Rockfill was used to create the safety berm. Rockfill was placed using dozer.
- Plate tamper was used along the abutment.
- Met with Roy (BGC) to examine the rockfill material at rockfill pile #1 near the Clark Builder's laydown area from 10:00 to 10:30.
- Rockfill areas high in moisture on the embankment were dug up using the dozer and excavator, filled with rockfill using the haul truck, and compacted using four passes. Survey was on the embankment taking as-builts and marking areas that needed to be cut (greater than 10cm) by the dozer. This was ongoing from 10:30 to 13:00.
- Three compaction tests were completed in along the West abutment. Proctor value of 98% was achieved with a moisture content ranging from 3.6 to 4.6 percent.
- D10 dozer started to bench along the West abutment in preparation for the next lift at 11:30.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Packer finished packing the Southwest corner of the embankment at 13:00.
- Four compaction tests were completed on the embankment. Proctor value of 98% was achieved with a moisture content ranging from 4.2 to 4.8 percent.
- Survey obtained as-builts. Next lift was approved by Harra (BGC) at 13:30. Haul trucks brought in rockfill for the next lift and was placed using the D10 dozer
- Took a sample of the potential rockfill material as requested by Roy with BGC. Sample was brought to the concrete lab to be tested for moisture content and sieve analysis.

3.0 DISCUSSION/OTHER

- Met with James (Clark Builders) to discuss the plans for compaction testing near their concrete footings for tomorrow morning.
- Assisted Roy (BGC) at the structural test fill location with the nuclear densometer.

Client:	JDS		High 20°C
File:	[Subject]		Low 10°C

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	Cat D-10 Dozer	8	Placing structural fill
	Hitachi 1200 Shovel	7	Loading Structural fill from ADR Stockpile
	Cat 777 Haul Truck	7	Hauling structural fill to embankment
	Cat 777 Haul Truck	7	Hauling structural fill to embankment
	CAT CS 78 B Compactor	5	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Began placement of structural fill at embankment. Elevation lift 891.25 was started at 2045 hrs. Placement was completed at 2300 hrs. Compaction completed at 0030 hrs and survey completed by 0100 hrs.
- Elevation lift 891.55 was started at 0100 hrs. Placement was completed at 0330 hrs. Compaction completed at 0430 hrs and survey completed by 0500 hrs.
- Elevation lift 891.0 started at 0500 and was incomplete by end of shift. Compaction was also incomplete and will be finished on dayshift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material was finer, mostly minus 100 mm. This met the BGC method spec requirement for structural fill..
- Ongoing grade checks during placement by contractor using laser level.
- All compaction was done with two passes (back and forth) of the 13.4 tonne vibratory roller with sufficient overlap that exceeded the method spec requirement of 2 passes with a 13.4 tonne vibratory roller. Eight compaction tests, using the nuclear densometer, were done. All eight exceeded 96 % of the standard proctor density of 2272 kg/m^3. All but one test ranged from 4.4 % MC to 5 % MC. One was 4 %.
- The load count was 44 loads placed. Assuming 45 m^3 per load, a total of 1,980 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Survey requirements for the structural fill were changed. A 0.45 metre lift is allowed and it will be determined from the average elevation of the previously placed lift.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Note that 2 777 Haul trucks, a D10 and a 1200 Hitachi shovel were used for loading and placing.

4.0 CLOSURE

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	Cat D-10 Dozer	5	Placing structural fill
	Hitachi 1200 Shovel	4.5	Loading Structural fill from ADR Stockpile
	Cat 777 Haul Truck	4.5	Hauling structural fill to embankment
	Cat 777 Haul Truck	4.5	Hauling structural fill to embankment
	Cat 777 Haul Truck	4.5	Hauling structural fill to embankment
	CAT CS 78 B Compactor	8	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Arrived on site at 1830 hrs. Contractor was in the process of “cutting” 15 cm from their placed lift because their large packers were broke down and the lighter packers were only approved for a 30cm lift. A test strip was done to confirm that their CS 54 packer could achieve the required compaction with two passes. After the lift was stripped, it turned out that the large CS 78 packer was up and running and that, in combination with the CS 54, were used to pack the 30 cm lift.
- Elevation lift 893.3 (45 cm lift) was started at 2210 hrs. Placement was completed at 0015 hrs. Compaction completed at 0145 hrs and survey completed by 0230 hrs.
- Elevation lift 893.65 started at 0245 hrs. Placement was completed by 0430 hrs.. Compaction was completed by 0615 hrs. Survey was incomplete by end of shift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material was finer, mostly minus 100 mm. This met the BGC method spec requirement for structural fill.
- Ongoing grade checks during placement by contractor using laser level. Lift 893.63 brought in the D-6 to do some finer grading.
- All compaction was done with two passes (back and forth) of the 13.4 tonne vibratory roller with sufficient overlap that exceeded the method spec requirement of 2 passes with a 13.4 tonne vibratory roller. Twelve compaction tests, using the nuclear densometer, were done. All eight exceeded 96 % of the standard proctor density of 2272 kg/m^3. All but one test ranged from 4.6 % MC to 5.9 % MC. One was 4 %.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- The load count was 49 loads placed. Assuming 45 m^3 per load, a total of 2,205 m^3 of structural fill was placed on the embankment during nightshift. Note that placement only went for 4.5 hrs which worked out to a rate of approximately 500 m3 per hour during actual placement.

3.0 DISCUSSION/OTHER

- BGC approved the use of the Volvo 11 tonne packer as a substitute for the 13.4 tonne CS 78 packer if necessary.

4.0 CLOSURE

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	Cat D-10 Dozer	8	Placing structural fill
	Hitachi 1200 Shovel	7	Loading Structural fill from ADR Stockpile
	Cat 777 Haul Truck		Hauling structural fill to embankment
	Cat 777 Haul Truck	7	Hauling structural fill to embankment
	Cat 777 Haul Truck	7	Hauling structural fill to embankment
	CAT CS 78 B Compactor	5	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at embankment. Completed elevation lift 895.17. Placement was completed at 1930 hrs.
- Elevation lift 895.55 was started at 1945 hrs. Placement was completed at 2200 hrs.
- Elevation lift 895.95 was started at 2215 hrs. Placement was completed at 0230 hrs.
- Elevation lift 896.35 was started at 0230 hrs. Placement was completed at 0540 hrs. Compaction was also incomplete and will be finished on dayshift.
- Elevation lift 896.75 started at 0540 and was incomplete by end of shift. Compaction was also incomplete and will be finished on dayshift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material was fine, mostly minus 100 mm. This met the BGC method spec requirement for structural fill. A water truck was set up at the loading face to spray water as the shovel loaded material. This was an attempt to moisture condition the material.
- Ongoing grade checks during placement by contractor using laser level. Survey confirmed that the average elevation was anywhere from 8 cm to 3 cm below design.
- All compaction was done with two passes (back and forth) of the 13.4 tonne vibratory roller with sufficient overlap that exceeded the method spec requirement of 2 passes with a 13.4 tonne vibratory roller. Sixteen compaction tests, using the nuclear densometer, were done. All sixteen exceeded 97 % of the standard proctor density of 2272 kg/m^3. Tests ranged from 2.9 % MC to 5.6 % MC.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- The load count was 121 loads placed. Assuming 38 m^3 per load, a total of 4,598 m^3 of structural fill was placed on the embankment during nightshift. Please note the revised volume per truck estimate, this based on the visual observation that the loads were definitely smaller, maybe 80 % of the loads placed yesterday.

3.0 DISCUSSION/OTHER

- Survey requirements for the structural fill were changed. A 0.40 metre lift is being placed with survey checks to confirm average elevation is between minus 10 cm and plus 5 cm. Once the west section of the lift is placed and compacted, it is surveyed, checked and then a new lift is placed while the east portion is being compacted. Once the east portion is compacted, again survey does its' check. There is no delay in placement waiting for either survey or compaction to be completed.

	Cat 777 Haul Truck	11	Hauling structural fill to embankment
	CAT CS 78 B Compactor	11	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at embankment. Compaction of Elevation lift 897.58 from day shift was completed, tested and surveyed by 1900.
- Continuation of fill of Elevation lift 897.95 from day shift continued at 1930 hrs. Placement was completed at 2300 hrs. Compaction and survey completed at 1100 hrs.
- Elevation lift 898.32 was started at 2130 hrs. Placement was completed at 0200 hrs.
- Elevation lift 898.70 was started at 0210 hrs. Placement was incomplete by end of shift. Compaction was also incomplete and will be finished on dayshift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material was fine, visually appeared to have less than 30 % over 19 mm and smaller than over 150 mm particle size. This meets the BGC method specification requirement for structural fill. A water truck did not precondition the stockpile this shift. This structural fill was tested for moisture content after placement. Moisture content ranged from 4.4 % MC to 5.7 % MC.
- Ongoing grade checks during placement by contractor using laser level. Survey confirmed that the average surveyed elevation ranged from 3 cm to 5 cm below target design elevation. This also meets the BGC method specification requirements for 40 cm lift thicknesses.
- All compaction was done with two passes (back and forth) of the 13.4 tonne vibratory roller. Sufficient overlap and complete coverage meets the method specification requirements for 2 passes with a 13.4 tonne vibratory roller. Seventeen compaction tests, using the nuclear densometer, were completed. The tested areas exceeded

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work (Day Shift)
-	Cat D-10 Dozer	10.5	Placing structural fill
-	Hitachi 1200 Excavator	9	Loading Structural fill from ADR Stockpile
-	Cat 777 Haul Truck	10	Hauling structural fill to embankment
-	Cat 777 Haul Truck	10	Hauling structural fill to embankment
-	Cat 777 Haul Truck	10	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	11	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Density tests were completed on nightshift's structural lift. Nightshift's lift met BGC structural fill specifications.
- Start of lift #1 (899.05m design elevation) started at 07:00. Compactor started at 09:00 and finished at 11:30. Two passes was observed with sufficient speed and overlap. Loose lift finished at 10:40. Survey confirmed the average elevation to be 898.97m, which calculates to be a 0.32m lift. Moisture content was between 4.2 to 6.4%.
- Structural fill was coming from stockpile #3-1 (near Clark) and the stockpile north of the embankment. Both are approved sources. Structural fill from the stockpile north of the embankment appears to have a moisture content of 5 to 6%, whereas the material from stockpile #3-1 has a moisture content of 4 to 5%. Material was fine, visually appeared to have less than 30% over 19 mm. This meets the BGC method specification requirement for structural fill.
- Start of lift #2 (899.37m design elevation) started at 10:40. Compactor started at 11:30 and finished at 14:50. Two passes was observed with sufficient speed and overlap. Loose lift finished at 14:00. Survey confirmed the average elevation to be 899.32m, which calculates to be a 0.35m lift. Moisture content was between 4.1 to 6.1%.
- Start of lift #3 (899.72m design elevation) started at 14:00. Compactor started at 14:50 and finished at 17:30. Two passes was observed with sufficient speed and overlap. Loose lift finished at 17:00. Survey confirmed the average elevation to be 899.68m, which calculates to be a 0.36m lift. Moisture content was between 3.4 to 5.6%.
- Density tests were completed on the embankment and complied with BGC's compaction specifications for structural fill.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

3.0 DISCUSSION/OTHER

- 1200 Excavator was seen to be loading 777 Haul trucks at stockpile #3-1 (near Clark) at 12:30 with no moisture conditioning.

