Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Iron (Fe)-Total	MB-LOR	L2143384-1, -2, -3, -4
Method Blank	Manganese (Mn)-Total	MB-LOR	L2143384-1, -2, -3, -4
Matrix Spike	Dissolved Organic Carbon	MS-B	L2143384-2, -3, -4
Matrix Spike	Dissolved Organic Carbon	MS-B	L2143384-1
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2143384-1, -2, -3, -4
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2143384-1, -2, -3, -4
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2143384-1, -2, -3, -4
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2143384-1, -2, -3, -4
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2143384-1, -2, -3, -4

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			

Reference Information

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

RA226-MMER-FC Water Ra226 by Alpha Scint, MDC=0.01 Bq/L EPA 903.1

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
FC	ALS ENVIRONMENTAL - FORT COLLINS, COLORADO, USA
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-08-08 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Re: ALS Workorder: 1808254
Project Name:
Project Number: L2143384

Dear Mr. Stack:

One water sample was received from ALS Environmental, on 8/14/2018. The sample was scheduled for the following analysis:

Radium-226

The results for these analyses are contained in the enclosed reports.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed.

Thank you for your confidence in ALS Environmental. Should you have any questions, please call.

Sincerely,

ALS Environmental
Katie M. O'Brien
Project Manager

ALS Environmental – Fort Collins is accredited by the following accreditation bodies for various testing scopes in accordance with requirements of each accreditation body. All testing is performed under the laboratory management system, which is maintained to meet these requirement and regulations. Please contact the laboratory or accreditation body for the current scope testing parameters.

1808254

Radium-226:

The sample was prepared and analyzed according to the current revision of SOP 783.

All acceptance criteria were met.

Lab ID: 1808254-1

Legal Location:

Matrix: WATER

Collection Date: 8/7/2018

Percent Moisture:

Analyses	Result	Qual	Report Limit	Units	Dilution Factor	Date Analyzed
----------	--------	------	--------------	-------	-----------------	---------------

Explanation of Qualifiers**Radiochemistry:**

- "Report Limit" is the MDC

U or ND - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

W - DER is greater than Warning Limit of 1.42

* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.

- Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.

G - Sample density differs by more than 15% of LCS density.

D - DER is greater than Control Limit

M - Requested MDC not met.

LT - Result is less than requested MDC but greater than achieved MDC.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.

H - LCS Recovery above upper control limit.

P - LCS, Matrix Spike Recovery within control limits.

N - Matrix Spike Recovery outside control limits

NC - Not Calculated for duplicate results less than 5 times MDC

B - Analyte concentration greater than MDC.

B3 - Analyte concentration greater than MDC but less than Requested MDC.

Inorganics:

B - Result is less than the requested reporting limit but greater than the instrument method detection limit (MDL).

U or ND - Indicates that the compound was analyzed for but not detected.

E - The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.

M - Duplicate injection precision was not met.

N - Spiked sample recovery not within control limits. A post spike is analyzed for all ICP analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than four times the spike added concentration.

Z - Spiked recovery not within control limits. An explanatory note may be included in the narrative.

* - Duplicate analysis (relative percent difference) not within control limits.

S - SAR value is estimated as one or more analytes used in the calculation were not detected above the detection limit.

Organics:

U or ND - Indicates that the compound was analyzed for but not detected.

B - Analyte is detected in the associated method blank as well as in the sample. It indicates probable blank contamination and warns the data user.

E - Analyte concentration exceeds the upper level of the calibration range.

J - Estimated value. The result is less than the reporting limit but greater than the instrument method detection limit (MDL).

A - A tentatively identified compound is a suspected aldol-condensation product.

X - The analyte was diluted below an accurate quantitation level.

* - The spike recovery is equal to or outside the control criteria used.

+ - The relative percent difference (RPD) equals or exceeds the control criteria.

G - A pattern resembling gasoline was detected in this sample.

D - A pattern resembling diesel was detected in this sample.

M - A pattern resembling motor oil was detected in this sample.

C - A pattern resembling crude oil was detected in this sample.

4 - A pattern resembling JP-4 was detected in this sample.

5 - A pattern resembling JP-5 was detected in this sample.

H - Indicates that the fuel pattern was in the heavier end of the retention time window for the analyte of interest.

L - Indicates that the fuel pattern was in the lighter end of the retention time window for the analyte of interest.

Z - This flag indicates that a significant fraction of the reported result did not resemble the patterns of any of the following petroleum hydrocarbon products:

- gasoline

- JP-8

- diesel

- mineral spirits

- motor oil

- Stoddard solvent

- bunker C

Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2144122-2
Matrix Spike	Copper (Cu)-Dissolved	MS-B	L2144122-1, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Copper (Cu)-Dissolved	MS-B	L2144122-2
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2144122-1, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2144122-2
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2144122-2
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2144122-1, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2144122-2
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2144122-1, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2144122-2
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2144122-1, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2144122-2
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2144122-2
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2144122-1, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2144122-2
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2144122-2
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2144122-1, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2144122-2
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2144122-2
Matrix Spike	Zinc (Zn)-Dissolved	MS-B	L2144122-1, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Zinc (Zn)-Dissolved	MS-B	L2144122-2

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B

Reference Information

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CL-IC-N-WR Water Chloride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 µm), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

Reference Information

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-08-07 C

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Chain of Custody (COC) / Analytical Request Form

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Laboratory Control Sample	Sulfur (S)-Dissolved	MES	L2144130-1
Matrix Spike	Dissolved Organic Carbon	MS-B	L2144130-4
Matrix Spike	Dissolved Organic Carbon	MS-B	L2144130-1
Matrix Spike	Dissolved Organic Carbon	MS-B	L2144130-1
Matrix Spike	Dissolved Organic Carbon	MS-B	L2144130-1
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2144130-1, -3, -4
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2144130-1, -3, -4
Matrix Spike	Copper (Cu)-Dissolved	MS-B	L2144130-1, -3, -4
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2144130-1, -3, -4
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2144130-1, -3, -4
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2144130-1, -3, -4
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2144130-1, -3, -4
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2144130-1, -3, -4
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2144130-1, -3, -4
Matrix Spike	Zinc (Zn)-Dissolved	MS-B	L2144130-1, -3, -4

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
MES	Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RRV	Reported Result Verified By Repeat Analysis

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			

Reference Information

HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-L-IC-N-WR	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-WR	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode			
It is recommended that this analysis be conducted in the field.			
SO4-IC-WR	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-CALC-VA	Water	TDS (Calculated)	APHA 1030E (20TH EDITION)
This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".			
The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.			
TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.			
Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
----------------------------	---------------------

WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
----	---

VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA
----	---

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Dissolved Organic Carbon	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2147363-1
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2147363-1
Matrix Spike	Copper (Cu)-Dissolved	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2147363-1
Matrix Spike	Molybdenum (Mo)-Dissolved	MS-B	L2147363-1
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2147363-1
Matrix Spike	Silicon (Si)-Dissolved	MS-B	L2147363-1
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2147363-1
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2147363-1
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2147363-1
Matrix Spike	Aluminum (Al)-Total	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Total	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Total	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Copper (Cu)-Total	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Iron (Fe)-Total	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Total	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Potassium (K)-Total	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Total	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Total	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfur (S)-Total	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Titanium (Ti)-Total	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Zinc (Zn)-Total	MS-B	L2147363-1, -10, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTMF	Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B

Reference Information

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CL-IC-N-WR Water Chloride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

Reference Information

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

**** ALS test methods may incorporate modifications from specified reference methods to improve performance.**

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-08-15 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Mercury (Hg)-Total	MS-B	L2147434-1, -2, -3, -4, -5, -6
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2147434-1, -2, -3, -4, -5, -6
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2147434-1, -2, -3, -4, -5, -6
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2147434-1, -2, -3, -4, -5, -6
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2147434-1, -2, -3, -4, -5, -6
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2147434-1, -2, -3, -4, -5, -6
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2147434-1, -2, -3, -4, -5, -6
Matrix Spike	Barium (Ba)-Total	MS-B	L2147434-1, -2, -3, -4, -5, -6
Matrix Spike	Calcium (Ca)-Total	MS-B	L2147434-1, -2, -3, -4, -5, -6
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2147434-1, -2, -3, -4, -5, -6
Matrix Spike	Sodium (Na)-Total	MS-B	L2147434-1, -2, -3, -4, -5, -6
Matrix Spike	Strontium (Sr)-Total	MS-B	L2147434-1, -2, -3, -4, -5, -6

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E

Reference Information

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Weston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-08-15 E

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lw - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Dissolved Organic Carbon	MS-B	L2153562-7, -8
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Copper (Cu)-Dissolved	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Total	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Total	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Copper (Cu)-Total	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Total	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Potassium (K)-Total	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Total	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Total	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfur (S)-Total	MS-B	L2153562-1, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Reference Information

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 µm), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
----------------------------	---------------------

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Matrix Spike	Strontium (Sr)-Total	MS-B	L2155519-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
HTC	Hardness was calculated from Total Ca and/or Mg concentrations and may be biased high (dissolved Ca/Mg results unavailable).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)

Reference Information

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

BE-T-L-CCMS-VA Water Total Be (Low) in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

CARBONS-DOC-VA Water Dissolved organic carbon by combustion APHA 5310B

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CL-IC-N-VA Water Chloride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

CL-IC-N-WR Water Chloride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Reference Information

NO3-L-IC-N-VA	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-WR	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode			
It is recommended that this analysis be conducted in the field.			
SO4-IC-N-VA	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
SO4-IC-WR	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-CALC-VA	Water	TDS (Calculated)	APHA 1030E (20TH EDITION)
This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".			
The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.			
TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.			
Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-08-29 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Aluminum (Al)-Total	MB-LOR	L2158981-1, -2, -3, -4, -5, -6, -7, -8, -9
Laboratory Control Sample	Sulfur (S)-Dissolved	MES	L2158981-3
Matrix Spike	Dissolved Organic Carbon	MS-B	L2158981-1, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2158981-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2158981-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2158981-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2158981-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2158981-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2158981-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Total	MS-B	L2158981-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Total	MS-B	L2158981-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2158981-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Total	MS-B	L2158981-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Total	MS-B	L2158981-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfur (S)-Total	MS-B	L2158981-1, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MES	Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)

Reference Information

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lw - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Aluminum (Al)-Dissolved	MS-B	L2162627-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2162627-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2162627-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Copper (Cu)-Dissolved	MS-B	L2162627-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2162627-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2162627-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2162627-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Weston et al.			

Reference Information

NO2-L-IC-N-WR	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-WR	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode			
It is recommended that this analysis be conducted in the field.			
SO4-IC-WR	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-CALC-VA	Water	TDS (Calculated)	APHA 1030E (20TH EDITION)
This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".			
The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.			
TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.			
Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-09-08 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Nitrate (as N)	B	L2162671-1, -10, -11, -12, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2162671-1, -10, -11, -12, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2162671-1, -10, -11, -12, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2162671-1, -10, -11, -12, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2162671-1, -10, -11, -12, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2162671-1, -10, -11, -12, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2162671-1, -10, -11, -12, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

Reference Information

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-09-08 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2162688-2, -3, -4, -5

Qualifiers for Individual Parameters Listed:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			

Reference Information

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
----------------------------	---------------------

WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
----	---

VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA
----	---

Chain of Custody Numbers:

2018-09-08 C

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lw - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Matrix Spike	Manganese (Mn)-Total	MS-B	L2163930-1, -2, -3, -4, -5, -6
Matrix Spike	Sodium (Na)-Total	MS-B	L2163930-1, -2, -3, -4, -5, -6
Matrix Spike	Strontium (Sr)-Total	MS-B	L2163930-1, -2, -3, -4, -5, -6
Matrix Spike	Sulfur (S)-Total	MS-B	L2163930-1, -2, -3, -4, -5, -6

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Reference Information

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 µm), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
----------------------------	---------------------

WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
----	---

	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Dissolved Organic Carbon	B	L2165523-1
Method Blank	Silver (Ag)-Total	MB-LOR	L2165523-1, -3, -4, -5, -6
Matrix Spike	Dissolved Organic Carbon	MS-B	L2165523-1
Matrix Spike	Dissolved Organic Carbon	MS-B	L2165523-1
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2165523-1, -2, -3, -4, -5, -6
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2165523-1, -2, -3, -4, -5, -6
Matrix Spike	Copper (Cu)-Dissolved	MS-B	L2165523-1, -2, -3, -4, -5, -6
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2165523-1, -2, -3, -4, -5, -6
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2165523-1, -2, -3, -4, -5, -6
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2165523-1, -2, -3, -4, -5, -6
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2165523-1, -2, -3, -4, -5, -6
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2165523-1, -2, -3, -4, -5, -6
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2165523-1, -2, -3, -4, -5, -6
Matrix Spike	Aluminum (Al)-Total	MS-B	L2165523-2
Matrix Spike	Arsenic (As)-Total	MS-B	L2165523-2
Matrix Spike	Boron (B)-Total	MS-B	L2165523-2
Matrix Spike	Calcium (Ca)-Total	MS-B	L2165523-2
Matrix Spike	Lead (Pb)-Total	MS-B	L2165523-2
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2165523-2
Matrix Spike	Manganese (Mn)-Total	MS-B	L2165523-2
Matrix Spike	Potassium (K)-Total	MS-B	L2165523-2
Matrix Spike	Silicon (Si)-Total	MS-B	L2165523-2
Matrix Spike	Sodium (Na)-Total	MS-B	L2165523-2
Matrix Spike	Strontium (Sr)-Total	MS-B	L2165523-2
Matrix Spike	Sulfur (S)-Total	MS-B	L2165523-2

Qualifiers for Individual Parameters Listed:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
DLA	Detection Limit adjusted for required dilution
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
DTMF	Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			

Reference Information

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-L-IC-N-WR	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-WR	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode			
It is recommended that this analysis be conducted in the field.			
SO4-IC-WR	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-CALC-VA	Water	TDS (Calculated)	APHA 1030E (20TH EDITION)

Reference Information

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".
The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-09-15 C

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Dissolved Organic Carbon	MS-B	L2166950-7
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2166950-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2166950-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Copper (Cu)-Dissolved	MS-B	L2166950-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2166950-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2166950-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2166950-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2166950-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Calcium (Ca)-Total	MS-B	L2166950-1, -2, -3, -4, -6, -7
Matrix Spike	Cobalt (Co)-Total	MS-B	L2166950-1, -2, -3, -4, -6, -7
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2166950-1, -2, -3, -4, -6, -7
Matrix Spike	Manganese (Mn)-Total	MS-B	L2166950-1, -2, -3, -4, -6, -7
Matrix Spike	Nickel (Ni)-Total	MS-B	L2166950-1, -2, -3, -4, -6, -7
Matrix Spike	Sodium (Na)-Total	MS-B	L2166950-1, -2, -3, -4, -6, -7
Matrix Spike	Strontium (Sr)-Total	MS-B	L2166950-1, -2, -3, -4, -6, -7
Matrix Spike	Sulfur (S)-Total	MS-B	L2166950-1, -2, -3, -4, -6, -7
Matrix Spike	Nitrate (as N)	MS-B	L2166950-1, -2, -3, -4, -5, -6, -7

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)

Reference Information

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
----------------------------	---------------------

WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
----	---

VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA
----	---

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2167294-1, -2, -3, -4, -5
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2167294-1, -2, -3, -4, -5
Matrix Spike	Copper (Cu)-Dissolved	MS-B	L2167294-1, -2, -3, -4, -5
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2167294-1, -2, -3, -4, -5
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2167294-1, -2, -3, -4, -5
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2167294-1, -2, -3, -4, -5
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2167294-1, -2, -3, -4, -5
Matrix Spike	Barium (Ba)-Total	MS-B	L2167294-1, -2, -3, -4, -5
Matrix Spike	Calcium (Ca)-Total	MS-B	L2167294-1, -2, -3, -4, -5
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2167294-1, -2, -3, -4, -5
Matrix Spike	Sodium (Na)-Total	MS-B	L2167294-1, -2, -3, -4, -5
Matrix Spike	Strontium (Sr)-Total	MS-B	L2167294-1, -2, -3, -4, -5

Qualifiers for Individual Parameters Listed:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions)			

Reference Information

should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-09-19 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Laboratory Control Sample	Sulfur (S)-Total	MES	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Dissolved Organic Carbon	MS-B	L2171436-10, -2, -5, -6, -7, -8
Matrix Spike	Dissolved Organic Carbon	MS-B	L2171436-10, -2, -5, -6, -7, -8
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2171436-9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2171436-9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2171436-9
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2171436-9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2171436-9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2171436-9
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2171436-9
Matrix Spike	Uranium (U)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
MES	Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			

Reference Information

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-L-IC-N-WR	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-WR	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode			
It is recommended that this analysis be conducted in the field.			
SO4-IC-WR	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-CALC-VA	Water	TDS (Calculated)	APHA 1030E (20TH EDITION)
This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.			
TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

	Vanadium (V)-Dissolved (mg/L)	<0.00050				
	Zinc (Zn)-Dissolved (mg/L)	0.0012				
	Zirconium (Zr)-Dissolved (mg/L)	<0.00030				

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Dissolved Organic Carbon	MS-B	L2175170-1, -3, -4, -5, -6
Matrix Spike	Barium (Ba)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Calcium (Ca)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Copper (Cu)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Manganese (Mn)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Sodium (Na)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Strontium (Sr)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Sulfur (S)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTMF	Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions)			

Reference Information

should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-10-03 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lw - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-MAN-VA	Water	Conductivity (Manual)	APHA 2510 Conductivity
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-L-IC-N-VA	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-VA	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H pH Value

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-10-03 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Chromium (Cr)-Dissolved	MB-LOR	L2179645-6, -7
Method Blank	Nickel (Ni)-Dissolved	MB-LOR	L2179645-6, -7
Method Blank	Chromium (Cr)-Total	MB-LOR	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Method Blank	Magnesium (Mg)-Total	MB-LOR	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Dissolved Organic Carbon	MS-B	L2179645-1, -2, -4, -5, -6, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2179645-1, -2, -3, -4, -5, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2179645-1, -2, -3, -4, -5, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2179645-1, -2, -3, -4, -5, -8, -9
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2179645-1, -2, -3, -4, -5, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2179645-1, -2, -3, -4, -5, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2179645-1, -2, -3, -4, -5, -8, -9
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2179645-1, -2, -3, -4, -5, -8, -9
Matrix Spike	Barium (Ba)-Total	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Total	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Total	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Total	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Total	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)

Reference Information

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 µm), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Reference Information

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-10-10 C

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Dissolved Organic Carbon	MS-B	L2182778-1, -10, -11, -2, -3, -4, -6, -7, -9
Matrix Spike	Dissolved Organic Carbon	MS-B	L2182778-1, -10, -11, -2, -3, -4, -6, -7, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2182778-1, -10, -11, -2, -3, -4, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2182778-1
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2182778-1, -10, -11, -2, -3, -4, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2182778-1
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2182778-1, -10, -11, -2, -3, -4, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2182778-1
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2182778-1, -10, -11, -2, -3, -4, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2182778-1, -10, -11, -2, -3, -4, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2182778-1
Matrix Spike	Barium (Ba)-Total	MS-B	L2182778-1, -10, -11, -2, -3, -4, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Total	MS-B	L2182778-1, -10, -11, -2, -3, -4, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2182778-1, -10, -11, -2, -3, -4, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Total	MS-B	L2182778-1, -10, -11, -2, -3, -4, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Total	MS-B	L2182778-1, -10, -11, -2, -3, -4, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)

Reference Information

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-10-17 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lw - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2188467-6, -7, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2188467-6, -7, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2188467-6, -7, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2188467-6, -7, -9
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2188467-6, -7, -9
Matrix Spike	Barium (Ba)-Total	MS-B	L2188467-1, -2, -3, -4, -5, -8
Matrix Spike	Calcium (Ca)-Total	MS-B	L2188467-1, -2, -3, -4, -5, -8
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2188467-1, -2, -3, -4, -5, -8
Matrix Spike	Manganese (Mn)-Total	MS-B	L2188467-1, -2, -3, -4, -5, -8
Matrix Spike	Sodium (Na)-Total	MS-B	L2188467-1, -2, -3, -4, -5, -8
Matrix Spike	Strontium (Sr)-Total	MS-B	L2188467-1, -2, -3, -4, -5, -8
Matrix Spike	Sulfur (S)-Total	MS-B	L2188467-1, -2, -3, -4, -5, -8

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			

Reference Information

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Matrix Spike	Barium (Ba)-Total	MS-B	L2190604-1, -2, -3, -4
Matrix Spike	Calcium (Ca)-Total	MS-B	L2190604-1, -2, -3, -4
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2190604-1, -2, -3, -4
Matrix Spike	Manganese (Mn)-Total	MS-B	L2190604-1, -2, -3, -4
Matrix Spike	Sodium (Na)-Total	MS-B	L2190604-1, -2, -3, -4
Matrix Spike	Strontium (Sr)-Total	MS-B	L2190604-1, -2, -3, -4
Matrix Spike	Ammonia, Total (as N)	MS-B	L2190604-1, -2, -3, -4
Matrix Spike	Nitrate (as N)	MS-B	L2190604-1, -2, -3, -4
Matrix Spike	Sulfate (SO4)	MS-B	L2190604-1, -2, -3, -4

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			

Reference Information

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-L-IC-N-VA	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-VA	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode			
It is recommended that this analysis be conducted in the field.			
SO4-IC-N-VA	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-CALC-VA	Water	TDS (Calculated)	APHA 1030E (20TH EDITION)
This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.			
TSS-MAN-WR	Water	Total Suspended Solids by Gravimetric	APHA 2540 D
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Reference Information

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Matrix Spike	Copper (Cu)-Total	MS-B	L2194872-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2194872-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Manganese (Mn)-Total	MS-B	L2194872-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Potassium (K)-Total	MS-B	L2194872-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Sodium (Na)-Total	MS-B	L2194872-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Strontium (Sr)-Total	MS-B	L2194872-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Sulfur (S)-Total	MS-B	L2194872-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Uranium (U)-Total	MS-B	L2194872-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Zinc (Zn)-Total	MS-B	L2194872-1, -2, -3, -4, -5, -6, -7

Qualifiers for Individual Parameters Listed:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
HTC	Hardness was calculated from Total Ca and/or Mg concentrations and may be biased high (dissolved Ca/Mg results unavailable).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)

Reference Information

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

CARBONS-DOC-VA Water Dissolved organic carbon by combustion APHA 5310B

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CL-IC-N-WR Water Chloride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Reference Information

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
----------------------------	---------------------

WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
----	---

VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA
----	---

Chain of Custody Numbers:

2018-11-07 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Dissolved Organic Carbon	MS-B	L2197846-3, -4, -6
Matrix Spike	Dissolved Organic Carbon	MS-B	L2197846-3, -4, -6
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2197846-1, -2, -3, -4, -5, -6
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2197846-1, -2, -3, -4, -5, -6
Matrix Spike	Copper (Cu)-Dissolved	MS-B	L2197846-1, -2, -3, -4, -5, -6
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2197846-1, -2, -3, -4, -5, -6
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2197846-1, -2, -3, -4, -5, -6
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2197846-1, -2, -3, -4, -5, -6
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2197846-1, -2, -3, -4, -5, -6
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2197846-1, -2, -3, -4, -5, -6
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2197846-1, -2, -3, -4, -5, -6
Matrix Spike	Uranium (U)-Dissolved	MS-B	L2197846-1, -2, -3, -4, -5, -6
Matrix Spike	Boron (B)-Total	MS-B	L2197846-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Calcium (Ca)-Total	MS-B	L2197846-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Copper (Cu)-Total	MS-B	L2197846-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2197846-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Manganese (Mn)-Total	MS-B	L2197846-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Potassium (K)-Total	MS-B	L2197846-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Sodium (Na)-Total	MS-B	L2197846-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Sodium (Na)-Total	MS-B	L2197846-7
Matrix Spike	Strontium (Sr)-Total	MS-B	L2197846-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Sulfur (S)-Total	MS-B	L2197846-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Uranium (U)-Total	MS-B	L2197846-1, -2, -3, -4, -5, -6, -7

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
HTC	Hardness was calculated from Total Ca and/or Mg concentrations and may be biased high (dissolved Ca/Mg results unavailable).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			

Reference Information

EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 µm), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Weston et al.			
NO2-L-IC-N-WR	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-WR	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode			
It is recommended that this analysis be conducted in the field.			
SO4-IC-WR	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-CALC-VA	Water	TDS (Calculated)	APHA 1030E (20TH EDITION)
This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".			
The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.			
TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lw - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Canada Toll Free: 1 800 668 9878

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Zinc (Zn)-Dissolved	MB-LOR	L2200308-1, -2, -3, -6, -7, -8, -9
Matrix Spike	Dissolved Organic Carbon	MS-B	L2200308-7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2200308-10, -4, -5
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2200308-10, -4, -5
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2200308-10, -4, -5
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2200308-10, -4, -5
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2200308-10, -4, -5
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2200308-10, -4, -5

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTMF	Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
		Ion Balance Calculation	APHA 1030E

Reference Information

IONBALANCE-VA Water

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-11-21 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Aluminum (Al)-Dissolved	MB-LOR	L2204218-1, -2, -3, -4, -5
Matrix Spike	Dissolved Organic Carbon	MS-B	L2204218-1, -2, -4, -5
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2204218-1, -2, -3, -4, -5
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2204218-1, -2, -3, -4, -5
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2204218-1, -2, -3, -4, -5
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2204218-1, -2, -3, -4, -5
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2204218-1, -2, -3, -4, -5
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2204218-1, -2, -3, -4, -5
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2204218-1, -2, -3, -4, -5
Matrix Spike	Barium (Ba)-Total	MS-B	L2204218-1, -2, -3, -4, -5
Matrix Spike	Calcium (Ca)-Total	MS-B	L2204218-1, -2, -3, -4, -5
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2204218-1, -2, -3, -4, -5
Matrix Spike	Sodium (Na)-Total	MS-B	L2204218-1, -2, -3, -4, -5
Matrix Spike	Strontium (Sr)-Total	MS-B	L2204218-1, -2, -3, -4, -5
Matrix Spike	Sulfur (S)-Total	MS-B	L2204218-1, -2, -3, -4, -5

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)

Reference Information

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
----------------------------	---------------------

VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA
----	---

Chain of Custody Numbers:

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lw - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Zinc (Zn)-Dissolved	MB-LOR	L2207177-10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2207177-10, -7, -8
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2207177-10, -7, -8
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2207177-10, -7, -8
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2207177-10, -7, -8
Matrix Spike	Silicon (Si)-Dissolved	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2207177-10, -7, -8
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2207177-10, -7, -8
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2207177-10, -7, -8
Matrix Spike	Barium (Ba)-Total	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Total	MS-B	L2207177-5
Matrix Spike	Boron (B)-Total	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Total	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Total	MS-B	L2207177-5
Matrix Spike	Copper (Cu)-Total	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2207177-5
Matrix Spike	Manganese (Mn)-Total	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Potassium (K)-Total	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Potassium (K)-Total	MS-B	L2207177-5
Matrix Spike	Silicon (Si)-Total	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Total	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Total	MS-B	L2207177-5
Matrix Spike	Strontium (Sr)-Total	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Total	MS-B	L2207177-5
Matrix Spike	Sulfur (S)-Total	MS-B	L2207177-1, -10, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
DTMF	Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RRV	Reported Result Verified By Repeat Analysis

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			

Reference Information

BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
BR-L-IC-N-VA	Water	Bromide in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
F-IC-N-VA	Water	Fluoride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Weston et al.			
NO2-L-IC-N-VA	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			

Reference Information

NO3-L-IC-N-VA	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode			
It is recommended that this analysis be conducted in the field.			
SO4-IC-N-VA	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-CALC-VA	Water	TDS (Calculated)	APHA 1030E (20TH EDITION)
This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".			
The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.			
TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.			
Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-12-05 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

L2207177-COFC

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Dissolved Organic Carbon	MS-B	L2211283-1, -3, -4
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2211283-1, -2, -3, -4
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2211283-1, -2, -3, -4
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2211283-1, -2, -3, -4
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2211283-1, -2, -3, -4
Matrix Spike	Barium (Ba)-Total	MS-B	L2211283-1, -2, -3, -4
Matrix Spike	Boron (B)-Total	MS-B	L2211283-2
Matrix Spike	Calcium (Ca)-Total	MS-B	L2211283-1, -2, -3, -4
Matrix Spike	Calcium (Ca)-Total	MS-B	L2211283-2
Matrix Spike	Cobalt (Co)-Total	MS-B	L2211283-2
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2211283-1, -2, -3, -4
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2211283-2
Matrix Spike	Manganese (Mn)-Total	MS-B	L2211283-1, -2, -3, -4
Matrix Spike	Manganese (Mn)-Total	MS-B	L2211283-2
Matrix Spike	Nickel (Ni)-Total	MS-B	L2211283-2
Matrix Spike	Potassium (K)-Total	MS-B	L2211283-2
Matrix Spike	Sodium (Na)-Total	MS-B	L2211283-1, -2, -3, -4
Matrix Spike	Sodium (Na)-Total	MS-B	L2211283-2
Matrix Spike	Strontium (Sr)-Total	MS-B	L2211283-1, -2, -3, -4
Matrix Spike	Strontium (Sr)-Total	MS-B	L2211283-2
Matrix Spike	Sulfur (S)-Total	MS-B	L2211283-1, -2, -3, -4
Matrix Spike	Sulfur (S)-Total	MS-B	L2211283-2
Matrix Spike	Uranium (U)-Total	MS-B	L2211283-2
Matrix Spike	Nitrate (as N)	MS-B	L2211283-1, -2, -3, -4

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			

Reference Information

EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 µm), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Weston et al.			
NO2-L-IC-N-VA	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-VA	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode			
It is recommended that this analysis be conducted in the field.			
SO4-IC-N-VA	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-CALC-VA	Water	TDS (Calculated)	APHA 1030E (20TH EDITION)
This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".			
The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.			
TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lw - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Matrix Spike	Calcium (Ca)-Total	MS-B	L2212831-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2212831-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Manganese (Mn)-Total	MS-B	L2212831-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Molybdenum (Mo)-Total	MS-B	L2212831-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Potassium (K)-Total	MS-B	L2212831-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Sodium (Na)-Total	MS-B	L2212831-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Strontium (Sr)-Total	MS-B	L2212831-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Sulfur (S)-Total	MS-B	L2212831-1, -2, -3, -4, -5, -6, -7

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MES	Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Reference Information

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 µm), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

2018-12-19 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lw - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Aluminum (Al)-Dissolved	MB-LOR	L2214457-1, -2, -3, -4
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2214457-1, -2, -3, -4
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2214457-1, -2, -3, -4
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2214457-1, -2, -3, -4
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2214457-1, -2, -3, -4
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2214457-1, -2, -3, -4
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2214457-1, -2, -3, -4
Matrix Spike	Barium (Ba)-Total	MS-B	L2214457-1, -2, -3, -4, -5
Matrix Spike	Calcium (Ca)-Total	MS-B	L2214457-1, -2, -3, -4, -5
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2214457-1, -2, -3, -4, -5
Matrix Spike	Sodium (Na)-Total	MS-B	L2214457-1, -2, -3, -4, -5
Matrix Spike	Strontium (Sr)-Total	MS-B	L2214457-1, -2, -3, -4, -5
Matrix Spike	Sulfur (S)-Total	MS-B	L2214457-1, -2, -3, -4, -5

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
HTC	Hardness was calculated from Total Ca and/or Mg concentrations and may be biased high (dissolved Ca/Mg results unavailable).
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			

Reference Information

HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-L-IC-N-VA	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-VA	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode			
It is recommended that this analysis be conducted in the field.			
SO4-IC-N-VA	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-CALC-VA	Water	TDS (Calculated)	APHA 1030E (20TH EDITION)
This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".			
The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.			
TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.			
Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA
----	---

Chain of Custody Numbers:

2018-12-26 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lw - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Matrix Spike	Potassium (K)-Dissolved	MS-B	L2215744-1
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2215744-1, -2, -3, -4
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2215744-1
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2215744-1, -2, -3, -4
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2215744-1
Matrix Spike	Aluminum (Al)-Total	MS-B	L2215744-1, -2, -3, -4
Matrix Spike	Barium (Ba)-Total	MS-B	L2215744-1, -2, -3, -4
Matrix Spike	Boron (B)-Total	MS-B	L2215744-1, -2, -3, -4
Matrix Spike	Calcium (Ca)-Total	MS-B	L2215744-1, -2, -3, -4
Matrix Spike	Copper (Cu)-Total	MS-B	L2215744-1, -2, -3, -4
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2215744-1, -2, -3, -4
Matrix Spike	Manganese (Mn)-Total	MS-B	L2215744-1, -2, -3, -4
Matrix Spike	Potassium (K)-Total	MS-B	L2215744-1, -2, -3, -4
Matrix Spike	Sodium (Na)-Total	MS-B	L2215744-1, -2, -3, -4
Matrix Spike	Strontium (Sr)-Total	MS-B	L2215744-1, -2, -3, -4
Matrix Spike	Sulfate (SO4)	MS-B	L2215744-1, -2, -3, -4

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

Reference Information

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 µm), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

Reference Information

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
----------------------------	---------------------

VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA
----	---

Chain of Custody Numbers:

2019-01-02A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Appendix E – 2018 Water Balance and Water Quality Model Summary for the Minto Mine

Memo

To:	Deborah Flemming	Client:	Minto Explorations Ltd.
From:	Soren Jensen, Kaitlyn Kooy	Project No:	1CM002.065
Cc:	Dylan MacGregor (SRK)	Date:	March 28, 2019
Subject:	2018 Water Balance and Water Quality Model Summary for the Minto Mine Site		

1 Introduction and Background

This memorandum provides a summary of the 2018 water balance and water quality model updates for the Minto Mine site. The update covers the period January 1, 2018 through December 31, 2018.

The water balance update includes a review and summary of precipitation, flow and water inventory data for the Mine site. The water quality update includes a comparison of water quality data collected in 2018 to water quality model predictions for Phase VII of the Mine development. Water quality predictions for the Main Pit Tailings Management Facility (MPTMF) and the Water Storage Pond (WSP) are provided for 2018 and for the post-closure period when predicted concentrations are the same from year to year (steady state concentrations).

In October 2018, Minto ended the mill operation and commenced care and maintenance of the mine. Over the next few years, the water quality in the MPTMF and the WSP are expected to trend toward the post-closure predictions.

2 Water Balance Update

2.1 Precipitation

Table 1 shows a summary of monthly precipitation measured at the Mine site between October 2017 and December 2018 along with precipitation data from the regional station at Carmacks, YT (Climate ID: 2100301)¹, which is located 77 km Southwest of the Minto Mine. In the past, the meteorological station at Pelly Ranch (Climate ID 2100880)¹ located 25 km north of Minto was used as a regional reference station. However, the published data record from Pelly Ranch ends in March 2015 so the Carmacks Station was used instead.