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	Cat D-10 Dozer	12	Placing structural fill
	Hitachi 1200 Shovel	11	Loading Structural fill from ADR Stockpile
	Cat 777 Haul Truck	11	Hauling structural fill to embankment
	Cat 777 Haul Truck	11	Hauling structural fill to embankment
	Cat 777 Haul Truck	11	Hauling structural fill to embankment
	CAT CS 78 B Compactor	11	Compacting structural fill at embankment
	Water Truck	9.5	Moisture conditioning aggregates

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment, Elevation lift 900.05 m from day shift. Placement of fill completed by 20:10 hours. Compaction for this lift began at 19:00 hours and was completed by 21:20 hours. Compaction and moisture testing and final survey completed at 21:30 hours.
- Placement of Elevation lift 900.45 m started at 20:15 hours. Placement was completed at 01:00 hours. Compaction for this lift began at 21:45 hours and was completed by 03:00 hours. Compaction and moisture testing and final survey completed at 03:20 hours.
- Elevation lift 900.84 m was started at 02:10 hours. Placement was incomplete by end of shift. Compaction was also incomplete and will be finished on dayshift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material was slightly coarser than yesterday, but still visually appeared to have less than 30 % over 19 mm and smaller than over 150 mm particle size. If oversized cobbles or boulders were noticed in the lift, they were removed prior to compaction. This meets the BGC method specification requirement for structural fill.
- The moisture content of the structural fill source was visually lower than previous days. This was later confirmed via moisture content testing via nuclear densometer to be below 3 %. A water truck was used to precondition the stockpile prior to placement. During the evening, Pelly discovered that the hydraulic pump was beginning to overheat and could no longer condition the structural fill at the stockpile. Pelly elected to use the gravity fed end discharge of the water truck to moisture condition the embankment surface.
- All compaction was done with two passes (back and forth) of the 13.4 tonne vibratory roller. Sufficient overlap and complete coverage meets the method specification requirements for 2 passes with a 13.4 tonne vibratory

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

roller. Eleven compaction tests, using the nuclear densometer, were completed. The tested areas exceeded 95 % of the standard proctor density of 2272 kg/m^3 ranging from 95.6 % to 99.7 %. Moisture content ranged from 3.0 % MC to 5.2 % MC this is below the targeted BGC method specification requirements. Further moisture conditioning was held off until the extent of the rain event was to be determined.

- Ongoing grade checks during placement by contractor using laser level. Survey confirmed that the average surveyed elevation averaged around 3 cm below target design elevation of 40 cm lift thickness. This also satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 88 loads were placed during shift. Assuming 36 m^3 per load, a total of 3,168 m^3 of structural fill was placed on the embankment during nightshift. Haul trucks experienced difficulty completing loads during the rain event as inclined roadways became increasingly difficult to traverse. Additional work to ramps and haul roads carried out to improve route.

3.0 DISCUSSION/OTHER

- Moisture conditioning of structural fill after placement is more evenly distributed throughout the lift when preformed at the borrow source. If moisture conditioning is required after placement. The lift may be scarified and bladed to promote complete mixing.

4.0 CLOSURE

2.0 HEAP LEACH FACILITY

- Shift change occurred for much of the crew this evening.
- Continued placement of structural fill at Heap Leach Facility Embankment, lift elevation 901.82 m from day shift. South berm underbuilt, so it was pushed out. Compaction for this lift began at 19:00 hours and was completed by 21:30 hours. Compaction and moisture testing and final survey completed at 21:30 hours.
- Placement of lift elevation 902.07 m started at 19:15 hours. Placement was completed by 04:45. Compaction for this lift began at 21:45 hours but was not completed by the end of shift.
- Lift elevation 902.47 m was started at 03:10 hours. Placement was incomplete by end of shift. Compaction was also incomplete and will be finished on dayshift.
- Overbuilt material removed from the embankment side slope spread over the lower section of embankment at lift elevation 891.10 m. Compaction was not completed and should be completed on dayshift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material was fine, visually appeared to have less than 30 % over 19 mm and smaller than over 150 mm particle size. If oversized cobbles or boulders were noticed in the lift, they were removed prior to compaction. This meets the BGC method specification requirement for structural fill. A water truck was used to moisture condition the structural fill stockpile prior to loading.
- All compaction was done with two passes (back and forth) of the 13.4 tonne vibratory roller. Sufficient overlap and complete coverage meets the method specification requirements for 2 passes with a 13.4 tonne vibratory

Tetra Tech Canada Inc.
14940 - 123 Avenue

Client:	JDS		High 24°C
File:	[Subject]		Low 13°C

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work (Day Shift)
-	Cat D-10 Dozer	9.5	Placing structural fill
-	Cat D-10 Dozer	1	Resloping embankment toe
-	Hitachi 1200 Excavator	9	Loading Structural fill from ADR Stockpile
-	Cat 777 Haul Truck	9	Hauling structural fill to embankment
-	Cat 777 Haul Truck	9	Hauling structural fill to embankment
-	Cat 777 Haul Truck	9	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	10.5	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Grader levelled the West side of the embankment removing the oversaturated structural fill on the surface at 07:30.

- Continuation of nightshift's lift (900.82m design elevation) started at 07:00. Compactor started at 06:30 and finished at 08:45. Two passes was observed with sufficient speed and overlap. Loose lift finished at 07:30. Survey confirmed the average elevation to be 900.75m, which calculates to be a 0.33m lift. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 97.3% to 100%. The moisture content was between 2.1 to 4.9%, which does not comply with BGC requirements.

- Start of lift #1 (901.15m design elevation) started at 07:30. Compactor started at 08:45 and finished at 11:45. Two passes was observed with sufficient speed and overlap. Loose lift finished at 11:15. Survey confirmed the average elevation to be 901.07m, which calculates to be a 0.32m lift. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 94.7% to 99.0%. The moisture content from the ADR stockpile was 3.6% to 3.7%, which does not comply with BGC requirements. The moisture content from the stockpile north of the embankment was 5.9% to 7.9%, which complies with BGC requirements.

- Structural fill was coming from the stockpile west of the ADR foundation and the stockpile north of the embankment. Both are approved sources. Structural fill from the stockpile north of the embankment appears to have a moisture content of 5 to 6%, whereas the material from stockpile #3-1 has a moisture content of 3 to 4%. Material was slightly coarser than yesterday, but still visually appeared to have less than 30% over 19 mm. Oversize boulders were removed from lift. This meets the BGC method specification requirement for structural fill.

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

- Start of lift #2 (901.47m design elevation) started at 11:20. Compactor started at 11:50 and finished at 15:45. Two passes was observed with sufficient speed and overlap. Loose lift finished at 15:30. Survey confirmed the average elevation to be 901.42m, which calculates to be a 0.35m lift. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 96.5% to 99.3%. The moisture content from the ADR stockpile was 3.6% to 3.7%, which does not comply with BGC requirements. The moisture content from the stockpile north of the embankment was 7.6%, which complies with BGC requirements.

3.0 DISCUSSION/OTHER

- 1200 Excavator was seen to be loading 777 Haul trucks west of the ADR foundation at 12:50 with no moisture conditioning.
- Second D10 dozer was resloping the embankment toe from 15:30 to 16:30.

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work (Dayshift)
-	Cat D-10 Dozer	7.0	Placing structural fill, upper embankment
-	Cat D-10 Dozer	9.5	Placing structural fill, lower embankment
-	Hitachi 1200 Excavator	6.5	Loading Structural fill from ADR Stockpile
-	Cat 777 Haul Truck	6.5	Hauling structural fill to embankment
-	Cat 777 Haul Truck	6.5	Hauling structural fill to embankment
-	Cat 777 Haul Truck	6.5	Hauling structural fill to embankment
-	CAT CS 78 B Compactor	9.0	Compacting structural fill at embankment

2.0 HEAP LEACH FACILITY

- Continuation of nightshift's lower embankment lift (891.10m design elevation), compactor started at 06:45 and finished at 07:30. Two passes was observed with sufficient speed and overlap. Loose lift finished at 08:00. Survey confirmed the average elevation to be 891.08m, which calculates to be a 0.38m lift. The test area exceeded 95% of the standard proctor density of 2272 kg/m^3 at 100%. The moisture content was 4.0%, which does not comply with BGC requirements.

- Start of lower embankment lift #1 (891.48m design elevation) started at 07:30. Compactor started at 11:15 and finished at 12:30. Two passes was observed with sufficient speed and overlap. Loose lift finished at 10:30. Survey confirmed the average elevation to be 891.40m, which calculates to be a 0.32m lift. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 98.4% to 100%. The moisture content was 3.8% to 4.3%, which does not comply with BGC requirements.

- Start of lower embankment lift #2 (891.80m design elevation) started at 12:30. Compactor started at 15:00. Two passes was observed with sufficient speed and overlap. Nightshift to continue.

- Continuation of nightshift's upper embankment lift (902.07m design elevation) started at 07:40. Compactor started at 07:30 and finished at 09:00. Two passes was observed with sufficient speed and overlap. Loose lift finished at 08:45. Survey confirmed the average elevation to be 902.10m, which calculates to be a 0.43m lift. Density tests were completed by nightshift.

- Start of upper embankment lift #1 (902.50m design elevation) started at 08:45. Compactor started at 09:00 and finished at 11:15. Two passes was observed with sufficient speed and overlap. Loose lift finished at 10:00. Survey confirmed the average elevation to be 902.42m, which calculates to be a 0.32m lift. The tested areas

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 97.5% to 100%. The moisture content from the ADR stockpile was 3.6% to 4.4%, which does not comply with BGC requirements.

- Start of upper embankment lift #2 (902.82m design elevation) started at 10:15. Compactor started at 11:30 and finished at 14:45. Two passes was observed with sufficient speed and overlap. Loose lift finished at 14:00. Survey confirmed the average elevation to be 902.75m, which calculates to be a 0.33m lift. The tested areas exceeded 95% of the standard proctor density of 2272 kg/m^3 ranging from 95.7% to 98.1%. The moisture content from the ADR stockpile was 3.9% to 4.1%, which does not comply with BGC requirements. The moisture content from the stockpile north of the embankment was 5.7%, which complies with BGC requirements.
- Structural fill was coming from the stockpile west of the ADR foundation and the stockpile north of the embankment. Both are approved sources. Structural fill from the stockpile north of the embankment appears to have a moisture content of 5 to 6%, whereas the material from stockpile #3-2 has a moisture content of 3 to 4%. Material was slightly coarser than yesterday, but still visually appeared to have less than 30% over 19 mm. Oversize boulders were removed from lift. This meets the BGC method specification requirement for structural fill.
- Approximately 48 loads were placed during shift. Assuming 36 m^3 per load, a total of 1,728 m^3 of structural fill was placed on the embankment during dayshift.

3.0 DISCUSSION/OTHER

- East embankment ramp has been decommissioned.

Project:	Heap Leach Facility (HLF) Earthworks CQA	**Date:**	August 3, 2018
Location:	Eagle Gold Mine, YK	**Weather:**	Overcast, sporadic rain after 3:30
Client:	JDS		High 18°C
File:	ENG.WARC03235-02.005		Low 13°C

1.0 HLF EARTHWORKS CONSTRUCTION SUMMARY

Unit ID	Equipment	Earthworks Hours Worked	Work(Nightshift)
	Cat D-10 Dozer	11	Placing structural fill
	Hitachi 1200 Shovel	3	Loading Structural fill from ADR Stockpile
	Cat 777 Haul Truck	3	Hauling structural fill to embankment
	Cat 777 Haul Truck	3	Hauling structural fill to embankment
	Cat 777 Haul Truck	3	Hauling structural fill to embankment
	CAT CS 78 B Compactor	10	Compacting structural fill at embankment
	Water Truck	3	Moisture conditioning aggregates
	Link Belt 250 Excavator	4	Placing structural fill

2.0 HEAP LEACH FACILITY

- Continued placement of structural fill at Heap Leach Facility Embankment. Grades for embankment slope lower lift elevation 891.78 m placed during day shift were overbuilt by 30 cm.
- Re-grading of lift elevation 891.78 m began at 19:00 hours. Overbuilt fill was stockpiled to allow for compaction. The lift was keyed into side slope around the narrow area east of ramp as well as along the existing embankment slope. Re-grading completed by 01:45 hours. Compaction was competed by 02:20 hours. Compaction testing and survey were completed at 02:25 hours.
- Placement of lift elevation 892.18 m started at 2:30 hours. Placement was incomplete by end of shift. Compaction for this lift began at 04:00 hours but was not completed by the end of shift. Placement and compaction will be finished on dayshift.
- Shovel loaded structural fill from the ADR stockpile previously approved. Material was fine, visually appeared to have less than 30 % over 19 mm and smaller than over 150 mm particle size. If oversized cobbles or boulders were noticed in the lift, they were removed prior to compaction. This meets the BGC method specification requirement for structural fill. A water truck was used to moisture condition the structural fill stockpile prior to loading.
- All compaction was done with two passes (back and forth) of the 13.4 tonne vibratory roller. Sufficient overlap and complete coverage meets the method specification requirements for 2 passes with a 13.4 tonne vibratory roller. Six compaction tests, using the nuclear densometer, were completed. The tested areas exceeded 95 %

Tetra Tech Canada Inc.
14940 - 123 Avenue
Edmonton, AB T5V 1B4 CANADA
p. 780.451.2121 f. 780.454.5688

of the standard proctor density of 2272 kg/m^3 ranging from 95.3 % to 100.1 %. Moisture content ranged from 4.2 % MC to 5.2 % MC, which is below the targeted BGC method specification requirements.

- Each lift placed was benched into the existing side slope of the elevation 920 m raised lift. The uncompacted side slopes of the existing ramps to the 920 m raised lift were removed. Loose Type 3 Rock with visible voids in the sidewall of the excavation was as also removed. This complies with the placement methodologies outlined by BGC.
- Ongoing grade checks during placement by contractor using laser level. Survey confirmed that the average surveyed elevation averaged approximately 2 cm below target design elevation of 40 cm lift thickness. This satisfies the BGC method specification requirements of 50 cm maximum lift thicknesses.
- Approximately 42 loads were placed during shift. Assuming 36 m^3 per load, a total of 1,512 m^3 of structural fill was placed on the embankment during nightshift.

3.0 DISCUSSION/OTHER

- Placement of fill on lower embankment slope may be expedited if one or more ramps to the upper 920 m raised lift were removed.

ORE PREP PAD AND OVERLAND CONVEYOR FIELD REPORT

To:	Roman Bilobrowka; Calvin Goldschmidt; Chris Copley, Matt Coverdale, Mike Blusson		
Cc:	Chad Cowan; Robert Zschuppe; James Buyck, John Purvis, Richard Oswell, Mark Estrada	**From:**	Scott Dimitroff
Project:	Ore Prep Pad and Overland Conveyor	**Date:**	September 22, 2018
Location:	Eagle Gold Mine, YK	**Weather:**	Overcast
Client:	JDS		High 9°C
File:	ENG.WARC03235-02.005		Low -2°C

1.0 ORE PREP PAD AND OVERLAND CONVEYOR

- JDS requested that TetraTech provide construction monitoring for the Ore Prep Pad and Overland Conveyor.
- Arrived on site to find that a pad approximately 4 metres high had already been placed. The pad was being built out of excavated Type 3 material from the cut for the ore pad. Material was being packed with loaded haul trucks as the packer was broken down.
- The area from sta. 1100 (Dublin Gulch Creek) to the pad appeared to have been excavated down to original ground with an organic spill pile on the east edge.
- Proof rolling with a loaded 40 ton haul truck indicated some soft, wet areas that needed to be removed. The contractor was in the process of doing this.

2.0 DISCUSSION/OTHER

- TetraTech will provide monitoring of the fill placement.
- Lifts of the Type 3 were being placed in 0.7 metre lifts. Contractor was advised to reduce lifts to 0.3 metres but continued with 0.7 metre lifts.

COMPACTION DENSITY TEST SUMMARY REPORT

ASTM Designation D6938

Project: Eagle Gold Project | **Test Apparatus:** Nuclear | **Troxler No:** 60841

QC Inspection & Testing | **Specified Compaction:** 95 % Std. Proctor Max. Dry Density

Project No.: WARC.03235-05.005 | **Specified Moisture** (MC)**:** N/A

Client: JDS Energy & Mining/BGC | **Temperature** **Air:** 1.0 ºC **Soil:** 0.9 ºC

Attention: R.Morlan/D. Granda | **Date Tested:** 10/13/2018 **By:** R.Oswell

Contractor: Pelly Construction | **Construction Period:** Nightshift

Soil Description: Material Type 3 - Structural Fill - GRAVEL and sand, silty

Material Usage/Zone: HLF - West Spillway Downstream Sideslope

Date mm/dd/yyyy	**Test No.** / Probe (mm)	**Location:**	Elevation (m)	Dry Density (kg/m³)	MC %	Max. Dry Density	Opt. MC %	Comp % SPD
10/13/2018	**7** / 300	Spillway Slope - Lift 1 - South section	932.10	2234	5.7	2270	6.7	**98.4**
10/13/2018	**8** / 300	Spillway Slope - Lift 2 - Center section	932.55	2254	4.4	2270	6.7	**99.3**
10/13/2018	**9** / 300	Spillway Slope - Lift 3 - East section	933.00	2209	5.2	2270	6.7	**97.3**

Remarks: Compacted using CS78 13.4 tonne vibratory compactor.

COMPACTION DENSITY TEST SUMMARY REPORT

ASTM Designation D6938

Project: Eagle Gold Project | **Test Apparatus:** Nuclear | **Troxler No:** 60841

QC Inspection & Testing | **Specified Compaction:** 95 % Std. Proctor Max. Dry Density

Project No.: WARC.03235-05 | **Specified Moisture** (MC)**:** As Below

Client: JDS Energy & Mining/BGC | **Temperature** **Air:** 0.0 ºC **Soil:** 4.0 ºC

Attention: R.Morlan/D. Granda | **Date Tested:** 9/25/2018 **By:** A. Schoepp

Contractor: Pelly Construction | **Construction Period:** Nightshift

Soil Description: Structural Fill

Material Usage/Zone: Heap Leach Facility (HLF) Embankment

Date yyyy/mm/dd	**Test No.** / Probe (mm)	**Location:**	Elevation (m)	Dry Density (kg/m³)	MC %	Max. Dry Density	Opt. MC %	Comp % SPD
9/25/2018	**1** / 300	HLF Embankment - West lift	931.55	2190	3.7	2270	6.7	**96.5**
9/25/2018	**2** / 300	HLF Embankment - West lift	931.55	2231	4.0	2270	6.7	**98.3**
1/0/1900	**3** / 300	HLF Embankment - West lift	931.96	2277	3.9	2270	6.7	**100.3**

Remarks: Compacted using CS78 13.4 tonne, Volvo 11 tonne and CS68 9 tonne vibratory compactor.

EXECUTIVE SUMMARY

Tetra Tech Canada Inc. has completed the construction quality assurance program during the installation of the geosynthetic liner system at the Eagle Gold Heap Leach Facility located at Dublin Gulch, Yukon Territory, approximately 85 km North of the Town of Mayo, Yukon Territory, centered at 62°2'N, 135°50'W.

The Heap Leach Facility project included the following components:

- Construction of the Heap Leach Facility earthworks, geosynthetics, and pipework; and
- Surrounding infrastructure including: solution pumps and facilities, ore delivery, and heap stacking equipment and their associated structures.

This report covers the installation of the geosynthetics liner system in the In-heap Pond and the Heap Leach Pad up to elevation 1,000 m of the Heap Leach Facility.

The purpose of the construction quality assurance program was to verify the contractor's quality control program and conformance with the plans and specifications prepared for this project.

The field and laboratory testing performed before and during the completion of this project are presented in the report appendices and summarized in the report text. The completion of the construction quality assurance program demonstrates that the geosynthetic installation completed to date was completed in accordance with the project plans and specifications, and any variances documented and accepted by the proper authorities.

LIMITATIONS OF REPORT

This report and its contents are intended for the sole use of JDS Energy and Mining Inc. and their agents. Tetra Tech Canada Inc. (Tetra Tech) does not accept any responsibility for the accuracy of any of the data, the analysis, or the recommendations contained or referenced in the report when the report is used or relied upon by any Party other than JDS Energy and Mining Inc., or for any Project other than the proposed development at the subject site. Any such unauthorized use of this report is at the sole risk of the user. Use of this document is subject to the Limitations on the Use of this Document attached in the Appendix or Contractual Terms and Conditions executed by both parties.

1.0 INTRODUCTION

This report details the construction quality assurance (CQA) program completed during the installation of the geosynthetic liner system in the In-heap Pond and Heap Leach Pad section (up to elevation 1,000 m) of the Heap Leach Facility (HLF). The liner system was installed at the Eagle Gold Mine, at Dublin Gulch, owned and operated by Victoria Gold, located approximately 85 km North of Mayo, Yukon Territory.

The geosynthetics CQA program was implemented to ensure that the liner system installed within the in-heap pond and heap leach pad of the HLF satisfied the design requirements and was installed in accordance with the plans and specifications prepared for the project, and any variances were documented and accepted by the proper authorities.

For the purposes of this report, the term CQA refers to the activities of Tetra Tech Canada Inc. (Tetra Tech) relating to the testing and inspections required to assure the Client that the various elements met the requirements of the project specifications. This is distinct from quality control (QC), which refers to the activities of the Contractor in the construction of the various elements to meet the requirements of the specification.

1.1 Project Description

1.1.1 Project

The geosynthetic liner system for the In-heap Pond is a double liner system, which is installed directly on the prepared subgrade, consisting of the following layers (starting from the top to the bottom):

- An 80-mil double-sided, textured, linear low-density polyethylene (LLDPE) geomembrane;
- A double-sided geocomposite installed in the in-heap pond to serve as a leak detection layer connected to the pond's leak detection sump;
- A 60-mil double-sided textured LLDPE geomembrane; and
- A geosynthetic clay liner (GCL) reinforced with a layer of sodium bentonite.