Minto's Campbell Scientific meteorological station measures total precipitation using a Geonor gauge and a tipping bucket rain gauge. From October through May, the tipping bucket is equipped with a snowfall conversion adaptor, which allows it to measure snowfall as snow water

¹ Data obtained from Meteorological Service of Canada, Environment Canada.

equivalent. The Geonor precipitation gauge collects precipitation in a bucket and records precipitation by measuring the weight of the bucket. In the winter months, the bucket is partially filled with an antifreeze solution that melts any snow collected.

In 2018, the total precipitation measurement collected by the Geonor gauge were faulty for most of the year. Therefore, the monthly precipitation reported for site are based on measurements collected by the tipping bucket gauge. Figure 1 shows monthly precipitation recorded by the two gauges as well as total precipitation recorded at Carmacks.

Notes:

A: Data obtained from Meteorological Service of Canada, Environment Canada.

Approximately 192 mm of precipitation was measured at the Mine site in the 2018 hydrological year, which was lower than total precipitation measured in 2016 (242 mm) and 2017 (210 mm). Total annual precipitation of 192 mm roughly corresponds to a 1 in 100 dry year. This is the fifth year in a row that total annual precipitation at Minto has been lower than average.

Precipitation measured by the tipping bucket gauge at Minto and total precipitation measurement at Carmacks are in good agreement considering that the stations are located 77 km apart. The total annual precipitation at Carmacks is a little higher but still indicative of a very dry year. Precipitation measured at Carmacks was higher than at Minto in August but lower in June and July.

Figure 1: 2017 Monthly Total Precipitation Measurements at Minto and at Carmacks

2.2 Snow Course Data

Snow course surveys were completed at four established snow survey stations at the Mine site in 2018. Table 2 shows a summary of the snow survey data (i.e. an average of the results from the four stations) from 2009 to 2018. The depth and water equivalent of the snow pack provides an indication of the volume of surface runoff that must be managed the following freshet. In March, April and May 2018, approximately 320,000 m³ of surface runoff was collected from catchments at the Mine site upstream of the Water Storage Dam. This volume corresponds to roughly 30 mm of runoff. In comparison, approximately 20 mm of runoff was collected during freshet in 2017, which is consistent with the fact that the April 2017 snowpack was 40% lower than the April 2018 snowpack.

Table 2: Summary of Snow Survey Data for the Minto Mine Site

Year	February	March	April
	Water Equivalent (mm)	Water Equivalent (mm)	Water Equivalent (mm)
2009	92.7	110.0	150.7
2010	107.7	120.7	56.0
2011	106.0	141.7	111.7
2012	111.0	127.0	132.7
2013	91.3	106.0	62.7
2014	84.3	99.7	67.3
2015	90.3	76.6	67.8
2016	80.3	80.7	n/a
2017	79.0	72.7	59.3
2018	60.0	69.4	101.1

Source: X:\01_SITES\Minto\1CM002.024_Water_Balance_Support\2018 Water Balance Update\2018 Snow Survey Field Data.xlsx

2.3 Water Management

Water that is suitable for release into Minto Creek is conveyed to the Water Storage Pond (WSP), while water collected from active mine areas is routed to the Main Pit Tailings Management Facility (MPTMF) or the Area 2 Pit Tailings Management Facility (A2PTMF). Since November 2012, the MPTMF has also been used for subaqueous deposition of tailings. Deposition of mine water and tailings (subaqueous) to the A2PTMF commenced in April 2015.

Other water management features on the Mine site include:

- WSP: reservoir for water that meets discharge criteria and is destined for discharge to Minto Creek.
- W15 sump: collects surface runoff and seepage from:
 - The Southwest Waste Dump;
 - Part of the Main Waste Dump; and
 - Adjacent undisturbed catchments.

In 2018, water collected at W15 was routed to the Main Pit TMF from late April until May 21st at which time it was conveyed to the WSP from until August 20th. At that time the W15 water was again directed to the Main Pit TMF. Approximately 50% of the catchment that reports to W15 is covered by waste rock.

- W35 sump: collects surface runoff from the minimally disturbed southern catchments. Water collected at W35 in 2018 was piped to the Area 2 Pit TMF from late April until May 13th at which time it was directed to WSP. On September 2nd, the W35 sump water was redirected to the Area 2 Pit TMF.
- W62 sump (formerly known as W36 or W37 sump): collects surface runoff and seepage from the mill valley, including contributions from the Dry Stack Tailings Storage Facility. Water collected at the W62 sump is pumped to the MPTMF.

- Tailings Diversion Ditch: diverts water from (W35 Sump) minimally disturbed southern catchments to the WSP (can also be routed to the MPTMF).

2.4 2018 Water Balance

Table 3 summarizes the monthly water and tailings inventory in Minto's MPTMF and A2PTMF as well as water inventory in the WSP. In 2018, the water inventory in the MPTMF increased by approximately 7,000 m³, while the water inventory in A2PTMF increased by roughly 524,000 m³. The WSP water inventory increased by about 9,000 m³ between January 1 and December 31, 2018.

Table 4 shows a summary of the 2018 water balance for the Mine site. The total surface runoff collected on site was estimated to be 567,000 m³ based on the change in the water inventory and the known volume of water released to Minto Creek. The total catchment upstream of the Water Storage Dam measures approximately 1,040 ha. Therefore, 567,000 m³ of runoff from 1,040 ha gives a unit yield of approximately 54 mm/year.

The water and load balance model used for forecasting surface runoff volumes uses a site-wide annual average runoff coefficient, which has been derived based on previous years' water balance results. The runoff coefficient is estimated based on the total annual precipitation as follows:

- For dry years with less than 190 mm total precipitation: runoff coefficient = 0.15.
- For average to wet years with more than 309 mm total precipitation: runoff coefficient = 0.30.
- Runoff coefficients for years with total precipitation between 190 mm and 309 mm: interpolated values between 0.15 and 0.30.

In 2018 (hydraulic year) the estimated total precipitation was 192 mm (Table 1), which corresponds to a modelled runoff coefficient of 0.15. The site-wide runoff coefficient, based on the 2017 water balance (measured flows, water inventory and total precipitation), is:

$$\text{Annual Yield} / \text{Total Annual Precipitation} = \text{Runoff Coefficient} \rightarrow 54 \text{ mm} / 192 \text{ mm} = \mathbf{0.28}$$

The calculated value for the annual site-wide runoff coefficient is higher than the runoff coefficient estimated by the water balance model. However, the site-wide runoff coefficient is similar to the coefficient calculated in previous, slightly wetter years. The runoff coefficient calculated last year, another very dry year, was 0.27. Therefore, the method used by the water balance model to estimate runoff in dry years is likely too conservative (i.e. conservatively dry) and may have to be revised for future model runs.

3 Water Quality Model Update

3.1 Solid Phase Geochemistry

The neutralization potential ratio (NPR) and copper content of waste rock and tailings were reviewed in order to identify any new trends in the solid phase geochemistry that may have developed since the last source term update. Significant changes in the solid phase geochemistry would indicate a need for further analysis of the waste rock and tailings to generate new source terms that reflect the observed changes in the geochemistry.

No significant changes in geochemistry were observed in the properties of the waste rock in 2018 compared to similar materials produced in prior years (Figures 2 and 4). Therefore, no further evaluation of 2018 solid phase geochemistry was warranted.

The NPR and copper content of waste rock and tailings are shown in Figure 2 to Figure 5. The NPR of tailings solids appear to show a slightly increasing trend in 2018 (Figure 3) and copper concentrations a decreasing trend (Figure 5). Measured NPR was greater than 3 for all samples, which indicates that the tailings are not potentially acid generating.

3.2 Comparison of Measured Water Quality Data to Source Terms

3.2.1 Source Terms – Dry Stack Tailings Storage Facility

The Dry Stack Tailings Storage Facility (DSTSF) source terms used in the water and load balance model for the Minto were developed based on the observed water chemistry of samples collected at station W8 and W8A. This station was chosen because it had the highest concentrations of copper, cadmium, selenium, and sulfate during the period of record. The following points describe the source terms:

- Best Estimate source term: 50th percentile dissolved concentrations from W8A;
- Reasonable Worst Case source term: 95th percentile dissolved concentrations from W8A.

The Best Estimate and Reasonable Worst Case source terms were updated to include data to 2018 for comparison to the existing source terms. It was found that the updated source terms did not differ from the source terms used in the latest model revision, which included data up to and including 2016. Therefore, for consistency the original DSTSF source terms was be used in this 2018 update of the water balance and water quality model.

3.2.2 Source Terms – Waste Rock

The Main Waste Dump and the Southwest Waste Dump source terms used in the water and load balance model were defined based on observed water chemistry at station W15, which collects runoff from the Southwest Waste Dump. The latest model revision assigned Best Estimate waste rock source term as the 50th percentile dissolved concentrations at W15 until the end of 2016 and

the Reasonable Worst Case waste rock source term was the 95th percentile dissolved concentrations. Water quality data collected at W15 in 2018 followed the same trends as the historical data. Therefore, the original source term was used for the updated predictions presented here.

3.2.3 Source Term – Tailings Slurry

In 2018, sulfate concentrations in the Area 2 and Main Pit water decreased after reaching a peak in mid- to late 2017. In 2017, sulfate concentrations in the Area 2 and Main Pit water increased at a greater rate than in previous years, likely due to variability in sulfate loadings from tailings slurry.

In October 2018, the mill ceased operation. With the end of tailings deposition to the A2PTMF the load of sulfate to the pit water was significantly reduced. Therefore, the sulphate concentrations in the pit water is expected to continue to decrease.

3.3 Water Quality Model Results

Table 5 and 6 show revised model outputs from the water and load balance model for water quality in the Water Storage Pond (WSP) for 2018 and post-closure (best estimate and worst case) along with concentrations measured in 2018. Table 7 and 8 show revised model predictions of water quality in the MPTMF for 2018 and post-closure. Predictions for post-closure were selected to provide representative long-term indications of water quality trends. Predictions are for average precipitation conditions. The Water Use Licence (QZ14-031) effluent limits are also listed in the tables. Model runs started on 1 January 2016 and ended on 1 January 2045, at which point concentrations in the model roughly have reached steady state.

Water collected in the WSP includes clean (non-contact) runoff and effluent from Minto's water treatment plant. Median measured concentrations in the WSP in 2018 were lower than or comparable to the revised model predictions using best estimate source terms (Table 5), except for dissolved copper for which the measured median concentration was 31 µg/L compared to expected median concentrations of approximately 8 µg/L for the Best Estimate model scenario, but close to the predicted median concentration of 30 µg/L for the Reasonable Worst Case scenario (Table 6).

Dissolved copper concentrations in the WSP shows a decreasing trend between 2011 and 2015 followed by an increasing trend between 2015 and 2018 (Figure 6). The increase in copper concentrations in the WSP in 2018 was due to a reduction in the volume of treated MPTMF water that was pumped to the WSP. MPTMF water is treated using reverse osmosis, which removes nearly all dissolved copper.

Revised model predictions using reasonable worst case source terms are generally higher than comparable median and maximum measured values for the WSP, except for copper (Table 6).

Figure 6 Dissolved Copper Concentrations in WSP (Station W16)

The MPTMF was historically the primary water reservoir on site. In the model, the free water in the MPTMF and A2PTMF are more or less considered to belong to the same reservoir due to the high rate of flow between the two reservoirs while the mill was operating. During the care and maintenance phase, concentrations in the MPTMF and the A2PTMF are expected to change independently due to the lower rate of water transfer between the two reservoirs. For 2018, a comparison of measured MPTMF water quality with concentrations predicted for pit water for the Phase V/VI environmental assessment provides a good measure of actual vs. expected geochemical performance of the site. The median of measured concentrations in the MPTMF are generally at or below predicted median values except for nitrite, which was 3 to 4 times higher than expected (Table 7). Nitrite is relatively unstable and is produced and consumed by biological activity in the pit. Therefore, concentration predictions for nitrite by a mass-conservative load balance model are generally not reliable. Water quality model predictions using reasonable worst-case source terms are higher than measured median and maximum concentrations, except for nitrite (Table 8).

The overall favorable agreement in the results tables below indicates that the revised source terms are appropriate for describing the existing geochemical performance and the actual water management practices on site. Best estimate source terms are intended to provide an indication of the general trend in water quality parameter concentrations but are not intended to capture maximum or outlier concentration values. Therefore, the median values of best estimate model predictions are compared to measured median values.

4 Closing

The summary of the updated water balance and water quality model for the Minto Mine was prepared in support of annual reporting. SRK would be pleased to address any questions or comments.

Appendix F – Minto and McGinty Creek 2018 Surface Hydrology Update

Hydrology

1. Introduction

In 2018, as part of the EMSRP, Minto monitored hydrological conditions at water quality stations including the following: stations within the operational mine area; stations downstream from the mine operational area that are influenced by mine effluent discharge; and reference stations downstream from the mine operational area that are not exposed to effluent. Hydrological monitoring is performed using a variety of methods including: manual discrete discharge measurements with combinations of flow meters, continuous stage measurements through the deployment of Solinst Level Loggers and Barometric Loggers and monitoring of an engineered flume.

Minto maintained and monitored 8 hydrometric stations located on Minto Creek and McGinty Creek as listed below and shown in Figure 1.

- Minto Creek
 1. W3: Flume downstream of the Water Storage Pond (WSP);
 2. MC1: Located in Minto Canyon – mid-catchment;
 3. W1: Located approximately 1 km upstream of Yukon River – lower catchment; and
 4. W7: Tributary on the south side of Minto Creek.
- McGinty Creek
 5. MN-0.5: West Tributary of McGinty Creek
 6. MN-1.5: Upper East Arm of McGinty Creek
 7. MN-2.5: East Tributary of McGinty Creek
 8. MN-4.5: McGinty Creek near the Mouth

The following sections will present the methods used to measure flow at the hydrometric program, the summary of each station's hydrometric program and recommendations for future monitoring.

2. Methods

Minto personnel conduct regular discrete discharge measurements and maintenance at the stations listed below. Additionally, these stations are equipped with Solinst Level Logger and Barometric Logger for continuous measurements. Table 2-1 provides an overview of instrumentation available and discrete measurement frequency at these stations.

Table 2-1: Summary of Hydrometric Program

Station	Watershed	Years Monitored	Frequency of Discrete Measurement	Instrumentation Available
W3	Minto Creek	2012-2018	Weekly	Flume, Data Logger
MC1	Minto Creek	2012-2018	Weekly	Staff Gauge, Data Logger
W1	Minto Creek	2012-2018	Weekly	Staff Gauge, Data Logger
W7	Minto Creek	2013-2018	Monthly	Staff Gauge, Data Logger
MN-0.5	McGinty Creek	2014-2018	Monthly	Staff Gauge, Data Logger
MN-1.5	McGinty Creek	2018	Monthly	Staff Gauge, Data Logger
MN-2.5	McGinty Creek	2014-2018	Monthly	Staff Gauge, Data Logger
MN-4.5	McGinty Creek	2011-2018	Monthly	Staff Gauge, Data Logger

Stream-gauge data is collected and managed throughout the open water season by the Minto personnel. Velocities are measured using a Hach FH950 handheld electromagnetic flowmeter. Velocity and water depth measurements are converted to flows using the area-velocity relationship methods. All hydrometric data, calculated flows and the time-series of recorded water levels and temperature data from the loggers were processed by Minto personnel under SRK guidance.

Level logger data were compared to the staff gauge readings, logger records for water level may have shifted over the course of the season due to repositioning, and data were corrected to match staff gauge measurements.

Stage-discharge relationships (rating curves) were created with discrete flow measurements and staff gauge readings. For stations with level loggers, discharges were determined over the course of the 2017 hydrometric season to calculate mean monthly flows and total monthly runoff.

3. Minto Creek

3.1 Station W3 – Flume below the Water Storage Pond Dam

W3 is located about 500 meters downstream of the water storage pond dam and consists of a built concrete flume. Solinst loggers record water levels and atmospheric pressure every 30 minutes, in addition water levels at the flume are recorded daily for most of the year.

Due to ice buildup around the flume, water levels were artificially high from January 1st to June 10th, and then again from December 5th to the end of the year. A summary of the level and flow data recorded at W3 are presented in Figures 2 to 5. This data provided the necessary information to correct the recorded stage data and in turn generate a stage discharge relationship which is used to calculate the creek discharge. The stage-discharge relationship is presented in Figure 3.

Figure 2 presents the recorded water levels and water temperature for Minto Creek at W3 from June to December 2018.

The 2018 hydrograph and discrete measurements are shown in Figure 4.

W3 is directly influenced by discharge from the Water Storage Pond to Minto Creek. A comparison of monthly flows at W3 and the discharge from the WSP is presented in Figure 5. As expected the flows recorded at W3 are slightly higher than the rate of discharge because of baseflow and runoff at W3. The data for the months when the flume was impacted by ice (January-May, November-December) have been estimated from historical data.

Water was discharged from the WSP intermittently from June 9th to August 30th, 2018.

Table 3-1 provides a summary of the average water temperature, flow, and total flow volume in 2018. The increased temperatures from October through to December are believed to have been influenced by the water heaters located in the constructed flume.

Table 3-2 summarizes the historical mean monthly flows to previous years of the hydrometric program.

Table 3-1: W3 2017 Hydrometric Data and Temperature Summary

Note: 1 - Data based on previous Annual surface water hydrology analysis.

3.2 MC1 - Minto Creek Mid-Catchment

The hydrometric station MC1 on Minto Creek is located downstream of the W3 Flume and immediately upstream of the canyon along Minto Creek. The pressure transducer installed at this station recorded temperature and water levels at 15-minute intervals from June 5th to October 2nd (119 days). Figure 6 shows water level and temperature data for Minto Creek at MC1 from June 5th to October 2nd, 2018.

Over the course of the hydrometric program in 2018, numerous discrete discharge measurements were recorded in conjunction with water level readings recorded by both the pressure transducer and the staff gauge. This data provides the information necessary to generate a stage-discharge relationship which enables the computation of creek discharge for the recorded stage data. The stage-discharge relationship is presented in Figure 7.

The 2018 hydrograph and discrete measurements for MC1 are shown in Figure 8. In 2018, the maximum measured flow of 0.155 m³/s occurred on June 29th, 2018.

Table 3-3 provides a summary of the average water temperature, flow and total flow volume in 2018. The negative temperatures recorded in June and October indicate the end of spring and start of the freeze-up period. Table 3-4 summarizes the historical mean monthly flows to previous years of the hydrometric program.

3.3 W1 – Lower Minto Creek above Road Crossing

W1 station is located on the lower reach of Minto Creek before flowing into the Yukon River. In 2018, water level and temperature data were continuously measured and recorded every 15 minutes by the pressure transducer/data logger. Figure 9 shows Minto Creek at W1 water level and temperature data for the 109-day record from May 12th to October 3rd, 2018. During the summer 2018, this station dried up from July 10th to August 11th, and again from August 20th to 22nd, the data recorded during these periods were omitted from the figures. The lapses were recorded in the field and were identified in the temperature changes in the water temperature recorded by the levellogger.

The stage-discharge relationship for W1 is presented in Figure 10. The 2018 hydrograph and discrete measurements for W1 are shown in Figure 11. In 2018, the maximum measured flow during freshet was 0.292 m³/s occurred on May 12th, 2018. Figure 12 shows W1 and MC1 flows. W1 is located downstream of MC1 and it is expected that flows would be larger because it has a much larger catchment area than MC1. The surface area at W1 is wider and at low flows the HACH sensor is not covered leading to skewed discrete flow measurement. It was observed that flows during freshet and early spring were much higher at W1 and lower leading into fall. Water downstream of MC1 passes through a preferential pathway and by-passes W1. The creek dried up a few times during the season, July 10th to August 10th, and again August 19th to 22nd, 2018. Based on the temperature data, the creek seemed to have frozen on October 2nd.

Table 3-5 provides a summary of the average water temperature, flow and total flow volume in 2018. The negative temperatures recorded in October indicates the start of the freeze-up period. Table 3-6 summarizes the historical mean monthly flows to previous years of the hydrometric program. The history shows that freeze-up begins in October and that freshet typically occurs in April/May.

3.4 W7 – Tributary of Minto Creek

A staff gauge was installed at this station in the summer of 2013. Before the installation of the staff gauge, this station was regularly monitored for surface water quality. The staff gauge was damaged during the winter 2014 and repaired for the hydrometric program running in 2015. In 2016, no stage measurements were continuously recorded but several discrete discharge measurements were conducted during the open water season. In early June 2017, a staff gauge and loggers were installed at this site, which was continued during the 2018 season, a continuous water level and temperature were recorded as presented in Figure 13. Table 3-7 provides a summary of the average water temperature, flow and total flow volume in 2018.

Table 3-8 presents the summary of historically measured flows at W7, based on discrete measurements before 2017, and based on continuous pressure readings for 2017 and 2018. A rating curve was initiated in the 2017 hydrometric season, with limited data points the curve showed inconsistencies between discrete and pressure logger measurements, due to changes in the scheduling of measurements, more data points were collected in 2018, the curve is rudimentary but presented in Figure 14. It is the hope that with more data being collected the curve will become more accurate over the years. The loggers were installed July 4th and recorded water level and temperature every 30 minutes until September 30th.

The 2018 hydrograph and discrete measurements for W7 are shown in Figure 15.

As per recommended in 2017, the 2018 discrete measurements were conducted on a bi-weekly basis to help establish a more accurate Stage-Discharge curve. This should be continued in the 2019 season as it proved helpful.

4. McGinty Creek Hydrology

In 2018, hydrological monitoring on McGinty Creek was conducted as per the schedule outlined in the EMSRP station MN-1.5 was added to the monitoring station with continuous measurements. During the 2018 monitoring period, Minto Mine maintained and collected data from the following four hydrometric stations along McGinty Creek.

At the hydrometric stations, Solinst Level Loggers and Barometric Loggers were used in conjunction with staff gauge readings and manual flow measurements to produce volumetric flow rates conducted monthly during flow season.

4.1 Station MN-0.5 – West Tributary of McGinty Creek

MN-0.5 station is located on the upper west stem of McGinty Creek. In 2018, water level and temperature data were continuously measured and recorded every 30 minutes by a pressure transducer/data logger. Figure 16 shows McGinty Creek at MN-0.5 water level and temperature data for the 124-day record from June 11 to October 13, 2018.

A stage-discharge relationship was established for MN-0.5 but it has limited flow data and corresponding staff gauge reading, hence is was not very accurate, the stage curve is presented in Figure 17. Additional flow measurements through the years will be required to establish a stage-discharge curve for the station with greater accuracy.

Table 4-1 provides a summary of the average water temperature, flow and total flow volume in 2018 while table 4-2 provides a summary historical measured flows at MN-0.5. These flows are based on discrete measurements only.

4.2 Station MN-1.5 – Upper East Tributary of McGinty Creek

The station MN-1.5 was set-up with a continuous monitoring station for the 2018 season. A levellogger and a barologger were launched on July 5th, 2018. This station is monitored monthly for sampling and discrete hydrometric measurements. The staff gauge was installed on July 5th, as a newly monitored station the rating curve had a large error, as monitoring continues the stage curve will become more accurate. The stage and water temperature hydrograph for continuous monitoring throughout the 2018 season is presented in Figure 18. The hydrometric data and temperature for the season at MN-1.5 is presented below in table 4-3. The stream seems to have frozen over around October 1st, 2018.

4.2 Station MN-2.5 – East Tributary of McGinty Creek

MN-2.5 station is located on the lower stem of McGinty Creek. In 2018, water level and temperature data were continuously measured and recorded every 30 minutes by a pressure transducer/data logger. Figure 19 shows McGinty Creek at MN-2.5 water level and temperature data for the 99-day record from July 6th to October 13th, 2018.

A stage-discharge relationship was established for MN-2.5 but due to limited data flow and corresponding staff gauge reading it is not an accurate curve, with continuous monitoring more data will fill the curve and improve the accuracy.

Table 4-4 provides a summary of historical measured flows at MN-2.5. These flows are based on discrete measurements until 2016, the pressure loggers were used for 2017-2018.

Note: 1 - Data based on previous Annual Surface water Hydrology Analysis.

Note: Shaded cells indicate incomplete months of data

4.3 Station MN-4.5 - McGinty Creek near the Mouth

MN-4.5 station is located on the lower reach of McGinty Creek before flowing into the Yukon River. In 2018, water level and temperature data were continuously measured and recorded every 30 minutes by the pressure transducer/data logger. Figure 20 shows McGinty Creek at MN-4.5 water level and temperature data for the 140-day record from May 26 to October 13, 2018.

The stage-discharge relationship for MN-4.5 is presented in Figure 21. The 2018 hydrograph and discrete measurements for MN-4.5 are shown in Figure 22. In 2018, the maximum measured flow of 0.06 m³/s occurred on September 15th, 2018. Upon analysis of the temperature and flow variance, it is probable that the creek was very low and the levellogger was out of the water from July 27th to August 7th, 2018.

Table 4-5 provides a summary of the average water temperature, flow and total flow volume in 2018. Table 4-6 summarizes the historical mean monthly flows from previous years of the hydrometric program.

Table 4-5: MN-4.5 2018 Hydrometric Data and Temperature Summary

5. Hydrology QA/QC

Detailed procedures for hydrology monitoring at the Minto Mine are detailed in the *Minto Mine Surface Water Hydrology SOP*. In 2018, Minto environmental staff conducted a duplicate of hydrometric measurements at random station every week, to reach a 10% QAQC.

Minto Mine Physical Monitoring Plan

First Issue: June 2014

REVISION INFORMATION

Rev. Number	Issue Date	Description & Revisions Made
-	June, 2014	First issue
2015-1	November, 2015	Annual update of existing instrumentation and monitoring frequencies. Instruments Added: A215, A216, A217, A218, A2RAMP01, A2RAMP02, A2RAMP03, A2RAMP04, DSSH-26, DSSH-27, M82, M83, M84, M85, M86, M87, SWD06 Instruments Removed: DSI-14, DSI-21, DSSH-21, DSSH-22, DSSH-23, DSSH-25, WSP2
2016-1	December, 2016	Annual update of existing instrumentation and monitoring frequencies. Instruments Added: DSP-07, DSP-08, DSP-10, DSI-22, DSI-23, DSSH-28, DSSH-29, DSSH-30, DSSH-31, MV1, MV2, SWD-07, SWD-08, SWD-09 Instruments Replaced: DSSH-06, DSSH-10, DSSH-15, DSSH-18, DSSH-19, DSSH-20 Instruments Removed: A2RAMP01, A2RAMP02, A2RAMP03, A2RAMP04, SWD-02, SWD-02A, SWD-04A, SWD-05A, DSP-09
2017-1	November, 2017	Annual update of existing instrumentation and monitoring frequencies. Instruments Added: DSI-24, DSSH-32, M88, M89, M91, M92, M93, M94, SWD10, SWD11 Instruments Replaced: DSSH-17, DSSH-27, M82, M76, M86 Instruments Removed: DSI-23, DSSH-20, DSSH-29, M73, M75, M87
2018-1	December, 2018	Updated for care & maintenance. Inspection and monitoring frequencies revised. Instruments Added: DS1, DS3, DS4, MWDH1, MWDH2, MWDH3, MWDH4, MWDH5, MWDH6, M81, M95, M95, M97, M98, SWD12 Instruments Removed: M76, M85, M86, M91, SWD05A, SDI-3

Appendix B: Data Collection and Input Manuals

1 Introduction

The following document describes the instrumentation and monitoring program currently in place at Minto to monitor the stability of mining structures including waste rock, tailings, and water storage facilities. The program consists of two main components: instrumentation to measure ground conditions and deformation, and regular geotechnical inspections. The following sections summarize inspection and data collection frequencies, instrument installation details and locations, and data collection procedures.

Mining and monitoring activities at Minto included in this plan are licensed under the following:

- Type A Water Licence QZ14-031, August, 2015
- Type B Water Licence MS15-094, July 2016
- Quartz Mining Licence QML-0001, December, 2014

Existing mine structures at Minto are shown in Figure 1-1, and described in the following section. As of October, 2018 the mine has been placed in care and maintenance and no active mining is taking place.

Figure 1-1: Minto site plan (August 2017)

2 Mine Structures

Mine structures currently being monitored at Minto are listed in Table 1.

Table 1: Description of Mine Structures at Minto

Structure	Description	Instrumentation
Area 2 Pit and Area 2 Pit Tailings Management Facility (A2PTMF)	The Area 2 Pit was completed in 2015 to the extents licensed under Phase IV (Stages 1 and 2); the pit was extended to the south as part of Phase V/VI (Stage 3 and Stage 3 Expansion), completed in 2018. Tailings deposition into Area 2 Stage 2 pit (A2S2) began in March, 2015 and the pit is now maintained as a tailings management facility. Tailings deposition ceased in October 2018 when the mine was placed into care and maintenance. Dumping of NP:AP<3 waste rock (SAT) into the Stage 2 and Stage 3 pits, below the final water table at closure, took place in 2017 and 2018.	Survey hubs
Area 2 Underground	The Area 2 underground began development in 2016 and is accessed by the Minto South portal and decline south of the Area 2 and Area 118 Pits. Production mining ceased in October, 2018 and the mine is now accessed to maintain dewatering only.	None
Area 118 Pit	Mining of the Area 118 Pit was carried out in 2014. As part of Area 2 Stage 3 pit mining, overburden was dispatched to the pit, referred to as the Area 118 Backfill Dump.	None
Area 118 Backfill Dump	The Area 118 Backfill Dump is included in the Phase V/VI licence. Overburden was dispatched to the pit in 2017 as part of Area 2 pit mining.	None
Area 118 Underground	The Area 118 underground began development in 2013 and was completed in 2016. It is accessed by the Minto South portal and decline south of the Area 2 and Area 118 Pits. Production mining took place using a longhole stoping method.	None
Big Creek Bridge	Bridge on the Minto access road crossing Big Creek, located at Km 19. Licenced under Type B water licence MS15-094.	None
Barge Landings	Barge landings on the Minto access road at the Yukon river. Licensed under Type B water license MS15-094.	None
Camp	The camp consists of several connected bunkhouse buildings (Sherwood, Minto, Selkirk), a kitchen building, and several separate buildings including the gym and Site Services offices.	None
Copper Keel and Wildfire Underground	The Copper Keel and Wildfire underground are in the phase V/VI mining plan and have not commenced yet.	N/A
Dry Stack Tailings Storage Facility (DSTSF)	Construction of the DSTSF with filtered tailings placement was carried out from 2007 to November 2011. As part of progressive reclamation activities in 2012-2013, the DSTSF was covered with a layer of overburden approximately one to four meters thick. The DSTSF began showing deformation in 2009, interpreted as primarily horizontal sliding towards the north/northeast on an ice-rich layer in the underlying overburden, several meters above bedrock. The movement has continued since then but at a decreasing rate in response to construction of both the Mill Valley Fill waste rock buttress and the Mill Valley Fill Extension 2 waste rock buttress. Resloping and overburden cover	- Survey hubs - Thermistors - Inclinometers - Piezometers

Structure	Description	Instrumentation
	placement took place in 2017 and 2018 as part of progressive reclamation activities.	
Ice Rich Overburden Dump (IROD)	Originally constructed as a free-standing rockfill structure to contain ice-rich overburden. The IROD is no longer active and is now entirely surrounded by the Southwest Waste Dump rockfill. The area has been reclaimed with the Southwest Waste Dump in 2017.	None
Main Pit (Area 1 Pit) and Main Pit Tailings Management Facility (MPTMF)	Mining in the Main Pit was completed in 2011. Instability in the south wall of the pit occurred in 2009 during mining of Stage 3 of the pit, and subsequently a larger failure occurred in 2011 after completion of Stage 5. Continued sloughing and creep movement of the south wall led to the design and construction of a waste rock buttress, known as the South Wall Buttress, completed in 2013. Slurry tailings deposition into the pit began in 2012 and the pit is now maintained as a tailings management facility.	- Survey hubs - Inclinometer
Main Pit Dump	The Main Pit Dump is included in the Phase V/VI licence. Construction commenced in 2017 and ceased in 2018 when the mine placed in care and maintenance. The dump is located on the southwest side of the Main Pit.	Survey hubs
Main Waste Dump (MWD)	The Main Waste Dump stores waste rock released during the mining of the first three stages of the Main Pit. The dump is no longer active.	- Survey hubs - Inclinometer
Main Waste Dump Expansion (MWDE)	This dump is an extension of the MWD that stores waste rock released from the Minto North Pit. The dump is no longer active. Reclamation re-sloping began in 2016.	None
Main Waste Dump Wrap (MWDW)	This dump is a reclamation feature to shallow the slopes of the Main Waste Dump for reclamation purposes. The dump is no longer active.	Survey hubs
Mill Site	The mill site consists of the mill building, crusher and crusher stockpile pad.	None
Mill Valley Fill Extension (MFVE)	A waste rock buttress to the north of the DSTSF, constructed from January 2012 to March 2013 to prevent or decrease movement of the DSTSF. Resloping and overburden cover placement were carried out as part of progressive reclamation activities in 2017 and 2018.	Survey hubs
Mill Valley Fill Extension 2 (MVFE2)	An extension of the MVFE waste rock buttress to the northeast, constructed from November 2015 to August 2016 to further decrease movement of the DSTSF. Resloping and overburden cover placement were carried out as part of progressive reclamation activities in 2017 and 2018.	- Piezometers - Survey hubs - Inclinometers
Mill Valley Fill Extension 2 Collection Sump	A replacement sump for the Minto Creek Detention Structure (MCDS), constructed in 2016. It detains surface water considered impacted from upstream sub-catchment areas and directs it to the MPTMF or water treatment plant.	None
Minto Access Road	Road from the Yukon River barge crossing to the mine site. Licenced under Type B water licence MS15-094.	None
Minto East Underground	Accessed by the Minto South portal and decline south of the Area 2 and Area 118 Pits. Production was underway at the time the mine was placed in care and maintenance in October 2018.	None

Structure	Description	Instrumentation
Minto North Pit	Mining of the North Pit was completed in September 2016. The pit is currently inactive and the access is barricaded.	None
Ore Stockpiles	There are two primary ore stockpiles on site – North and South stockpile. These are located south of the crusher and east of the Area 2 pit.	None
Reclamation Overburden Dump (ROD)	Received the bulk of the overburden released as part of Phase IV and earlier mining of the Main Pit. The material in the ROD is available for use in reclamation of the mine at closure.	None
South Diversion Ditch	This structure was decommissioned in 2017 to allow for Area 2 Stage 3 Expansion mining activities.	None
South Wall Buttress (SWB)	Waste rock buttress constructed against the Main Pit south wall from 2009-2011 as a result of instability in the south wall of the pit. Now covered by the Main Pit Dump.	• Survey hubs
Southwest Waste Dump (SWD)	The Southwest Waste Dump (SWD) stores waste rock released during phase IV mining. The dump is no longer active. Resloping and overburden cover placement were carried out as part of progressive reclamation activities in 2016-2018.	• Survey hubs • Inclinometers • Thermistors • Piezometers
Tailings Diversion Ditch (TDD)	A diversion ditch located south of the DSTSF to divert unimpacted water around the tailings facility. The intake structure was extended in 2017 and 2018 to allow for the decommissioning of the South Diversion Ditch for A2S3 Expansion mining.	None
Water Storage Pond Dam (WSP)	The Water Storage Pond and Dam are located east of the mine along Minto Creek. The dam was constructed in 2006 as a clay-core water retention dam for collecting precipitation and surface water runoff at the site. Maximum depth of water at the face of the dam is approximately 15 m.	• Survey hubs • Thermistors • Piezometers

3 Design and Monitoring References

Table 2 lists the design reports for each structure and the monitoring/inspection guidance reports used to develop the inspection (Section 5) and instrumentation (Section 6) programs for each structure.