The geosynthetics liner system for the Heap Leach Pad Phase 1 is a single liner system, which is installed directly on the prepared subgrade, consisting of the following layers (starting from the top to the bottom):

- An 80-mil double-sided, textured, LLDPE geomembrane; and
- A GCL reinforced with a layer of sodium bentonite.

1.1.2 Location

The Eagle Gold Mine is located in Dublin Gulch, approximately 85 km North of Mayo, Yukon Territory, centered at 62°2'N, 135°50'W.

1.2 Project Documentation

The field and laboratory test data collected during the installation of the in-heap pond, and heap leach pad phase I liner system are detailed throughout this report and are presented in the following sections:

- Tables
- Figures
- Photographs
- Material Inventory Summary
- Panel Installation Summary
- Trial Seam Summary
- Panel Diagrams
- Seam Installation Summary
- Repair Logs
- Air Pressure Testing Summary
- Destructive Seam Testing
- Manufacturer Certification
- Geomembrane Reference Material
- Layfield QC Report
- Tetra Tech's Limitations on the Use of this Document
- Supporting Documentation for Section 3.10

1.3 Project Organization

JDS Energy and Mining Inc. (JDS), on behalf of StrataGold Corporation (StrataGold), a wholly owned subsidiary of Victoria Gold Corp., has been engaged for Engineering, Procurement, and Construction Management (EPCM) services to execute the Eagle Gold Project at Dublin Gulch, Yukon Territory.

JDS contracted NND-EBA Land Protection Corp., operating as NELPCo Limited Partnership (NELPCo), who used their engineering services provider Tetra Tech to provide CQA services throughout the duration of the liner installation, adhering to the design and specifications for the HLF prepared by BGC Engineering Inc. (BGC).

Tetra Tech's Project Manager was Chad Cowan, P.Eng. Scott Dimitroff and Kate Rogers, E.I.T. were Tetra Tech's CQA monitors for the entire geosynthetics portion of the project. Tetra Tech's CQA monitor was on site on a full-time basis for all geosynthetic installation. They worked closely with the contractor supervising daily activities such as panel placement, wedge welder and extruder qualifications, liner installation and repair inspection, and all testing completed on the liner material, both destructive and non-destructive.

The contractor for the geosynthetics installation was Layfield Group Ltd. (Layfield) of Edmonton, Alberta. The Foreman for Layfield was Chad Messervey, while Jason Wheeler was the Project Manager.

2.0 CONSTRUCTION QUALITY ASSURANCE PROGRAM

2.1 Objective

The objective of the CQA program was to ensure that the geosynthetic liner system was installed in accordance with the construction specifications. Table A, which summarizes the CQA requirements for the geosynthetics portion of this project, is attached.

The CQA program was designed to supplement the QC program implemented by Layfield, and fulfilled two purposes;

- To provide documentation of the specific technical requirements of the CQA program to be followed during the installation of the geosynthetic liner systems; and
- To be a source of information for personnel performing and monitoring construction.

2.2 Construction Quality Assurance Program Components

The following activities were performed as components of the CQA program:

- **Field inspections** performed by the CQA monitor. These inspections were primarily visual examinations, but also included measurements of materials and equipment used, and techniques employed. The purpose of these inspections was to demonstrate that the specific guideline, specification, or procedure for the activity was successfully completed.
- **Field laboratory seam testing** performed on site by the contractor and visually inspected by the CQA monitor according to specified procedures. Seam tests were performed on samples of the installed geomembrane seams to confirm the contractor's QC testing and ensure that actual seam performance was meeting the project seaming requirements.
- **Receiving inspections** performed by the CQA monitor. These inspections included visual examinations of materials received from the supplier along with their matching manufacturer certificates. The purpose of these inspections was to verify that the materials used met the requirements of the specifications and were free from defects.

3.0 HLF GEOSYNTHETIC LINER SYSTEM

3.1 Geosynthetic Liner Profile

3.1.1 In-Heap Pond Liner Profile

The completed geosynthetic liner system for the in-heap pond is a double liner system, which is installed directly on the prepared subgrade consisting of the following layers (starting from the top to the bottom):

- An 80-mil double-sided textured LLDPE geomembrane;
- A double-sided geocomposite installed in the in-heap pond and sump area to serve as a leak detection layer connected to the pond's leak detection sump;
- A 60-mil double-sided textured LLDPE geomembrane; and
- A GCL reinforced with a layer of sodium bentonite.

The 80-mil LLDPE double-sided textured geomembrane was placed directly on the geocomposite throughout all areas of the in-heap pond, apart from the sump area, as discussed below in section 3.10.

The double-sided geocomposite was installed between the 60-mil and 80-mil LLDPE geomembranes. The geocomposite is manufactured with a three dimensional bi-planar geonet, laminated on both sides with non-woven geotextile. The geocomposite serves as the leak detection layer which is connected to the pond's leak detection sump. A geocomposite with a geotextile weight of 270 g/m^2 was used on the embankment face above elevation 925 m, and in the West portion of the in-heap pond above elevation 930 m. All other areas of the in-heap pond used a geocomposite with a geotextile weight of 350 g/m^2, as shown in Figure 1.

The 60-mil LLDPE double-sided textured geomembrane was placed directly on the GCL in all areas throughout the in-heap pond.

The GCL was placed directly on the prepared subgrade, smooth and free of all rocks, stones, sticks, roots, sharp objects, or debris of any kind. GCL liner was covered the same day to limit exposure to moisture.

3.1.2 Heap Leach Pad Phase I

The geosynthetics liner system for the Heap Leach Pad Phase 1 is a single liner system, which is installed directly on the prepared subgrade, consisting of the following layers (starting from the top to the bottom):

- An 80-mil double-sided, textured, LLDPE geomembrane; and
- A GCL reinforced with a layer of sodium bentonite.

The 80-mil LLDPE double-sided, textured geomembrane was placed directly on the GCL throughout all areas of the heap leach pad phase I.

The GCL was placed directly on the prepared subgrade, smooth and free of all rocks, stones, sticks, roots, sharp objects, or debris of any kind. GCL liner was covered the same day to limit exposure to moisture.

3.2 Manufacturer's Quality Control Certification

GSE Environmental, SOLMAX, and SKAPS provided Manufacturing Quality Control certificates for the GCL, 60-mil and 80-mil LLDPE geomembrane, and geocomposite produced and delivered to site. These certificates show the average and minimum values for each roll of material delivered to site.

A summary of the manufacturer's certifications for the GCL, geomembrane, and geocomposite materials used for this project are included in Layfield's QC package shown in Appendix A.

Tetra Tech reviewed the test data contained within the Manufacturer's Certificates for comparison to the product specifications. This comparison demonstrated that the material supplied met or exceeded all the typical project-specific requirements. Any variances are discussed below, and in section 3.10.

3.3 Installation of 60-mil Linear Low-Density Polyethylene Geomembrane

The 60-mil geomembrane used in the geosynthetic liner system for this project was SOLMAX LLDPE series, 1.50 mm Black, Textured, manufactured by SOLMAX. The material was delivered to site in rolls measuring 6.8 m wide by approximately 165 m long. The 60-mil SOLMAX LLDPE is a double-sided textured geomembrane that was placed directly on the GCL. The specification sheet provided dictates values are outside of the range prescribed in the project specifications but was determined to be an acceptable product by BGC prior to installation. Product variances from design are outlined in section 3.10.

The 60-mil geomembrane was deployed immediately after placement of the GCL, so as to limit exposure of the GCL. In instances where GCL was left exposed overnight, or longer, it was thoroughly inspected to ensure it was clear of debris, and no swelling had occurred prior to any placement of 60-mil geomembrane. In instances where GCL was left exposed and snow had accumulated on the surface, the same inspection criteria listed above were evaluated once the snow had been removed, prior to any placement of 60-mil geomembrane.

The geomembrane overall panel layout and tie-in seams are included in Layfield's QC package shown in Appendix A. This final as-built differs from the design drawings provided by BGC, as discussed in section 3.10.

During placement, each geomembrane panel was inspected for signs of manufacturing defects or damage that may have been caused by the shipping, handling, or storage of the material. Any damage identified as part of the inspection were marked and removed from the roll prior to installation.

Photo 1 shows the deployment of 60-mil LLDPE on GCL, and Photo 2 shows a progress shot of 60-mil LLDPE installed.

3.4 Installation of Geocomposite

The double-sided geocomposite for this project was supplied by SKAPS. Geocomposite with a geotextile weight of 270 g/m^2 was used on the embankment face above elevation 925 m, and in the west portion of the in-heap pond above elevation 930 m (product: TN-220-2-8). All other areas of the in-heap pond used geocomposite with a geotextile weight of 350 g/m^2 (product: TN 350-2-8), as shown in Figure 1. The geocomposite was installed directly on top of the 60-mil LLDPE geomembrane.

The double-sided geocomposite was installed in all areas throughout the in-heap pond between the 60-mil and 80-mil LLDPE geomembranes including the sump area, pond slopes, and extends into the key trench which terminates at elevation 940 m. Double-sided geocomposite is manufactured with a three dimensional bi-planar geonet, laminated on both sides with non-woven geotextile and has a primary function of serving as the leak detection layer which is connected to the pond's leak detection sump.

The edges of adjacently placed geocomposite panels were overlapped and the geonet tied together using nylon ties (zip ties) at an approximate spacing of 1.5 m. A nylon tie spacing of 300 mm was used on slopes, and at roll ends. The upper geotextile layers of each geocomposite panel were then heat bonded using a Leister heat gun.

Photo 3 shows deployment of double-sided geocomposite. Photo 4 shows the geonet zip-tied together.

3.5 Installation of 80-mil Linear Low-Density Polyethylene Geomembrane

The 80-mil geomembrane used in the geosynthetic liner system for the in-heap pond portion of the project was SOLMAX LLDPE series, 2.00 mm Black, Textured, manufactured by SOLMAX. The material was delivered to site in rolls measuring 6.8 m wide by approximately 122 m long. The 80-mil SOLMAX LLDPE is a double-sided textured

geomembrane that was placed directly on the geocomposite. The specification sheet provided dictates values are outside of the range prescribed in the project specifications but was determined to be an acceptable product by BGC prior to installation. Product variances from design are outlined in section 3.10.

The 80-mil geomembrane used in the geosynthetic liner system for the heap leach pad portion of the project was SOLMAX LLDPE series, 2.00 mm Black RT, textured, manufactured by SOLMAX. The material was delivered to site in rolls measuring 6.8 m wide by approximately 122 m long. The 80-mil SOLMAX LLDPE is a double-sided textured geomembrane that was placed directly on the GCL.

The 80-mil geomembrane for the in-heap portion of the project was placed directly on top of the geocomposite. Prior to placement of the 80-mil, the geocomposite material was thoroughly inspected to ensure it was clear of debris. In instances where the geocomposite was left exposed for an extended length of time prior to placement of the 80-mil, and snow had accumulated on the surface, the same inspection criteria listed above were evaluated once the snow had been removed, prior to any placement of 80-mil geomembrane.

The 80-mil geomembrane used in the geosynthetic liner system for the heap leach pad portion of the project was deployed immediately after placement of the GCL, so as to limit exposure of the GCL. In instances where GCL was left exposed overnight, or longer, it was thoroughly inspected to ensure it was clear of debris, and no swelling had occurred prior to any placement of 80-mil geomembrane.

The geomembrane overall panel layout and tie-in seams are included in Layfield's QC package shown in Appendix A. This final as-built differs from the design drawings provided by BGC, as discussed in section 3.10.

During placement, each geomembrane panel was inspected for signs of manufacturing defects or damage that may have been caused by the shipping, handling, or storage of the material. Any damage identified as part of the inspection were marked and removed from the roll prior to installation.

Photo 5 shows the installation of 80-mil LLDPE on top of geocomposite.

3.6 Trial Seams

Seam quality is one of the most critical aspects of geomembrane installation. The ambient conditions at the time of seaming, setup of the welding equipment, and other variables can all affect the quality of the welded seams. Care was taken by the Installer to ensure that the welding equipment was properly set up and producing a conforming seam prior to field seaming operations. The welding equipment was requalified at four-hour intervals, as per Layfield's QC program, and as necessary during the working day, in accordance with specifications. Photo 6 shows a trial seam being completed.

3.7 Seam Wedge (Fusion) Welding

The seaming operations were continuously monitored by the CQA monitor to ensure there were no isolated problems, such as water puddles or dirt under the liner that could affect seam quality over any length of the seam. The temporary leading edges of the geomembrane occasionally became dirty due to windblown dust and mud from open areas of the clay subgrade. These edges were scrubbed and wiped clean prior to seaming.

3.7.1 Air Pressure Test

Fusion welded seams were non-destructively tested over their full-length using air pressure testing. The air pressure tests were performed by Layfield and observed by the CQA monitor. An air channel located between the dual tracks

of the fusion welded seam was pressurized to a minimum of 210 kN/m^2, or 30 lbs/in^2 (pounds per square inch [psi]) for a period of at least five minutes; an air pressure loss of more than 28 kN/m^2 or 4 psi required that the air leak be located, repaired, and retested. Photo 7 shows an air test in progress.

3.7.2 Destructive Test

Samples of the fusion welded seams were destructively tested at regular intervals of minimum one per 500 linear metres of seam throughout the installation of the liner, to ensure that seam quality did not change throughout seaming operations. In cases where a failed coupon from a destructive test was identified, the total length of failed seam was determined by taking additional destructive tests 3 linear metres before and after the first destructive test and retesting until a passing destructive test result was obtained in both directions of the first failed destructive test. The length of seam between the passing destructive tests was then replaced, patched, or extrusion welded. Photo 8 shows an area where a destructive test was taken from a seam.

Some variability existed in the case of failed destructs from what is outlined in the specifications provided. This is discussed in section 3.10.

3.8 Extrusion Welding

Each panel and seam were inspected continuously by the CQA monitor during the installation. Any defects found in the LLDPE membrane or in the seams were marked so that the installation crew was aware that a defect was found. Once all repairs were completed by the installer, the CQA monitor reviewed each panel and seam from the anchor trench to the panel end to ensure all defects were adequately repaired. Any defects identified in the 60-mil geomembrane were repaired prior to placing geocomposite.

Any repairs to the panels or seams were completed by placing an extrusion welded bead over defects smaller than 6 mm, or by extrusion welding a patch of LLDPE over any destructive sample holes, tears, or holes larger than 6 mm, or areas with blisters. Scratches, scuffs, or creases were generally repaired by placing an extrusion welded bead over the defect area. Photo 9 displays patch repair work completed using an extrusion welder.

3.8.1 Vacuum Test

All extrusion welded repairs were non-destructively tested using the vacuum box test method. The vacuum box assembly consists of a rigid housing, a transparent viewing window, and a vacuum gauge. The weld to be tested was wetted with a soapy solution and the vacuum box assembly was placed over the soapy weld, ensuring a seal over the test area.

A vacuum pressure between 5 psi to 8 psi was induced for at least 15 seconds, and the area within the viewing window was examined for the presence of bubbling, indicating a leak. Suspect areas were marked, repaired, and retested. As with the air pressure tests, the vacuum box tests were performed by Layfield and observed by the CQA monitor. Photo 10 shows a repair being tested using the vacuum box method.

3.9 In-Heap Pond Sumps

The in-heap pond includes a system of three sumps at the very bottom of the pond. As-built conditions show some variations from design, but no new drawings were re-issued for the modified liner system.

3.9.1 Closure Sump

The completed geosynthetic liner system for the closure sump consists of the following layers (starting from the top to the bottom), any variations in this assembly from design are discussed in section 3.10.

- A top layer 60-mil double-sided textured LLDPE geomembrane, welded to the bottom layer 60-mil LLDPE geomembrane;
- A 16 oz. non-woven geotextile encasing the piping and backfill;
- A bottom layer 60-mil double-sided textured LLDPE geomembrane continuous to meet the 60-mil LLDPE geomembrane on the in-heap pond slopes; and
- A GCL reinforced with a layer of sodium bentonite.

An as-built sketch of the sump liner profile is shown in Figure 2.

3.9.2 Leak Detection and Recovery System Sump

The completed geosynthetic liner system for the leak detection and recovery system (LDRS) sump consists of the following layers (starting from the top to the bottom), any variations in this assembly from design are discussed in section 3.10.

- A top layer 80-mil double-sided textured LLDPE geomembrane, welded to be continuous to surrounding slopes;
- A 16 oz. non-woven geotextile, which ties into the double-sided geocomposite existing on the surrounding slopes;
- A bottom layer 60-mil double-sided textured LLDPE geomembrane continuous to meet the 60-mil LLDPE geomembrane on the in-heap pond slopes; and
- Closure sump assembly as listed in section 3.9.1.

An as-built sketch of the sump liner profile is shown in Figure 2.

3.10 Variations from Design

3.10.1 Proposed Panel Layout

Section 4.1.1 of the Technical Specifications provided by BGC on October 16, 2017 (Specs.) dictate the “alignments, lengths, and areas are shown on the Drawings. Exact locations and lengths may vary to suit field conditions, as approved by the Engineer.” in reference to the proposed panel layout.

Due to the size of the liner, and design slopes of the in-heap pond, the original panel layout (shown in Figure 3) was not achievable, and upon installation, there were some variances from Section 4.1.7.1 of the Specs., which is summarized below:

- Geomembrane panels oriented such that they are perpendicular to the natural contours (parallel to the maximum slope;
- No horizontal seams allowed on slopes steeper than 3H:1V;
- All seams shall be oriented such that they are shingled in a down-slope direction; and

- If cross seams are required on a steep slope, the end of each panel shall be cut at a diagonal of 45° and seamed to prevent installation of a horizontal seam.

The as-built grading of the HLF in-heap pond shown in Figure 4 displays some areas with sloping greater than 3H:1V. This was stated as acceptable in an email from BGC sent October 28, 2018 (Appendix B). Comparing the as-built grading (Figure 4), and the as-builts of the LLDPE (Appendix A), it is apparent that there are horizontal seams located on slopes greater than 3H:1V.

3.10.2 Vehicle Contact with Geomembrane

Due to the sequence of works of the in-heap pond liner and sump piping, access to the sumps was required after the liner had been installed, but before over drainage fill (ODF) placement. To accommodate this schedule, BGC issued Field Memo 007 (FM-007) (Appendix B) which allowed for a reduced layer of ODF to be placed and serve as a “haul road” for material access to the in-heap pond sumps.

The Contractor responsible for the sump piping installation proposed a list of equipment to run on the reduced layer of ODF over the liner, that was approved by BGC. The equipment list is shown in Table 1.

Table 1: List of Approved Equipment to Drive on Installed Liner

Type	Code	Model 1	Model 2
Excavator 1	EXC045	CAT 324 EXC	324 E EXC045
Excavator 2	EXC014	CAT 314 EXC	314E LCR
Excavator 3	EXC140	DOOSAN DX140 EXC	DX140 LC
Dozer	DZR016	CAT D6T Dozer	D6T LGP
Loader	LDR004	CAT 950 Loader	950K LDR 004
Skid Steer	LDR040	CAT 279 Skidsteer	279D
Rock Truck 1	TRK512	CAT 401 RT	740B
Rock Truck 2	TRK513	CAT 301 RT	730C
Packer	PKR009	CAT CS56B Packer	PKR009

Additionally, the approved equipment was required to follow a specific path on and off the liner with only a forward and backward drive direction.

Tetra Tech completed sieve analysis on the ODF being placed throughout the haul road placement to ensure it adhered to FM-007. Results can be seen in Appendix B.

3.10.3 LLDPE Material Requirements

Section 4.1.5 of the Specs. provides Table 4.1. Geomembrane Properties, that dictate the properties that the supplied geomembrane is required to meet or exceed; however, some of the values listed are higher than those listed in the Geosynthetic Research Institute (GRI) GM 13 and GM 17.

It was acknowledged by BGC via email (Appendix B) that the proposed liner was acceptable provided it met the GRI values.

Table B shows Table 4.1 from the Specs. with the values from the GRI bracketed next to it in red.

3.10.4 Installation Requirements

3.10.4.1 LLDPE and Geocomposite Installation

The Sepcs. state, “no geomembrane deployment shall be allowed during periods of wet or extremely windy weather or in the presence of ponded water”. As the installation pushed into the months of October to January, there were installation days where there was snow falling/accumulating on the LLDPE, and geocomposite. Generally, the snow was removed using leaf blowers and shovels, to be <25 mm thick, prior to the installation of the next layer. In instances where welding was occurring, and it began to snow, the area being welded would be marked for a destructive test to be taken from to ensure the weld was not compromised. If the destructive test failed, the procedure as outlined in section 3.7.2 would be followed to determine the length of failed seam that was required to be repaired. Days of snow and adverse weather were reported on the Daily Reports, issued daily throughout liner installation.

3.10.4.2 GCL Installation

In general, as the installation of the liner system progressed, GCL would only remain exposed at panel edges where the width of LLDPE was not as wide as the GCL placed, and in these instances, it was typically 300 mm to 500 mm of exposure. As mentioned above, as the installation pushed into the months of October to January, there were installation days where the anticipated amount of liner was not completed in its entirety due to snow fall. In these instances, there were multiple panels of GCL left exposed overnight. As stated in the specs., “The GCL shall be installed in advance of the geomembrane installation, provided the GCL panels can be covered with seamed geomembrane within each day of deployment. Only those GCL panels that can be covered in the same day shall be unpackaged and installed. If exposed GCL cannot be permanently covered before the end of the work day, it shall be temporarily covered with plastic or other waterproof material to prevent hydration.” BGC was made aware of these occurrences and instructed that any snow accumulation was to be removed, and a thorough visual inspection of the GCL completed by the CQA to determine if it had hydrated.

It was reported in the Daily Reports when GCL was left exposed overnight.

3.10.5 Spark Testing

The Specs. state in section 4.1.5 “The In-Heap Pond liner shall be High Performance GSE UltraFlex Leak Location Textured (or approved equal) for post-installation damage utilizing spark testing technology per ASTM D 7240 and utilizing electrical resistivity testing per ASTM D 7002 on exposed geomembranes and ASTM D 7007 after water or cover soil placement”.