4 Roles and Responsibilities

Table 3 lists the roles and responsibilities for physical monitoring on the site. The list below has been updated to reflect the care and maintenance workforce.

Table 3: Roles and Responsibilities

Role	Responsibilities
Environmental Monitors	• Collect instrumentation data at specified frequencies • Input data into monitoring spreadsheets/databases • Internal reporting of monitoring data • Maintain equipment
Environmental Officers	• Ensure compliance with license requirements • Compile monthly and annual Water Licence reports • Visual inspections at specified frequencies • Communicate with consultants as required
External Geotechnical Consultant	• Review monthly and annual Water Licence reports • Review and update Physical Monitoring Plan • Site inspections at specified frequencies

5 Inspections

Table 4 lists the regular, required inspections.

Table 4: Inspections

Structure	Frequency	Description
Area 2 Pit and Area 2 Pit Tailings Management Facility (A2PTMF)	Quarterly	Visual inspection and review of monitoring data as per OMS Manual. Two of the inspections by a professional engineer.
Area 2 Underground	N/A	No longer accessible.
Area 118 Pit	N/A	No longer accessible.
Area 118 Backfill Dump	Semi-Annually – May/June post thaw, and September pre freeze-up	Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year.
Area 118 Underground	N/A	No longer accessible.
Big Creek Bridge	Annually	Visual inspection by a professional engineer as per MS15-094.
Camp	Semi-Annually – May/June post thaw, and September pre freeze-up	Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year.
Copper Keel, Wildfire Underground	N/A	N/A – structure does not exist yet.
Dry Stack Tailings Storage Facility (DSTS)	Quarterly	Visual inspection and review of monitoring data as per OMS Manual. Two of the inspections by a professional engineer.
Main Pit (Area 1 Pit) and Main Pit Tailings Management Facility (MPTMF)	Quarterly	Visual inspection and review of monitoring data as per OMS Manual. Two of the inspections by a professional engineer.
Main Pit Dump	Quarterly	Visual inspection and review of monitoring data. Two of the inspections by a professional engineer.
Main Waste Dump (MWD)	Semi-Annually – May/June post thaw, and September pre freeze-up	Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year.

Structure	Frequency	Description
Main Waste Dump Expansion (MWDE)	Semi-Annually – May/June post thaw, and September pre freeze-up	Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year.
Main Waste Dump Wrap (MWDW)	Semi-Annually – May/June post thaw, and September pre freeze-up	Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year.
Mill Site	Semi-Annually – May/June post thaw, and September pre freeze-up	Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year.
Mill Valley Fill Extension (MFVE)	NA	Covered by MVFE2.
Mill Valley Fill Extension 2 (MVFE2)	Quarterly	Visual inspection and review of monitoring data. Two of the inspections by a professional engineer.
Mill Valley Fill Extension 2 Collection Sump	Monthly	Visual inspection. Semi-annual inspections by a professional engineer.
Minto Access Road	Annually	Visual inspection by a professional engineer as per MS15-094.
Minto East Underground	Semi-annually	Visual inspection by a professional engineer as per Underground Ground Control Plan.
Minto North Pit	Semi-Annually – May/June post thaw, and September pre freeze-up	Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year.
Ore Stockpiles	Semi-Annually – May/June post thaw, and September pre freeze-up	Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year.
Reclamation Overburden Dump (ROD)	Semi-Annually – May/June post thaw, and September pre freeze-up	Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year.
Ridgetop Waste Dump	Semi-Annually – May/June post thaw, and September pre freeze-up	Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year.

Structure	Frequency	Description
South Wall Buttress (SWB)	NA	Covered by Main Pit Dump.
Southwest Waste Dump (SWD)	Semi-Annually – May/June post thaw, and September pre freeze-up	Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year.
Tailings Diversion Ditch (TDD)	Semi-Annually – May/June post thaw, and September pre freeze-up	Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year.
Water Storage Pond Dam (WSP)	Monthly	Visual inspection and review of monitoring data. Semi-annual inspections by a professional engineer.

6 Instrumentation

A map of site wide active instrumentation is shown in Appendix A. Installation information and data collection schedules are contained in the following sections. Instruments with a strikethrough shown were destroyed in 2018 or are no longer operational.

Inclinometers

Inclinometers are used to measure lateral, differential ground movement in a borehole. Inclinometer stations consist of grouted, slotted PVC pipe into which the inclinometer probe is lowered and deflection is measured at 0.5m intervals. The current probe used on site is an RST digital MEMS inclinometer system.

Table 5: Inclinometers

Area	ID	Northing (m)	Easting (m)	Elevation (m)	A0 Azimuth	Hole Depth (m)	Date Installed	Reading Frequency
Area 2 Pit	A2I-1	6944164.73	385298.95	822.46	302	55.5	2013-04-26	Semi-annually

Southwest Waste Dump	SDI-3	6944591.11	383966.00	847.42	90	46.5	2010-02-11	Quarterly

Survey Hubs

Survey hubs are used to monitor surface movement of structures and are comprised of steel posts cemented into waste rock or bedrock and equipped with a threaded base to which a high precision RTK-corrected GPS instrument is attached. The GPS currently used on site is a Trimble R8.

Table 6: Survey Hubs

Thermistors

Thermistor strings are used to measure ground temperature profiles in boreholes, and in particular permafrost conditions at Minto. Thermistor strings consist of multiple temperature sensor nodes distributed along a single multi-conductor cable, installed within or attached to the outside of grouted PVC pipe. EBA and RST thermistor strings have been installed on site. EBA thermistors are read using a basic ohmmeter and RST thermistors are read using a RST TH2016B readout unit.

Table 7: Thermistors

Area	ID	Northing (m)	Easting (m)	Elevation (m)	Thermistor String No.	Nodes	Hole Depth (m)	Date Installed	Reading Frequency

Vibrating Wire Piezometers

Vibrating wire piezometer strings are used to measure piezometric pressure profiles in boreholes. They consist of multiple vibrating wire sensors installed on PVC pipe in grouted boreholes. RST vibrating wire piezometers are installed on site and data is collected with an RST VW2106 readout unit.

Table 8: Vibrating Wire Piezometers

Area	ID	Northing (m)	Easting (m)	Elevation (m)	Sensor	No.	Sensor Elevation (m)	Date Installed	Reading Frequency

7 Instrumentation Procedures and Documentation

Data collection manuals for all monitoring devices are included in Appendix B.

After collection, data is input into a series of spreadsheets and databases used for storing, tracking and interpreting instrumentation data. Instructions for data input are contained in the instrumentation manuals in Appendix B.

8 Quality Assurance/Quality Control

Planned job observations (PJO's) are routinely performed and documented on Environmental Monitors to verify data collection is consistent with the designed procedures.

Data collection equipment is returned to the manufacturers as per their recommended calibration schedules.

All data is reviewed and summarized by a Geotechnical Engineer monthly as part of the Water Licence reporting.

9 Reporting

Regular processing and review of monitoring data is completed and presented in the following documents.

Table 9: Reporting

Report	Frequency	Submission
Minto Mine Type A Water Licence QZ14-031 Monthly Report (Clause 4.4)	Monthly	Submitted to Yukon Water Board maximum 30 days following each month
DSTSF Inspection Reports	Quarterly	Filed internally within one week of the inspection
Water Storage Pond Dam Inspection Reports	Monthly	Filed internally within one week of the inspection
Area 2 and Main Pit Tailings Storage Facility Inspection Reports	Quarterly	Filed internally within one month of the inspection
Semi-Annual Site-wide Geotechnical Inspection Report	After spring melt (May/June) and before freeze-up (September)	Submitted to Yukon Water Board within 60 days of inspection.
Minto Mine Type A Water Licence QZ14-031 Annual Report (Clause 4.5)	Annually	Submitted to Yukon Water Board by March 31 each year
Minto Mine Type B Water Licence MS15-094 Annual Inspection Report (Clause 34)	Annually	Submitted to Yukon Water Board with the Annual Report

Appendix B: Data Collection and Input Manuals

Inclinometer Measurements

Please refer to RST MEMS Digital Inclinometer System Instruction Manual for complete instruction.

System Overview:

Figure 1 – System Overview

1. Soft Shell Case
2. Digital Inclinometer Probe (w/ protective end cap)
3. Reel Battery Charger
4. 70mm/2.75" OD Cable Grip
5. 85mm/3.34" OD Cable Grip
6. Ultra-Rugged Field PC
7. 12V DC car adapter for Reel Battery Charger or Ultra-Rugged Field PC
8. Spare Reel Battery
9. Silicone Lubricant (for use on connectors)
10. USB Cable for Ultra-Rugged Field PC
11. AC Adapter (110-240V) for Reel Battery Charger
12. AC Adapter (110-240V) for Ultra-Rugged Field PC
13. Cable Reel with Wireless Communication System and protective end cap
14. Reel Carrying Case

1. Make sure the battery for the reel and the Field PC are charged.
2. Lift up protective box with two hands and put it on side as a work bench.

3. Remove cap from inclinometer casing and look for A_0 marking (black mark).

4. Remove excess water inside the probe and the cable connector.
Probe is very sensitive and susceptible to vibration. **DO NOT BANG THE PROBE.** Use a paper towel to wipe it.
5. Apply silicon lubricant to probe and cable connector when needed.

6. Connect the inclinometer cable to the probe by aligning the keyways and threading the connector onto the probe. Turn the threaded ring, but not the cable.

7. Turn on the power of the reel. A green light indicates that the power is on. This energizes the accelerometers and makes them less susceptible to shock.

8. Check the depth of the hole. Turn on Field PC and select the hole you are going to measure.

9. Always start with **UPPER** Wheel in the A_0 direction.

10. Lower the probe gently and carefully. When it gets close to the bottom lower it very gently to avoid bouncing the probe off the bottom of the hole. The cable has aluminum sleeve marks which are spaced at 0.5m and it has a red measure mark with label every 5m.

11. Lower the probe gently to ensure the bottom of the hole is encountered. (Slightly passed the designated depth). Double check your correct depth by pulling out reel to the next 5m mark and counting back each 0.5m for each increment.
12. Place the cable grip on top of the casing and hang the cable by the aluminum crimps.

13. Connect the Field PC to the reel. Use the pen attached to the field PC and press “Connections”.

14. Once connected, hit “Readings”.

15. At each depth allow the A and B readings as well as the noise level become stabilized before you accept the readings. Ideally noise level should be at or below 30 μV .

16. Wear gloves as the Envirobond inside the inclinometer casing can be sticky and irritable. Pull up gently to the next marker and let the aluminum crimp to sit on the metal grip. Wait for the readings and noise level to stabilize and then hit “Accept”.

17. If you accidentally pull the probe too far (more than an inch), lower the probe back down to the previous bead then pull up to the bead you want to measure. This will ensure that the readings remain consistent.
18. At each 5m mark, check that you are at the right location. If you miss or overpass a reading, go back to the previous 5m depth. For examples, if something goes wrong at 41.5m, go back to 45m and drop the cable to 45.5m. Then gently pull up to 45m and hit "Accept" again. There are arrow keys on the Field PC which allow you to adjust your depth.

19. Once the last reading (0.5m) is taken, gently take out the probe and turn it 180° so that the **Lower** wheel

is now in the A₀ direction.

20. Go back gently to the bottom of hole and take the second set of readings.

21. During the measurement of the second set of readings, checksum data will appear in a smaller font below the current readings. Checksum should be reasonably small and consistent. Ideally it should be somewhere between -0.0035m to +0.0045m.
22. If the checksum is large ($> 0.01\text{m}$) and inconsistent, check the following:
 - Is the probe at the right depth?
 - Is the probe in the correct direction?
 - Lower the probe to the previous depth and retake the reading again.

It is possible that checksum is high due to differential pressure in the ground. In that case continue measurement and keep monitoring checksum.

23. Once readings are completed, take out the probe and wipe away the Envirobind gently. Put the caps back onto the probe and connector.

Data Input

Note: Windows Mobile Device Center must be installed on the computer in order to collect the readout unit to the computer.

1. Connect the USB cable from the readout unit to the computer and turn the power on.
2. Open DMM for Windows

3. *File – Open – Project Database*

The database for all inclinometer data is stored here:

<X:\Mine Technical\03 - Monitoring\! Inclinometers\Master Database>

4. *File – Import – Import RPP file*

Navigate to the mobile device and select the .rpp file for the appropriate monitoring station and date. The data will then import and save in the database automatically.

Thermistor Readings

Two different types of thermistors are currently installed on site – RST and EBA thermistors.

To read RST thermistors:

1. Connect adapter cord to the TH2016B Readout Box.
2. Record the resistivity (Ohms) for each thermistor node on paper or store the data in the readout box with the following steps:
 - a. Scroll with the Up/Down arrows to the **Memory** screen and press enter (arrow key)

- b. Scroll with the Up/Down arrows to the **Store Data** screen and press enter

- c. Scroll with the Up/Down arrows to the station being monitored and press enter to store the reading

- d. The data is now stored and the readbox can be turned off by pressing the escape button (ESC) three times to get back to the main menu and scrolling to Power Off.

To read EBA thermistors:

1. Connect the EBA 16 Point Ground Temperature Dial into the thermistor cable.
2. Connect the multi-meter to the EBA 16 Point Ground Temperature Dial.
3. Record on paper the resistance in Ohm's (Ω) for each point.

Data Downloading

1. Connect USB cord from computer to the readout box.
2. Open the software Multi Readout Host.

3. Turn on the power on the readout box.
4. The software will recognize the readout unit and prompt to download data. Choose "Yes" to download the data from the readout unit.

5. Once data is downloaded you will have the option to save all data as .csv file. Choose "Yes" and the data will be stored in My Documents in a folder named "TH2016data".

6. The software can be used to setup new locations or view data but no further steps are required.

Data Input

Spreadsheets for piezometer data input and tracking are stored here:

X:\Mine Technical\03 - Monitoring\! Piezo and GTC

1. Open the spreadsheet for the area monitored

2. Open the tab "GTC Readings"

- [illegible]

Vibrating Wire Piezometer Readings

1. Connect adapter cord to the VW2106 Readout Box.
2. Connect the coloured wires to the correct wire clips on the extension cable. Make sure the wires do not touch each other.
3. Record the **DATE** and **TIME** as barometric pressure will be needed to calibrate the water level.
4. Record the measurement (between 7000B to 9000B) and the temperature (°C) for each piezometer. The piezometer ID should be labeled on the wire (eg. P5a and P5b).

5. Alternatively the data can be stored in the readout box:
 - a. Scroll with the Up/Down arrows to the **Memory** screen and press enter (arrow key)

- b. Scroll with the Up/Down arrows to the **Store Data** screen and press enter

- c. Scroll with the Up/Down arrows to the station being monitored and press enter to store the reading

- d. The data is now stored and the readout box can be turned off by pressing the escape button (ESC) three times to get back to the main menu and scrolling to Power Off.

Data Downloading

7. Connect USB cord from computer to the readout box.
8. Open the software Multi Readout Host.

9. Turn on the power on the readout box.
10. The software will recognize the readout unit and prompt to download data. Choose "Yes" to download the data from the readout unit.

11. Once data is downloaded you will have the option to save all data as .csv file. Choose "Yes" and the data will be stored in My Documents in a folder named "VW2016data".

12. The software can be used to setup new locations or view data but no further steps are required.

Data Input

Spreadsheets for piezometer data input and tracking are stored here:

X:\Mine Technical\03 - Monitoring\! Piezo and GTC

4. Open the spreadsheet for the area monitored

5. Open the tab "Piezo Readings"

- In a new row, input the date, time, barometric pressure, B-unit and temperature readings for each instrument.

Appendix H – 2018 AMP McGinty Creek Selenium Memo (Minnow)

June 28, 2018

Mr. Ryan Herbert
Environmental Manager
Minto Mine
PO Box 11
Whitehorse Central PO
Whitehorse, Yukon
Y1A 2V3

Dear Mr. Herbert,

Re: Evaluation of a Dissolved Selenium AMP Threshold Exceedance in McGinty Creek

The Minto Mine (Minto) engaged Minnow Environmental Inc. (Minnow) as a Qualified Professional (QP) to evaluate the concentration of dissolved selenium that exceeded thresholds identified in the Minto Mine's Operations Adaptive Management Plan (AMP; Minto 2017). The exceedance occurred on May 26, 2018 at McGinty Creek Station MN-4.5 (Figure 1). As required under the AMP, this brief letter report determines if the exceedance was mine-related and whether the exceedance was likely to have affected aquatic resources.

Background

Exploration drilling within the McGinty Creek watershed began in 2009 around a single continuous zone of high-grade ore (Minto North Pit; Figure 1) located northeast of the mine's Main Waste Dump. Pit-stripping and road construction began in August 2015 following approval under the Minto Mine's Water Use Licence (WUL; QZ14-031). The Minto North Pit is located within the catchment of McGinty Creek's east arm, which travels 9.5 km to the Yukon River (Figure 1). There is no direct release of effluent from the Minto North Pit to McGinty Creek. Operations in the Minto North Pit continued until October 1, 2016.

Yukon Government Energy, Mines, and Resources (EMR) approved Minto Mine's AMP 2017-01 under the current Quartz Mining License (QML-0001). The Yukon Water Board approved the updated AMP (AMP 2017-02) under the current Water Use Licence (QZ41-031). This assessment is relative to the AMP 2017-02 specific thresholds.

As described in an evaluation of exceedances that occurred in November 2017 (Minnow 2018a), the AMP includes three Specific Thresholds (ST) and three Specific Performance Thresholds (SPT) for surface waters (Figure 2). Analytes that exceed a ST objective at MN-4.5 trigger a SPT. Each SPT is associated with response steps, including notification, review, evaluation, and actions. Two consecutive samples exceeding the ST-1 objective triggers SPT-1. Analytes exceeding ST-2 and/or ST-3 objectives will trigger SPT-2 (Figure 2) and two consecutive samples exceeding either ST-2 or ST-3 objectives will trigger SPT-3 (only if the first exceedance was confirmed to have been due to mine loading).

AMP Response when SPT-2 has Been Triggered

Date: April 2018
Project 177202.0047

Figure 2

Nitrate and dissolved selenium had previously exceeded ST-2 and ST-3 objectives at MN-4.5 on November 10, 2018 (Minnow 2018a). Exceedances of both analytes were unrelated to the mine as concentrations were higher than ST-2 objectives prior to the operation of the mine at MN-4.5 and at other upstream locations (dissolved selenium; Minnow 2018a). Concentrations of nitrate and dissolved selenium were well below applicable guidelines for the protection of aquatic life and effects to aquatic life were not expected.

Methods

Water quality monitoring stations are located on the west and east arms of McGinty Creek (considered as “reference” and “exposed” arms, respectively) and near the mouth as it flows into the Yukon River (Figure 1). Review of historical and current conditions (2009 to 2018) included data from these stations as well as those from an additional monitoring area associated with the annual sediment, periphyton, and benthic invertebrate community monitoring that has been implemented annually since 2011 (URC; Figure 1; Minnow 2012, 2013, 2014, 2015, 2016, 2017, 2018b).

The 12-month rolling averages for dissolved selenium were calculated and compared to the ST-3 objective (0.00016 mg/L; Table 1). Averages were calculated by taking the average of the current sample and the previous 364 days of samples beginning in 2016. Individual grab samples for dissolved selenium were compared to the ST-2 objective (0.00020 mg/L; Table 1) and to the British Columbia Water Quality Guideline (BCWQG) of 0.0020 mg/L as has been adopted under the WUL (BCMOE 2014).

Results

Dissolved selenium exceeded the ST-3 objective at MN-4.5 on May 26, 2018 (0.00020 mg/L; Table 2, Figure 3), triggering SPT-2, and prompting an evaluation under the AMP. The calculated 12-month rolling average for dissolved selenium at MN-4.5 exceeded the ST-3 objective at the beginning of 2016, throughout most of 2017, and into 2018 (0.00015 to 0.00020 mg/L; Table 2, Figure 3). Concentrations of dissolved selenium at MN-4.5 were usually lower than at MN-0.5, which exceeded the ST-3 objectives throughout 2016 to 2018 (0.00015 to 0.00021 mg/L; Table 2, Figure 3). Station MN-0.2 (west arm; reference) and all stations on the east arm (MN-1.5 and MN-2.5; exposed) were below ST-3 objectives (Table 2, Figure 3).

Dissolved selenium did not exceed the ST-2 objective on May 26, 2018 (Table 3, Figure 4). Review of previous data indicates that dissolved selenium only exceeded the ST-2 objective at MN-4.5 twice in 2015 (once prior to Minto North Pit operations) and once each in 2016 and 2017. Station MN-0.5 on the west arm (reference) had multiple exceedances before, during, and after Minto North Pit operations (Table 3, Figure 4). This also occurred at URC, the area monitored annually by Minnow since 2011 and located upstream of MN-0.5 (0.00020 to 0.00086 mg/L; Table 4, Figure 1).

Historical concentrations suggest that the source of the dissolved selenium on the west arm was unrelated to the mine. Concentrations of dissolved selenium in the east arm (reference) were below the ST-2 objectives except for once in 2010 at MN-2.5 (0.00038 mg/L; Table 3, Figure 4). Any potential mine-related dissolved selenium would be more likely to occur on the east arm of McGinty Creek, as this area is downgradient of the Minto North Pit. Lastly, all concentrations of dissolved selenium were well below the BCWQG of 0.0020 mg/L, thus no effect on the aquatic resources at MN-4.5 would be expected (Tables 3 and 4).

Table 1: Specific Thresholds for McGinty Creek, Station MN-4.5

Analytes	Units	Specific Threshold 1 (85 th percentile)	Water Quality Objectives	
			Specific Threshold 2 Individual Data Point Evaluator (95 th percentile)	Specific Threshold 3 Central Tendency Evaluator (95 th percentile of annual medians)
Total Suspended Solids	mg/L	52	269	32
Ammonia	mg/L	0.040	0.12	0.046
Nitrite	mg/L	0.0060	0.050	0.0050
Nitrate	mg/L	0.20	0.23	0.083

	10-Nov-17	0.000072	0.00020	0.000072	0.000071	0.00019
2018	26-May-18	0.000070	0.00019	0.000068	0.000070	0.00020

Note: Values are a rolling average of the previous 12 months of data, see Table 4 for actual sample days for each station.

Shading indicates that the value exceeded the Specific Threshold (ST-3) for dissolved selenium (0.00016 mg/L).

Shading indicates that the value exceeded the British Columbia Water Quality Guideline for selenium (0.002 mg/L; BCMOE 2014).

Figure 3: Twelve Month Rolling Average Dissolved Selenium (mg/L) Water Quality Samples on McGinty Creek, Minto Mine, 2016 to 2018

Note: See Table 4 for actual sampling days.

Note: Bolded values are less than the laboratory reporting limit (LRL) and presented as 1/2x LRL.

Shading indicates that the value exceeded the Specific Threshold (ST-2) for dissolved selenium (0.00020 mg/L).

Shading indicates that the value exceeded the British Columbia Water Quality Guideline for selenium (0.002 mg/L; BCMOE 2014).

Figure 4: Dissolved Selenium (mg/L) Water Quality Grab Samples on McGinty Creek, Minto Mine, 2009 to 2018

Notes:

Unfilled circles are less than the laboratory reporting limit (LRL) and presented as 1/2x LRL.

Shaded area represents time period Minto North Pit was operational.

2016	0.00030
2017	0.00086

Note: Bolded values are less than the laboratory reporting limit (LRL) and presented as 1/2x LRL.

 Shading indicates that the value exceeded the Specific Threshold (ST-2) for dissolved selenium (0.00020 mg/L).

 Shading indicates that the value exceeded the British Columbia Water Quality Guideline for selenium (0.002 mg/L; BCMOE 2014).

^a Samples were collected during the Sediment, Periphyton, and Benthic Invertebrate Community Monitoring Programs, 2011 to 2017.

Conclusions and Recommendations

Dissolved selenium exceeded the ST-3 objective at MN-4.5, but the source was unrelated to the Minto Mine and consistent with reference concentrations further upstream on the west arm of McGinty Creek. Dissolved selenium was well below applicable guidelines for the protection of aquatic life, so effects to aquatic life would not be expected.

It is recommended that sampling continue as scheduled since the exceedance of dissolved selenium was unrelated to the mine. Increased frequency is not required at this time. Two investigations show that exceedances of dissolved selenium are unrelated to the mine, and it is recommended that a reevaluation of the Specific Thresholds (which are lower than reference) be conducted.

Sincerely,

Minnow Environmental Inc.

Appendix I – 2018 AMP Groundwater SRK Memo

Memo

To:	Deborah Flemming, Minto Explorations Ltd.	Client:	Minto Explorations Ltd.
From:	Dan Mackie, PGeo Laura Volden, MSc, GIT	Project No:	1CM002.057
Cc:		Date:	March 20, 2019
Subject:	Minto Mine – Summary of 2018 Groundwater OAMP SPT Exceedances		

1 Purpose

Groundwater monitoring at the Minto Mine, Yukon, is conducted and reviewed through the Minto Mine Groundwater Monitoring Plan (Minto, 2016) and the Operational Adaptive Management Plan (OAMP; Minto, 2017). The purpose of this memo is to summarize groundwater quality (and locations) at Minto that have exceeded a specific performance threshold (SPT) of the OAMP in 2018.

2 Background

The groundwater monitoring network at Minto includes 10 active multi-level monitoring wells that have been installed between 2009 and 2017. The monitoring wells are located across the site, both outside of the current mining footprint and topographically (and hydraulically) down gradient of mining activities. Monitoring locations are shown on Figure 1. All of these monitoring wells were installed after the start of mining (except MW09-03, which was installed after the main Minto operations began, but before mining at the adjacent Minto North Pit started). Details of groundwater monitoring locations can be found in SRK (2018).

Groundwater monitoring is conducted as required by the Groundwater Monitoring Plan. Review of groundwater monitoring results is carried out as part of the OAMP. In the OAMP, performance thresholds have been defined to establish changes in concentration and concentration values for specific constituents of concern (CoCs) at which actions may need to be taken by Minto to avoid potential impacts to the environment. Specifically, the OAMP states:

Specific Performance Thresholds (SPTs) are defined for each of the Effluent Quality Standards (EQS) parameters identified in Clause 9 (a), Table 1 of Water Use Licence QZ14-031, with the exception of pH, oil and grease, iron and nitrite.

There are three SPT levels for groundwater quality defined in the OAMP for the Minto Creek Catchment, and two for the McGinty Creek Catchment. Of the 10 multi-port monitoring wells active in the monitoring network, only three are compared to the SPT in the AMP. They are MW12-05 and MW12-06 (Minto Creek Catchment), and MW09-03 (McGinty Creek Catchment). All three of these monitoring wells are located hydraulically or topographically down gradient of certain mine components:

- MW09-03 – topographically down gradient of the Minto North Pit in the McGinty Creek catchment;
- MW12-06 – hydraulically and/or topographically down gradient of the Main and Area 2 open pits, DSTSF and MVFE, in the Minto Creek catchment;
- MW12-05 – hydraulically and topographically down gradient of all mine activities in the Minto Creek catchment.

Attachment 1 provides table of SPT threshold concentrations. SPTs for each catchment are summarized below:

Minto Creek Catchment

1. SPT-1 corresponds to a trend-based assessment designed to flag potential rapidly-increasing groundwater concentrations that have not yet exceeded concentration-based thresholds.
2. SPT-2 generally corresponds to the EQS concentrations defined in the OAMP (with four exceptions: Cr-D, Cu-D, Ni-D and sulphate).
3. SPT-3 generally corresponds to the estimated concentrations in groundwater that would be necessary to cause exceedance of the Water Quality Objectives in lower Minto Creek under long term steady state conditions.

McGinty Creek Catchment

1. SPT-1 is triggered when there are three consecutive exceedances of the 75th percentile background level in a single monitoring port.
2. SPT-2 is triggered when there are three consecutive exceedances of the 95th percentile background level in a single monitoring port.

Groundwater monitoring results are reviewed monthly and, if a SPT is reached or exceeded, data are reviewed, interpretations are made, the risk narrative is assessed (in terms of the receiving environment), and management actions are defined. If an OAMP SPT has not been reached for any parameter at any location, no further action is taken on the assumption that there has been no change of significance from defined baseline conditions. Monthly OAMP reports are provided to the Yukon Government as per the OAMP.

3 Groundwater AMP SPT Events

Table 1 and Table 2 summarize groundwater locations and parameters for which OAMP SPTs have been reached for the 2018 monitoring year. CoCs at any groundwater monitoring location that are not identified in this table are assumed to not have changed by a significant amount relative to established baseline conditions. Baseline groundwater conditions are defined in the OAMP based on data from MW09-03 prior to 2015 (start of Minto North mining).

Groundwater monitoring data for all CoCs are included in Attachment 2.

Table 1 Minto Creek Catchment threshold exceedances

Monitoring Well Zone	Parameter	SPT	Context
MW12-05-01	Al	1	1 of 4 samples exceeded threshold concentration
	Se	1	1 of 4 samples exceeded threshold concentration
	SO ₄ ²⁻	2	4 of 4 samples exceeded threshold concentration
MW12-05-02	SO ₄ ²⁻	2	4 of 4 samples exceeded threshold concentration
MW12-05-03	SO ₄ ²⁻	1	1 of 4 samples exceeded threshold concentration
MW12-05-04	As	1	1 of 4 samples exceeded threshold concentration
MW12-05-05	Zn	1	1 of 4 samples exceeded threshold concentration
MW12-05-06	Al	1	1 of 4 samples exceeded threshold concentration
	Cu	1	1 of 4 samples exceeded threshold concentration
MW12-06-01	As	1	2 of 4 samples exceeded threshold concentration
	Cr	3	4 of 4 samples exceeded threshold concentration
	Zn	1	1 of 4 samples exceeded threshold concentration
MW12-06-02	As	1	1 of 4 samples exceeded threshold concentration

Table 2 McGinty Creek Catchment threshold exceedances

Monitoring Well Zone	Parameter	SPT	Context
MW09-03-01	Ag	1	1 of 9 samples exceeded threshold concentration
	Al	1	1 of 9 samples exceeded threshold concentration
		2	3 of 9 samples exceeded threshold concentration
	As	1	3 of 9 samples exceeded threshold concentration
		2	6 of 9 samples exceeded threshold concentration
	Cd	1	3 of 9 samples exceeded threshold concentration
	Cr	2	1 of 9 samples exceeded threshold concentration
	Cu	1	5 of 9 samples exceeded threshold concentration
	Mo	1	3 of 9 samples exceeded threshold concentration
	Se	1	5 of 9 samples exceeded threshold concentration
	Zn	1	2 of 9 samples exceeded threshold concentration
		2	4 of 9 samples exceeded threshold concentration

Monitoring Well Zone	Parameter	SPT	Context
MW09-03-02	Ag	2	1 of 9 samples exceeded threshold concentration
	Al	1	2 of 9 samples exceeded threshold concentration
		2	2 of 9 samples exceeded threshold concentration
	Cd	1	7 of 9 samples exceeded threshold concentration
	Cr	1	1 of 9 samples exceeded threshold concentration
	Cu	1	5 of 9 samples exceeded threshold concentration
	Se	1	2 of 9 samples exceeded threshold concentration
	Zn	2	9 of 9 samples exceeded threshold concentration
	SO ₄ ²⁻	1	6 of 9 samples exceeded threshold concentration
	NO ₃ ⁻	1	3 of 9 samples exceeded threshold concentration
		2	6 of 9 samples exceeded threshold concentration

4 Discussion

Monitoring results for CoCs are routinely reviewed to provide context on potential impacts of mining activities to groundwater. Groundwater SPT exceedances (events) have occurred for a limited number of parameters and do not necessarily correlate with distance from mining activities (i.e., events have not necessarily all occurred at monitoring wells in relatively close proximity to mining activities). Some of these events may reflect elevated background concentrations that were not identified prior to start of mining because monitoring wells were not in place at that time.

Ongoing events are addressed specifically as follows:

- Sulphate SPT events in MW12-05 have been restricted to the deeper zones (MW12-05-01, MW12-05-02, and MW12-05-03) which monitor depths greater than 85 meters below ground surface (m bgs). Recently, the MW12-05-03 sulphate trend appears to have stabilised at a concentration below that of Minto Creek catchment SPT-2. The sulphate trend at MW12-05-01 and MW12-05-02 continues to increase, but at a slower rate than previously. This may suggest that Zone 1 may be approaching equilibrium with groundwater. Zones shallower than Zone 3 all record stable and far lower sulphate concentrations (<100 mg/L). Surface water stations in the Minto Creek catchment downstream of the mine footprint (e.g. MC1) display stable trends in sulphate at similar concentrations to those observed in the shallow zones at MW12-05 (SRK, 2018).
- Sulphate at MW09-03-02 exceeded thresholds in the first half of 2018 but has been decreasing consistently since. Both MW09-03-02 and MN-4.5, a surface water monitoring station downstream in McGinty Creek, demonstrate a seasonal trend, with the highest concentrations in groundwater occurring in Q2, and the highest concentrations in surface water occurring in Q4. While groundwater concentrations have been decreasing, values at MN-4.5 remain stable in the range of baseline monitoring.

- Nitrate at MW09-03-02 has been increasing since the beginning of 2017 and has consistently exceeded the McGinty Creek SPT-2. The nitrate concentration of the deeper zone, MW09-03-01, remains stable and below both SPTs. Presently, the Minto North Pit acts as a hydraulic sink, capturing (locally) groundwater topographically downgradient (including MW09-03). Therefore, migration of pit water is not the cause of the nitrate increase observed at MW09-03-02. The likely explanation for the observed water quality at MW09-03 is flushing of blasting residuals from the rock used to construct the mine haul road on the topographically downgradient side of the Minto North Pit, and immediately adjacent to the monitoring well. This effect is expected to be relatively short-lived, as blasting residuals will flush out over time. Data from the nearest McGinty Creek surface water monitoring station (MN-1.5) indicate nitrate concentrations remain within the range observed during baseline monitoring (SRK, 2018).
- As with nitrate, since the Minto North Pit is acting as a hydraulic sink, the other SPT events at MW09-03 (Ag, Al, As, Cd, Cr, Cu, Mo, Se, Zn) are not likely caused by migration of the pit water. Threshold exceedances of Ag, Cr and Mo were isolated occurrences and could be due to surface contamination during sampling, laboratory error or temporary site activities. Concentrations of the remaining elements had higher annual averages in 2018 than in the past but demonstrate a high degree of variability and could potentially be caused by flushing of blasting residuals in the rock used to construct the mine haul road. The concentration of these parameters at MN-1.5 are within pre-mining conditions, indicating no identifiable impact from SPT events.
- Chromium concentrations at MW12-06-01 have been increasing since monitoring began in 2016 and have consistently exceeded SPT 3 with seasonality that shows peak values occurring late in the year. W8A, a surface water monitoring station that collects water from sumps under the tailings facility shows similar seasonality, but with peak concentrations decreasing each year. As high chromium concentrations are only observed in the deepest zone, it is likely caused by an isolated zone of chromium rich minerals in the rock.
- Arsenic concentrations at MW12-05-04 and multiple depths at MW12-06 exceeded thresholds during the last monitoring event of 2018. These exceedances were isolated, except for MW12-06-01, and appear almost systematic, suggesting they were caused by temporary site activities, field contamination during sampling or laboratory error. Surface water concentrations remain in the range of baseline and show no response to the sudden increases.
- Events occurring in MW12-05 and MW12-06 other than sulphate (Al, As, Cu, Se, Zn) were generally isolated in 2018 and are likely reflective of field contamination during sampling, temporary site activities or laboratory error. Surface water concentrations in Minto Creek remain in the range of baseline conditions and show no response to the heightened groundwater events.