The request for information (RFI) EPCM-RFI-022 issued July 6, 2018 from JDS on behalf of Layfield to BGC (Appendix B), proposes to remove the requirement for a conductive backed liner, and use a valid-test (vacuum) to validate liner in the LDS layer. BGC-RFI-020 issued October 2, 2018 states a specification clarification that reads:

> “The project specifications call for Leak Location (or approved equal) for post-installation damage utilizing spark testing technology in the HLF in-heap pond. EPCM-RFI-022 approved vacuum (VALID) testing in place of spark testing. VALID testing is not possible once the liner is covered with Overliner Drain Fill (ODF). The current project schedule will not likely allow opportunity to fully place ODF in acceptable conditions (see BGC-RFI-016 regarding cold temperature liner system installation). The risk of leaving the liner exposed over the winter is significant with a high probability of damage due to environmental stress cracking from wind and snow induced loading and movement at temperatures below minus 25 degrees C. BGC made StrataGold aware of these risks and the decision was made to place ODF on the liner as soon as possible after incremental placement of the 2.0 mm LLDPE top liner to protect the liner over winter. VALID

> testing may be completed on the portion of the liner exposed and not yet covered with ODF once the top liner is completed. The final decision to complete the VALID testing will be made at that time."

As of August 2019, no valid testing has been completed on the installed liner system.

3.10.6 Liner Profile in Sumps

BGC-RFI-028 issued November 7, 2018 (Appendix B) modifies the liner detail shown on the Issued for Construction (IFC) drawings EGHLF XD-05-01 through 05-04. The installed liner system in the sumps is as shown in the as-built in Figure 2.

3.10.7 Frequency of Destructive Tests

Initially, destructive tests were being taken approximately one every 300 m for each type of LLDPE, as was suited to the field conditions at the time (temperature above 0°, dry). As the installation progressed into temperatures below 0°, and snow/ice, the frequency of destructive tests was increased to one every 150 m.

Upon testing several failing destructs in the liner system in the sump area, it became apparent that there were several entire seams that would need repair. To eliminate excessive destructive tests, a destruct was taken from every seam at the beginning of the seam, and the end of the seam, and if both failed, the seam was marked to be repaired. If only one end of the seam failed, then the failure would be chased every 3 m until a passing destruct was tested. Testing every seam at beginning and end allowed confidence in the integrity of the seams in an area where there were several failing destructs.

The quantity of failed destructs in a small area over a short period of time questioned whether the VM-20 model wedge welding machines being used by Layfield were adequate for the temperatures/field conditions at the time. Layfield introduced XL model wedge welders to be used in colder weather operations. Additionally, specific cold weather guidelines were set in place, as discussed in section 3.10.8.

In instances of entirely failed seams, a cap strip of LLDPE was placed, and wedge welded, or the seam was extruded over. Destructive Seam Testing logs can be found in Appendix A.

3.10.8 Installation of Liner in Cold/Wet Weather

The Technical Specifications state "No seaming shall be conducted if the temperature measured at 15 cm above the geomembrane is lower than 5°C or above 38°C, without written acceptance by the Engineer. When the temperature is below 10°C, the Installer shall preheat the weld zone by a hot air device", but in BGC-RFI-016, this statement is amended as follows:

> Cold weather installations should follow guidelines as outlined in GRI GM9: *Standard Practice for Cold Weather Seaming of Geomembranes*. No geomembrane material shall be seamed when liner (sheet) temperatures are less than 0 degrees C (32 degrees F) unless the following conditions are complied with:
>
> 1. Seaming of the geomembrane at material temperatures below 0 degrees C (32 degrees F) is allowed if the Geomembrane Installer (Layfield) can demonstrate to the Owner's Representatives (Tetra Tech and BGC), using pre-qualification test seams, that field seams comply with the project specifications, the safety of the crew is ensured, and geomembrane material can be fabricated (i.e., pipeboots, penetrations, repairs etc.) at sub-freezing temperatures.

2. The Geomembrane Installer shall submit to the Owner's Representative for approval, detailed procedures for seaming at low temperatures, including the following:

    a. Preheating of the geomembrane, if necessary.

    b. The provision of a tent or other device if necessary to prevent heat losses during seaming and rapid heat losses subsequent to seaming.

    c. Number of test welds to determine appropriate seaming parameters.

3. Trial welds shall always be done in the environment (temperature) and geometry in which production welding is to be done.

4. Freezing temperatures can cause geomembrane sheets to crack when unrolled, folded, impacted, or loaded. Geomembranes when unrolled or folded in cold weather should not crack, craze, or distort in texture. A sheet temperature of minus 10 degrees C (14 degrees F) is the lower limit that a geomembrane shall be unrolled unless it is shown otherwise to the satisfaction of the Owner's Representative.

5. Section 3.8.1.2 of the project technical specifications addresses placement of Overliner Drain Fill (ODF) on the installed liner. A sheet temperature of minus 10 degrees C (14 degrees F) is the lower limit that ODF shall be placed on the geomembrane unless it is shown otherwise to the satisfaction of the Owner's Representative.

In response to BGC-RFI-016, Layfield submitted their Cold Weather Installation Procedure (Appendix B), and through thorough discussions between BGC, JDS, and Tetra Tech, it was determined that provided all the above conditions had been met, Layfield would be able to continue seaming in colder temperatures.

3.10.8.1 Bend Test

In addition to BGC-RFI-016, it was requested that an additional test be completed to determine the ductility of the liner in colder conditions. Sageos; a geosynthetic research and development laboratory, references ASTM D2136-02: Standard Test Method for Coated Fabrics – Low-Temperature Bend Test (Appendix B) as an applicable test for cold weather conditions. The testing apparatus was built by Tetra Tech, and upon testing LLDPE ductility in a variety of temperatures, it appeared that the integrity of the LLDPE conformed to the Specs.

4.0 CONSTRUCTION QUALITY ASSURANCE RECORDS AND TESTS

The following tasks where performed during the installation of the geosynthetic liner system:

- Material Inventory Record;
- Panel Installation Record;
- Trial (or Qualification) Seams;
- Geomembrane Fusion Seam Installation;
- Air Pressure Tests (Wedge Welding);
- Vacuum Test and Repairs (Extrusion Welding);

- Panel Diagrams; and
- Destructive Testing of Geomembrane Seam.

The following provides a brief description of the various CQA testing methodologies. Records of these activities are included in Layfield's QC package shown in Appendix A.

4.1 Material Inventory

An inventory of the 60-mil LLDPE, and 80-mil LLDPE geomembrane liner was completed as the material was placed. This inventory is documented in the material inventory summary data sheets contained in the installer's QC records.

A panel installation summary data sheet contains further information on the individual panels of geomembrane installed and can be found in Layfield's QC package shown in Appendix A.

4.2 Trial (or Qualifying) Seams

Trial seams using both the hot wedge welder and the extrusion welder were produced using strips of LLDPE geomembrane prior to the welding of any seams each day, and every four hours thereafter. When any significant changes in ambient temperature or wind speed were observed, or if seaming was delayed for an extended period, additional trial seams were required for each machine and each material being used or affected. Seaming of installed geomembrane panels did not commence until passing trial seams were completed.

A minimum of five test coupons were cut from the trial seams for both peel and shear strength and tested by Layfield on site. The CQA monitor was present during trial seam testing to observe that quality seams were being produced. In order to receive a passing result, the trial seam sample was required to meet the criteria laid out in Table 2.

Table 2: LLDPE Seam Strength Properties

Material (mil)	Fusion (Wedge Weld) Shear Strength (PPI)	Fusion (Wedge Weld) Peel (PPI)	Extrusion Shear Strength (PPI)	Extrusion Peel (PPI)
60	90	75	90	66
80	120	100	120	88

In addition to meeting the minimum strength requirements, the test coupons were required to meet an adhesion specification of less than 25% incursion into the weld.

These minimum requirements are based on GRI Test Method GM19 – Seam Strength and Related Properties of Thermally Bonded Polyolefin Geomembranes (GRI 2011). The minimum strengths and adhesion specifications are detailed in Appendix C.

All trial seam results are recorded and detailed in Layfield's QC package shown in Appendix A.

4.3 Geomembrane Seaming

The CQA monitor observed and recorded information pertinent to fusion welding (hot wedge seaming) of both the 60-mil and 80-mil geomembrane. The details include start times of the seam, length of the seam, ambient temperature, welding equipment identification and operator, and machine settings.

A summary of the seaming completed can be found in Layfield's QC package shown in Appendix A.

4.4 Non-destructive Testing of Geomembrane Seams

4.4.1 Hot Wedge Welding

All hot wedge welded seams were non-destructively tested using the air pressure test method by Layfield, as described in Section 3.6.1 Air pressure testing results can be found in Layfield's QC package shown in Appendix A. Seams that failed air pressure tests were investigated for possible causes and depending on the cause, repaired and retested or extrusion welded, and vacuum tested.

4.4.2 Extrusion Welding

Extrusion welded repairs were non-destructively tested using the vacuum box test method by Layfield and observed by the CQA monitor. Any weld defects found using the vacuum box test method were marked as VTF (vacuum test failed) at the defect's location and repaired, prior to placement of the next layer. Vacuum box testing results are documented in the repair logs contained in Layfield's QC package shown in Appendix A. The panel diagrams contained in Appendix A display the location of each repair.

4.5 Destructive Testing of Geomembrane Seams

Destructive tests were carried out on wedge welded seams at a frequency of one per 150 linear metres (500 linear feet) of seam, with the exception of those described in Section 3.10. Samples were selected by the CQA monitor to give the best representation of seam quality and were tested by both the CQA monitor and the installer. They were tested to ensure they met or exceeded the minimum peel and shear strength requirements outlined in Table 2. The locations of the destructive samples varied from seam to seam but most samples were obtained from locations in the seam that would not affect the integrity of the liner system or require any extra patches or extrusion welding. Examples of locations of destructive samples include anchor trenches and seam cut offs. Results of the destructive testing are presented in Layfield's QC package shown in Appendix A.

5.0 PROJECT SUMMARY

Tetra Tech provided CQA services during the installation of the geosynthetic lining system installed in the In-heap Pond and Phase 1 of the Heap Leach Pad of the HLF at the Eagle Gold Mine Project located approximately 85 km North of Mayo, Yukon Territory. The completed geosynthetic lining system installed consists of the following layers (starting from top to bottom):

In-heap Pond:

- A 80-mil double-sided textured LLDPE geomembrane;
- A double-sided geocomposite installed in the in-heap pond and sump area to serve as a leak detection layer connected to the pond's leak detection sump;
- A 60-mil double-sided textured LLDPE geomembrane; and
- A GCL reinforced with a layer of sodium bentonite.

Heap Leach Pad (Phase 1):

- A 80-mil double-sided textured LLDPE geomembrane; and
- A GCL reinforced with a layer of sodium bentonite.

The CQA program was conducted in accordance with the construction drawings, specifications, and any Engineer approved revisions as discussed with BGC throughout the duration of the project. The monitoring and testing completed confirm that the geosynthetic material has been installed in accordance with the project plans, specifications, and Engineer approved revisions, prepared for this project.

6.0 CLOSURE

We trust this document meets your present requirements. If you have any questions or comments, please contact the undersigned.

Respectfully submitted,

TABLES

Table A Observations and Tests for Installation of Geomembrane
Table B Table 4.1 from BGC Technical Specifications

Table A: Observations and Tests for Installation of Geomembranes

Observation or Test Method*	Suggested Regulatory Requirements**		Tetra Tech Requirements	
		Number of Tests Suggested		Number of Tests Performed
Observation for uniformity, damage, imperfections, holes, cracks, thin spots, or foreign material.	Continuous.	-	Continuous.	Continuous.
Chemical Resistance:	Manufacturers' Certificates.	-	Reviewed Manufacturers' Certificates (included in Appendix J).	Prior to material deployment.
Resistance to chemical waste mixtures.				
Resistance to pure chemical reagents.				
Thickness (ASTM D5199).				
Density (ASTM D1505/D 792).				
Tensile Properties (ASTM D6693):				
Tensile strength at yield.				
Tensile strength at break.				
Elongation at yield.				
Elongation at break.				
Tear resistance (ASTM D1004).				
Puncture resistance (ASTM D4833).				
Carbon black content (range) (ASTM D1603).				
Carbon black dispersion (ASTM D5596).				
Oxidative Induction Time (ASTM D3895/D5885).				
Oven aging at 85°C (ASTM D5721/D3895/D5885).				
UV Resistance (GM 11/ASTM D3895/D5885).				
Observations for uniformity, damage, imperfections.	All sheets or panels prior to installation and documentation of repairs.	-	Continuous.	Continuous.
Observation for tears, punctures, folding, blisters.	All sheets or panels prior to installation and documentation of repairs.	-	Continuous.	Continuous.
Observation and inspection of test seams.	At start of work by each seaming crew; after every four hours of seaming, with every change in seaming equipment, and with significant changes in sheet temperature (assume 21 days).	>35	One to three tests per each day of the fifteen (15) days construction.	50
Sample of material during construction for future testing and analysis.	One sample taken for each geomembrane lot number and stored in a light-free environment.	>4	One sample taken for each geomembrane lot sample.	Material available on-site for testing.
Non-destructive testing of field seams.	All field seams, record test location, date, time, test results, and documentation of repairs and retesting.	-	Continuous.	Continuous.
Observations of patching and overlay seams that cannot be non-destructively tested.	All patches and overlays, record inspections, and document repairs.	-	Continuous.	Continuous.
Destructive testing of field seams: Bonded seam strength. Peel adhesion.	Sampling at fixed increments of not more than 150 m. Random locations with equivalent number of samples to a 150 m fixed increment.	>37	Random locations with equivalent number of samples to a 150 m fixed increment.	54

Notes:

* As per Geosynthetic Research Institute Test Method GM13 "Test Methods, Test Properties and Testing Frequency for High Density Polyethylene (HDPE) Smooth and Textured Geomembranes" (Revision 9: June 1, 2009) and as per Draft Guidelines for Landfills in Alberta (Alberta Environment 2004).

** As per Draft Guidelines for Landfills in Alberta (Alberta Environment 2004).

Number of tests proposed will vary depending on panel layout, as set out by synthetic liner installer.

*** Number of destructive seam tests required for Cell 2 is approximately 37 (Calculation (38,857m^2 (lined area) ÷7m (panel wideth))/150 m (test frequency) ×1 HDPE layer = 37 tests).

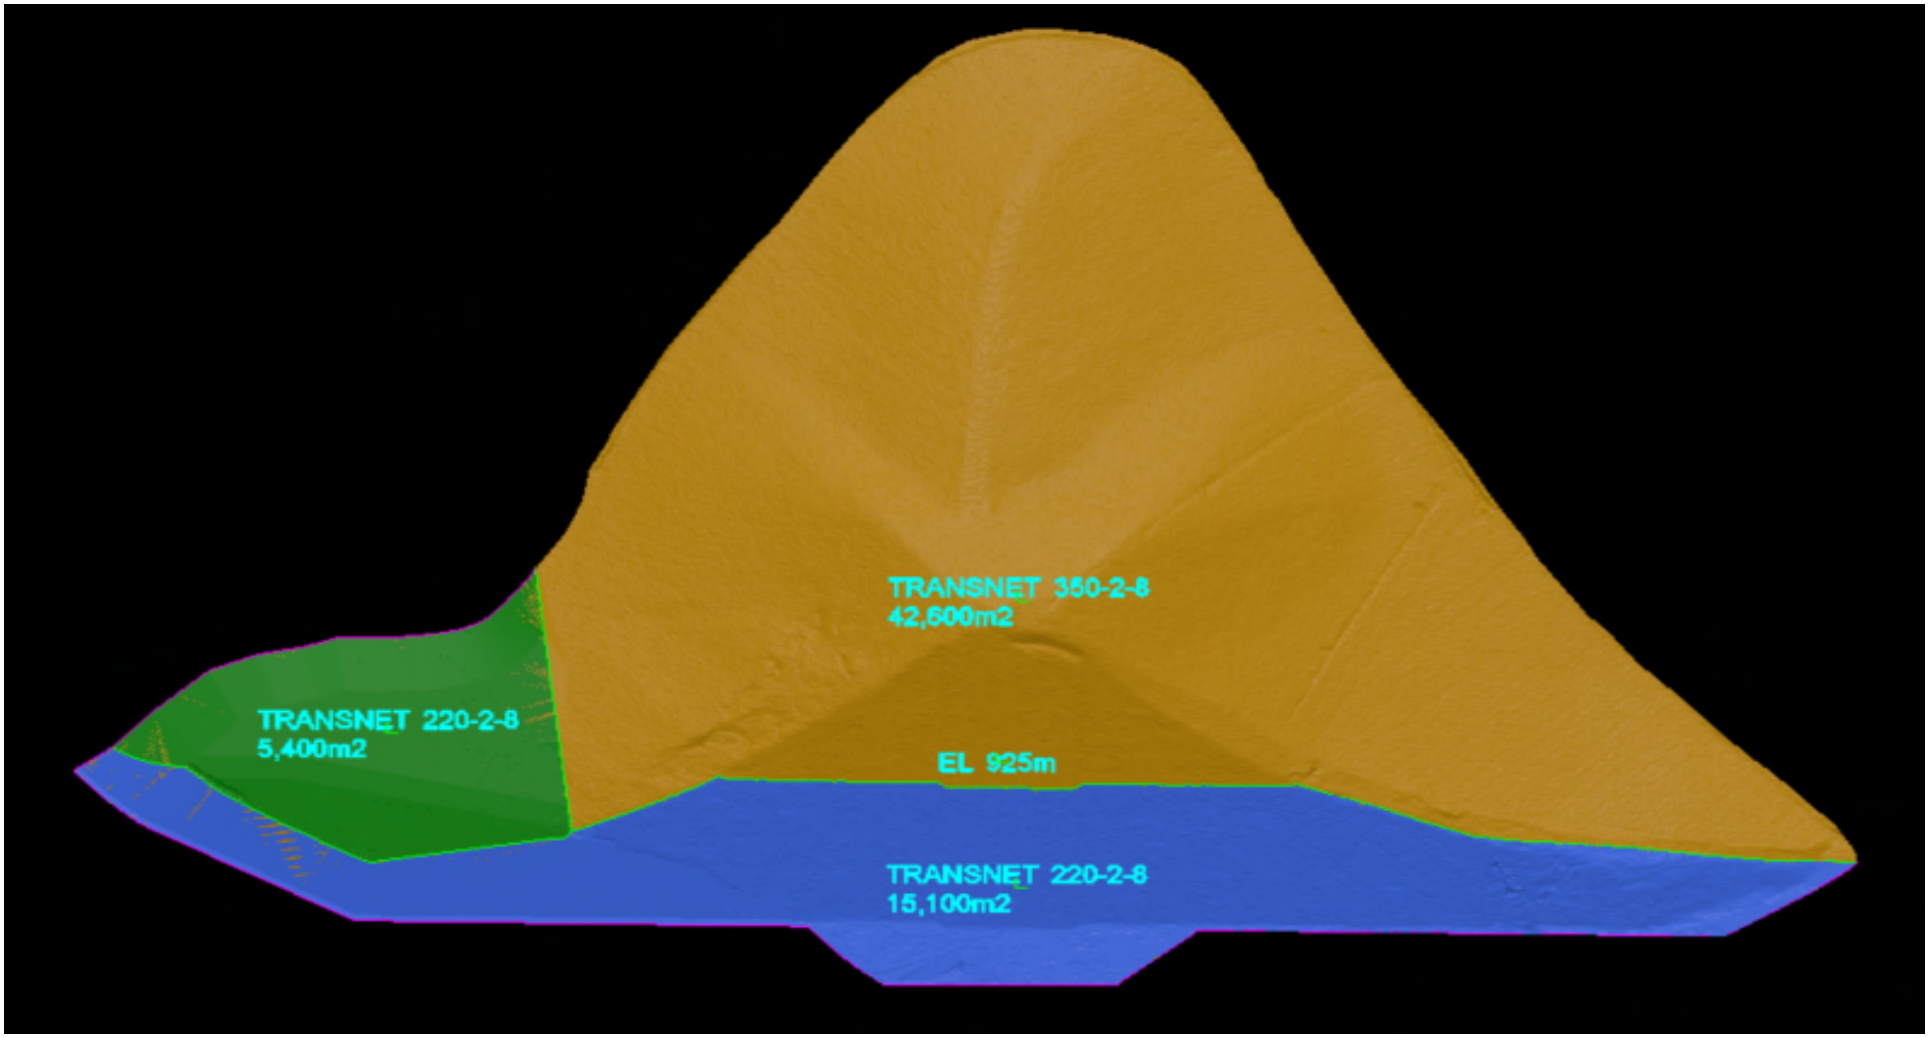

Table B: Table 4.1 from BGC Specs – Geomembrane Properties

CERTIFICATE OF SUBGRADE SURFACE INSPECTION

PROJECT NAME: Gold Eagle Event Pond
PROJECT NUMBER: CT001143
OWNER/CONTRACTOR: Victoria Gold / JDS Mining
LOCATION: Gold Eagle, YK

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the soil subgrade surface described below, and:

- ☑ *found it to be an acceptable surface on which to install geomembrane; OR*
- ☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☐ Partial or ☑ Complete): _____
Dimensions of Subgrade Inspection: _____
Anchor Trench Dimensions: 0.5m to 1m deep to 1m wide
Comments: Entire Pond's subgrade is now accepted.

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:

Date: 2019-04-15
Signature: [signature]
Name: BRADLEY McLEOD
Title: QC Technician

OWNERS REPRESENTATIVE:

I, the undersigned, a duly appointed representative of the Owner, hereby understand the soil subgrade surface inspection described above and authorize Layfield to proceed with deployment of geosynthetics on the subgrade provided.

Date: April 30 2019

CERTIFICATE OF FINAL INSPECTION AND ACCEPTANCE

PROJECT NAME: Gold Eagle Event Pond
PROJECT NUMBER: CT001143 **DATE:** 2019-04-27
OWNER: Victoria Gold
LOCATION: Gold Eagle, YK

Scope of Installation(s): THE WORK
Area/Layer: Event Pond Area Inspected: ☐ Partial or ☐ Complete
Dimensions: Approx. 450m by 108m ~ 48,600m² of geocomposite GCL, 60mil LLDPE DST and 80mil LLDPE DST per layer. All liner tested with air channel and point stress testing. Repairs and Details tested. Two heater installed

Part 1 – LAYFIELD CANADA LTD.