5 Conclusions

Groundwater exceedances of the OAMP SPTs in 2018 have been limited. Consistent SPT exceedance is not widespread; most wells (~66%) did not exceed more than one OAMP SPT in 2018.

Where regular exceedances have been identified (Al, As, Cd, Cu, Mo, Se and Zn at MW09-03-01; Cd, Cu, Zn, nitrate, and sulphate at MW09-03-02; sulphate at MW12-05-01 and MW12-05-02; Cr at MW12-06-01), the likely cause is either a lack of characterization or the range of pre-mining groundwater concentrations (MW12-05-01 and MW12-06-01), or local, temporary mine-related sources of CoCs (i.e., apparent influence of the haul road rock on groundwater in the MW09-03 zones). While the source of high sulphate in MW12-05-01 and MW12-05-02 is yet to be determined, it is thought to be naturally occurring in the deeper groundwaters and efforts to identify the source continue.

Overall, the groundwater CoC exceedances of the OAMP SPTs have not required mitigation as surface water bodies have not been impacted by elevated groundwater concentrations. Groundwater monitoring should continue as per the Minto Mine Groundwater Monitoring Plan, and results should continue to be evaluated against the Operational Adaptive Management Plan SPTs and compared with other studies assessing natural background conditions.

2018-02-21 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) LC50 test.

Test species	<i>Oncorhynchus mykiss</i>
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Statistical software	CETIS Version 1.8.7
Test endpoints	Survival (96-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as ZnSO ₄)

Table 2. Summary of test conditions: 48-h *Daphnia magna* LC50 test.

Test species	<i>Daphnia magna</i>
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Statistical software	CETIS Version 1.8.7
Test endpoints	Survival (48-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

APPENDIX B – Toxicity test data

Rainbow Trout Summary Sheet

Client: ALS

Start Date/Time: Feb 23/18 @ 1520h

Work Order No.: 180268

Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: L2059190-1 W3

Sample Date: Feb 20/18

Date Received: Feb 22/18

Sample Volume: 2x20L

Other: -

Test Validity Criteria:

≥ 90% control survival

WQ Ranges:

T (°C) = 15 ± 1; DO (mg/L) = 7.0 to 10.3; pH = 5.5 to 8.5

Dilution Water:

Type: Dechlorinated Municipal Tap Water

Hardness (mg/L CaCO₃): 11

Alkalinity (mg/L CaCO₃): 10

Test Organism Information:

Batch No.: 0112186

Source: Vancouver Island Trout Hatchery

No. Fish/Volume (L): 10/10L

Loading Density (g/L): 0.26 ± 0.31

Mean Length ± SD (mm): 30 ± 2

Mean Weight ± SD (g): 0.31 ± 0.06

Range: 27 - 32

Range: 0.22 - 0.40

Zinc Reference Toxicant Results:

Reference Toxicant ID: RTZn107

Stock Solution ID: 17Zn05

Date Initiated: February 16, 2018

96-h LC50 (95% CL): 135.7 (95.4 - 184.6) µg/L Zn

Reference Toxicant Mean and Historical Range: 92.8 (55.5 - 155.3) µg/L Zn

Reference Toxicant CV (%): 29

Test Results: The 96-hour LC50 is estimated to be >100% (40).

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

LC = Lethal Concentration, IC = Inhibition Concentration

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted a sub-lethal toxicity test for ALS Environmental on samples identified as L2111715-1 W2 and L2111715-3 W50. The samples were collected on June 12, 2018 and delivered to the Nautilus Environmental laboratory in Burnaby, BC on June 15, 2018. The samples were transported in six to seven 1-L containers for both samples and additional one 20-L container for L2111715-3 W50. The samples were received at a temperature of 7.6°C and were stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing.

This report describes the results of the toxicity tests using *Ceriodaphnia dubia*. Copies of raw laboratory data sheets and statistical analyses are provided in Appendix A. The chain-of-custody form is provided in Appendix B.

2.0 METHODS

Methods for the toxicity test are summarized in Table 1. Testing using *C. dubia* was conducted according to procedures described by Environment Canada (2007). Statistical analyses for all the tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test species	<i>Ceriodaphnia dubia</i>
Organism source	In-house culture
Organism age	<24 hour old neonates, produced within a 12 hour window
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20-mL glass test tube
Test volume	15 mL
Test solution depth	10 cm
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	10 per treatment
Number of organisms	1 per replicate
Control/dilution water	20% Perrier water and 80% deionized water + 5 µg/L Se and 2 µg/L vitamin B12
Test solution renewal	Daily (100% renewal)
Test temperature	25 ± 1°C
Feeding	Daily with <i>Pseudokirchneriella subcapitata</i> and YCT (3:1 ratio)
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen, pH and conductivity measured daily; hardness and alkalinity of undiluted sample measured at test initiation; survival and reproduction checked daily
Test protocol	Environment Canada (2007), EPS 1/RM/21
Statistical software	CETIS Version 1.8.7
Test endpoints	Survival and reproduction ≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods; no ephippia present
Test acceptability criteria for controls	
Reference toxicant	Sodium chloride (NaCl)

3.0 RESULTS

Results of the toxicity tests are summarized in Table 2. There were no adverse effects observed on either survival or reproduction of *C. dubia*, with the LC and IC values greater than >100% (v/v).

Table 2. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	L2111715-1 W2		L2111715-3 W50	
	Survival (%)	Reproduction (Mean $\pm$ SD)	Survival (%)	Reproduction (Mean $\pm$ SD)
Laboratory Control	90	14.2 $\pm$ 7.0 ¹	100	15.5 $\pm$ 4.9
1.56	90	15.0 $\pm$ 5.7	90	16.2 $\pm$ 6.7
3.12	100	16.6 $\pm$ 2.6	100	18.9 $\pm$ 2.7
6.25	100	18.0 $\pm$ 1.8	100	18.2 $\pm$ 2.6
12.5	100	19.4 $\pm$ 3.0	80	16.1 $\pm$ 8.6
25	100	20.3 $\pm$ 1.7	100	22.1 $\pm$ 3.3
50	90	19.1 $\pm$ 7.4	100	20.9 $\pm$ 3.5
100	100	22.8 $\pm$ 2.1	90	18.5 $\pm$ 7.3
Test Endpoint (% v/v)				
LC50	>100	--	>100	--
IC25	--	>100	--	>100
IC50	--	>100	--	>100

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration, ¹ = Reproduction met passing criteria; the mean number of young per surviving female that produced three broods was 17.

4.0 QA/QC

The health histories of the test organisms used in the exposures were acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. Uncertainty associated with the tests is best described by the standard deviation around the mean and/or the confidence intervals around the point estimates.

Results of the reference toxicant test conducted during the testing program are summarized in Table 3. Results for this test fell within the ranges for organism performance of the mean and two standard deviations, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the organisms used in this test was appropriate. The reference toxicant test was performed under the same conditions as those used for the samples.

Table 3. Reference toxicant test results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 2.0 g/L NaCl	2.0 (1.8 – 2.3) g/L NaCl	7	June 13, 2018
	Reproduction (IC50): 1.0 g/L NaCl	1.3 (0.9 – 1.9) g/L NaCl	23	

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration, IC = Inhibition Concentration

APPENDIX A – *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: ALS
Work Order No.: 130978

Start Date/Time: June 15/18 e 1030h
Set up by: W. GMM

Sample Information:

Sample ID: W2 CUMIS-1 W2
Sample Date: June 12/18
Date Received: June 15/18
Sample Volume: 6X 1L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: BS060718A LB
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 20
Mortality (%) in previous 7 d: 0
Individual female # used ≥ 8 young on test day: 26, 7, 10, 11, 13-17, 21-30, 32, 33, 35, 36, 37

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd186
Stock Solution ID: 18Na02 (100g/L NaCl)
Date Initiated: June 13/18

7-d LC50 (95% CL): 2.0(1.7-2.3) g/L NaCl
7-d IC50 (95% CL): 1.0(0.7-1.1) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0(1.8-2.3) g/L NaCl CV (%): 7
7-d IC50 Reference Toxicant Mean and Historical Range: 1.3(0.9-1.9) g/L NaCl CV (%): 23

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	<u>>100</u>	
IC25 % (v/v) (95% CL)		<u>>100</u>
IC50 % (v/v) (95% CL)		<u>>100</u>

Ceriodaphnia dubia Summary Sheet

Client: ALS
Work Order No.: 180978

Start Date/Time: June 15/18 1030h
Set up by: EMM

Sample Information:

Sample ID: W50 L211715-3 W50
Sample Date: June 12/18
Date Received: June 15/18
Sample Volume: 7X 1L + 1X20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: B3060718 A & B
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 20
Mortality (%) in previous 7 d: 0
Individual female # used ≥ 8 young on test day: 2, 6, 7, 10, 11, 13-17, 21-30, 32, 33, 35, 36, 37

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd186
Stock Solution ID: 18Na02 (100g/L NaCl)
Date Initiated: June 13/18

7-d LC50 (95% CL): 2.0(1.7 - 2.3) g/L NaCl
7-d IC50 (95% CL): 1.0(0.7 - 1.1) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0(1.8 - 2.3) g/L NaCl CV (%): 7
7-d IC50 Reference Toxicant Mean and Historical Range: 1.3(0.9 - 1.9) g/L NaCl CV (%): 23

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	<u>>100</u>	
IC25 % (v/v) (95% CL)		<u>>100</u>
IC50 % (v/v) (95% CL)		<u>>100</u>

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) LC50 test.

Test species	Oncorhynchus mykiss
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Statistical software	CETIS Version 1.8.7
Test endpoints	Survival (96-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as ZnSO ₄)

Table 2. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) LT50 test.

Test species	<i>Oncorhynchus mykiss</i>
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 18 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	100% (undiluted) sample, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked at 1h, 2h, 4h and daily thereafter
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Statistical software	CETIS Version 1.8.7
Test endpoints	Time (hours) to 50% mortality
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as ZnSO ₄)

Table 3. Summary of test conditions: 48-h *Daphnia magna* LC50 test.

Test species	<i>Daphnia magna</i>
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Statistical software	CETIS Version 1.8.7
Test endpoints	Survival (48-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

Table 4. Summary of test conditions: 48-h *Daphnia magna* LT50 test.

Test species	<i>Daphnia magna</i>
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	100% (undiluted) sample, plus laboratory control
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked at 1h, 2h, 4h and daily thereafter.
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Statistical software	CETIS Version 1.8.7
Test endpoint	Time (hours) to 50% mortality
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

Rainbow Trout Summary Sheet

Client: ALS Environmental

Start Date/Time: June 15, 2018, 1715h

Work Order No.: 180979

Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: L2111715-2
Sample Date: June 12, 2018
Date Received: June 15, 2018
Sample Volume: 3 x 20L
Other: -

Test Validity Criteria:

≥ 90% control survival

WQ Ranges:

T (°C) = 15 ± 1; DO (mg/L) = 7.0 to 10.3; pH = 5.5 to 8.5

Dilution Water:

Type: Dechlorinated Municipal Tap Water
Hardness (mg/L CaCO₃): 12
Alkalinity (mg/L CaCO₃): 10

Test Organism Information:

Batch No.: 050718a
Source: Aqua Farms
No. Fish/Volume (L): 10 / 12L
Loading Density (g/L): 0.49
Mean Length ± SD (mm): 39 ± 2
Mean Weight ± SD (g): 0.58 ± 0.08

Range: 36 - 42

Range: 0.46 - 0.70

Zinc Reference Toxicant Results:

Reference Toxicant ID: RTZn124
Stock Solution ID: 18Zn03
Date Initiated: 08 June 18
96-h LC50 (95% CL): 93.5 (66.2 - 123.7) µg/L Zn

Reference Toxicant Mean and Historical Range: 92.1 (43.6 - 194.6) µg/L Zn

Reference Toxicant CV (%): 45%

Test Results: The 96 hour LT50 is estimated to be >96 hours. 0% trout mortality in undiluted sample.

ALS ENVIRONMENTAL ANALYTICAL REPORT

Sample ID Description Sampled Date Sampled Time Client ID						
Grouping	Analyte					

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
---------------	--------	------------------	--------------------

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
----------------------------	---------------------

Chain of Custody Numbers:

2018-08-08 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) LC50 test.

Test species	<i>Oncorhynchus mykiss</i>
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival (96-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as ZnSO ₄)

Table 2. Summary of test conditions: 48-h *Daphnia magna* LC50 test.

Test species	<i>Daphnia magna</i>
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival (48-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

APPENDIX B – Toxicity test data

Rainbow Trout Summary Sheet

Client: ALS (Minto)

Start Date/Time: Aug 10/18 @ 1210h

Work Order No.: 181314

Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: L2143380-1 W3
Sample Date: Aug 7/18
Date Received: Aug 9/18
Sample Volume: 2 x 20L
Other: —

Test Validity Criteria:

≥ 90% control survival

WQ Ranges:

T (°C) = 15 ± 1; DO (mg/L) = 7.0 to 10.3; pH = 5.5 to 8.5

Dilution Water:

Type: Dechlorinated Municipal Tap Water
Hardness (mg/L CaCO₃): 6
Alkalinity (mg/L CaCO₃): 7

Test Organism Information:

Batch No.: 071218a
Source: Aqua Farms
No. Fish/Volume (L): 10/12L
Loading Density (g/L): 0.52
Mean Length ± SD (mm): 38 ± 2
Mean Weight ± SD (g): 0.62 ± 0.11

Range: 34 - 42

Range: 0.48 - 0.85

Zinc Reference Toxicant Results:

Reference Toxicant ID: RTZn13i
Stock Solution ID: 18Zn06
Date Initiated: Aug 3/18
96-h LC50 (95% CL): 46.76 (37.6 - 57.8) µg/L Zn

Reference Toxicant Mean and Historical Range: 90.76 (41.6 - 197.7) µg/L Zn

Reference Toxicant CV (%): 40%

Test Results: The 96h LC50 is estimated to be >100% (w/v).

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
---------------	--------	------------------	--------------------

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
----------------------------	---------------------

Chain of Custody Numbers:

2018-10-03 C

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) LC50 test.

Test species	<i>Oncorhynchus mykiss</i>
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival (96-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as ZnSO ₄)

Table 2. Summary of test conditions: 48-h *Daphnia magna* LC50 test.

Test species	<i>Daphnia magna</i>
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival (48-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted sub-lethal toxicity tests for ALS Environmental on sample identified as L2175227-1 W3. The sample was collected on October 2, 2018 and delivered to the Nautilus Environmental laboratory in Burnaby, BC on October 4, 2018. The sample was transported in seven 20-L and three 1-L plastic containers and received at a temperature of 5.0°C. The sample was stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing.

The following toxicity tests were performed on sample L2175227-1 W3:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d rainbow trout (*Oncorhynchus mykiss*) embryo viability
- 7-d *Lemna minor* growth inhibition
- 72-h *Pseudokirchneriella subcapitata* growth inhibition

Testing for L2175227-1 W3 was initiated on October 4, 2018 for *C. dubia*, *O. mykiss* and *L. minor* and on October 5, 2018 for *P. subcapitata*. This report describes the results of these toxicity tests. Copies of raw laboratory data sheets and statistical analyses for each test species are provided in Appendices A to D. The chain-of-custody form is provided in Appendix E.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 to 4. Testing using *C. dubia*, *L. minor* and *P. subcapitata* were conducted according to procedures described by Environment Canada (2007a, 2007b and 2007c). The rainbow trout embryo viability test followed procedures described by Environment Canada (1998) and modified by Canaria *et al.* (1999). Statistical analyses for all the tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test species	<i>Ceriodaphnia dubia</i>
Organism source	In-house culture
Organism age	<24 hour old neonates, produced within a 12 hour window
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20-mL glass test tube
Test volume	15 mL
Test solution depth	10 cm
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	10 per treatment
Number of organisms	1 per replicate
Control/dilution water	20% Perrier water and 80% deionized water + 5 µg/L Se and 2 µg/L vitamin B12
Test solution renewal	Daily (100% renewal)
Test temperature	25 ± 1°C
Feeding	Daily with <i>Pseudokirchneriella subcapitata</i> and YCT (3:1 ratio)
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen, pH and conductivity measured daily; hardness and alkalinity of undiluted sample measured at test initiation; survival and reproduction checked daily
Test protocol	Environment Canada (2007a), EPS 1/RM/21
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival and reproduction ≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods; no ephippia present
Test acceptability criteria for controls	
Reference toxicant	Sodium chloride (NaCl)

Table 2. Summary of test conditions: 7-d rainbow trout (*Oncorhynchus mykiss*) embryo viability test.

Test species	<i>Oncorhynchus mykiss</i>
Organism source	Hatchery
Organism age	<30 minutes post fertilization, <24 hour old gametes
Test type	Static-renewal
Test duration	7 days
Test vessel	2-L plastic container
Test volume	2 L
Test solution depth	17 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	4 per treatment
Number of organisms	30 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	Daily (80% renewal)
Test temperature	14 ± 1°C
Feeding	None
Light intensity	Dark
Photoperiod	24 hours dark
Aeration	Continuous gentle aeration
Test measurements	Temperature, dissolved oxygen, pH and conductivity measured daily; hardness and alkalinity of undiluted sample measured at test initiation; survival checked daily
Test protocol	Environment Canada (1998), EPS 1/RM/28; Canaria et al. (1999)
Statistical software	CETIS Version 1.9.4
Test endpoint	Embryo viability
Test acceptability criterion for controls	Embryo viability ≥70%
Reference toxicant	Sodium dodecyl sulphate (SDS)

Table 3. Summary of test conditions: 7-d *Lemna minor* growth inhibition test.

Test species	<i>Lemna minor</i> , strain CPCC# 490
Organism source	In-house axenic culture, obtained from Canadian Phycological Culture Centre, and originally isolated from Wainfleet, Stinking Barn, Niagara Peninsula, Ontario, Canada
Organism age	7- to 10-day old culture
Test type	Static
Test duration	7 days
Test vessel	250-mL glass container
Test volume	100 mL
Test solution depth	4 cm
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	4 per treatment
Number of organisms	Two 3-frond plants per replicate
Control/dilution water	Modified APHA media (deionized water plus 1% of each APHA stock solution A, B and C)
Test solution renewal	None
Test temperature	25 ± 2°C
Feeding	None
Light intensity	4000 to 5600 lux
Photoperiod	24 hours light
Aeration	None
Test measurements	Test area temperature measured daily; temperature, pH and conductivity measured in all concentrations at test initiation; dissolved oxygen of highest concentration measured at test initiation; temperature and pH measured at test termination
Test protocol	Environment Canada (2007b), EPS 1/RM/37
Statistical software	CETIS Version 1.9.4
Test endpoints	Number of fronds and dry weight
Test acceptability criterion for controls	≥ 8-fold increase in number of fronds
Reference toxicant	Potassium chloride (KCl)

Table 4. Summary of test conditions: 72-h *Pseudokirchneriella subcapitata* growth inhibition test.

Test species	<i>Pseudokirchneriella subcapitata</i> , strain CPCC #37
Organism source	In-house axenic culture, obtained from Canadian Phycological Culture Center, and originally isolated from Nivelta River, Norway.
Organism age	3-to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test vessel	Microplate
Test volume	220 µL
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	4 per treatment; 8 for laboratory control
Number of organisms	10,000 cells/mL
Control/dilution water	Deionized water supplemented with nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Feeding	None
Light intensity	3600 to 4400 lux
Photoperiod	24 hours light
Aeration	None
Test measurements	Test area temperature measured daily; temperature and pH measured at test initiation; pH of two control wells measured at test termination
Test protocol	Environment Canada (2007c), EPS 1/RM/25
Statistical software	CETIS Version 1.9.4
Test endpoint	Algal cell growth inhibition
Test acceptability criteria for controls	> 16-fold increase in number of algal cells; CV ≤ 20%; no trend when analyzed using Mann-Kendall test
Reference toxicant	Zinc (added as ZnSO ₄)

3.0 RESULTS

Results of the toxicity tests are summarized in Tables 5 to 8. For sample L2175227-1 W3, there were no adverse effects observed on survival and reproduction of *C. dubia* (Table 5), embryo viability of *O. mykiss* (Table 6), cell yield of *P. subcapitata* (Table 8) or on frond growth and dry weight of *L. minor* (Table 7). The LC and IC values were therefore greater than the highest test concentration for each of these endpoints in the toxicity tests. Stimulatory effects were observed for *P. subcapitata* cell yield, with percent stimulation ranging from 5.6 to 464.5%.

Table 5. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	Survival (%)	Reproduction (Mean ± SD)
Laboratory Control	100	16.8 ± 2.9
1.56	90	15.7 ± 7.2
3.12	100	19.8 ± 3.0
6.25	100	20.6 ± 2.2
12.5	100	21.2 ± 3.7
25	100	17.6 ± 5.4
50	100	18.1 ± 4.0

Test Endpoint (% v/v)		
IC25	>97	>97
IC50	>97	>97

SD = Standard Deviation, IC = Inhibition Concentration

Table 8. Results: 72-h *Pseudokirchneriella subcapitata* growth inhibition test.

Concentration (% v/v)	Cell Yield (x 10⁴ cells/mL) (Mean ± SD)	Stimulation (%)
Laboratory Control	31.0 ± 2.6	--
1.5	32.8 ± 2.4	5.6
3.0	47.5 ± 4.9 *	53.2
6.0	85.8 ± 5.7 *	176.6
11.9	133.5 ± 5.2 *	330.6
23.8	164.5 ± 6.5 *	430.6
47.6	175.0 ± 3.2 *	464.5
95.2	150.0 ± 7.4 *	383.9
Test Endpoint (% v/v)		
IC25	>95.2	--
IC50	>95.2	--

SD = Standard Deviation, IC = Inhibition Concentration

* = Indicates cell yield that were significantly greater than the control

4.0 QA/QC

The health histories of the test organisms used in the exposures were acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. Uncertainty associated with the tests is best described by the standard deviation around the means and/or the confidence intervals around the point estimates.

There were no deviations from the test methodologies, except for the 7-d rainbow trout embryo viability test. The eggs were exposed using a blocked design (eggs from each of the four female fish were distributed separately in each replicate A to D) rather than pooled, as specified in the test protocol. The modification was used because the egg quality from each female varied considerably, and blocking would minimize the effects of poor quality eggs from one particular female fish. The deviations did not seem to affect the results of the test since control criterion was met at the end of the exposure.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 9. Results for these tests fell within the range for organism performance of the mean and two standard deviations, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in the tests was appropriate. The reference toxicant tests were performed under the same conditions as those used for the samples.

Table 9. Reference toxicant test results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 1.8 g/L NaCl	2.0 (1.8 – 2.2) g/L NaCl	5	October 17, 2018
	Reproduction (IC50): 1.2 g/L NaCl	1.3 (0.8 – 1.9) g/L NaCl	21	
<i>O. mykiss</i>	Viability (EC50): 4.4 mg/L SDS	4.2 (2.0 – 8.8) mg/L SDS	38	October 4, 2018
<i>L. minor</i>	No. Fronds (IC50): 3.5 g/L KCl	3.5 (2.9 – 4.2) g/L KCl	10	September 21, 2018
<i>P. subcapitata</i>	Growth (IC50): 29.1 µg/L Zn	31.2 (25.9 – 37.7) µg/L Zn	9	September 21, 2018

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration, IC = Inhibition Concentration, EC = Effective Concentration

APPENDIX A – *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: ALS (Minto)
Work Order No.: 181673

Start Date/Time: 04/18/18 1400h
Set up by: U/JS

Sample Information:

Sample ID: 217522-1 W-3
Sample Date: 04/2/18
Date Received: 04/4/18
Sample Volume: 7x20L & 3x1L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: BB092518A & B
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 18
Mortality (%) in previous 7 d: 2.5
Individual female # used ≥ 8 young on test day: 2, 3, 5, 7-10, 14, 18, 19, 22, 23, 26, 30, 32-40

NaCl Reference Toxicant Results:

Reference Toxicant ID: 18NaCl Cd198
Stock Solution ID: 18NaCl (100g/L NaCl)
Date Initiated: 04/17/18

7-d LC50 (95% CL): 1.8(1.6-2.2) g/L NaCl
7-d IC50 (95% CL): 1.2(1.1-1.3) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0(1.8-2.2) g/L NaCl CV (%): 5
7-d IC50 Reference Toxicant Mean and Historical Range: 1.3(0.8-1.9) g/L NaCl CV (%): 21

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	<u>>100</u>	
IC25 % (v/v) (95% CL)		<u>>100</u>
IC50 % (v/v) (95% CL)		<u>>100</u>

APPENDIX B – *Oncorhynchus mykiss* Toxicity Test Data

Rainbow Trout Early Life Stage Summary Sheet

Client: ALS

Start Date/Time: October 4, 2018 @ 1450h

Work Order No.: 181672

Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: L2175227-1 W3

Sample Date: October 2, 2018

Date Received: October 4, 2018

Sample Volume: 7 x 20 L

Dilution Water:

Type: Dechlorinated Tap Water

Hardness (mg/L CaCO₃): 12

Alkalinity (mg/L CaCO₃): 14

Test Organism Information:

Batch No.: 100418

Source: Lynden Fish Hatcheries, New Dundee, ON

Loading Density: 1.06 g/L

Number of male broodstock used: 4

Number of female broodstock used: 4

Sperm motility check: Verification of sperm motility using a compound microscope

SDS Reference Toxicant Results:

Reference Toxicant ID: RTE108

Stock Solution ID: 18502

Date Initiated: October 4, 2018

7-d EC50 (95% CL): 4.4 (4.2-4.6) mg/L SDS

Reference Toxicant Mean and Range: 4.2 (2.0-8.8) mg/L SDS

Reference Toxicant CV (%): 38

APPENDIX C – *Lemna minor* Toxicity Test Data

Lemna minor Summary Sheet

Client: ALS (minto)
Work Order No.: 181

Start Date: Oct 4/18
Set up by: MLJ

Sample Information:

Sample ID: L2175227-1 W3
Sample Date: Oct 2/18
Date Received: Oct 4/18
Sample Volume: 7X20L, 3X1L

Test Organism Information:

Culture Date: 092718
Age of culture (Day 0): 7 days
>8X growth in APHA?: Y (35 Fronds)

KCI Reference Toxicant Results:

Reference Toxicant ID: Lm164
Date Initiated: Sept 21/18

7-d No. of Fronds IC50 (95% CL): ^{MLJ}
3.6 (3.0 - 4.2) g/L KCl
3.5 (2.9 - 4.3)

7-d No. Fronds IC50 Reference Toxicant Mean (2 SD Range): 3.5 (2.9 - 4.2) CV (%): 10
g/L KCl

Test Results:	Number of Fronds		Dry Weight	
	IC25 %(v/v) (95% CL)	797	797	797
	IC50 %(v/v) (95% CL)	797	797	797

APPENDIX D – *Pseudokirchneriella subcapitata* Toxicity Test Data

***Pseudokirchneriella subcapitata* Summary Sheet**

Client: ALS (mint)
Work Order No.: 181675

Start Date: Oct 5/18
Set up by: ML

Sample Information:

Sample ID: L2175227-1 W3
Sample Date: Oct 2/18
Date Received: Oct 4/18
Sample Volume: 7x20L, 3x1L

Test Organism Information:

Culture Date: Sept 28/18
Age of culture (Day 0): 7d

Zinc Reference Toxicant Results:

Reference Toxicant ID: SC174
Stock Solution ID: 18Zn05
Date Initiated: Sept 21/18

72-h IC50 (95% CL): 29.1(21.9-33.8) µg/L Zn

72-h IC50 Reference Toxicant Mean and Range: 31.2(25.9-37.7) µg/L Zn CV (%): 9

Test Results:

	Algal Growth
IC25 %(v/v) (95% CL)	<u>795.0</u>
IC50 %(v/v) (95% CL)	<u>795.0</u>

RISS - SITDR

Page 2 of 2

If effluent was non-compliant with the authorized limits set out in Schedule 4, indicate the cause(s) of non-compliance and remedial measures planned or implemented in response to the failure of acute lethality tests.

Q4 Ra226 sample was lost enroute to the lab. EC Inspector was notified upon discovery of the error and the mine will increase Ra226 sampling for 10 consecutive weeks as per the MDMER para 13(4)(a). on the next scheduled sampling day - March 19, 2019.

Notes:

During the 2018 winter flow estimates at the FDP - W3 were required due to ice and flows backing up. This phenomena and required estimation was discussed with the EC Inspector. The following is the summary of the flow estimates.

2018 Notes for the Annual MMER Report regarding flow estimates

As discussed with the EC Inspector - Total effluent volume was an estimate based on the first two weeks of January, on January 16th the flume froze and backed up.

As discussed with the EC Inspector - The W3 station was iced over and flume readings were inaccurate, an average of February 2018 (220.4 m3/day), March 2017 (186.3 m3/day) and April 2017 (216 m3/day) were used to estimate total effluent volume in March 2018 (208 m3/day) multiplied by the number of days in March (31).

As discussed with the EC Inspector - The W3 station was iced over and flume readings were inaccurate, an average of February 2018 (220.4 m3/day), March 2017 (186.3 m3/day) and April 2017 (216 m3/day) were used to estimate total effluent volume in March 2018 (208 m3/day) multiplied by the number of days in March (31).

Since the flume was backed up the monthly flow is an estimate based on the averages of March 2018 (208 m3/day), April 2017 (216 m3/day) and May 2017 (1460 m3/day).

Since the flume was backed up the monthly flow is an estimate based on the averages of April 2018 (212 m3/day), May 2017 (1460 m3/day) and June 2017 (1544 m3/day).

Effluent Characterization
Certificates of Analysis (COA's)

Minto Explorations Ltd.
ATTN: Minto Environment - Coordinator
Suite 2100- 510 West Georgia St
Vancouver BC V6B 0M3

Date Received: 16-MAY-18
Report Date: 31-MAY-18 16:56 (MT)
Version: FINAL

Client Phone: 604-759-4659

Certificate of Analysis

Lab Work Order #: L2095920

Project P.O. #: 229096

Job Reference:

C of C Numbers: 2018-05-16 A 1 of 2, 2018-05-16 A 2 of 2

Legal Site Desc:

Shane Stack
Account Manager

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Aluminum (Al)-Total	MB-LOR	L2095920-13, -4
Laboratory Control Sample	Aluminum (Al)-Total	MES	L2095920-13, -4
Laboratory Control Sample	Boron (B)-Total	MES	L2095920-1, -10, -11, -12, -13, -14, -15, -3, -5, -6, -7, -8, -9
Laboratory Control Sample	Iron (Fe)-Total	MES	L2095920-1, -10, -11, -12, -13, -14, -15, -3, -5, -6, -7, -8, -9
Matrix Spike	Dissolved Organic Carbon	MS-B	L2095920-10, -11, -12, -13, -14, -5, -7, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2095920-1, -10, -11, -12, -13, -14, -15, -2, -3, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2095920-4
Matrix Spike	Boron (B)-Dissolved	MS-B	L2095920-1, -10, -11, -12, -13, -14, -15, -2, -3, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2095920-1, -10, -11, -12, -13, -14, -15, -2, -3, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2095920-4
Matrix Spike	Copper (Cu)-Dissolved	MS-B	L2095920-1, -10, -11, -12, -13, -14, -15, -2, -3, -5, -6, -7, -8, -9
Matrix Spike	Copper (Cu)-Dissolved	MS-B	L2095920-4
Matrix Spike	Lithium (Li)-Dissolved	MS-B	L2095920-1, -10, -11, -12, -13, -14, -15, -2, -3, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2095920-1, -10, -11, -12, -13, -14, -15, -2, -3, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2095920-4
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2095920-1, -10, -11, -12, -13, -14, -15, -2, -3, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2095920-4
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2095920-1, -10, -11, -12, -13, -14, -15, -2, -3, -5, -6, -7, -8, -9
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2095920-4
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2095920-1, -10, -11, -12, -13, -14, -15, -2, -3, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2095920-4
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2095920-1, -10, -11, -12, -13, -14, -15, -2, -3, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2095920-4
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2095920-1, -10, -11, -12, -13, -14, -15, -2, -3, -5, -6, -7, -8, -9
Matrix Spike	Boron (B)-Total	MS-B	L2095920-13
Matrix Spike	Calcium (Ca)-Total	MS-B	L2095920-13
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2095920-13
Matrix Spike	Manganese (Mn)-Total	MS-B	L2095920-13
Matrix Spike	Sodium (Na)-Total	MS-B	L2095920-13
Matrix Spike	Strontium (Sr)-Total	MS-B	L2095920-13
Matrix Spike	Sulfur (S)-Total	MS-B	L2095920-13
Matrix Spike	Uranium (U)-Total	MS-B	L2095920-13

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution
DLAI	Detection limit raised due to low level analytical interference or background.
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
DTMF	Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MES	Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter

Reference Information

MS-B Scan (considered acceptable as per OMOE & CCME).
 Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
 RRV Reported Result Verified By Repeat Analysis

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
BR-L-IC-N-VA	Water	Bromide in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
F-IC-N-VA	Water	Fluoride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			

Reference Information

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)
 Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
 This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value
 This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode
 It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)
 This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".
 The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC
 This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-05-16 A 1 of 2 2018-05-16 A 2 of 2

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Conductivity	B	L2123725-1
Laboratory Control Sample	Strontium (Sr)-Dissolved	MES	L2123725-1, -10, -11, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Dissolved Organic Carbon	MS-B	L2123725-1, -10, -2, -3, -7
Matrix Spike	Dissolved Organic Carbon	MS-B	L2123725-12
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2123725-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2123725-16, -17, -18, -19, -20, -21, -22
Matrix Spike	Boron (B)-Dissolved	MS-B	L2123725-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2123725-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2123725-16, -17, -18, -19, -20, -21, -22
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2123725-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2123725-16, -17, -18, -19, -20, -21, -22
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2123725-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Molybdenum (Mo)-Dissolved	MS-B	L2123725-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2123725-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2123725-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2123725-16, -17, -18, -19, -20, -21, -22
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2123725-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2123725-16, -17, -18, -19, -20, -21, -22
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2123725-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2123725-16, -17, -18, -19, -20, -21, -22
Matrix Spike	Uranium (U)-Dissolved	MS-B	L2123725-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Aluminum (Al)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Aluminum (Al)-Total	MS-B	L2123725-19, -20, -21, -22
Matrix Spike	Barium (Ba)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Total	MS-B	L2123725-19, -20, -21, -22
Matrix Spike	Barium (Ba)-Total	MS-B	L2123725-12, -2
Matrix Spike	Boron (B)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Total	MS-B	L2123725-19, -20, -21, -22
Matrix Spike	Calcium (Ca)-Total	MS-B	L2123725-12, -2
Matrix Spike	Copper (Cu)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Iron (Fe)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Lead (Pb)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Lithium (Li)-Total	MS-B	L2123725-12, -2
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2123725-19, -20, -21, -22
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2123725-12, -2
Matrix Spike	Manganese (Mn)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Total	MS-B	L2123725-19, -20, -21, -22

Reference Information

	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Manganese (Mn)-Total	MS-B	L2123725-12, -2
Matrix Spike	Molybdenum (Mo)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Nickel (Ni)-Total	MS-B	L2123725-12, -2
Matrix Spike	Potassium (K)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Potassium (K)-Total	MS-B	L2123725-12, -2
Matrix Spike	Silicon (Si)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Silver (Ag)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Total	MS-B	L2123725-19, -20, -21, -22
Matrix Spike	Sodium (Na)-Total	MS-B	L2123725-12, -2
Matrix Spike	Strontium (Sr)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Total	MS-B	L2123725-19, -20, -21, -22
Matrix Spike	Strontium (Sr)-Total	MS-B	L2123725-12, -2
Matrix Spike	Sulfur (S)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfur (S)-Total	MS-B	L2123725-12, -2
Matrix Spike	Titanium (Ti)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Uranium (U)-Total	MS-B	L2123725-1, -10, -11, -13, -14, -16, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Uranium (U)-Total	MS-B	L2123725-12, -2

Qualifiers for Individual Parameters Listed:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
DLA	Detection Limit adjusted for required dilution
DLAI	Detection limit raised due to low level analytical interference or background.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
DTMF	Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.
MES	Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RRV	Reported Result Verified By Repeat Analysis

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			

Reference Information

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-L-IC-N-WR	Water	Chloride in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-L-IC-N-WR	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-WR	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode			
It is recommended that this analysis be conducted in the field.			
SO4-IC-WR	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-CALC-VA	Water	TDS (Calculated)	APHA 1030E (20TH EDITION)

Reference Information

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-07-04 B 1 of 3 2018-07-04 B 2 of 3 2018-07-04 B 3 of 3

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Arsenic (As)-Total	MB-LOR	L2158985-1, -2, -3, -4
Laboratory Control Sample	Sulfur (S)-Dissolved	MES	L2158985-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Dissolved Organic Carbon	MS-B	L2158985-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2158985-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2158985-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2158985-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2158985-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2158985-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2158985-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2158985-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Total	MS-B	L2158985-1, -2, -3, -4
Matrix Spike	Barium (Ba)-Total	MS-B	L2158985-5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Total	MS-B	L2158985-1, -2, -3, -4
Matrix Spike	Calcium (Ca)-Total	MS-B	L2158985-5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2158985-1, -2, -3, -4
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2158985-5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Total	MS-B	L2158985-1, -2, -3, -4
Matrix Spike	Sodium (Na)-Total	MS-B	L2158985-1, -2, -3, -4
Matrix Spike	Sodium (Na)-Total	MS-B	L2158985-5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Total	MS-B	L2158985-1, -2, -3, -4
Matrix Spike	Strontium (Sr)-Total	MS-B	L2158985-5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DTMF	Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MES	Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

Reference Information

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 µm), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

Reference Information

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-09-05 D

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Laboratory Control Sample	Sulfur (S)-Total	MES	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Dissolved Organic Carbon	MS-B	L2171436-10, -2, -5, -6, -7, -8
Matrix Spike	Dissolved Organic Carbon	MS-B	L2171436-10, -2, -5, -6, -7, -8
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2171436-9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2171436-9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2171436-9
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2171436-9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2171436-9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2171436-9
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2171436-9
Matrix Spike	Uranium (U)-Dissolved	MS-B	L2171436-1, -10, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
MES	Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-WR	Water	Nitrite & Nitrate Nitrogen	EPA 300.1
Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			

Reference Information

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:			
Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]			
MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-L-IC-N-WR	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-WR	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode			
It is recommended that this analysis be conducted in the field.			
SO4-IC-WR	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-CALC-VA	Water	TDS (Calculated)	APHA 1030E (20TH EDITION)
This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.			
TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Dissolved Organic Carbon	MS-B	L2175170-1, -3, -4, -5, -6
Matrix Spike	Barium (Ba)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Calcium (Ca)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Copper (Cu)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Manganese (Mn)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Sodium (Na)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Strontium (Sr)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6
Matrix Spike	Sulfur (S)-Total	MS-B	L2175170-1, -2, -3, -4, -5, -6

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTMF	Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions)			

Reference Information

should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$\text{Ion Balance (\%)} = [\text{Cation Sum} - \text{Anion Sum}] / [\text{Cation Sum} + \text{Anion Sum}]$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

2018-10-03 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lw - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Matrix Spike	Magnesium (Mg)-Total	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Total	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Total	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Total	MS-B	L2179645-1, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ANIONS-N+N-CALC-VA	Water	Nitrite & Nitrate in Water (Calculation)	EPA 300.0
Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).			
BE-D-L-CCMS-VA	Water	Diss. Be (low) in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
BE-T-L-CCMS-VA	Water	Total Be (Low) in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)

Reference Information

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 µm), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Reference Information

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) LC50 test.

Test species	<i>Oncorhynchus mykiss</i>
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival (96-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as ZnSO ₄)

Table 2. Summary of test conditions: 48-h *Daphnia magna* LC50 test.

Test species	<i>Daphnia magna</i>
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival (48-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

APPENDIX B – Toxicity test data

Rainbow Trout Summary Sheet

Client: ALS Environmental

Start Date/Time: 05 October 2018; 1545h

Work Order No.: 181670

Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: L2175227-1 W3
Sample Date: 02 October 2018
Date Received: 04 October 2018
Sample Volume: 7x20L, 3x1L
Other: -

Test Validity Criteria:

≥ 90% control survival

WQ Ranges:

T (°C) = 15 ± 1; DO (mg/L) = 7.0 to 10.3; pH = 5.5 to 8.5

Dilution Water:

Type: Dechlorinated Municipal Tap Water
Hardness (mg/L CaCO₃): 15
Alkalinity (mg/L CaCO₃): 12

Test Organism Information:

Batch No.: 083018b
Source: Lyndon Fish Hatcheries
No. Fish/Volume (L): 10/12L
Loading Density (g/L): 0.42
Mean Length ± SD (mm): 38 ± 3
Mean Weight ± SD (g): 0.50 ± 0.09

Range: 34 - 43
Range: 0.34 - 0.68

Zinc Reference Toxicant Results:

Reference Toxicant ID: RTZn138
Stock Solution ID: 182n06
Date Initiated: 05 October 2018
96-h LC50 (95% CL): 178.2 (132.2 - 358.8) µg/L Zn

Reference Toxicant Mean and Historical Range: 85.0 (33.6 - 215.0) µg/L Zn
Reference Toxicant CV (%): 49

Test Results: The 96 hour LC50 is estimated to be >100% (1/v).

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted sub-lethal toxicity tests for ALS Environmental on sample identified as L2175227-1 W3. The sample was collected on October 2, 2018 and delivered to the Nautilus Environmental laboratory in Burnaby, BC on October 4, 2018. The sample was transported in seven 20-L and three 1-L plastic containers and received at a temperature of 5.0°C. The sample was stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing.

The following toxicity tests were performed on sample L2175227-1 W3:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d rainbow trout (*Oncorhynchus mykiss*) embryo viability
- 7-d *Lemna minor* growth inhibition
- 72-h *Pseudokirchneriella subcapitata* growth inhibition

Testing for L2175227-1 W3 was initiated on October 4, 2018 for *C. dubia*, *O. mykiss* and *L. minor* and on October 5, 2018 for *P. subcapitata*. This report describes the results of these toxicity tests. Copies of raw laboratory data sheets and statistical analyses for each test species are provided in Appendices A to D. The chain-of-custody form is provided in Appendix E.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 to 4. Testing using *C. dubia*, *L. minor* and *P. subcapitata* were conducted according to procedures described by Environment Canada (2007a, 2007b and 2007c). The rainbow trout embryo viability test followed procedures described by Environment Canada (1998) and modified by Canaria *et al.* (1999). Statistical analyses for all the tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test species	<i>Ceriodaphnia dubia</i>
Organism source	In-house culture
Organism age	<24 hour old neonates, produced within a 12 hour window
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20-mL glass test tube
Test volume	15 mL
Test solution depth	10 cm
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	10 per treatment
Number of organisms	1 per replicate
Control/dilution water	20% Perrier water and 80% deionized water + 5 µg/L Se and 2 µg/L vitamin B12
Test solution renewal	Daily (100% renewal)
Test temperature	25 ± 1°C
Feeding	Daily with <i>Pseudokirchneriella subcapitata</i> and YCT (3:1 ratio)
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen, pH and conductivity measured daily; hardness and alkalinity of undiluted sample measured at test initiation; survival and reproduction checked daily
Test protocol	Environment Canada (2007a), EPS 1/RM/21
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival and reproduction ≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods; no ephippia present
Test acceptability criteria for controls	
Reference toxicant	Sodium chloride (NaCl)

Table 2. Summary of test conditions: 7-d rainbow trout (*Oncorhynchus mykiss*) embryo viability test.

Test species	<i>Oncorhynchus mykiss</i>
Organism source	Hatchery
Organism age	<30 minutes post fertilization, <24 hour old gametes
Test type	Static-renewal
Test duration	7 days
Test vessel	2-L plastic container
Test volume	2 L
Test solution depth	17 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	4 per treatment
Number of organisms	30 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	Daily (80% renewal)
Test temperature	14 ± 1°C
Feeding	None
Light intensity	Dark
Photoperiod	24 hours dark
Aeration	Continuous gentle aeration
Test measurements	Temperature, dissolved oxygen, pH and conductivity measured daily; hardness and alkalinity of undiluted sample measured at test initiation; survival checked daily
Test protocol	Environment Canada (1998), EPS 1/RM/28; Canaria et al. (1999)
Statistical software	CETIS Version 1.9.4
Test endpoint	Embryo viability
Test acceptability criterion for controls	Embryo viability ≥70%
Reference toxicant	Sodium dodecyl sulphate (SDS)

Table 3. Summary of test conditions: 7-d *Lemna minor* growth inhibition test.

Test species	<i>Lemna minor</i> , strain CPCC# 490
Organism source	In-house axenic culture, obtained from Canadian Phycological Culture Centre, and originally isolated from Wainfleet, Stinking Barn, Niagara Peninsula, Ontario, Canada
Organism age	7- to 10-day old culture
Test type	Static
Test duration	7 days
Test vessel	250-mL glass container
Test volume	100 mL
Test solution depth	4 cm
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	4 per treatment
Number of organisms	Two 3-frond plants per replicate
Control/dilution water	Modified APHA media (deionized water plus 1% of each APHA stock solution A, B and C)
Test solution renewal	None
Test temperature	25 ± 2°C
Feeding	None
Light intensity	4000 to 5600 lux
Photoperiod	24 hours light
Aeration	None
Test measurements	Test area temperature measured daily; temperature, pH and conductivity measured in all concentrations at test initiation; dissolved oxygen of highest concentration measured at test initiation; temperature and pH measured at test termination
Test protocol	Environment Canada (2007b), EPS 1/RM/37
Statistical software	CETIS Version 1.9.4
Test endpoints	Number of fronds and dry weight
Test acceptability criterion for controls	≥ 8-fold increase in number of fronds
Reference toxicant	Potassium chloride (KCl)

Table 4. Summary of test conditions: 72-h *Pseudokirchneriella subcapitata* growth inhibition test.

Test species	<i>Pseudokirchneriella subcapitata</i> , strain CPCC #37
Organism source	In-house axenic culture, obtained from Canadian Phycological Culture Center, and originally isolated from Nivelta River, Norway.
Organism age	3-to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test vessel	Microplate
Test volume	220 µL
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	4 per treatment; 8 for laboratory control
Number of organisms	10,000 cells/mL
Control/dilution water	Deionized water supplemented with nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Feeding	None
Light intensity	3600 to 4400 lux
Photoperiod	24 hours light
Aeration	None
Test measurements	Test area temperature measured daily; temperature and pH measured at test initiation; pH of two control wells measured at test termination
Test protocol	Environment Canada (2007c), EPS 1/RM/25
Statistical software	CETIS Version 1.9.4
Test endpoint	Algal cell growth inhibition
Test acceptability criteria for controls	> 16-fold increase in number of algal cells; CV ≤ 20%; no trend when analyzed using Mann-Kendall test
Reference toxicant	Zinc (added as ZnSO ₄)

3.0 RESULTS

Results of the toxicity tests are summarized in Tables 5 to 8. For sample L2175227-1 W3, there were no adverse effects observed on survival and reproduction of *C. dubia* (Table 5), embryo viability of *O. mykiss* (Table 6), cell yield of *P. subcapitata* (Table 8) or on frond growth and dry weight of *L. minor* (Table 7). The LC and IC values were therefore greater than the highest test concentration for each of these endpoints in the toxicity tests. Stimulatory effects were observed for *P. subcapitata* cell yield, with percent stimulation ranging from 5.6 to 464.5%.

Table 5. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	Survival (%)	Reproduction (Mean ± SD)
Laboratory Control	100	16.8 ± 2.9

Test Endpoint (% v/v)		
IC25	>95.2	--
IC50	>95.2	--

SD = Standard Deviation, IC = Inhibition Concentration

* = Indicates cell yield that were significantly greater than the control

4.0 QA/QC

The health histories of the test organisms used in the exposures were acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. Uncertainty associated with the tests is best described by the standard deviation around the means and/or the confidence intervals around the point estimates.

There were no deviations from the test methodologies, except for the 7-d rainbow trout embryo viability test. The eggs were exposed using a blocked design (eggs from each of the four female fish were distributed separately in each replicate A to D) rather than pooled, as specified in the test protocol. The modification was used because the egg quality from each female varied considerably, and blocking would minimize the effects of poor quality eggs from one particular female fish. The deviations did not seem to affect the results of the test since control criterion was met at the end of the exposure.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 9. Results for these tests fell within the range for organism performance of the mean and two standard deviations, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in the tests was appropriate. The reference toxicant tests were performed under the same conditions as those used for the samples.

Table 9. Reference toxicant test results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 1.8 g/L NaCl	2.0 (1.8 – 2.2) g/L NaCl	5	October 17, 2018
	Reproduction (IC50): 1.2 g/L NaCl	1.3 (0.8 – 1.9) g/L NaCl	21	
<i>O. mykiss</i>	Viability (EC50): 4.4 mg/L SDS	4.2 (2.0 – 8.8) mg/L SDS	38	October 4, 2018

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: BB092518A & B
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 18
Mortality (%) in previous 7 d: 2.5
Individual female # used ≥ 8 young on test day: 2, 3, 5, 7-10, 14, 18, 19, 22, 23, 26, 30, 32-40

NaCl Reference Toxicant Results:

Reference Toxicant ID: 18NaCl Cd198
Stock Solution ID: 18NaCl (100g/L NaCl)
Date Initiated: 04/17/18

7-d LC50 (95% CL): 1.8(1.6-2.2) g/L NaCl
7-d IC50 (95% CL): 1.2(1.1-1.3) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0(1.8-2.2) g/L NaCl CV (%): 5
7-d IC50 Reference Toxicant Mean and Historical Range: 1.3(0.8-1.9) g/L NaCl CV (%): 21

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	<u>>100</u>	
IC25 % (v/v) (95% CL)		<u>>100</u>
IC50 % (v/v) (95% CL)		<u>>100</u>

APPENDIX B – *Oncorhynchus mykiss* Toxicity Test Data

Rainbow Trout Early Life Stage Summary Sheet

Client: ALS

Start Date/Time: October 4, 2018 @ 1450h

Work Order No.: 181672

Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: L2175227-1 W3

Sample Date: October 2, 2018

Date Received: October 4, 2018

Sample Volume: 7 x 20L

Dilution Water:

Type: Dechlorinated Tap Water

Hardness (mg/L CaCO₃): 12

Alkalinity (mg/L CaCO₃): 14

Test Organism Information:

Batch No.: 100418

Source: Lynden Fish Hatcheries, New Dundee, ON

Loading Density: 1.06 g/L

Number of male broodstock used: 4

Number of female broodstock used: 4

Sperm motility check: Verification of sperm motility using a compound microscope

SDS Reference Toxicant Results:

Reference Toxicant ID: RTE108

Stock Solution ID: 18502

Date Initiated: October 4, 2018

7-d EC50 (95% CL): 4.4 (4.2-4.6) mg/L SDS

Reference Toxicant Mean and Range: 4.2 (2.0-8.8) mg/L SDS

Reference Toxicant CV (%): 38

Test Results:

APPENDIX D – *Pseudokirchneriella subcapitata* Toxicity Test Data

***Pseudokirchneriella subcapitata* Summary Sheet**

Client: ALS (mint)
Work Order No.: 181675

Start Date: Oct 5/18
Set up by: ML

Sample Information:

Sample ID: L2175227-1 W3
Sample Date: Oct 2/18
Date Received: Oct 4/18
Sample Volume: 7x20L, 3x1L

Test Organism Information:

Culture Date: Sept 28/18
Age of culture (Day 0): 7d

Zinc Reference Toxicant Results:

Reference Toxicant ID: SC174
Stock Solution ID: 18Zn05
Date Initiated: Sept 21/18

72-h IC50 (95% CL): 29.1(21.9-33.8) µg/L Zn

72-h IC50 Reference Toxicant Mean and Range: 31.2(25.9-37.7) µg/L Zn CV (%): 9

Test Results:

	Algal Growth
IC25 %(v/v) (95% CL)	<u>795.0</u>
IC50 %(v/v) (95% CL)	<u>795.0</u>

1 INTRODUCTION

1.1 Site Description

The Minto Mine is a high-grade copper mine located within Selkirk First Nation (SFN) Category A Settlement Land Parcel R-6A approximately 240 km northwest of Whitehorse, Yukon Territory (62°37'N latitude and 137°15'W longitude; Figure 1.1). It is owned and operated by Minto Explorations Ltd. (MintoEx), a wholly owned subsidiary of Capstone Mining Corporation (Capstone). Mine development was initiated in 1997, commercial operations started in October 2007, and the mine entered temporary care and maintenance on October 19, 2018. The facility was permitted to conduct open pit and underground mining with milling at a rate of 4,200 tonnes of copper/gold/silver ore. Minto Mine produced 35.9 million pounds of copper in 2017. Mill tailings are stored in the Main Pit, Area 2 Pit, and the Dry Stack Tailing Storage Facility (DSTSF; Figure 1.2). Mine-impacted seepage from the DSTSF and under the Mill Valley Fill Extension (MVFE) is collected at the toe of the MVFE and pumped to the Main Pit (Figure 1.2). Non-impacted water and treated mine-impacted water are collected in a Water Storage Pond (WSP; Figure 1.2). Effluent from the WSP is periodically discharged to Minto Creek under conditions specified in Water Use Licence (WUL) QZ14-031 (August 2015). Minto Creek, in turn, discharges to the Yukon River approximately 7.7 km south-east of the WSP (Figure 1.2).

1.2 Background

Under the WUL, Minto Mine implements an Environmental Monitoring, Surveillance, and Reporting Plan (EMSRP) that includes routine water quality monitoring during the ice-free period (typically from April to October or November) in Minto Creek and reference tributaries at sampling frequencies varying from weekly to monthly. In accordance with the WUL, the Minto Mine submits water quality data to the Yukon Water Board as original laboratory reports and monthly summary reports within 30 days of month-end. Water quality monitoring data indicates that total suspended solids concentrations can increase dramatically during high flow events and concurrent concentrations of many metals (including aluminum, chromium, copper, and iron) are higher than Canadian Water Quality Guidelines (CWQGs) for the protection of aquatic life even under background and reference conditions (e.g., HKP 1994, Minnow 2009, 2010a,b).

Minto Mine also implements biological monitoring under the EMSRP, including Environmental Effects Monitoring (EEM) in accordance with federal requirements under the *Fisheries Act* and an Aquatic Environmental Monitoring Plan (AEMP). Biological monitoring under EEM is implemented every three years and Phase 4 of the EEM was recently completed (Minnow 2018b). Some mine influence was observed in routine water quality monitoring and water samples collected in conjunction with benthic invertebrate sampling. Analytes with concentrations higher

than reference (or the reference range), include conductivity, hardness, nitrate, total Kjeldahl nitrogen, total phosphorus, and total aluminum, arsenic, copper, iron, molybdenum, and selenium. Concentrations of nitrate were most strongly associated with the release of water from the WSP, but remained below the CWQG. Mean concentrations of aluminum and arsenic were above CWQG but at both reference and exposed areas. Copper exceeded CWQG but was lower than the site-specific water quality objective (SSWQO). Primary EEM metrics (density, taxon richness, Simpson's Evenness, and Bray-Curtis index) were within reference condition at upper Minto Creek but density was significantly lower at upper Minto Creek than reference in a control-impact comparison (Minnow 2018b). The difference was not considered ecologically meaningful since the magnitude of difference was below the critical effect size (CES) of ± 2 standard deviations (Minnow 2018b). Fish exposed to the highest concentrations of Minto Mine effluent (25 percent [%]) for 47 days were slightly larger and of better condition than reference fish, but differences were less than the CES of 10%, and considered not to be ecologically meaningful (Minnow 2018b). The study design for the Phase 5 EEM has been submitted and work should begin in the summer of 2019.

The annual AEMP includes monitoring of water, sediment, periphyton, benthic invertebrates, fish, and fish habitat. Data from 1994 (baseline) and 2006 to 2017 have been reported previously (e.g., Minnow 2018a), with some program modification over time. AEMP water quality monitoring has indicated that analytes were all below WUL SSWQOs. Fluoride was above CWQG at both the exposed and references areas. Total copper was above CWQG at upper Minto Creek but dissolved copper was below the SSWQO. Concentrations of copper in upper and lower Minto Creek were greater than the Interim Sediment Quality Guidelines (ISQGs) for the protection of aquatic life and the reference areas. Similar concentrations were observed in previous years. In 2017, the periphyton community at lower Minto Creek had a different composition than lower Wolverine Creek. Temporal variability was observed in periphyton community metrics and composition between lower Minto and lower Wolverine creeks. Benthic invertebrate community of lower Minto Creek did not differ from either reference, or was intermediate between references for all community metrics. High temporal variability in benthic invertebrate community condition was presumably due to inter-annual variability in environmental conditions.

1.3 Objectives

The objectives of this study and report are to characterize and interpret current (2018) sediment quality, periphyton and benthic invertebrate community condition, and tissue quality (periphyton and benthic invertebrate) of Minto Creek relative to reference and previous years' conditions. Supporting environmental data are also reported.

2 METHODS

2.1 Overview

Minnow Environmental Inc. implemented the Minto Creek sediment, periphyton, and benthic invertebrate assessment from September 5 to 12, 2018 with the assistance of Minto Mine staff. The Minto Mine was not actively discharging during the study and had not been discharging since August 31, 2018. The study was completed in accordance with specifications of the Minto Mine WUL (QZ14-031). Sediment sampling was undertaken in upper Minto Creek, lower Minto Creek, and corresponding reference areas (Table 2.1; Figure 2.1). Toxicity tests were run on sediment from lower Minto and lower Wolverine creeks (Table 2.1; Figure 2.1). Periphyton and benthic invertebrate community and tissue sampling were undertaken in erosional habitat of lower Minto Creek and their corresponding reference areas (Table 2.1; Figure 2.1). Supporting measures (e.g., field meter measures, water quality samples, depth, flow, habitat observations) were collected at all sampling areas.

2.2 Supporting Measures

2.2.1 Field Collection

Many environmental variables were measured to support the sediment quality, periphyton community, benthic invertebrate community, and tissue chemistry data collected for the Minto Creek assessment. The location of each station was recorded using a handheld Geographic Positioning System (GPS) with coordinates recorded in Universal Transverse Mercator (UTM) units (using the North American Datum of 1983).

Supporting measures collected concurrent with sediment sampling (i.e., at depositional areas) included core penetration depth (lower creek areas only), sample texture, and the presence or absence of organic detritus. *In situ* measurements, including temperature, dissolved oxygen, specific conductance, and pH were taken at each station using either a YSI ProPlus field meter (Yellow Springs Instruments, Yellow Springs, OH) or a Hanna 4M multiparameter field meter (Woonsocket, RI).

At periphyton and benthic invertebrate stations (community and tissue), *in situ* water quality measurements (by field meter as described above), water depth (by meter stick), and water velocity (by HACH FH950 handheld flow meter [HACH Company, Loveland, CO]) were measured. Habitat was characterized at each periphyton and benthic invertebrate sampling area and included elevation, gradient, creek wetted and bankfull widths (by tape measure or range finder), water appearance, creek morphology, bank condition, substrate texture, instream cover and features, overhead canopy, aquatic vegetation, riparian vegetation, surrounding land use and

anthropogenic disturbance. At each benthic invertebrate station, the intermediate axis lengths of 100 rocks that were washed during collection of the community sample were measured and the percent embeddedness of ten randomly selected rocks were evaluated and recorded. This type of substrate characterization is similar to those recommended under the Canadian Aquatic Biomonitoring Network (CABIN) protocol (CABIN 2012) for characterizing benthic invertebrate habitat. This provides additional information to assess and standardize habitat conditions among sampling stations and areas. Summary statistics of intermediate axis lengths (including the median and geometric mean) and median embeddedness were calculated for each station as per the CABIN protocol.

Water samples for chemical analysis were collected at all sampling areas (Table 2.1, Figure 2.1). Samples were collected using a master bottle from which the collected water was poured into pre-labeled sample bottles and preservatives were added, as required. A field duplicate was collected from one area using a split sample method; water from the master bottle was poured into one bottle and then into a duplicate bottle. Water samples for dissolved organic carbon (DOC) and for dissolved metals were filtered in the field using 0.45 micrometre (μm) polypropylene filters. Immediately after collection, water samples were placed in a cooler and later into a refrigerator at approximately 4 degrees Celsius ($^{\circ}\text{C}$). They were later submitted to ALS Environmental in Whitehorse, YT, for analysis of alkalinity by auto titration, anions by ion chromatography, total and dissolved organic carbon by combustion, total inorganic carbon by CO_2 purge, total cyanide by Continuous Flow Analyzer (CFA), conductivity by electrode, hardness by calculation, total and dissolved mercury by Cold Vapour Atomic Fluorescence Spectrophotometry (CVAFS [low]), total and dissolved metals by Collision Cell Mass Spectrometry (CCMS) and Inductively Coupled Plasma-Optical Emission Spectrophotometry (ICP-OES), total and dissolved phosphorus by colour, total dissolved and suspended solids by gravimetrics, pH and turbidity by meter, and ammonia by fluorescence.

The productivity of lower Minto and lower Wolverine creeks was evaluated using measurements of chlorophyll-a in periphyton. Chlorophyll-a is the primary photosynthetic pigment of all oxygen-evolving photosynthetic organisms (Wetzel 2001) and therefore provides an indicator of the standing stock of photosynthetic organisms representing the lowest trophic level. Minto Creek is a lotic system and measuring chlorophyll-a in periphyton was considered more representative of productivity than measuring it in water. A stainless steel razor blade was used to scrape periphyton from five rocks and then periphyton was transferred to filter paper which was placed in a pre-labeled opaque sampling jar. The surface area sampled was measured and recorded. All samples were maintained in coolers with ice packs during transport and then kept frozen on site until submission to ALS Environmental (Whitehorse, YT).

2.2.2 Data Analysis

A formal data quality review (DQR) was completed to assess water data quality (Appendix A). The quality of the data was evaluated by comparing laboratory method detection limits (MDL) to target detection limits, which are ideally $\leq 1/10^{\text{th}}$ of guideline values. On a subset of samples, the laboratory conducted Quality Assurance/Quality Control (QA/QC) analysis, including method blanks, laboratory duplicates, matrix spikes, spiked blanks, and certified reference materials. Field duplicates were collected and analyzed as a part of the DQR.

Water quality of Minto Creek was evaluated relative to WUL objectives, concentrations measured at reference areas, applicable CWQG (CCME 1999), and historical water quality. Supporting field measures (temperature, dissolved oxygen, pH, and specific conductance) and chlorophyll-a results were tested for differences between lower Minto Creek and reference areas (lower Wolverine and lower Big creeks) using two-sample t-tests. The assumption of normality was assessed using the Shapiro Wilks' test ($\alpha = 0.05$) and homogeneity of variance was assessed using Levene's Test ($\alpha = 0.05$). If variances were unequal, then the two-sample t-test for unequal variances was conducted (Ruxton 2006). Data were $\log_{10}$ transformed when required to meet the assumption of normality. A value of 1 was added before taking the logarithm if values of zero were in the data set. If normality could not be achieved after data transformation, a non-parametric Mann-Whitney test was used. A significance level (α) of 0.05 was used for all statistical tests of supporting field measures. Statistical comparisons were conducted in excel using the Real Statistics (Zaiontz 2018) add-in for Microsoft Excel. A magnitude of difference (MOD) was reported for statistical comparisons that were significant as:

$$MOD = \frac{(MCT_{Exp} - MCT_{Ref})}{MCT_{Ref}} \times 100\%$$

where *MCT* is the measure of central tendency (i.e., mean for the ANOVA after back-transforming to original data units when a transformation was used, and median for the Mann-Whitney test).

Chlorophyll-a was compared to the British Columbia Water Quality Guideline (BCWQG). Creek productivity was characterized by comparing chlorophyll-a concentrations to the Dodds et al. (1998) productivity classification system for temperate streams.

2.3 Sediment Quality

2.3.1 Sample Collection and Laboratory Analysis

Sediment samples were collected for particle size and chemical analysis at depositional areas within Minto Creek and reference creeks (Table 2.1, Figure 2.1). At lower Minto and lower Wolverine creeks, sediment samples for particle size analysis were collected using a

15.24 centimetre (cm) x 15.24 cm (6 inches ["] x 6") stainless steel petite ponar grab sampler (0.023 square metres [m²] sampling area). A composite sample was created by collecting the surficial 2 cm of sediment from each of three acceptable grabs (i.e., full to each edge of the sampler) using a stainless steel spoon. Each sample that formed the composite was added to a plastic bin and mixed together. The mixed composite samples were placed into pre-labeled glass sampling jars. Sediment samples for chemical analyses were collected by carefully inserting a 4.7 cm (2"; inside diameter) Lexan™ core tube into sediment deposits, capping the end with a fitted plastic cap, and retrieving by hand. From each acceptable core (i.e., each core containing an intact, representative sediment-water interface), the surficial 2 cm of sediment was manually extruded upwards into a graded core collar, cut with a stainless steel core knife, and placed into a pre-labeled glass sampling jar. Samples from three cores were composited to form a single sample from each station. At upper Minto and upper McGinty creeks, sediment deposits were rare and typically very shallow (i.e., deposits were less than one centimeter in depth). Collection of sediment by ponar or coring was ineffective in the upper creek areas and therefore sediments were collected using a stainless steel spoon. At locations of sediment deposition, surficial sediment was carefully collected by slowly spooning the sediment into a pre-labeled glass jar, with care taken to avoid the loss of fine material. In order to be as consistent as possible with the sediment collected in the lower creek areas, samples included no more than the top 1 cm of deposited sediment. Immediately after collection, sediment samples were placed in a cooler and later into a refrigerator at approximately 4°C. They were later submitted to ALS Environmental in Whitehorse, YT or Burnaby, BC, for analysis of particle size by dry and wet sieving and pipette sedimentation method, total organic carbon and loss on ignition by combustion, inorganic carbon derived from a calculation, metals by collision/reaction cell-inductively coupled plasma mass spectrometry (CRC ICP-MS), mercury by CVAFS, total Kjeldahl nitrogen by colorimetric analysis, and pH by probe.

Survival and growth were measured in sediment toxicity tests (10-day *Chironomus dilutus* and 14-day *Hyalella azteca*) at lower Minto and lower Wolverine creeks (Environment Canada 1997, 2013). Sediment for toxicity testing was collected using a 15.24 cm x 15.24 cm (6" x 6") stainless steel petite ponar grab sampler (0.023 m² sampling area) and the top 2 cm from three grabs were collected to form a composite sample from each station (five stations formed the replicates in the toxicity tests). Samples from each station were placed into a pre-labeled 1 L jar and mixed with a stainless steel spoon. Immediately after collection, samples were placed in a cooler, then later transferred to a refrigerator and stored at approximately 4°C until they were submitted to Nautilus Environmental Inc. in Burnaby, BC for sediment toxicity testing.

2.3.2 Data Analysis

A formal DQR was completed to assess the sediment data quality (Appendix A). The MDLs achieved by the laboratory were compared to target limits, generally $\leq 1/10^{\text{th}}$ guideline values. Laboratory QA/QC analysis included method blanks, laboratory duplicates, spiked blanks and certified reference materials (Appendix A). Sediment chemistry endpoints were summarized by reporting mean, standard deviation, minimum, and maximum for each area. Sediment quality data were evaluated relative to sediment quality guidelines (SQGs) for the protection of aquatic life (e.g., CCME 1999) and reference concentrations to identify metals with the potential to adversely affect aquatic life and/or that could be elevated due to mine activity. Sediment quality data were also compared to results obtained in previous years of sampling (1994 and 2006 to 2017). Interpretation was conducted with careful consideration of a methodological change made in 2010 and carried through to 2018 (sediments collected as described in Section 2.3.1) relative to previous years. Sediments collected in years before 2010 were collected within the active channel of the creek using an aluminum or Teflon scoop. Samples were submitted whole for analysis of particle size distribution, which generally included significant quantities of gravel and sand. Only material passing through a 230 mesh sieve ($< 63 \mu\text{m}$; silt and clay) was digested and analyzed for metals. While this approach does analyze the geochemically-relevant fine sediment (e.g., Horowitz 1991), it impedes interpreting the biological significance of sediment chemistry. Organisms are exposed to whole sediment (not just fines) and SQGs for the protection of aquatic life (e.g., CCME 1999) apply to whole sediment.

The laboratory performed QA/QC on sediment toxicity tests by comparing results to reference toxicant tests. Total ammonia was monitored in lower Minto and lower Wolverine sediment toxicity test vessels. If un-ionized ammonia (as N) rose above 0.20 milligram per litre (mg/L) in reference treatments (lower Wolverine Creek) renewal of overlying water would be required. Sediment toxicity from lower Minto Creek were compared to lower Wolverine Creek and laboratory control sediment. Results were also compared to previous sediment toxicity testing conducted in 2011 and 2015 to 2017 (Minnow 2012, 2016, 2017, 2018a). Statistical analysis were conducted and summarized in a report by Nautilus Environmental (Appendix C).