I, BRADLEY McLEOD, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield's QC program and the terms and conditions of the contract.

Layfield Representative:
Name: BRADLEY McLEOD
Title: QC Technician
Date: 2019-04-27 **Signature:**

Part 2 – OWNER (or Representative)

I, Scott Dintinfl, a duly appointed representative of TetraTech, do hereby take over and accept the installation(s) described above, and confirm that the work has been completed in accordance with the project specifications and the terms of the conditions of the contract.

I have evaluated and measured the work together with the Layfield representative, and agree that the measurements shown are both true and correct, and that the installation has met our approval.

Owners Representative:
Name: Scott Dintinfl
Title: Project Technologist
Company: Tetra Tech

INSTALLATION WARRANTY

Layfield Reference No. : (Job #) CT001143

LAYFIELD CANADA LTD. (LAYFIELD) hereby warrants to Victoria Gold Corp; (the Customer) that the work performed by LAYFIELD on the Installation described as Event Pond will:

1. Meet the field seam specifications set out in the contract between LAYFIELD and the Customer (as amended by LAYFIELD's quotation), all workmanship to meet the requirements of LAYFIELD's Field Installation Quality Assurance program, and be free of defects at the time of completion of the Installation; and

2. Be free of installation defects from the date of the completion of the Installation (April 27, 2019), for a period of One year so long as the completed Installation is used for the purposes and in the manner for which the Installation was designed.

Should damage or defects within the scope of the aforesaid warranties occur, LAYFIELD shall repair the damage or defects, PROVIDED THAT the area to be repaired must first be made ready by the Customer and be in a clean, dry, unencumbered condition, free from all water, soil, sludge, residuals, and liquids of any kind.

To enable LAYFIELD to investigate and determine the cause of any alleged damage or defect, notice and details of any claim hereunder must be presented in writing to LAYFIELD within thirty (30) days after the alleged damage or defect was first noticed or observed. Failure to provide such notice and details shall invalidate all warranties provided hereunder.

The liability of LAYFIELD under the aforesaid warranties are subject to the following conditions:

a. LAYFIELD's only obligation shall be to repair or replace any defective workmanship and in no event shall LAYFIELD be liable for any amount in excess of the cost of the Installation;

b. No allowance will be made for repairs, replacements or alterations made by the Customer unless with the prior written consent of LAYFIELD;

c. The warranties hereunder extend only to the Customer and are not transferable;

d. The warranties hereunder shall not apply to any damage or defects resulting from misuse, mechanical abuse by machinery, equipment or persons, excessive pressures or stresses, exposure of the completed Installation of harmful chemicals, unusual weather conditions, casualty catastrophe such as (but not limited to) earthquake, flood, hail, tornado, or any other act of God;

e. Under no circumstances shall LAYFIELD be liable for any special, direct, indirect, or consequential damages including the loss of use of the Installation howsoever caused;

f. All liner materials provided for the Installation are covered by a separate warranty provided by Solmax, and LAYFIELD shall not be liable for material failure claims hereunder;

g. The warranties hereunder are given in lieu of all other warranties, express, implied, statutory, or otherwise, and the Customer expressly waives all other warranties and claims whatsoever except those specifically given herein, and the Customer acknowledges that the warranties hereunder are accepted in preference to and to the exclusion of any or all other warranties; and

h. An Installation Warranty will <u>not</u> be provided for lining projects unless the installation is completed by LAYFIELD personnel or designated LAYFIELD subcontractors.

CERTIFICATE OF SUBGRADE SURFACE INSPECTION

PROJECT NAME: Eagle Gold In Heap Pond
PROJECT NUMBER: CT001143
OWNER/CONTRACTOR: Victoria Gold / JDS Mining
LOCATION: Eagle Gold Mine, YT

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the subgrade surface described below, and:

- ☑ *found it to be an Acceptable surface on which to install geomembrane; OR*
- ☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☐Partial or ☑Complete): _____
Dimensions of Subgrade Inspection: Approx 62,000 m2
Anchor Trench Dimensions: 0.5 x 0.5
Comments: Final Subgrade acceptance to cover all the in heap pond scope

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:

Date: 18 May 2019
Signature: _____
Name: Chad Messervey
Title: Project Supervisor

OWNERS REPRESENTATIVE:

I, the undersigned, a duly appointed representative of the Owner, hereby understand the subgrade surface inspection described above and authorize Layfield to proceed with deployment of geosynthetics on the subgrade provided.

REPAIR TYPE:

G&W - GRIND & WELD	B - BOOT	P - PATCH
RS - RECONSTRUCTED SEAM	C - CAP	S - SKIRT
HAW - HOT AIR WELD		

REMARKS 10P is Pick test only, floating patch

LAYFIELD
ENVIRONMENTAL CONTAINMENT

CERTIFICATE OF FINAL INSPECTION AND ACCEPTANCE

PROJECT NAME: Eagle Gold In Heap Pond
PROJECT NUMBER: CT001143 **DATE:** June 30, 2019
OWNER: Victoria Gold
LOCATION: Eagle Gold Yukon

Scope of Installation(s): **THE WORK**
Area/Layer: In heap pond Area Inspected: ☐ Partial or ☑ Complete
Dimensions: 62,000 m2 of GCL, 60 mil LLDPE, Geocomposite and 80 mil LLDPE

Part 1 – LAYFIELD CANADA LTD.

I, Chad Messervey, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield's QC program and the terms and conditions of the contract.

Layfield Representative:
Name: Chad Messervey
Title: Project Supervisor
Date: June 30, 201[illegible] **Signature:**

Part 2 – OWNER (or Representative)

I, _____, a duly appointed representative of _____, do hereby accept and receive the installation(s) described above, and confirm that the work has been completed in accordance with the project specifications and the terms and conditions of the contract.

I have evaluated and measured the work together with the Layfield representative, and agree that the measurements shown are both true and correct, and that the installation has met our approval.

Owners Representative:
Name: Scott Dinsdale
Title: QA Monitor
Company: TetraTech
Date: Aug 8, 2019 **Signature:**

INSTALLATION WARRANTY

Layfield Reference No. : (Job #) CT001143

LAYFIELD CANADA LTD. (LAYFIELD) hereby warrants to Victoria Gold Corp; (the Customer) that the work performed by LAYFIELD on the Installation described as In Heap Pond will:

1. Meet the field seam specifications set out in the contract between LAYFIELD and the Customer (as amended by LAYFIELD's quotation), all workmanship to meet the requirements of LAYFIELD's Field Installation Quality Assurance program, and be free of defects at the time of completion of the Installation; and

2. Be free of installation defects from the date of the completion of the Installation (May 18, 2019), for a period of One year so long as the completed Installation is used for the purposes and in the manner for which the Installation was designed.

Should damage or defects within the scope of the aforesaid warranties occur, LAYFIELD shall repair the damage or defects, PROVIDED THAT the area to be repaired must first be made ready by the Customer and be in a clean, dry, unencumbered condition, free from all water, soil, sludge, residuals, and liquids of any kind.

To enable LAYFIELD to investigate and determine the cause of any alleged damage or defect, notice and details of any claim hereunder must be presented in writing to LAYFIELD within thirty (30) days after the alleged damage or defect was first noticed or observed. Failure to provide such notice and details shall invalidate all warranties provided hereunder.

The liability of LAYFIELD under the aforesaid warranties are subject to the following conditions:

a. LAYFIELD's only obligation shall be to repair or replace any defective workmanship and in no event shall LAYFIELD be liable for any amount in excess of the cost of the Installation;

b. No allowance will be made for repairs, replacements or alterations made by the Customer unless with the prior written consent of LAYFIELD;

c. The warranties hereunder extend only to the Customer and are not transferable;

d. The warranties hereunder shall not apply to any damage or defects resulting from misuse, mechanical abuse by machinery, equipment or persons, excessive pressures or stresses, exposure of the completed Installation of harmful chemicals, unusual weather conditions, casualty catastrophe such as (but not limited to) earthquake, flood, hail, tornado, or any other act of God;

e. Under no circumstances shall LAYFIELD be liable for any special, direct, indirect, or consequential damages including the loss of use of the Installation howsoever caused;

f. All liner materials provided for the Installation are covered by a separate warranty provided by Solmax, and LAYFIELD shall not be liable for material failure claims hereunder;

g. The warranties hereunder are given in lieu of all other warranties, express, implied, statutory, or otherwise, and the Customer expressly waives all other warranties and claims whatsoever except those specifically given herein, and the Customer acknowledges that the warranties hereunder are accepted in preference to and to the exclusion of any or all other warranties; and

h. An Installation Warranty will not be provided for lining projects unless the installation is completed by LAYFIELD personnel or designated LAYFIELD subcontractors.

CERTIFICATE OF INSPECTION OF SOIL SUBGRADE SURFACE

PROJECT NAME: EAGLE GOLD HEAP LEACH
PROJECT NUMBER: CT001143
OWNER/CONTRACTOR: VICTORIA GOLD / JDS MINING
LOCATION: EAGLE GOLD MINE, YT.

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the soil subgrade surface described below, and:

☑ *found it to be an acceptable surface on which to install geomembrane; OR*

☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☐ Partial or ☑ Complete):
Dimensions of Subgrade Inspection: APPROX 172000 m²
Anchor Trench Dimensions: 0.5m x 0.5 m
Comments: AREA IS ACCEPTABLE FOR INSTALL & WILL BE REPAIRED AS NECESSARY THROUGHOUT CONSTRUCTION.

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:

Date:
Signature:
Name: Austin Green
Title: Field Supervisor.

OWNERS REPRESENTATIVE:

I, the undersigned, a duly appointed representative of the Owner, hereby understand the soil subgrade surface inspection described above and authorize Layfield to proceed with deployment of geosynthetics on the subgrade provided.

Date: June 9, 2019
Signature:
Name: Scott Dittrich
Title: QA monitor
Company: Tetra Tech

DETAIL TYPE:

AD - ANIMAL DAMAGE	DS-# - DESTRUCT SAMPLE NUMBER	IO - INSUFFICIENT OVERLAP	T - THREE PANEL INTERSECTION
ATL - AIR TEST LEAK	EE - EARTHWORK EQUIPMENT DAMAGE	MD - MANUFACTURER/DELIVERY DAMAGE	VL - VACUUM TEST LEAK
BO - FUSION WELDER BURN	EXT - EXTENSION	P - PENETRATION	WR - WRINKLE
CR - CREASE	FM - FISHMOUTH	PT - PRESSURE TEST CUT	WS - WELDER RESTART
D - INSTALLATION DAMAGE	FS - FAILED SEAM LENGTH	SI - SOIL SURFACE IRREGULARITY	OTHER:

TEST METHOD:

AL - AIR LANCE	VB - VAC BOX
PS - POINT STRESS	ST - SPARK TEST

REPAIR TYPE:

G&W - GRIND & WELD	B - BOOT	P - PATCH
RS - RECONSTRUCTED SEAM	C - CAP	S - SKIRT
HAW - HOT AIR WELD		

REMARKS