2.4 Periphyton Community

2.4.1 Sample Collection and Laboratory Analysis

Periphyton is the assemblage of algae, bacteria, fungi, and meiofauna attached to submerged substrate in freshwaters. However, periphyton communities are generally characterized based on the attached alga community, which represent the lowest trophic level and are indicators of primary productivity. Periphyton community samples were collected in erosional habitat of lower

Minto, lower Wolverine, and lower Big creeks (Table 2.1, Figure 2.1). A stainless steel razor blade was used to scrape periphyton from five randomly selected rocks in each of the five replicate stations per area. The area sampled was measured and recorded. Samples preserved with Lugol's iodine solution were placed in pre-labeled sampling jars. The samples were placed in a cooler, then later transferred to a refrigerator and stored at approximately 4°C until they were shipped to Plankton Resources Inc. (Winnipeg, MB) for analysis to species level.

2.4.2 Data Analysis

A formal DQR was completed to assess the quality of the periphyton community data (Appendix A). Laboratory duplicate samples were collected on 10% of the periphyton community samples. Periphyton communities were compared between lower Minto Creek and reference areas, lower Wolverine and lower Big creeks. Temporal comparisons were made to data collected in 1994 and 2011 to 2018.

Total organism density (cells per centimetre squared [cells/cm²]) and biomass (microgram per centimetre squared [µg/cm²]) were calculated for periphyton community samples. The diversity metric "number of taxa" (also known as taxon richness) included all separate taxa identified to the species level. Simpson's Diversity and Evenness indices were computed according to formulae presented by Smith and Wilson (1996) and recommended by Environment Canada (2012). These indices take into account the relative abundance of taxa and number of taxa, with values ranging from 0 (low diversity or evenness) to 1 (high diversity or evenness). The Bray-Curtis index was also calculated according to Environment Canada (2012). This metric takes into account the abundance of each taxon at each station compared to the median reference abundance (lower Wolverine Creek), to compute an index of the relative "dissimilarity" of each station from the hypothetical reference median station. Larger Bray-Curtis index values indicate greater dissimilarity from reference.

Periphyton community endpoints were summarized by reporting mean, median, minimum, maximum, and standard deviation for each study area. Differences among Minto Creek and the reference areas were tested using a two-sample t-test, with a p-value < 0.10. A p-value of 0.10 was used as per suggested EEM guidelines (Environment Canada 2012). The assumption of normality was assessed using the Shapiro Wilks' test ($\alpha = 0.05$) and homogeneity of variance was assessed using Levene's Test ($\alpha = 0.05$). If variances were unequal, then the two-sample t-test for unequal variances was conducted (Ruxton 2006). Data that could not be normalized were log, square root, or fourth root transformed. A value of 1 was added before taking the logarithm if values of zero were in the data set. If data could not be normalized after transformation, a non-parametric Mann-Whitney test was applied. Statistical comparisons were conducted using

Real Statistics in excel (Zaiontz 2018). A magnitude of difference (MOD) was calculated for each community metric as:

$$MOD = \frac{(\bar{X}_{Exp} - \bar{X}_{Ref})}{SD}$$

where the SD is an estimate of the reference standard deviation. The estimate of the reference standard deviation was the pooled standard deviation in the two-sample t-test for equal variances or the reference standard deviation when the two-sample t-test for unequal variances was applied.

The MOD for the Mann-Whitney test was calculated using medians instead of means and the pooled median absolute deviation (MAD) instead of the SD. The MAD is calculated as the median of the absolute values of the differences between each observation and the median observation for that area (and corrected by a factor of 1.4826 to scale the MAD to a comparable magnitude to the SD). A study design with two areas and $n = 5$ samples per area has an approximate power of 0.9 to detect a two standard deviation difference between areas using $\alpha = 0.1$ (Environment Canada 2012).

Periphyton data collected in 2018 were compared to data collected in baseline studies (HKP 1994) and from 2011 to 2017. Due to differences in reporting of periphyton community data in the 1994 baseline report (e.g., taxa were only identified as present, common or dominant), a non-statistical comparison was performed against 1994 data using proportional abundances at the taxonomic level of Phylum.

2.5 Benthic Invertebrate Community

2.5.1 Sample Collection and Laboratory Analysis

Benthic invertebrate community samples were collected in erosional habitat of lower Minto, lower Wolverine, and lower Big creeks as required under the WUL (Table 2.1, Figure 2.1). Benthic invertebrate community samples were collected from riffle/run habitat with cobble and gravel substrate using a Surber sampler (0.093 m²) outfitted with 500 µm mesh. Three grab composites (0.279 m² area in total) were collected at five replicate stations within each sampling area. For each grab, the substrate within the sampler was disturbed and scrubbed (by hand and nail brush) with care taken to ensure that all dislodged organic material was swept into the sampler collection net. The substrate was disturbed to a depth of approximately 3 cm over a period of approximately five minutes. This procedure was repeated at new subsampling locations for the second and third grab, following which all of the material contained in the collection net was carefully transferred to a pre-labeled 1 litre (L) wide-mouth plastic jar using a stainless steel spoon and a wash bottle while working over a plastic bin to avoid any potential loss of organisms. Any organisms that adhered to the sieve bag were removed by hand and added to the sample. All samples were

labeled internally (using wooden sticks) and externally with the station number, area identifier, Minnow project number, date and field personnel in order to ensure correct identification at the laboratory. Samples were preserved within six hours of collection using buffered formalin solution to a nominal concentration of 10% in ambient water.

All benthic invertebrate samples were shipped to Cordillera Consulting in Summerland, BC. Each sample was elutriated to remove sand, gravel, clay, and the remaining organic material was preserved in 70% ethanol. Elutriate was examined for any mollusc or Trichoptera cases, then each sample was examined to estimate the total number of invertebrates. If the estimated number of organisms were greater than 600 and the sample was fine and non-clumping, a subsample was taken using a Folsom Plankton Splitter (Motodo 1959, Van Guelpen et al. 1982). Empty snail or bivalve shells, empty caddisfly cases, and invertebrate fragments such as legs, gills, antennae etc. were kept but excluded from the count. When organism fragments were encountered, only the heads were counted towards the total. Larval and pupal exuviae were excluded while terrestrial stages and terrestrial drop-ins were indicated as such but excluded from the total count. Benthic invertebrates were identified to the “lowest practicable taxonomic level” (which in most cases were genus) and counted. Following identification and counting, representative specimens of each new taxon were preserved in a museum quality vial with a polyseal lid and added to the Minto Mine voucher collection. Internal labels were used to identify the taxa, the client, date collected, site code, and the project.

2.5.2 Data Analysis

A formal DQR was completed to assess the benthic invertebrate community data quality (Appendix A). Laboratory QA/QC included an assessment of sub-sampling error and sorting efficiency on at least 10% of the samples (Appendix A). Benthic invertebrate communities were evaluated using summary metrics, including invertebrate density (number of organisms per m², calculated based on a sample area of 0.279 m²), number of taxa, Simpson's Diversity and Evenness, and Bray-Curtis index. Before these endpoints could be calculated, abundances of organisms identified to a less-specific level were first added to abundances of organisms within that grouping identified to a more-specific level (e.g. abundances of organisms only identified to Order were added to abundances of organisms identified to Family, Genus, or Species within that Order). This process (data compression) assess benthic invertebrate taxonomic richness without redundancy. Abundance of a less-specific taxon was redistributed within that taxon proportionally according to abundances of organisms identified to more-specific levels. Data compression was conducted proportionally because the distribution of organisms identified beyond the family-level likely reflect the proportional distribution of organisms identified to associated less-specific levels, because those organisms are frequently at early developmental stages and lack some

differentiating features. Total organism density (individuals/m²), taxon richness, Simpson's Diversity and Evenness, and Bray-Curtis index were calculated in the same manner as periphyton community data (Section 2.4.2). It was noted that in previous years total organism density did not always account for area sampled (2013 to 2017). All density samples were re-calculated to include area and total organism density now represents individuals/m². Bray-Curtis index was calculated based on the median of each reference area as well as the combined reference median. The combined reference median was presented within the text, as this is the optimal method for determining potential effluent effects, since using a reference median value calculated from only one area biases the outcome toward detecting a difference between two areas regardless of potential anthropogenic stressors. This occurs because the area used to calculate the median was inherently more similar to itself than any other area (Huebert et al. 2011), even if the two areas in question are 'natural-pristine' areas.

The relative proportions of the most abundant taxa were calculated relative to the total number of organisms in the sample. Dominant taxon groups were defined as groups representing greater than 10% of total organism abundance in one or more areas or any groups considered important indicators of environmental stress. In this study, relative proportions of the major groups, such as chironomids and EPT taxa (Ephemeroptera [mayfly], Plecoptera [stonefly], Trichoptera [caddisfly] taxa) were examined. It is often possible to relate low relative abundance of sensitive taxonomic groups (e.g., EPT taxa) to environmental stress (e.g., Taylor and Bailey 1997). Similarly, high relative abundance of tolerant taxonomic groups (e.g., oligochaetes) may also indicate higher environmental stress (Chapman et al. 1982a,b).

Differences among Minto Creek and the reference areas were tested using ANOVA with $\alpha = 0.1$ as per EEM guidelines (Environment Canada 2012). Prior to ANOVA, all data were transformed ($\log_{10}$, square root, or fourth root transformation) as necessary to meet assumptions of normality (Shapiro Wilks' test; $\alpha = 0.05$) and homogeneity of variance (Levene's test; $\alpha = 0.05$). A value of 1 was added before taking the logarithm if values of zero were in the data set. If data failed the assumptions of normality and homogeneity of variance, then a non-parametric Kruskal-Wallis test was conducted. Post-hoc contrasts following the ANOVA were conducted between the exposed area and each reference area using the contrast methods described in Oehlert (2010). Contrasts following the Kruskal-Wallis test were conducted using Dunn's test using the *dunn.test* package in R (Dinno 2017; R Core Team 2017). A magnitude of difference (MOD) for each comparison and community metric was calculated using the same approach as described for the periphyton (Section 2.4.2).

Benthic invertebrate community data were also evaluated in comparison to results obtained in previous years of sampling (1994, 2006, 2008, and 2010 to 2016). Summary metrics from earlier

years were previously re-calculated (Minnow 2011) to ensure consistency and appropriate comparisons over time.

2.6 Tissue Chemistry

2.6.1 Sample Collection and Laboratory Analysis

Periphyton and benthic invertebrate tissue samples were collected from lower Minto (exposed), lower Wolverine (reference), and lower Big creeks (reference; Table 2.1, Figure 2.1). Periphyton samples were collected by scraping submerged cobble-size rocks with a stainless steel razor blade. Scraped material (periphyton) was placed in pre-labeled sample jars. Benthic invertebrate tissue samples were collected in areas with cobble substrate using a kick-net, and by overturning rocks and collecting organisms by hand. Periphyton and benthic invertebrate tissue samples (2 to 5 grams [g]) were placed into pre-labeled sample jars and Whirl-Pak™ bags, respectively. A total of five periphyton and five benthic invertebrate samples were collected at each area. Immediately after collection, all tissue samples were placed in a cooler, and later in a freezer until they were submitted to ALS Environmental in Burnaby, BC. Samples were analyzed for percent moisture and for metals by High-Resolution ICP-MS, and later converted to dry weight using percent moisture.

2.6.2 Data Analysis

Summary statistics were calculated for each metal by area and tissue type (periphyton and benthic invertebrates). The follow summary statistics were reported: sample size, percent of values below the laboratory reporting limit (LRL), mean, standard deviation, minimum value, median, and maximum value. Commonly used substitution methods (e.g., substituting values < LRL with half the LRL) for censored data introduces bias in summary statistics (Helsel 2012). Means and standard deviations were therefore estimated using the Kaplan-Meier (K-M) method. This method involves transforming the left censored (i.e., < value) dataset to a right censored (i.e., > value) dataset, and then using the K-M estimator (used to estimate the mean survival time in survival analysis) to estimate the mean. The calculation was conducted using the *survfit* function in the *survival* package (Therneau 2017) in R and involves calculating the area under the K-M survival curve. The K-M method is non-parametric and can accommodate multiple laboratory reporting limits (LRLs). This method of estimating the mean is equivalent to using the distribution of detectable values below the LRL to represent values that are < LRL. For example, the mean of the data set {1, 2, < 4, 5} is estimated as the mean of 1, 2, [$\frac{1}{2} \times 1 + \frac{1}{2} \times 2$], and 5 which is 2.375. The value < 4 is replaced by the distribution of values below 4 (i.e. 1 and 2 with equal weight of $\frac{1}{2}$). Similarly, the mean of the data set {1, 1.6, 2, 2.1, < 4, 5} is estimated as the mean of 1, 1.6, 2, 2.1, [$\frac{1}{4} \times 1 + \frac{1}{4} \times 1.6 + \frac{1}{4} \times 2 + \frac{1}{4} \times 2.1$], and 5 which is 2.229. Again, the value < 4 is replaced by

the distribution of values below 4 (i.e., 1, 1.6, 2, and 2.1 with equal weight of $\frac{1}{4}$). If the minimum value in the data set is below the LRL then it is replaced with the LRL. Therefore, if there is only one LRL and no detected values below the LRL, then the K-M estimate of the mean is equivalent to replacing the value below the LRL with the LRL (i.e., the best guess for the values $< \text{LRL}$ is the LRL). When a standard deviation could not be estimated (e.g., when all data were below the LRL), then it was not reported. When a value was reported below a poor LRL (defined as a LRL that exceeded the maximum detected value) then the value was removed from the dataset.

The primary objective of tissue collection was to support a selenium assessment reported under a separate cover. Accordingly, data are reported herein for future reference with limited interpretation. Tissue metal concentrations for periphyton and benthic invertebrates from LMC (exposed) were compared relative to LWC and LBC (reference) using analysis of variance (ANOVA). The comparisons were conducted using ANOVA on untransformed or $\log_{10}$ -transformed data (whichever transformation best fit the data identified using Shapiro-Wilk's test). When assumptions of normality and homogeneity of variances were not met (Shapiro-Wilk's test and Levene's test on the median, respectively), the Kruskal-Wallis test was used. When data were reported below multiple laboratory reporting limits (LRLs), the Wilcoxon Score test (WST) as used (Helsel 2012). Post-hoc contrasts following the ANOVA were conducted between the exposed area and each reference area using the contrast methods described in Oehlert (2010). Contrasts following the Kruskal-Wallis test were conducted using Dunn's test using the *dunn.test* package in R (Dinno 2017; R Core Team 2017). Contrasts for the WST were conducted as separate two-sample WST. The WST was conducted using the *cenfit* function of the *NADA* package in R (Lee 2017). Statistical comparisons were conducted using a significance level (α) of 0.05. P-values for the contrasts were Bonferroni adjusted for the $n = 2$ comparisons.

A magnitude of difference (MOD) was reported for statistical comparisons that were significant as:

$$MOD = \frac{(MCT_{Exp} - MCT_{Ref})}{MCT_{Ref}} \times 100\%$$

where *MCT* is the measure of central tendency (i.e., mean for the ANOVA after back-transforming to original data units when a transformation was used, and median for the Mann-Whitney test and WST). The median for the WST was estimated using the Kaplan-Meier method as described above.

3 SUPPORTING MEASURES

3.1 Field Measures

Mean temperature at the sediment sampling area of upper Minto Creek (2.6°C) was significantly higher than in upper McGinty Creek (1.9°C; Figure 3.1, Appendix Table B.3). Specific conductance was significantly higher in upper Minto Creek (481 micro Siemens per centimetres [$\mu\text{S}/\text{cm}$]) than in upper McGinty Creek (119 $\mu\text{S}/\text{cm}$; Figure 3.1, Appendix Table B.3). Dissolved oxygen (percentage and mg/L) was significantly lower at upper Minto Creek (70.0% saturation and 9.52 mg/L) than at upper McGinty Creek (84.9% saturation and 11.76 mg/L; Figure 3.1, Appendix Table B.3). The pH at upper Minto Creek (7.97) was significantly higher than reference area, upper McGinty Creek (7.49; Figure 3.1, Appendix Table B.3). Temperature at lower Minto Creek (4.5°C) was not significantly different from at the reference area, lower Wolverine Creek (5.5°C; Figure 3.1, Appendix Table B.3). Lower Minto Creek (329 $\mu\text{S}/\text{cm}$) had significantly higher specific conductance than compared to the lower Wolverine Creek reference (170 $\mu\text{S}/\text{cm}$; Figure 3.1; Appendix Table B.3). Lower Minto Creek had significantly higher dissolved oxygen (85.5% saturation and 11.25 mg/L) compared to lower Wolverine Creek (38.1% saturation and 4.93 mg/L; Figure 3.1, Appendix Table B.3). Lower dissolved oxygen at lower Wolverine Creek could be attributed to sampling in back eddies, which were the only areas that support sediment deposition. Lower Minto Creek had significantly higher pH (8.05) than lower Wolverine Creek (7.40; Figure 3.1, Appendix Table B.3).

Physico-chemical measurements were also taken in erosional areas of lower Minto, lower Wolverine, and lower Big creeks in support of benthic invertebrate community sampling. Temperature was the only parameter measured that was significantly lower at lower Minto Creek (2.6°C) compared to both reference areas, lower Wolverine (4.4°C) and lower Big Creek (6.6°C; Figure 3.2, Appendix Table B.4). No significant differences were observed between lower Minto Creek and both reference creeks for dissolved oxygen (percentage and mg/L), specific conductance, or pH (Figure 3.2). All areas were within the range of the WUL objective for pH.

3.2 Water Chemistry and Chlorophyll-a

The quality of water chemistry data was assessed prior to data analysis and interpretation, and was judged as good (Appendix A). Fluoride exceeded the interim CWQG in upper and lower Minto Creek and reference area, upper McGinty Creek (Table 3.1). Total copper concentrations (a metal of particular interest at the Minto Mine) were above CWQG at upper Minto Creek and reference areas lower Wolverine and lower Big creeks but dissolved copper was well below SSWQO set out in the WUL (Table 3.1, Appendix Table B.7).

Figure 3.1: Physico-chemical Measurements in Depositional Areas of Upper and Lower Minto Creek Relative to Reference Areas, Minto Mine, 2018

Notes: Samples sizes were n = 5 in all areas (except for pH at upper Minto Creek, n = 4). Different letters represent a significant difference between areas within each creek area.

Figure 3.2: Physico-chemical Measurements in Erosional Areas in Lower Minto Creek and Reference Areas, Minto Mine, 2018

Notes: Samples sizes were n = 5 in all areas. Asterisk (*) indicates when lower Minto Creek was significantly different from lower Wolverine and lower Big creeks.

^a CCME (Canadian Council of Ministers of the Environment). 1999. Canadian Environmental Quality Guidelines. 1999 (plus updates), Canadian Council of Ministers of the Environment, Winnipeg. See Appendix Table B.6 for explanatory notes on selected water quality guidelines.

^b Based on lowest guideline using highest temperature and pH.

^c Based on lowest guideline using highest pH.

^d Based on lowest guideline using lowest hardness.

^e Based on guideline using 25th percentile of hardness, DOC, and field pH.

^f Dissolved Cadmium (µg/L) guidelines based on the following formula using the lowest hardness: $e(0.736(\ln(\text{Hardness})-4.943))$.

^g Dissolved Copper water quality objective depends on concentration of dissolved organic carbon (DOC). If DOC is > 10 mg/L/ DOC is ≤ 10 mg/L.

Chlorophyll-a data quality was assessed prior to data analysis and interpretation, and was judged as good (Appendix A). Concentrations of periphyton chlorophyll-a were not significantly different between lower Minto Creek (55 milligram per metre squared [mg/m^2]) and lower Wolverine Creek ($43 \text{ mg}/\text{m}^2$; Figure 3.3, Appendix Table B.8) but was below the BCWQG of $100 \text{ mg}/\text{m}^2$ for the protection of aquatic life (BCMOE 1985). Station LWC-5 (reference) had higher concentrations of chlorophyll-a compared to guidelines, but overall both areas were below guidelines and did not differ significantly (Figure 3.3, Appendix Table B.8). Chlorophyll-a concentrations have been variable over time and between areas but concentrations are often higher (but not always significantly different and below BCWQG) at lower Minto Creek (Appendix Figure B.1). Dodd's et al (1998) classification system sets the trophic status of lower Minto ($55 \text{ mg}/\text{m}^2$) and lower Wolverine creeks ($43 \text{ mg}/\text{m}^2$) as mesotrophic. Based on only total phosphorus, both creeks would be defined as oligotrophic as was observed in previous years (Dodds et al. 1998).

3.3 Summary

Supporting measures collected in September 2018 indicated good Minto Creek water quality. Influence of the Minto Mine was evident in higher specific conductance and pH than in reference creeks, but water quality concentrations were lower than SSWQO. Concentration of total copper at upper Minto Creek was higher than CWQG and the reference area but dissolved copper was much lower than the SSWQO. Total copper concentrations were lower than CWQG at lower Minto Creek but were higher than CWQG at lower Wolverine and lower Big creeks (reference areas) indicating concentrations might be natural. Mean concentrations of chlorophyll-a were not significantly different between areas and were below BCWQG. Production classification at the exposure and reference areas were different from 2017 (lower Minto Creek was mesotrophic and lower Wolverine Creek was oligotrophic) as lower Minto and lower Wolverine creeks were defined as mesotrophic.

Figure 3.3: Concentrations of Chlorophyll-a in Periphyton at Lower Wolverine and Lower Minto Creeks, Minto Mine WUL, 2018

Notes: Different letters represent significant differences between areas. Sample size = 5.

4 SEDIMENT QUALITY

4.1 Sediment Particle Size and Chemistry

Sediment data quality were assessed prior to data analysis and interpretation, and were judged as good, except for a lack of agreement between field duplicates for particle size and other physical tests (Appendix A). Sediments collected in 2018 were largely composed of fine particles in the silt and sand size categories (Figure 4.1, Table 4.1, Appendix Table C.1). Mean total organic carbon (TOC) content of sediment collected from upper Minto Creek (2.9%) was slightly lower (but not significantly) than at the upper McGinty Creek reference area (3.8%; Table 4.1). Lower Minto Creek had lower (but not significantly) TOC (4.1%) than the lower Wolverine Creek reference area (6.4%; Table 4.1). Arsenic and copper were the only analytes with mean concentrations greater than Interim Sediment Quality Guidelines (ISQG) for the protection of aquatic life (CCME 1999) in an effluent-exposed area (Table 4.1, Appendix Table C.1). However, mean arsenic concentration in upper Minto Creek was below ISQG and lower than the reference area, upper McGinty Creek (which was greater than ISQG). This suggests that arsenic concentrations were unrelated to the Minto Mine. Mean copper concentration in upper Minto Creek was above the Probable Effect Level (PEL) and lower Minto Creek was greater than the ISQG. Concentrations of copper at lower Wolverine Creek were also above the ISQG (Figure 4.2, Table 4.1). With progression from upper to lower Minto Creek, sediment copper concentrations decreased from a mean of 210 to 45 milligram per kilogram (mg/kg), respectively, indicating improvement with distance downstream.

Due to the predominantly erosional habitat in upper Minto Creek, relatively few areas had deposited sediment and even this only occurred in small quantities that likely wash away each year during freshet. Therefore, elevated copper in fine sediment in the upper reaches of Minto Creek may be of limited importance in terms of exposure and potential effects to biota. In lower Minto Creek, fine sediment deposits were somewhat more common and therefore more relevant to aquatic life.

4.2 Temporal Comparisons

Particle size distribution in 2018 was similar to the distribution observed from 2010 to 2017 but was notably different from data collected prior to 2010, which employed different sampling methodology (Figure 4.1). Mean copper concentration at upper Minto Creek in 2018 was greater than the PEL and most previous years (except 2016), including the 1994 baseline that was greater than the ISQG (Figure 4.2). At lower Minto Creek, mean copper concentration in 2018 was greater than ISQG as was the case during most years, and was greater than 1994 baseline (Figure 4.2, Table 4.1, Appendix Table C.1). This does not necessarily indicate an influence of

Figure 4.1: Particle Size Distribution of Sediment Collected in Minto Creek and Reference Locations, 1994 to 2018¹

Notes:

Methods used in 1994 were not specified, fine sediment was collected in triplicate in the mainstem of Minto Creek (HKP 1994).

nd = no data.

¹ REF1 = Station W6 (south-flowing tributary) in 2006 to 2008 and McGinty Creek in 2010 to 2018; UMC = Upper Minto Creek; REF2 = Station W7 (north-flowing tributary) in 2006 to 2009 and Wolverine Creek in 2010 to 2018; LMC = Lower Minto Creek.

- Indicates sediment concentration exceeding CSQG ISQG.
- Indicates sediment concentration exceeding CSQG PEL.
- Indicates sediment concentration exceeding higher reference mean by more than two times.
- Indicates sediment concentration exceeding higher reference mean by more than two times and higher than CSQG ISQG and/or PEL.

^a Canadian Sediment Quality Guidelines: ISQG = interim sediment quality guideline; PEL = probable effect level (CCME 1999).

Figure 4.2: Copper Concentrations (Mean $\pm$ Standard Deviation) in Sediment Collected in Minto Creek and Reference Locations, 1994 to 2018 ²

Note: TEL = Threshold Effect Level.

¹ Methods were not specified, fine sediment was collected in triplicate in the mainstem of Minto Creek (HKP 1994).

² Reference 1 = Station W6 (south-flowing tributary) in 2006 to 2008 and McGinty Creek in 2010 to 2018; Reference 2 = Station W7 (north-flowing tributary) in 2006 to 2009 and Wolverine Creek in 2010 to 2018.

* = no data.

the Minto Mine as concentrations were within the historical range and sampling methodology applied in 1994 was unspecified.

4.3 Sediment Toxicity

Sediment toxicity test conditions and associated supporting water quality parameters were all within the range outlined in the test protocols, and testing was judged to be acceptable (Appendix A). Survival and growth were evaluated using the 10-day test of *C. dilutus* (midge) and the 14-day test of *H. azteca* (amphipod).

No effects to *H. azteca* survival or growth were observed (Table 4.2). *H. azteca* results (no effects in 2018) were similar to those of 2011 and 2015 to 2017 (Minnow 2012, 2016, 2017, 2018a). Survival of *C. dilutus* was significantly lower in sediment collected from lower Minto Creek than in laboratory control sediment (sand) and field reference sediment (lower Wolverine Creek; Table 4.2). Survival at lower Minto Creek was leveraged by one station that had higher mortalities (50%) than the remaining four stations with lower mortalities (20% to 30%). Growth of *C. dilutus* was not significantly different between lower Minto Creek and the reference sediment. In previous years, growth was only significantly different in 2017, whereas survival was significantly different between areas in 2017 and 2018 but not in 2011, 2015, and 2016. Temporal comparisons show differences in responses despite similar sediment chemistry.

4.4 Summary

Overall, concentrations of metals in Minto Creek sediments were similar to reference and lower than sediment quality guidelines with the exception of copper. Concentrations of copper in Minto Creek (both upper and lower) were greater than the sediment quality guideline and reference. Copper concentrations in sediment were similar to results seen after the methodology change and lower than concentrations in 2008. Sediment toxicity testing of *C. dilutus* suggested adverse effects to survival (but not growth) in lower Minto Creek sediment when compared to the laboratory control and the field reference (lower Wolverine Creek). No effects to *H. azteca* were observed.

Table 4.2: Minto Mine Sediment Toxicity Test Results for Lower Wolverine and Lower Minto Creeks, September 2018

Area	<i>Hyalella azteca</i>		<i>Chironomus dilutus</i>	
	Survival (%)	Dry Weight (mg)	Survival (%)	Dry Weight (mg)
Control Sediment	96 ± 5.5	0.21 ± 0.020	92 ± 4.5	2.20 ± 0.090
Lower Wolverine Creek (Reference)	100 ± 0	0.26 ± 0.060	88 ± 8.4	2.64 ± 0.51
Lower Minto Creek (Exposed)	94 ± 5.5	0.27 ± 0.020	70 ± 12.2	2.98 ± 0.31

- Significantly different than control sediment.
- Significantly different than reference sediment.
- Significantly different than reference and control sediment.

Note: Data presented as mean ± standard deviation.

5 PERIPHYTON COMMUNITY

5.1 Primary Metrics and Community Composition

The quality of periphyton community data was assessed prior to data analysis and interpretation and judged as good (Appendix A). Analysis of the periphyton community on the basis of density (cells/cm²) indicated that all five periphyton community metrics (density, taxon richness, Simpson's Diversity and Evenness, and Bray-Curtis index) were not significantly differently between lower Minto and lower Wolverine creeks (Table 5.1a, Appendix Tables D.1 and D.3). This indicates that periphyton community at lower Minto Creek was not significantly different from reference areas.

Analysis of the periphyton community based on biomass (µg/cm²) indicated that three out of five metrics (density, Simpson's Evenness, and Bray-Curtis index) were significantly different at lower Minto Creek compared to lower Wolverine Creek. Lower Minto Creek had higher density, lower evenness, and higher Bray-Curtis Index (indication of differences in community structure; Table 5.1b, Appendix Tables D.2 and D.4).

Dominant phyla in lower Minto and Wolverine creeks were Bacillariophyceae (diatoms) and Cyanophyta (blue-green algae). Bacillariophyceae was dominant at lower Minto Creek (85% of community) and lower Wolverine Creek (82% of the community; Figure 5.1). Little information is available regarding sensitivities of specific periphyton taxon groups and tolerances to mining activities to assist in interpretation (Deniseger et al. 1986, De Jonge et al. 2008).

5.2 Temporal Comparisons

Substantial temporal variability in periphyton community composition was evident among samples taken in Minto Creek and reference since 1994 (Figure 5.1). For example, at lower Minto Creek, Bacillariophyceae (diatoms) were dominant in 1994, 2013, 2014, 2016, and 2018, Rhodophyta (red algae) in 2012, and Cyanophyta (blue-green algae) in 2011, 2015, and 2017 (Figure 5.1). This lack of temporal consistency was also observed at lower Wolverine Creek, with Cyanophyta dominant in 2011 and 2013 and Bacillariophyceae in 2012 and 2014 to 2018 (Figure 5.1).

5.3 Summary

Evaluation of periphyton community biomass (µg/cm²) indicated significant differences in a number of metrics in lower Minto Creek relative to the lower Wolverine Creek reference. Based on biomass (but not cells/cm²), the periphyton community of lower Minto Creek and lower Wolverine Creek had different density, evenness, and community structures. However, substantial differences in periphyton community summary metrics and community composition were apparent among years at both lower Minto and lower Wolverine creeks, indicating

Table 5.1: Statistical Contrasts of Periphyton Density (cells/cm²) and Biomass (µg/cm²) based Community Metrics between Lower Wolverine Creek and Lower Minto Creek Areas, Minto Mine WUL, 2018

Notes:

Observed effect size = (exposure mean - reference mean)/pooled standard deviation.

T = two-sample t-test, MW = Mann Whitney test, T_{unequal} = two-sample t-test for unequal variances, SD = standard deviation.

 P-value < 0.10.

 Effect size magnitude > 2.

^a Measure of Central Tendency = back-transformed mean for two-sample t-tests and medians for MW tests.

^b Magnitude of difference computed on transformed means and SD on transformed scale. Means and SD are replaced with medians and the median absolute deviation (MAD) for the MW test.

Figure 5.1: Periphyton Community (cells/cm²) Composition in Lower Minto Creek (1994, 2011 to 2018) and Lower Wolverine Creek (2011 to 2018)

Note: Data presented as mean $\pm$ standard deviation.

substantial temporal variability. The differences observed in the periphyton communities of lower Minto Creek and lower Wolverine Creek in 2018 were within natural temporal variability and do not provide any resolution of potential mine influence.

6 BENTHIC INVERTEBRATE COMMUNITY

6.1 Primary Metrics and Community Composition

Benthic invertebrate community data quality was assessed prior to data analysis and interpretation, and was judged as good (Appendix A). Benthic invertebrate community metrics of density, number of taxa, and Simpson's Diversity and Evenness were not significantly different among areas (Table 6.1, Appendix Table E.3). Bray-Curtis index was significantly higher at lower Minto Creek than both reference areas (Table 6.1, Figure 6.1). Overall, the primary metrics suggest a limited mine influence (Table 6.1, Appendix Table E.3).

Dominant taxonomic groups in lower Minto, lower Wolverine, and lower Big creeks included EPT taxa and chironomids (non-biting midges). Oligochaetes and acari were also dominant at individual stations. Percent EPT was significantly higher and percent chironomids was significantly lower at lower Minto Creek compared to lower Wolverine Creek (Figure 6.2, Table 6.1, Appendix Tables E.1 to E.3). The significantly higher proportion of EPT and lower proportion of chironomids suggests limited mine influence on benthic invertebrate community (Chapman et al. 1982a,b, Rosenberg and Resh 1993, Taylor and Bailey 1997).

Correspondence Analysis (CA) explained 57.0% of the total community variance in the first two CA axes (Appendix Table E.5). The first CA axis explained 42.3% of the total variation in the original benthic abundance data, and significantly separated lower Minto Creek from lower Wolverine and lower Big creeks (Table 6.1, Figure 6.3). Lower Minto Creek had strong negative CA Axis-1 scores and stations were separated from lower Wolverine and lower Big creeks by high relative abundance of the *Diamesa* (Family Chironomidae), *Nemoura* (stonefly), *Ostracerca* (stonefly), and *Baetis rhodani* group (mayfly; Figure 6.3, Appendix Tables E.4 and E.5). The reference areas had strong positive CA Axis-1 scores that were dominated by *Zapada cinctipes* (stonefly) and *Drunella spinifera* (mayfly; Figure 6.3, Appendix Tables E.4 and E.5). The reference areas were separated on CA Axis-2 (which explained 14.7% of the total variation) and lower Minto Creek had significantly lower CA Axis-2 scores compared to lower Big Creek and not significantly different compared to lower Wolverine Creek (Table 6.1, Figure 6.3). The Bray-Curtis index shows that lower Minto Creek has a different community composition than lower Wolverine and lower Big creeks. The CA Axis-1 shows that lower Minto Creek and the reference areas are separated by different Ephemeroptera and Plecoptera species. Even though the areas consist of different communities, the organisms that belong in these communities are typically sensitive to pollution, which suggests limited mine influence.

Table 6.1: Statistical Comparisons of Benthic Invertebrate Community Metrics among Lower Minto Creek and Reference Areas, Minto Mine WUL, 2018

Metric	Comparison		Area Mean or Median ^a		Statistical Contrasts		
	Exposure Site	Reference Site			Significant Difference between areas?	Direction	P-value ^b

■ Indicates a statistically significant difference between exposed and reference areas, $p = 0.10$.

^a For transformed data, the back-transformed mean is reported; for ranked data, the median is reported.

^b The overall p-value of the 3 group comparison used if there were no significant differences between all areas.

^c Calculated as recommended by Environment Canada 2012.

^d Percent Ephemeroptera (mayfly), Plecoptera (stonefly), Trichoptera (caddisfly).

Figure 6.1: Comparison of Benthic Invertebrate Primary Metrics among Lower Minto Creek and Reference Areas, Minto Mine, 2018

Notes: An Asterisk (*) above lower Minto Creek indicates exposed area was significantly different ($p < 0.10$) from both reference areas.

Figure 6.2: Comparison of Benthic Invertebrate Supporting Metrics among Lower Minto Creek and Reference Areas, Minto Mine, 2018

Notes: An Asterisk (*) above lower Minto Creek indicates exposed area was significantly different ($p < 0.10$) from both reference areas. EPT = Ephemeroptera (mayfly), Plecoptera (stonefly), and Trichoptera (caddisfly).

Figure 6.3: Correspondence Analysis (CA) Scatterplot for Benthic Invertebrate Relative Densities at Lower Minto Creek and Associated Reference Areas, Minto Mine, 2018

Notes: Relative taxa densities were 4th root transformed before CA calculations. Taxa present at two or fewer stations or accounted for less than 10% of the total abundance at any station were removed from the analysis.

6.2 Correlation Analysis

Correlation analysis between seven benthic indices and three supporting measurements resulted in seven significant correlations at a p-level of 0.050, of which three were significant at the Bonferroni-corrected p-level of 0.0024 (Table 6.2). It is important to consider that illustration of a significant or suggestive degree of correlation between two variables does not necessarily imply a cause-and-effect relationship, although it is cause to investigate further and to consider known biological responses to environmental differences.

All three correlations significant at the Bonferroni-corrected p-level were with specific conductance (Table 6.2, Figure 6.4). Bray-Curtis index and percent Plecoptera were positively correlated and CA Axis-1 was negatively correlated with specific conductance (Table 6.2, Figure 6.4). High specific conductance is a mine influence but the CA Axis-1 score indicates both areas are separated by Ephemeroptera and Plecoptera organisms. These species are typically associated with being sensitive to pollution so positive associations suggest limited mine influence.

6.3 Temporal Comparisons

Temporal comparisons of the benthic invertebrate community condition of lower Minto Creek were made in order to augment data interpretation, but their power was tempered by temporal changes in sampling location, sampling methodology, level of replication, and analytical processing techniques. Baseline data (1994) were collected near the mouth of Minto Creek as three single grab samples, 2006 data were collected at Station W2 in the same manner, 2008 and 2010 data were collected at Station W2 as three-grab composites whereas 2011 to 2018 data were collected as five replicate three-grab samples from a large area upstream of Station W2. Only in the later years (2011 to 2018) do data represent an area (i.e., lower Minto Creek) rather than a station. In addition, data collected in 2013 to 2018 were sieved using 500 µm mesh as recommended for federal EEM (Environment Canada 2012), whereas all years prior to 2011 used 250 µm (both mesh sizes were used in 2012 to assist in transition). This was expected to result in lower densities from 2013 and later.

Benthic invertebrate density at lower Minto Creek in 2018 was the highest observed over the 2012 to 2018 period (500 µm) and within the natural variability (Figure 6.5). Number of taxa at lower Minto Creek in 2018 was lower than in 1994 and within the historical range from 2006 onwards (Figure 6.5). Simpson's Evenness was within the historical range documented after methodological change in 2011 (Figure 6.5). Over the 2012 to 2018 period, benthic invertebrate community metrics were stable.

Table 6.2: Correlations between Benthic Invertebrate Metrics and Supporting Environmental Measurements at Minto Mine WUL, 2018

		Temperature (°C)	Specific Conductivity (µS/cm)	pH

Figure 6.5: Primary Benthic Invertebrate Community Metrics at Lower Minto Creek, 1994 to 2018

Notes: Data presented as mean ± standard deviation where replicated. Asterisk (*) indicates a year the mine was not discharging.

6.4 Summary

The erosional benthic invertebrate community of lower Minto Creek differed from reference communities for Bray-Curtis index, percent EPT, Plecoptera, Ephemeroptera, and Chironomids, and CA Axis-1 and Axis-2. A potential decrease in number of taxa from 2012 to 2014 identified in previous reporting (Minnow 2015) appears to have been natural variability since number of taxa increased from 2014 to 2016 and decreased in 2018 (Minnow 2015, 2016, 2017). Bray-Curtis index shows lower Minto Creek has a different community composition than the reference areas, but the CA Axis-1 indicates that the differences are between pollution sensitive organisms (Ephemeroptera and Plecoptera). The similarity of the benthic community of lower Minto Creek to reference communities and the temporal stability in the benthic community of lower Minto Creek suggest limited mine influence.

7 TISSUE CHEMISTRY

7.1 Overview

As indicated in Section 2.6, tissue chemistry data are provided here simply to report the ancillary data collected along with the selenium data reported separately. Data interpretation were therefore limited to basic comparisons of metal concentrations in tissue collected at the exposure area (lower Minto Creek) to those collected at reference creeks (lower Wolverine and lower Big creeks).

7.2 Periphyton Tissue

The quality of periphyton tissue data was assessed prior to data analysis and interpretation, and was assessed as good (Appendix A).

Concentrations of eight analytes in periphyton tissue were significantly greater at lower Minto Creek than at both reference areas (Table 7.1, Appendix Table C.2). Analytes of concern such as copper and selenium were significantly different from both reference (Table 7.1). No significant differences were observed between areas for selenium in 2013 (Figure 7.1), whereas from 2014 to 2018, periphyton selenium concentrations were significantly greater at lower Minto Creek than at the reference areas (only between lower Big Creek in 2017; Figure 7.1). Significantly higher concentrations of selenium at lower Minto Creek compared to reference areas over the last three years suggest an influence of the mine on Minto Creek.

7.3 Benthic Invertebrate Tissue

Benthic invertebrate tissue data quality were assessed prior to data analysis and interpretation, and were judged to be of good quality, with the exception that field duplicate samples lacked close agreement for several analytes (Appendix A). Of the analytes that lacked close agreement, only two analytes differed significantly at lower Minto Creek compared to both references areas (Figure 7.1, Appendix A).

Four analytes had significantly higher concentrations of benthic invertebrate tissue at lower Minto Creek compared to both reference areas (Table 7.1, Appendix Table C.3). Cadmium, cobalt, and rubidium were significantly lower at Minto Creek and bismuth was intermediate between reference areas (Table 7.1, Appendix Table C.3). Selenium in benthic invertebrate tissue was significantly higher at lower Minto Creek compared to lower Big Creek but did not differ significantly when compared to lower Wolverine Creek (Table 7.1, Figure 7.2, Appendix Table C.3). Selenium concentration has previously been significantly higher at lower Minto Creek compared to either reference since 2014, except in 2016 when lower Minto Creek was significantly lower than lower Wolverine Creek (Figure 7.2). Selenium at all areas were below guidelines indicating limited mine

Indicates a mean concentration in lower Minto Creek that is significantly different than the mean concentration in lower Wolverine Creek (ANOVA; p = 0.050).

Indicates a mean concentration in lower Minto Creek that is significantly different than the mean concentration in lower Big Creek (ANOVA; p = 0.050).

Indicates a mean concentration in lower Minto Creek that is significantly different than the mean concentration in lower Wolverine and lower Big creeks (ANOVA; p = 0.050).

^a Benthic invertebrate tissue data were normalized by log transformation (ANOVA, p = 0.050).

^b Periphyton tissue data were normalized by log transformation (ANOVA, p = 0.050).

^c Benthic invertebrate tissue data were analyzed using a non-parametric Wilcoxon Score Test (p = 0.050).

^d Periphyton tissue data were analyzed using a non-parametric Wilcoxon Score Test (p = 0.050).

^e Benthic invertebrate tissue data were analyzed using a Kruskal-Wallis test (p = 0.050).

^f Periphyton tissue data were analyzed using a Kruskal-Wallis test (p = 0.050).

Figure 7.1: Periphyton Tissue Selenium Concentrations, 2012 to 2018

Notes: Mean concentrations at exposure areas that differ significantly ($p < 0.05$) within year from a reference area are marked with an "a" for differences relative to lower Wolverine Creek and "b" for differences relative to lower Big Creek, $n = 5$, except in lower Minto and lower Big creeks in 2012 ($n = 1$). Unfilled circles represent samples $<$ laboratory reporting limits.

Figure 7.2: Benthic Invertebrate Tissue Selenium Concentrations, 2012 to 2018

Notes: Mean concentrations at exposure areas that differ significantly ($p < 0.05$) within year from a reference area are marked with an "a" for differences between lower Wolverine Creek and "b" for differences between lower Big Creek, $n = 5$, except in 2012 ($n = 1$). Statistics not conducted in 2012 due to low sample size. Unfilled circles represent samples $<$ laboratory reporting limits.

influence. Concentration of copper at lower Minto Creek was not significantly different from lower Wolverine and lower Big creeks. Variability in concentrations of copper in benthic invertebrate tissue has been high among years. In 2013, 2016, and 2017 copper was significantly higher in benthic invertebrates from lower Minto Creek compared to lower Wolverine Creek, but in 2014 and 2018 copper was not significantly different among areas (Figure 7.3). In 2015, copper was significantly lower at lower Minto Creek compared to lower Big Creek (Figure 7.3). This lack of consistency suggests observed differences likely represent natural variability.

Figure 7.3: Benthic Invertebrate Tissue Copper Concentrations, 2012 to 2018

Notes: Mean concentrations at exposure areas that differ significantly ($p < 0.05$) within year from a reference area are marked with an "a" for differences relative to lower Wolverine Creek and "b" for differences relative to lower Big Creek, $n = 5$, except in 2012 ($n = 1$). Statistics not conducted in 2012 due to low sample size. Unfilled circles represent samples < laboratory reporting limits.

8 CONCLUSIONS AND RECOMMENDATIONS

8.1 Conclusions

The Minto Mine sediment, periphyton, and benthic assessment undertaken from September 5 to 12, 2018 serves to compare water quality (field measures and chemistry), sediment quality, periphyton and benthic invertebrate community, and tissue quality of Minto Creek to reference creeks and previous data.

Supporting measures collected in September 2018 indicated good Minto Creek water quality. The influence of the Minto Mine was evident in higher specific conductance and pH than in reference creeks; however, water quality met SSWQO. Concentration of total copper at upper Minto Creek was above CWQG and higher than at reference areas but dissolved copper was below the SSWQO. Moving downstream, copper concentrations at lower Minto Creek were below CWQG but concentrations were above CWQG at reference areas. Mean concentrations of chlorophyll-a at lower Minto and lower Wolverine creeks were not significantly different and were below BCWQG. In 2018, trophic status in lower Minto and lower Wolverine creeks were classified as mesotrophic, differing from 2017 where lower Minto and lower Wolverine creeks were classified as mesotrophic and oligotrophic, respectively (Dodds et al. 1998).

Concentrations of metals in Minto Creek sediments were similar to reference and lower than sediment quality guidelines with the exception of copper. Concentrations of copper in Minto Creek (both upper and lower) were greater than the sediment quality guideline and reference, but were similar to concentrations observed in previous years. Sediment toxicity testing of *C. dilutus* indicated an adverse survival response in lower Minto Creek sediment when compared to the laboratory control and the field reference (lower Wolverine Creek) sediment. However, no growth response was observed, nor were there responses to survival and growth in tests of *H. azteca*.

Periphyton community evaluated on the basis of biomass ($\mu\text{g}/\text{cm}^2$) indicated significant differences in a number of metrics in lower Minto Creek relative to the lower Wolverine Creek reference. In general, lower Minto Creek had a significantly lower density, higher evenness, and different community structure compared to lower Wolverine Creek. However, inconsistent periphyton community summary metrics and community composition among years at both lower Minto Creek and lower Wolverine Creek indicated substantial temporal variability. The differences observed in the periphyton communities of lower Minto Creek and lower Wolverine Creek in 2018 were within natural temporal variability and do not provide any resolution of potential mine influence.

The erosional benthic invertebrate community of lower Minto Creek differed from both references on the basis of Bray-Curtis index but not density, taxon richness, Simpson's Diversity, or

Simpson's Evenness. The CA Axis analysis suggested that the Bray-Curtis index separated lower Minto Creek and reference areas by differing Ephemeroptera and Plecoptera species. High temporal variability has been observed at the exposure and reference areas (e.g., Minnow 2015, 2016, 2017, 2018a), presumably due to inter-annual variability in environmental conditions (e.g., flow, ice scour).

Concentration of selenium in periphyton tissue collected at mine-exposed lower Minto Creek was significantly higher than at both reference areas. Selenium concentrations were only significantly higher in benthic invertebrate tissue at lower Minto Creek when compared to lower Big Creek. High concentration of selenium in periphyton and benthic invertebrate tissue over time could indicate a mine influence but concentrations were below the benthic invertebrate guideline for the protection of aquatic life indicating no effects would be expected.

8.2 Recommendations

Based on results and conclusions of the 2018 Minto Mine sediment, periphyton, and benthic assessment, it is recommended that the program is repeated in 2019. It is recommended that both lower Wolverine Creek and lower Big Creek continue to be sampled as reference areas for the benthic invertebrate community assessment to provide perspective on whether any of the observed differences are actually due to mine influence or simply due to natural differences among creeks. It is also recommended that periphyton community monitoring be removed from the WUL monitoring program as results are highly variable and are not effective in determining potential mine-related effects.

A1 INTRODUCTION

This Data Quality Review (DQR) provides an evaluation of data collected as part of the 2018 Minto Creek Sediment, Periphyton, and Benthic Invertebrate Community Assessment Report. The objective of the DQR is to define the overall quality of the data presented in the report, and, by extension, the confidence with which the data can be used to derive conclusions.

A1.1 Background

A variety of factors can influence the chemical and biological measurements made in an environmental study and thus affect the accuracy and/or precision of the data. Inconsistencies in sampling or laboratory methods, use of instruments that are inadequately calibrated or which cannot measure to the desired level of accuracy or precision, and contamination of samples in the field or laboratory are just some of the potential factors that can lead to the reporting of data that do not accurately reflect actual environmental conditions. Depending on the magnitude of the problem, inaccuracy or imprecision have the potential to affect the reliability of any conclusions made from the data. Therefore, it is important to ensure that monitoring programs incorporate appropriate steps to control the non-natural sources of data variability (i.e., minimize the variability that does not reflect natural spatial and temporal variability in the environment) and thus assure the quality of the data.

Data quality as a concept is meaningful only when it relates to the intended use of the data. That is, one must know the context in which the data will be interpreted in order to establish a relevant basis for judging whether or not the data set is adequate. The DQR involves comparison of actual field and laboratory measurement performance to data quality objectives (DQOs) established for a particular study, such as evaluation of laboratory reporting limits (LRL), blank sample data, data precision (based on field and laboratory duplicate samples), and data accuracy (based on matrix spike recoveries and/or analysis of standards or certified reference materials). Trusted analytical laboratories certified by Canadian Association for Laboratory Accreditation (CALA) with rigorous internal quality assurance programs were selected to ensure the highest possible quality.

DQOs were established either at the outset of the field program or by the laboratories and reflect reasonable and achievable performance expectations. The LRLs were set at the outset of the field program for water, sediment, and tissue quality. Only results that were below the LRL were evaluated against target detection limits. Target detection limits should be at least as low as applicable guidelines, ideally $\leq 1/10$ th guideline values. Tissue samples were compared to the LRL the laboratory quoted they could achieve. Programs involving a large number of samples and analytes usually result in some analytes that exceed the DQOs. This

is particularly so for multi-element scans (e.g., ICP scans for metals) since the analytical conditions are not necessarily optimal for every element included in the scan. Generally, scan results may be considered acceptable if no more than 20% of the parameters fail to meet the DQOs. Overall, the intent of comparing data to DQOs was not to reject any measurement that did not meet the DQO, but to ensure that any questionable data received more scrutiny to determine what effect, if any, this had on interpretation of results within the context of this project.

A1.2 Types of Quality Control Samples

Several types of quality control (QC) samples were assessed based on samples collected (or prepared) in the field and laboratory. These samples included the following:

- **Blanks** are samples of de-ionized water and/or appropriate reagent(s) that are handled and analyzed the same way as regular samples. These samples will reflect any contamination that occurred in the field (in the case of field or travel blanks) or the laboratory (in the case of laboratory or method blanks). Analyte concentrations should be non-detectable although a DQO of twice the LRL allows for slight “noise” around the LRL.
- **Field Duplicates** are sub-sample pairs collected from a randomly selected field station using identical collection and handling methods that are then analyzed separately in the laboratory. The duplicate samples are handled and analyzed in an identical manner in the laboratory. The data from field duplicate samples reflect natural variability, as well as the variability associated with sample collection methods, and therefore provide a measure of field precision.
- **Laboratory Duplicates** are sub-sample pairs created in the laboratory from randomly selected field samples which are sub-sampled and then analyzed independently using identical analytical methods. The laboratory duplicate sample results reflect any variability introduced during laboratory sample handling and analysis and thus provide a measure of laboratory precision.
- **Spike Recovery Samples** are created in the laboratory by adding a known amount/concentration of a given analyte (or mixture of analytes) to a randomly selected test sample previously divided to create two sub-samples. The spiked and regular sub-samples are then analyzed in an identical manner. The spike recovery represents the difference between the measured spike amount (total amount in spiked sample minus amount in original sample) relative to the known spike amount (as a percentage). Two types of spike recovery samples are commonly analyzed. Spiked blanks (or blank spikes) are created using laboratory control materials whereas matrix spikes are

created using field-collected samples. The analysis of spiked samples provides an indication of the accuracy of analytical results.

- **Certified Reference Materials** are samples containing known chemical concentrations that are processed and analyzed along with batches of environmental samples. The sample results are then compared to target results to provide a measure of analytical accuracy. The results are reported as the percent of the known amount that was recovered in the analysis.

The following QC was applied to benthic invertebrate community samples as follows:

- **Organism Recovery Checks** for benthic invertebrate community samples involve the re-processing of previously sorted material from a randomly selected sample to determine the number of invertebrates that were not recovered during the original sample processing. The reprocessing is conducted by an analyst not involved during the original processing to reduce any bias. This check allows the determination of accuracy through assessment of recovery efficiency.
- **Laboratory Subsamples** are community samples prepared by the laboratory to ensure that the fraction of the total sample examined was actually an accurate representation of the total number of organisms. By comparing the amount recovered between at least two sub-samples, one can assess the analytical precision. In addition, comparisons of the sub-samples from the whole community sample allows for an evaluation of sub-sampling accuracy.

A2 WATER SAMPLES

A2.1 Laboratory Reporting Limits

The LRL for total mercury and total zinc were higher than targeted LRL but were lower than guideline levels (Table A.1). Therefore, data for this project can be reliably interpreted relative to guidelines.

A2.2 Laboratory Blank Sample Analysis

Three blank samples were detectable including nitrate, total aluminum, and total barium (Appendix B). Under ALS's DQO, nitrate was considered reliable and total aluminum and barium limits of reporting were adjusted (Appendix B). The samples were associated with no inadvertent contamination of samples within the laboratory during analysis.

A2.3 Data Precision

Relative percent differences (RPDs) between field duplicate samples were greater than 25% for 12 analytes including total suspended solids, turbidity, total phosphorus, and total aluminum, chromium, copper, iron, selenium, silicon, sulfur, titanium, and dissolved cadmium (Table A.2). These differences could be due to multi-element scans but only 12% of the field duplicate samples failed the DQO, therefore the samples were associated with good field precision.

Agreement was achieved between all laboratory duplicate samples (Appendix B). This indicates that samples were associated with good analytical precision.

A2.4 Data Accuracy

Analyte recoveries for spiked blanks all met the DQO indicating excellent analytical accuracy for the water sample analyses (Appendix B).

The analyte recoveries for matrix spiked samples failed to meet the DQO for ten analytes including dissolved organic carbon, total inorganic and organic carbon, and total and dissolved barium, calcium, magnesium, manganese, sodium, strontium, and dissolved sulphur. Recovery of these analytes could not be accurately calculated due to high analyte background in the samples. The matrix spiked samples indicate good analytical accuracy for the water sample analyses (Appendix B).

Recoveries of certified reference materials all met the DQO indicating excellent analytical accuracy (Appendix B).

A3 SEDIMENT SAMPLES

A3.1 Laboratory Reporting Limits

Results for six analytes were reported as less than LRL but had no associated guidelines. Analytes with guidelines were all detectable indicating that the data can be reliably interpreted.

A3.2 Laboratory Blank Sample Analysis

All blank samples contained non-detectable analyte concentrations indicating no inadvertent contamination of samples within the laboratory during analysis (Appendix C).

A3.3 Data Precision

The RPD between field duplicate samples had 35% of samples that exceeded the DQO (Table A.3). The analytes that exceeded the DQO were loss on ignition, particle size, total Kjeldahl nitrogen, carbon analytes, and total copper, manganese, potassium, selenium, and thallium. High field variability can also be observed in replicate samples within areas. This will be considered during interpretation of the results.

Agreement was achieved between all laboratory duplicate samples as the RPDs were lower than the laboratory DQO (Appendix C). This indicates that reported sample results were associated with excellent analytical precision.

A3.4 Data Accuracy

Analyte recoveries for spiked blanks all met the DQO indicating excellent analytical accuracy for the sediment sample analyses (Appendix C).

Recoveries of all analytes in certified reference materials met the DQO (Appendix C). These data indicated excellent analytical accuracy associated with the analysis of sediment samples.

Table A.3: Field Duplicate Results for Analysis of Sediment Quality, Minto Mine, 2018

Analytes		Units	Lab Report L2163149		
			LMC-3	LMC-3X	RPD (%)
			10-Sep-2018	10-Sep-2018

	Total Uranium (U)	mg/kg	1.6	1.1	33
	Total Vanadium (V)	mg/kg	59	57	3.4
	Total Zinc (Zn)	mg/kg	53	64	19

 > 40% Relative Percent Difference (RPD).

A4 SEDIMENT TOXICITY TESTING

Results for the reference toxicant tests for both the 10-day *Chironomus dilutus* and the 14-day *Hyalella azteca* tests were within the acceptability range for organism performance of mean and two standard deviations (Appendix C – Nautilus Environmental Report). Water quality parameters remained within the acceptability criteria throughout testing. The sensitivity of the organisms was deemed to be appropriate when compared to historical results obtained by the laboratory (Appendix C – Nautilus Environmental Report).

A5 PERIPHYTON COMMUNITY

Close agreement was achieved between laboratory duplicate samples for both density (cells/cm²; Table A.4) and biomass (µg/cm²; Table A.5). This indicates that data can be reliably interpreted.

Table A.4: Laboratory Duplicate Results for Analysis of Periphyton Group Density (cells/cm²)

Algal Density (cells/cm ²)	LWC-3	LWC-3R	RPD (%)
Cyanobacteria	2,297	3,015	27
Bacillariophyceae	46,655	46,799	0.31
Total	48,952	49,813	1.7

 > 30% Relative Percent Difference (RPD).

Table A.5: Laboratory Duplicate Results for Analysis of Periphyton Group Biomass (µg/cm²)

Algal Biomass (µg/cm ²)	LWC-3	LWC-3R	RPD (%)
Cyanobacteria	4.2	5.1	19
Bacillariophyceae	25	24	4.7
Total	29	29	0.94

 > 30% Relative Percent Difference (RPD).

A6 BENTHIC INVERTEBRATE COMMUNITY

Two re-sorted samples met the objective for percent organism recovery; both of which had a percent recovery of 98% (Table A.6). All benthic invertebrate samples were analyzed whole except for LMC-5 (50%; Table A.7), and sub-sampling variability was required. Sub-sampling of sample LMC-5 met the DQO of 20% (Table A.8). This indicates that the data can be reliably interpreted.

Table A.6: Percent Sorting Efficiency of Benthic Invertebrates, Minto Mine, 2018

Station	Initial Sort	Re-sort	Percent sorting efficiency ^a
LBC-2	57	1	98%
LWC-5	154	3	98%

 Sorting efficiency < 90%.

^a Percent sorting efficiency = $(1 - (\# \text{ in QA/AC re-sort} / (\# \text{ sorted originally} + \# \text{ in QA/QC re-sort}))) * 100$.

Table A.7: Percent of Benthic Invertebrate Sample Analyzed for Each Station, Minto Mine, 2018

Area	Station				
	1	2	3	4	5
LWC	100%	100%	100%	100%	100%
LBC	100%	100%	100%	100%	100%
LMC	100%	100%	100%	100%	50%

Table A.8: Percent Subsampling Error for Benthic Invertebrate Samples, Minto Mine, 2018

Sample	Number of organisms in fraction 1 (50%)	Number of organisms in fraction 2 (50%)	Actual density	Precision (range of RPD %) ^a		Accuracy (range expressed as %) ^b	
LMC-5	375	356	731	5.1	5.1	2.6	2.6

 Value exceeded the < 20% data quality objective.

^a Relative percent difference (RPD) among subsamples.

^b Range of deviation of abundance estimates derived from sub-samples compared to analysis of entire sample (expressed as % of total organisms present).

A7 TISSUE SAMPLES

A7.1 Laboratory Reporting Limits

Four periphyton tissue analytes were below LRLs and did not meet target detection limits, including boron, selenium, tellurium, and tin (Table A.9). Target concentrations are not based on guidelines; rather represent detection limits quoted by the laboratory.

Four benthic invertebrate tissue analytes were below LRLs and did not meet targets: total bismuth, boron, tellurium, and tin. For each analyte, 6 out of 16 samples exceeded targets (Table A.10). Target concentrations are not guidelines but represent detection limits quoted by the laboratory. Data for this project can be reliably interpreted.

All chlorophyll-a periphyton samples were detectable and interpretable.

A7.2 Laboratory Blank Sample Analysis

Periphyton (chlorophyll-a, tissue) blank samples contained non-detectable analyte concentrations indicating no inadvertent contamination of samples within the laboratory during analysis (Appendix C). Benthic invertebrate tissue blank samples contained non-detectable analyte concentrations except for two samples, percent moisture, and chromium (Appendix C). Fewer than 20% of the field duplicate samples failed the DQO and samples were associated with good field precision.

A7.3 Data Precision

Periphyton field duplicate samples showed close agreement among analytes except for two analytes: cesium and selenium. Only 5.7% of the field duplicate samples failed the DQO and samples were associated with good field precision (Table A.11).

Laboratory duplicate periphyton tissue samples showed good agreement among all duplicate analyte concentrations (Appendix C). Periphyton samples were associated with good analytical precision.

Benthic invertebrate field duplicate samples did not meet the DQO for most analytes (Table A.12). Tissue samples can be highly variable (consistent with field replicates) and this will be considered when analyzing the data.

The RPD between the field duplicate periphyton chlorophyll-a samples was 22%, indicating that the data was associated with good laboratory precision (Table A.13).

Table A.9: Laboratory Reporting Limits (LRL) for Periphyton Tissue Samples Relative to Targets, Minto Mine, 2018 ^a

Analyte	Units	Method Detection Limits	
		Target	Achieved
Total Boron (B)	mg/kg ww	0.20	1.0 - 2.0
Total Selenium (Se)	mg/kg ww	0.010	0.10 - 0.20
Total Tellurium (Te)	mg/kg ww	0.0040	0.020 - 0.040
Total Tin (Sn)	mg/kg ww	0.020	0.10 - 0.20

 Target LRL were exceeded.

^a Only analytes with reported values less than LRL were presented.

Table A.10: Laboratory Reporting Limits (LRL) for Benthic Invertebrate Tissue Samples Relative to Targets, Minto Mine, 2018 ^a

Analyte	Units	Method Detection Limits	
		Target	Achieved
Total Bismuth (Bi)	mg/kg ww	0.0020	0.0020 - 0.0060

Chlorophyll-a	mg/m ²	374	465	22

 > 30% Relative Percent Difference (RPD).

A7.4 Data Accuracy

Analyte recoveries for spiked blanks all met the DQO indicating excellent analytical accuracy for periphyton (chlorophyll-a, tissue) and benthic invertebrate tissue (Appendix C).

Certified reference material met the DQO for periphyton and benthic invertebrate tissue indicating good analytical accuracy (Appendix C).

A8 DATA QUALITY STATEMENT

Water, periphyton tissue and community, and benthic community data were all of good quality compared to DQO indicating that they can be reliably interpreted. Sediment was of good quality but field variability was high. Lack of agreement between field duplicate benthic invertebrate tissue samples were observed. Over 20% of the analytes measured for benthic invertebrate duplicate tissue samples had RPDs that were greater than 30%, failing the DQO. However, variability within an area for sediment and benthic invertebrate samples is common and the basis for statistical contrasts, and is therefore considered when analyzing the data. The overall quality of data for this project was good to serve the project objectives.

Table B.6: Explanatory Notes for Selected Water Quality Guidelines, Minto Mine WUL, 2018

Analyte		Water Quality Guidelines	Unit	CCME ^a
Physical, anion and nutrient analytes	Total Ammonia	0.41	mg/L	Ammonia guideline is based on highest field pH of 8.32 and highest temperature of 6.3°C
	Fluoride	0.12	mg/L	Guideline is an interim level
Total Metals	Aluminum	0.10	mg/L	Guideline is based on pH of > 6.5
	Cadmium	0.00012 / 0.0014 ^b	mg/L	Guideline is based on lowest hardness of 68.1 mg/L
	Chromium	0.0010	mg/L	Guideline is based hexavalent chromium (Cr VI)
	Copper	0.0020	mg/L	Guideline is based on lowest hardness of 68.1 mg/L
	Lead	0.0020	mg/L	Guideline is based on lowest hardness of 68.1 mg/L
	Nickel	0.071	mg/L	Guideline is based on lowest hardness of 68.1 mg/L
	Zinc	0.024 / 0.11 ^b	mg/L	Guidelines are based on 25% percentile hardness, pH, and DOC

Water quality guideline not met.

Water use licence objectives not met.

^a CCME (Canadian Council of Ministers of the Environment). 1999. Canadian Environmental Quality Guidelines. 1999 (plus updates), Canadian Council of Ministers of the Environment, Winnipeg. See Appendix Table B.6 for explanatory notes on selected water quality guidelines.

^b Based on lowest guideline using highest pH.

^c Based on lowest guideline using lowest hardness.

^d Based on guideline using 25th percentile of hardness, DOC, and field pH.

^e Dissolved Cadmium (µg/L) guidelines based on the following formula using the lowest hardness: $e^{(0.736(\ln(\text{Hardness})-4.943))}$.

^f Dissolved copper water quality objective depends on concentration of dissolved organic carbon (DOC). If DOC is > 10 mg/L/ DOC is ≤ 10 mg/L.

Water quality guideline not met.

Water use licence objectives not met.

^a CCME (Canadian Council of Ministers of the Environment). 1999. Canadian Environmental Quality Guidelines. 1999 (plus updates), Canadian Council of Ministers of the Environment, Winnipeg. See Appendix Table B.6 for explanatory notes on selected water quality guidelines.

^b Based on lowest guideline using highest pH.

^c Based on lowest guideline using lowest hardness.

^d Based on guideline using 25th percentile of hardness, DOC, and field pH.

^e Dissolved Cadmium (µg/L) guidelines based on the following formula using the lowest hardness: $e^{(0.736(\ln(\text{Hardness})-4.943))}$.

^f Dissolved copper water quality objective depends on concentration of dissolved organic carbon (DOC). If DOC is > 10 mg/L/ DOC is ≤ 10 mg/L.

Table B.8: Concentration of Chlorophyll-a Measured at Five Benthic Stations in Lower Wolverine and Lower Minto Creeks, Minto Mine WUL, 2018

Lower Wolverine Creek (Reference)		Lower Minto Creek (Exposed)	
Station	mg/m ²	Station	mg/m ²
LWC-1	5.2	LMC-1	52
LWC-2	9.7	LMC-2	56
LWC-3	9.6	LMC-3	83
LWC-4	5.0	LMC-4	28
LWC-5	187	LMC-5	57
Mean	43	Mean	55
Standard Deviation	80	Standard Deviation	20

 Chlorophyll-a exceeded the BCWQG of 100 mg/m².

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Total Inorganic Carbon	MS-B	L2161443-1, -2
Matrix Spike	Total Inorganic Carbon	MS-B	L2161443-1, -2
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2161443-1, -2
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2161443-1, -2
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2161443-1, -2
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2161443-1, -2
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2161443-1, -2
Matrix Spike	Barium (Ba)-Total	MS-B	L2161443-1, -2
Matrix Spike	Calcium (Ca)-Total	MS-B	L2161443-1, -2
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2161443-1, -2
Matrix Spike	Sodium (Na)-Total	MS-B	L2161443-1, -2
Matrix Spike	Strontium (Sr)-Total	MS-B	L2161443-1, -2

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
BR-L-IC-N-WR	Water	Bromide in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CARBONS-TIC-VA	Water	Total inorganic carbon by CO2 purge	APHA 5310B TOTAL ORGANIC CARBON (TOC)
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".			
CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310B TOTAL ORGANIC CARBON (TOC)
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
CN-T-CFA-VA	Water	Total Cyanide in water by CFA	ISO 14403:2002
This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.			
EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
F-IC-N-WR	Water	Fluoride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)

Reference Information

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-PRES-COL-VA Water Total P in Water by Colour APHA 4500-P Phosphorus

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is determined colourimetrically after persulphate digestion of the sample.

Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples.

Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis.

P-TD-COL-VA Water Total Dissolved P in Water by Colour APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Dissolved Phosphorus is determined colourimetrically after persulphate digestion of a sample that has been lab or field filtered through a 0.45 micron membrane filter.

Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples.

Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

TURBIDITY-VA Water Turbidity by Meter APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

Reference Information

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WR	ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

1 of 1

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lw - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Nitrate (as N)	B	L2163084-1, -2, -4
Method Blank	Aluminum (Al)-Dissolved	MB-LOR	L2163084-1, -2, -3, -4
Method Blank	Barium (Ba)-Dissolved	MB-LOR	L2163084-1, -2, -3, -4
Matrix Spike	Dissolved Organic Carbon	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Dissolved Organic Carbon	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Total Inorganic Carbon	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Total Inorganic Carbon	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Total Inorganic Carbon	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Total Organic Carbon	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Total Organic Carbon	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Barium (Ba)-Total	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Calcium (Ca)-Total	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Manganese (Mn)-Total	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Sodium (Na)-Total	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Strontium (Sr)-Total	MS-B	L2163084-1, -2, -3, -4
Matrix Spike	Ammonia, Total (as N)	MS-B	L2163084-1, -2, -3, -4

Qualifiers for Individual Parameters Listed:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
HTD	Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
BR-L-IC-N-WR	Water	Bromide in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
CARBONS-TIC-VA	Water	Total inorganic carbon by CO2 purge	APHA 5310B TOTAL ORGANIC CARBON (TOC)
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".			
CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310B TOTAL ORGANIC CARBON (TOC)
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".			
CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)

Reference Information

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

CN-T-CFA-VA Water Total Cyanide in water by CFA ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

F-IC-N-WR Water Fluoride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 µm), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-PRES-COL-VA Water Total P in Water by Colour APHA 4500-P Phosphorus

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is determined colourimetrically after persulphate digestion of the sample.

Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples.

Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis.

P-TD-COL-VA Water Total Dissolved P in Water by Colour APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Dissolved Phosphorus is determined colourimetrically after persulphate digestion of a sample that has been lab or field filtered through a 0.45 micron membrane filter.

Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples.

Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

TURBIDITY-VA Water Turbidity by Meter APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
AREA SAMPLED-VA	Biota	Area Sampled (cm2)	Not Applicable
CHLOROA-F-VA	Biota	Chlorophyll a in Biota by Fluorometer	EPA 445.0

This analysis is done using procedures adapted from EPA Method 445.0. Chlorophyll-a is determined by a routine acetone extraction followed with analysis by fluorometry using the non-acidification procedure. This method is not subject to interferences from chlorophyll b. Note: Biota samples are typically submitted as scrapings on a filter.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Arsenic (As)	DUP-H	L2163149-1, -10, -11, -2, -3, -4, -5, -7, -8, -9
Duplicate	Cobalt (Co)	DUP-H	L2163149-1, -10, -11, -2, -3, -4, -5, -7, -8, -9
Duplicate	Copper (Cu)	DUP-H	L2163149-1, -10, -11, -2, -3, -4, -5, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-TIC-PCT-SK	Soil	Total Inorganic Carbon in Soil A known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.	CSSS (2008) P216-217
C-TOC-CALC-SK	Soil	Total Organic Carbon Calculation Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon. (TIC)	CSSS (2008) 21.2
C-TOT-LECO-SK	Soil	Total Carbon by combustion method The sample is ignited in a combustion analyzer where carbon in the reduced CO2 gas is determined using a thermal conductivity detector.	CSSS (2008) 21.2
HG-200.2-CVAF-VA	Soil	Mercury in Soil by CVAAS Soil samples are digested with hot nitric and hydrochloric acids, followed by CVAAS analysis. This method is fully compliant with the BC SALM strong acid leachable metals digestion method.	EPA 200.2/1631E (mod)
IC-CACO3-CALC-SK	Soil	Inorganic Carbon as CaCO3 Equivalent	Calculation
LOI-420-SK	Soil	Loss on Ignition @ 420 C The dry-ash method involves the removal of organic matter by combustion at 420OC for 2 hours. Samples are dried prior to combustion. Reference: McKeague, J.A. Soil Sampling and Methods of Analysis. Can. Soc. Soil Sci.(1978) method 3.81	CSSS (1978) METHOD 3.81
MET-200.2-CCMS-VA	Soil	Metals in Soil by CRC ICPMS This method uses a heated strong acid digestion with HNO3 and HCl and is intended to liberate metals that may be environmentally available. Silicate minerals are not solubilized. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, Tl, V, W, and Zr. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. Analysis is by Collision/Reaction Cell ICPMS.	EPA 200.2/6020A (mod)
N-TOTKJ-COL-SK	Soil	Total Kjeldahl Nitrogen The soil is digested with sulfuric acid in the presence of CuSO4 and K2SO4 catalysts. Ammonia in the soil extract is determined colorimetrically at 660 nm.	CSSS (2008) 22.2.3
PH-1:2-VA	Soil	pH in Soil (1:2 Soil:Water Extraction) This analysis is carried out in accordance with procedures described in the pH, Electrometric in Soil and Sediment method - Section B Physical/Inorganic and Misc. Constituents, BC Environmental Laboratory Manual 2007. The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water. The pH of the solution is then measured using a standard pH probe.	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL
PSA-PIPET+GRAVEL-SK	Soil	Particle size - Sieve and Pipette Particle size distribution is determined by a combination of techniques. Dry sieving is performed for coarse particles, wet sieving for sand particles and the pipette sedimentation method for clay particles. Reference: Burt, R. (2009). Soil Survey Field and Laboratory Methods Manual. Soil Survey Investigations Report No. 5. Method 3.2.1.2.2. United States Department of Agriculture Natural Resources Conservation Service.	SSIR-51 METHOD 3.2.1

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-TIC-PCT-SK	Soil	Total Inorganic Carbon in Soil A known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.	CSSS (2008) P216-217
C-TOC-CALC-SK	Soil	Total Organic Carbon Calculation Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon. (TIC)	CSSS (2008) 21.2
C-TOT-LECO-SK	Soil	Total Carbon by combustion method The sample is ignited in a combustion analyzer where carbon in the reduced CO ₂ gas is determined using a thermal conductivity detector.	CSSS (2008) 21.2
HG-200.2-CVAF-VA	Soil	Mercury in Soil by CVAAS Soil samples are digested with hot nitric and hydrochloric acids, followed by CVAAS analysis. This method is fully compliant with the BC SALM strong acid leachable metals digestion method.	EPA 200.2/1631E (mod)
IC-CACO3-CALC-SK	Soil	Inorganic Carbon as CaCO ₃ Equivalent	Calculation
LOI-420-SK	Soil	Loss on Ignition @ 420 C The dry-ash method involves the removal of organic matter by combustion at 420OC for 2 hours. Samples are dried prior to combustion. Reference: McKeague, J.A. Soil Sampling and Methods of Analysis. Can. Soc. Soil Sci.(1978) method 3.81	CSSS (1978) METHOD 3.81
MET-200.2-CCMS-VA	Soil	Metals in Soil by CRC ICPMS This method uses a heated strong acid digestion with HNO ₃ and HCl and is intended to liberate metals that may be environmentally available. Silicate minerals are not solubilized. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, Tl, V, W, and Zr. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. Analysis is by Collision/Reaction Cell ICPMS.	EPA 200.2/6020A (mod)
N-TOTKJ-COL-SK	Soil	Total Kjeldahl Nitrogen The soil is digested with sulfuric acid in the presence of CuSO ₄ and K ₂ SO ₄ catalysts. Ammonia in the soil extract is determined colorimetrically at 660 nm.	CSSS (2008) 22.2.3
PH-1:2-VA	Soil	pH in Soil (1:2 Soil:Water Extraction) This analysis is carried out in accordance with procedures described in the pH, Electrometric in Soil and Sediment method - Section B Physical/Inorganic and Misc. Constituents, BC Environmental Laboratory Manual 2007. The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water. The pH of the solution is then measured using a standard pH probe.	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL
PSA-PIPET+GRAVEL-SK	Soil	Particle size - Sieve and Pipette Particle size distribution is determined by a combination of techniques. Dry sieving is performed for coarse particles, wet sieving for sand particles and the pipette sedimentation method for clay particles. Reference: Burt, R. (2009). Soil Survey Field and Laboratory Methods Manual. Soil Survey Investigations Report No. 5. Method 3.2.1.2.2. United States Department of Agriculture Natural Resources Conservation Service.	SSIR-51 METHOD 3.2.1

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

SUMMARY

Sample and Test Type Information

Sample ID	LMC and LWC
Sample collection date	September 5 to 11, 2018
Sample receipt date	September 13, 2018
Sample receipt temperature	6.8°C
Test types	14-d <i>Hyaella azteca</i> survival and growth 10-d <i>Chironomus dilutus</i> survival and growth

Results

Endpoint (mean + SD)	Sample ID		
	Control Sediment	LWC	LMC
<i>H. azteca</i> survival	96.0 ± 5.5	100 ± 0.0	94.0 ± 5.5
<i>H. azteca</i> growth	0.21 ± 0.02	0.26 ± 0.06	0.27 ± 0.02
<i>C. dilutus</i> survival	92.0 ± 4.5	88.0 ± 8.4	70.0 ± 12.2*, α
<i>C. dilutus</i> growth	2.20 ± 0.09	2.64 ± 0.51	2.98 ± 0.31

SD = Standard Deviation

(*) Indicates a statistically significant effect relative to the control sediment

(α) Indicates a statistically significant effect relative to reference sediment LWC

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted freshwater sediment toxicity tests for Minnow Environmental Inc. on samples identified as LMC and LWC. The samples were collected on September 5, 9, 10 and 11, 2018; each sample was transported in five 500-mL glass container and delivered to laboratory in Burnaby, BC on September 13, 2018. The samples had a temperature of 6.8°C on receipt and were stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. A 14-d *Hyalella azteca* and a 10-d *Chironomus dilutus* survival and growth sediment toxicity test was conducted on the samples and the test results are provided in this report. Copies of laboratory data sheets and printouts of statistical analyses for the tests are provided in Appendices A and B, analytical chemistry is provided in Appendix C and the chain-of-custody form is provided in Appendix D.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 and 2. Testing was conducted according to procedures described by Environment Canada (1997 and 2017). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Ammonia concentrations were measured in-house three times per week on reference sediment sample LWC to ensure that un-ionized ammonia was below 0.2 mg/L (Environment Canada, 2017). Samples of overlying water were also collected at test initiation and termination, and sent to ALS Environmental, Burnaby, BC for measurements of total ammonia concentration. Analytical results are provided in Appendix C.

Table 1. Summary of test conditions: *Hyalella azteca* survival and growth test.

Test species	<i>Hyalella azteca</i>
Organism source	Aquatic BioSystems, Fort Collins, CO
Organism age	2- to 9-days old
Test type	Static
Test duration	14 days
Test vessel	375-mL glass container
Test volume	100 mL sediment; 175 mL overlying water
Test replicates	5 per sample
Number of organisms	10 per replicate
Control/dilution water	Reconstituted water
Test solution renewal	None
Test temperature	23 ± 1°C
Feeding	0.75 mL of YCT and 1.35 mg of Tetramin per replicate daily
Light intensity	500 to 1000 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	Continuous gentle aeration
Test measurements	Temperature, dissolved oxygen, pH and conductivity of overlying water measured daily; hardness, alkalinity and total ammonia of overlying water measured at test initiation and termination; unionized ammonia measured three times weekly in overlying water of reference sample
Test protocol	Environment Canada (2017), EPS 1/RM/33
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival and dry weight
Test acceptability criteria for controls	≥80% survival and ≥0.1 mg/amphipod dry weight
Reference toxicant	Sodium chloride (NaCl)

Table 2. Summary of test conditions: *Chironomus dilutus* survival and growth test.

Test species	<i>Chironomus dilutus</i>
Organism source	Aquatic BioSystems, Fort Collins, CO
Organism age	Third instar
Test type	Static
Test duration	10 days
Test vessel	375-mL glass container
Test volume	100 mL sediment; 175 mL overlying water
Test replicates	5 per sample
Number of organisms	10 per replicate
Control/dilution water	Reconstituted water
Test solution renewal	None
Test temperature	23 ± 1°C
Feeding	6 mg of Tetramin per replicate daily
Light intensity	500 to 1000 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	Continuous gentle aeration
Test measurements	Temperature, dissolved oxygen, pH and conductivity of overlying water measured daily; hardness, alkalinity and total ammonia of overlying water measured at test initiation and termination
Test protocol	Environment Canada (1997), EPS 1/RM/32
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival and dry weight
Test acceptability criteria for controls	≥70% survival and ≥0.6 mg/worm dry weight
Reference toxicant	Potassium chloride (KCl)

3.0 RESULTS

No adverse effects was observed on either the survival or growth of *H. azteca* compared to the control sediment or the reference sediment LWC (Table 3). Sample LMC was significantly different on the survival of *C. dilutus* compared to both the control and reference sediment (Table 4); there were no significant effects observed on dry weight.

Measured total ammonia concentrations in the *H. azteca* and *C. dilutus* tests are summarized in Table 5. These concentrations were at levels that are not expected to cause adverse effects to

either species. Un-ionized ammonia measurements on the reference sediment sample were below 0.2 mg/L throughout the *H. azteca* test; therefore, renewal of the overlying water was not required (Environment Canada, 2017).

Table 3. Results: *Hyaella azteca* survival and growth test.

Sample ID	Mean $\pm$ SD	
	Survival (%)	Average Dry Weight (mg/org)
Control Sediment	96.0 $\pm$ 5.5	0.21 $\pm$ 0.02
LWC	100 $\pm$ 0.0	0.26 $\pm$ 0.06
LMC	94.0 $\pm$ 5.5	0.27 $\pm$ 0.02

SD = Standard Deviation

Table 4. Results: *Chironomus dilutus* survival and growth test.

Sample ID	Mean $\pm$ SD	
	Survival (%)	Average Dry Weight (mg/org)
Control Sediment	92.0 $\pm$ 4.5	2.20 $\pm$ 0.09
LWC	88.0 $\pm$ 8.4	2.64 $\pm$ 0.51
LMC	70.0 $\pm$ 12.2*, α	2.98 $\pm$ 0.31

SD = Standard Deviation

(*) Indicates a statistically significant effect relative to the control sediment

(α) Indicates a statistically significant effect relative to reference sediment LWC

Table 5. Summary of total overlying ammonia concentrations (mg/L N) measured in the toxicity tests.

Sample ID	<i>Hyaella azteca</i>		<i>Chironomus dilutus</i>	
	Day 0	Day 14	Day 0	Day 10
Control Sediment	0.0096	1.66	0.0096	0.223
LWC	0.0708	0.0869	0.0708	1.01
LMC	0.390	0.0625	0.390	0.068

4.0 QA/QC

The health histories of the test organisms used in the exposures were acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviations around the means.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 7. Results for these tests fell within the acceptable range for organism performance of mean and two standard deviations, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate.

Table 6. Reference toxicant test results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>H. azteca</i>	Survival (LC50): 6.6 g/L NaCl	5.8 (5.0–6.8)	8	September 28, 2018
<i>C. dilutus</i>	Survival (LC50): 7.1 g/L KCl	5.0 (2.9 – 8.6)	28	September 28, 2018

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration

APPENDIX B – *Chironomus dilutus* Toxicity Test Data

Chironomus dilutus Sediment Test Summary Sheet

Client: Milnow Environmental Inc.
 Work Order No.: 181544

Start Date: Sept 28/18
 Set up by: KOL

Sample Information:

Sample ID: LMC and LWC
 Sample Date: Sept 5, 9-11, 2018
 Date Received: Sept 13, 2018
 Sample Volume: 5x 500 mL per sample

Test Organism Information:

Species: C. dilutus
 Supplier: Aquatic Biosystems, CO
 Date received: Sept 27/18
 Age or size (Day 0): 3rd in-star

KCI Reference Toxicant Results:

Reference Toxicant ID: ca #A154 CT 70
 Stock Solution ID: n/a
 Date Initiated: Sept 28/18

96-h LC50 (95% CL): ca 6.7-1 (5.0-10.6)

96-h LC50 Reference Toxicant Mean and Range: ca 5.8 (5.0-6.8) CV (%): ca 8 28
2-98 5.0 (2.9-8.6)

Test Results:

Sample ID	Survival $\pm$ SD (%)	Average Dry Wt. $\pm$ SD (mg)
Control Sediment	92.0 $\pm$ 4.5	2.20 $\pm$ 0.09
LWC	88.0 $\pm$ 8.4	2.64 $\pm$ 0.51
LMC	70.0 $\pm$ 12.2*, α	2.98 $\pm$ 0.31
	$\pm$	$\pm$
	$\pm$	$\pm$
	$\pm$	$\pm$
	$\pm$	$\pm$

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
---------------	--------	------------------	--------------------

HG-WET-MICR-CVAF-VA Tissue Mercury in Tissue by CVAFS Micro (WET) EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-WET-CCMS-MID-VA Tissue Metals in Tissue by CRC ICPMS (WET) EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-MICR-VA Tissue Moisture in Tissue Puget Sound WQ Authority, Apr 1997

This analysis is carried out gravimetrically by drying the sample at <60 deg. C.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

1 of 2

2 of 2

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Chromium (Cr)-Total	B	L2163138-1, -2, -3, -4

Qualifiers for Individual Parameters Listed:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
DLIS	Detection Limit Adjusted: Insufficient Sample

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7
This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.			
MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8
Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.			
Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.			
MOISTURE-BIOPSY-VA	Tissue	Moisture Content (low weight) in tissue	Puget Sound WQ Authority, Apr 1997
This analysis is carried out gravimetrically by drying the sample at <60 deg. C for a minimum of three days.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

					LBC	0.028	-
				LWC	LBC	0.002	-

Note: Magnitude of Difference = (group 1 mean - group 2 mean)/pooled standard deviation.

Highlighted values indicate significance differences; p-value < 0.10.

Effect size magnitude > 2.

^a ANOVA= Analysis of Variance; K-W = Kruskal-Wallis

^b Pairwise comparisons calculated using Least-squares means with Tukey's adjustment for multiple comparisons for ANOVAs and Dunn's Test with no adjustment for K-W

Table E.4: Correspondence Analysis Axis Station Scores Using Benthic Invertebrate Abundances at the Lowest Practical Level of Taxonomic Resolution

Area	CA Axis-1 (42.3%)	CA Axis-2 (14.7%)
LWC-1	0.336	0.302
LWC-2	0.803	1.80
LWC-3	0.716	0.0486
LWC-4	0.461	0.329
LWC-5	0.380	-0.0579
LBC-1	0.351	-0.468
LBC-2	0.230	-0.257
LBC-3	0.570	-0.717
LBC-4	0.777	-0.901
LBC-5	0.744	-0.243
LMC-1	-1.01	0.328
LMC-2	-1.28	0.272
LMC-3	-1.08	-0.227
LMC-4	-1.12	-0.228
LMC-5	-0.880	0.0205

Notes: Relative taxon densities were 4th root transformed before CA calculation.

Taxa present at two or fewer stations or accounted for less than 10% of the total abundance at any station were removed from the analysis.

Notes: The intermediate axis is measured perpendicular to the longest axis and is the axis in which the substrate rolls downstream. Embeddedness refers to how deeply the rock is surrounded or buried by other substrate.

Sample Reception

On September 25, 2018, Cordillera Consulting received 15 from Minnow Environmental. When samples arrived to Cordillera Consulting, exterior packaging was initially inspected for damage or wet spots that would have indicated damage to the interior containers.

Samples were logged into a proprietary software database (INSTAR1) where the clients assigned sample name was recorded along with a Cordillera Consulting (CC) number for cross-reference. Each sample was checked to ensure that all sites and replicates recorded on field sheets or packing lists were delivered intact and with adequate preservative. Any missing, mislabelled or extra samples were reported to the client immediately to confirm the total numbers and correct names on the sample jars. The client representative was notified of the arrival of the shipment and provided a sample inventory once intake was completed.

See table below for sample inventory:

Table 1: Summary of sample information including Cordillera Consulting (CC) number

Site	Sample	CC#	Date	Size	# of Jars
LMC	LMC-1	CC191354	9/11/2018	500µM	1

Sample Sorting

- Using a gridded Petri dish, fine forceps and a low power stereo-microscope (Olympus, Nikon, Leica) the sorting technicians removed the invertebrates and sorted them into family/orders.
- The sorting technician kept a running tally of total numbers excluding organisms from Porifera, Nemata, Platyhelminthes, Ostracoda, Copepoda, Cladocera and terrestrial drop-ins such as aphids. These organisms were marked for their presence (given a value of 1) only and left in the sample. They were not included towards the 300-organism subsample count.
- Where specimens are broken or damaged, only heads were counted.
- Subsampling was conducted with the use of a Marchant Box.
- When using the Marchant box, cells were extracted at the same time in the order indicated by a random number table. If the 300th organism was found part way into sorting a cell then the balance of that cell was sorted. If the organism count had not reached 300 by the 50th cell then the entire sample was sorted.
- The total number of cells sorted and the number of organisms removed were recorded manually on a bench sheet and then recorded into INSTAR1
- Organisms were stored in vials containing 80% ethanol and an interior label indicating the site names, date of sampling, site code numbers and portion subsampled. This information was also recorded on the laboratory bench sheet and on INSTAR1.
- The sorted portion of the debris was preserved and labeled separately from the unsorted portion and was tested for sorting efficiency (Sorting Quality Control – Sorting Efficiency). The unsorted portion was also labeled and preserved in separate jars.

Percent sub-sampled and total countable invertebrates pulled from the samples were summarized in the table below.

Table 2: Percent sub-sample and invertebrate count for each sample

Sample	Date	CC#	500 micron fraction	
			% Sampled	# Invertebrates
LMC-1	11-Sep-18	CC191354	100%	539
LMC-2	06-Sep-18	CC191355	100%	230
LMC-3	06-Sep-18	CC191356	100%	62
LMC-4	06-Sep-18	CC191357	100%	367
LMC-5	06-Sep-18	CC191358	50%	367
LBC-1	07-Sep-18	CC191359	100%	188

LBC-2	07-Sep-18	CC191360	100%	57
LBC-3	07-Sep-18	CC191361	100%	365
LBC-4	07-Sep-18	CC191362	100%	191
LBC-5	07-Sep-18	CC191363	100%	292
LWC-1	10-Sep-18	CC191364	100%	221
LWC-2	10-Sep-18	CC191365	100%	26
LWC-3	08-Sep-18	CC191366	100%	126
LWC-4	08-Sep-18	CC191367	100%	174
LWC-5	08-Sep-18	CC191368	100%	154

Sorting Quality Control - Sorting Efficiency

As a part of Cordillera's laboratory policy, all projects undergo sorting efficiency checks.

- As sorting progresses, 10% of samples were randomly chosen by senior members of the sorting team for resorting.
- All sorters working on a project had at least 1 sample resorted by another sorter.
- An efficiency of 90 % was expected (95% for CABIN samples).
- If 90/95% efficiency was not met, samples from that sorter were resorted.
- To calculate sorting efficiency the following formula was used:

$$\frac{\#OrganismsMissed}{TotalOrganismsFound} * 100 = \%OM$$

Table 3: Summary of sorting efficiency

CC #	Number of Organisms Recovered (initial sort)	Number of Organisms in Re-sort	Percent Recovery
CC191360	57	1	98%
CC191368	154	3	98%
Average Recovery			98%

Sorting Quality Control - Sub-Sampling QC

Certain Provincial and Mining projects require additional sorting checks in the form of sub-sampling QC, (Environmental Effects Monitoring (EEM) protocol). This ensured that any fraction of the total sample that was examined was actually an accurate representation of the number of total organisms. Organisms from the additional sub-samples were not identified; rather total organism count only was compared.

Sub-Sampling efficiency was measured on 10% of the number of sub-sampled samples in the project. Ex. In a project where 50 of 100 total samples were processed through subsampling using a Marchant box, then 10% of 50; or 5 samples were used for sub sampling efficiency.

Sub-Sampling efficiency was performed by fractioning the entire sample into sub-sample percentages. On each sub-sampled portion, a total organism count was recorded and compared to the rest of the sub-samples. In order to pass, all fractions were required to be within 20% of total organism count.

Example: If 300 organisms are found in 10% of the sample, the sorter will continue to sample in 10% fractions until the entire sample is separated. They will then count the total number of organisms in each of the 10 fractions of 10% and compare the organism count.

When divergence is >20% the sorting manager examines for the source of the problem and takes steps to correct it. With the Marchant box, the problem typically rested with how the box is flipped back to the upright position. For this reason subsampling was performed by experienced employees only. Another common source of area would be the type of debris in the sample. Samples with algae or heavy with periphyton have a higher incident of failure due to clumping than clear samples.

Table 4: Summary of Sub Sample efficiency

Station ID		Organisms in Subsample																				Sorter		Actual Total	Precision Error		Accuracy Error	
CC#	Sample Name																					By	Time		Min (%)	Max (%)	Min (%)	Max (%)
191358	LMC-5	375	356																			DS	140	731	5.07	5.07	2.60	2.60

Taxonomic Effort

The next procedure was the identification to genus-species level where possible of all the organisms in the sample.

- Identifications were made at the genus/species level for all insect organisms found including Chironomidae (Based on CABIN protocol).
- Non-insect organisms (except those not included in CABIN count) were identified to genus/species where possible and to a minimum of family level with intact and mature specimens.
- The Standard Taxonomic Effort lists compiled by the CABIN manual¹, SAFIT², and PNAMP³ were used as a guide line for what level of identification to achieve where the condition and maturity of the organism enabled.
- Organisms from the same families/order were kept in separate vials with 80% ethanol and an interior label of printed laser paper.
- Chironomidae was identified to genus/species level where possible and was aided by slide mounts. CMC-10 was used to clear and mount the slide.
- Oligochaetes was identified to family/genus level with the aid of slide mounts. CMC-10 was used to clear and mount the slide.
- Other Annelida (leeches, polychaetes) were identified to the family/genus/species level with undamaged, mature specimens.
- Mollusca was identified to family and genus/species where possible
- Decapoda, Amphipoda and Isopoda were identified at family/genus/species level where possible.
- Bryozoans and Nemata remained at the phylum level
- Hydrachnidae and Cnidaria were identified at the family/genus level where possible.
- When requested, reference collections were made containing at least one individual from each taxa listed. Organisms represented will have been identified to the lowest practical level.
- Reference collection specimens were stored in 55 mm glass vials with screw-cap lids with polyseal inserts (museum quality). They were labeled with taxa name, site code, date identified and taxonomist name. The same information was applied to labels on the slide mounts.

Taxonomic QC

The taxonomists for this project were certified by the Society of Freshwater Science (SFS) Taxonomic Certification Program at level 2 which is the required certification for CABIN projects:

Scott Finlayson: Group 1 General Arthropods (East/West); Group 2 EPT (East/West);
Group 3 Chironomidae (East/West); Group 4 Oligochaeta

Adam Bliss: Group 1 General Arthropods (East/West); Group 2 EPT (East/West);
Group 3 Chironomidae

Rita Avery: Group 1 General Arthropods (East/West); Group 2 EPT (East/West)

Taxonomic Keys

Below is a reference list of taxonomic keys utilized by taxonomists at Cordillera Consulting. Cordillera taxonomists routinely seek out new literature to ensure the most accurate identification keys are being utilized. This is not reflective of the exhaustive list of resources that we use for identification. A more complete list of taxonomic resources can be found at Southwest Association of Freshwater Invertebrate Taxonomists. (2015).

1. Introduction

Minto Explorations Ltd. (MEL), a wholly owned subsidiary of Capstone Mining Corp., owns and operates the Minto Mine, a high-grade copper mine, located approximately 240 km northwest of Whitehorse, Yukon Territory (Figure 1-1). The project is located within Selkirk First Nation (SFN) Category A Settlement Land Parcel R6A, and is centered at approximately 62°37'N latitude and 137°15'W longitude. The Minto Mine commenced commercial operation in October 2007 and is permitted to conduct mining and milling operations at a rate of 4,200 tonnes of ore per day (tpd). Some of the Minto ore deposits (copper/gold/silver) currently being mined are located in the upper reaches of the Minto Creek watershed approximately 12 km to the west of the Minto Creek confluence with the Yukon River (Figure 1-2). As of November 2018, Minto is under temporary closure and all mining activity is ceased. The mine is under care and maintenance and is still bound to complying with the Water Use License requirements.

MEL is required, under the terms of its water use license #QZ14-031 (Amendment 1), to conduct an aquatic environmental monitoring program, of which this fisheries monitoring program in Minto Creek is a component. This current report provides details of the monitoring conducted during the open water season in 2018 and the results of the work undertaken. This program was carried out under DFO Scientific Collection Licence number XR 187 2018.

2. Previous Studies

Numerous studies on fisheries and fish habitat have been conducted over the recent history of the Minto Mine. These studies are summarized chronologically in Table 2-1, below.

Table 2-1: Minto Creek Fish Investigations

Year	Months	Purpose of Study	Conducted by
1994	June, August, September	Baseline Collection	Hallam Knight Piesold (HKP)
2006	September	Baseline Collection	Access Consulting Group (ACG)
2007	May, June, August, September	Environmental Effects Monitoring Study Design Development	ACG / Minnow Environmental (Minnow)
2008	June, September	Environmental Effects Monitoring, Cycle I	ACG / Minnow
2009	June, July	Monitoring	ACG
2009	September, October	Fish Re-location	ACG
2010	June - October	Juvenile Chinook Salmon Mark-recapture program, compliance Monitoring	ACG
2011	July - October	Environmental Effects Monitoring Cycle II, Compliance Monitoring	ACG, Minnow
2011	July, August	EEM Cycle II – Growth Trials	ACG, Minnow
2012	May - September	Compliance Monitoring Se in tissue study	ACG, MEL (Minto Exploration Ltd.)
2013-2015	May - October	Compliance Monitoring	ACG/AEG, MEL
2016	June - September	Compliance Monitoring	MEL, AEG
2017	June – September	Compliance Monitoring	MEL

Attempts to collect fish in lower Minto Creek while conducting the Phase 1 Metal Mining Effluent Regulation (MMER), Environmental Effects Monitoring (EEM) study in 2008 resulted in the capture of no fish during the entire fisheries program (June – September). This is consistent with the findings of previous fish investigations conducted in the creek (HKP 1994; R&D 2006, 2007). Fish use of Minto Creek is transient and likely short-lived, as has been found in other non-natal chinook rearing creeks (Walker 1976; Scrivener et al. 1994).

The majority of fish previously using the creek system are juvenile chinook salmon (*Onchorynchus tshawytscha*), as determined by the above investigations. Other species that have been found in the creek in low numbers include round whitefish (*Prosopium cylindraceum*), Arctic grayling (*Thymallus arcticus*), Slimy sculpin (*Cottus cognatus*) and Burbot (*Lota lota*). Of these, only slimy sculpin have been captured on a regular basis.

Juvenile chinook salmon (JCS) have never been encountered in the creek before July and their numbers tend to peak in late August or early September. Moreover, the mark-recapture investigation conducted in 2010 on JCS indicates that use of the creek is transient. The majority of JCS using the system stay in the creek for about two to three weeks or less.

A summary of past fish sampling results in Minto Creek is presented in Table 2-2.

Table 2-2: Summary of Fish captures in Minto Creek between 2008 and 2017

Year	Method	Effort	Summary Statistics	Units	Juvenile Chinook Salmon	All Other Species
2008	Backpack Electrofishing	796 secs	Catch	#	1	0
			CPUE	Fish/min	0.075	0
	Baited Gee Minnow Trapping	28.6 days	Catch	#	18	0
			CPUE	Fish/day	0.63	0
2009	Baited Gee Minnow Trapping	28.6 days	Catch	#	136	142
			CPUE	Fish/day	4.76	4.97
2010	Baited Gee Minnow Trapping	145.9 days	Catch	#	2293	2307
			CPUE	Fish/day	15.72	15.81
2011	Baited Gee Minnow Trapping	71 days	Catch	#	12	29
			CPUE	Fish/day	0.17	0.41
2012	Backpack Electrofishing	1051 secs	Catch	#	0	4
			CPUE	Fish/min	0	0.23
	Baited Gee Minnow Trapping	43 days	Catch	#	3	6
			CPUE	Fish/day	0.07	0.14
2013	Backpack Electrofishing	3402 secs	Catch	#	0	4
			CPUE	Fish/min	0	0.07
	Baited Gee Minnow Trapping	62.5 days	Catch	#	121	7
			CPUE	Fish/day	1.94	0.11
2014	Baited Gee Minnow Trapping	70.2 days	Catch	#	151	3
			CPUE	Fish/day	2.15	0.04
2015	Baited Gee Minnow Trapping	67.3 days	Catch	#	6	0
			CPUE	Fish/day	0.089	0
2016	Baited Gee Minnow Trapping	69.3 days	Catch	#	6	0
			CPUE	Fish/day	0.086	0
2017	Baited Gee Minnow Trapping	43.3 days	Catch	#	0	0
			CPUE	Fish/day	0.000	0

JCS presence in Minto creek was observed to be influenced by mine water discharge. During non-discharge periods, and prior to operations (baseline), numbers of JCS and other species of fish in the system were found to be very low. In contrast, during the two major discharge events (2009 and 2010), numbers of JCS were 20 to 30 times higher in the system (see Table 2-3 below), indicating that they may

have been attracted into the system as a likely result of a more consistent temperature and flow regime associated with mine water discharge. Numbers of other species of fish during discharge events did not increase. It is important to note however, that numbers of other species using the system has been consistently very low, prior to mine development and during operations.

Table 2- 3: Maximum Catch per Unit Effort (CPUE) of Juvenile Chinook Salmon in Minto Creek using baited Minnow traps 1994-2018

Year	Month	JCS – CPUE (#fish/trap-day)*	Minto Creek Conditions
1994	September	0	Pre-development – no discharge
2008	September	0.9	Operational – no discharge
2009	September/October	20.0	Discharge
2010	August	30.0	Discharge
2011	September	0.43	No discharge – high TSS contribution from tributary
2012	September	0.19	No discharge – high TSS contribution from tributary
2013	October	5.01	Operational – no discharge
2014	September	5.05	Operational – no discharge
2015	July	0.30	Operational – no discharge
2016	July	0.30	Operational – no discharge
2017	June-September	0.00	Discharge only during June trapping

**CPUE calculated for actual 24-hr period (rather than nominal 24-hr period)*

Minto Creek does not provide preferred spawning habitat for fish because it completely freezes during winter months with no flow in lower Minto Creek. Accordingly, there is no evidence of spawning in Minto Creek (HKP 1994; R&D 2006, 2007), nor is there traditional knowledge indicating spawning occurred in the system (HKP 1994). Lower Minto Creek is also subject to low or zero flow conditions during periods in the summer when a portion (or all) of the flow sometimes infiltrates the ground, preventing the establishment of resident fish populations in this section of the stream. A natural barrier to fish passage exists at approximately km 1.2 upstream in Minto Creek from the Yukon River, therefore limiting fish use upstream of the barrier. This barrier is largely comprised of organic debris and can be considered to be temporary as it will likely degrade over time, although it has been consistently observed since it was first

characterized in 2010. Sampling effort has been applied upstream of the barrier during every sampling event since 2010 and resulted in no fish capture. New temporary barriers may also be established in any given year and could occur both upstream and further downstream of the current barrier location. The canyon located upstream of the current barrier however, is a permanent barrier to fish passage due to its high gradient, thus limiting fish habitat to the lower 2.0 km of the system.

Water temperatures tend to remain cooler in Minto Creek than in the Yukon River. This likely deters fish, in particular JCS, from entering the system until creek temperatures approach or equilibrate with the Yukon River. Minto Creek is subject to large diurnal fluctuations in temperature (up to 5°C or more) throughout the open water season. This daily variation is not ideal for fish and may limit their interest in using the creek for rearing.

Creek bottom substrate is comprised mostly of fines (silt/sand) with limited cobble/gravel sections which are more desirable for fish. In addition, significant input of suspended solids from a tributary in 2011 and 2012 may have further limited the use of the system by JCS during those years.

Bottom substrate at the mouth of Minto Creek and at the Yukon River confluence consists primarily of silt and mud which is not considered suitable substrate for salmonid spawning (grayling, salmon etc.). Aerial surveys for spawning fish were conducted in 2011, 2012, 2013 and 2014, and no adult fish were observed spawning near the Minto Creek/Yukon River confluence. No signs were present during the surveys that this area is used for spawning (such as redds or carcasses).

Starting in 2012, the compliance monitoring program included sampling efforts in Big Creek, which serves as a reference site. The same fish species as in Minto Creek were generally observed in Big Creek, and the CPUE has normally been slightly higher in Big Creek. Table 2-4 summarizes fish captures in Big Creek from 2012 to 2017.

Table 2-4: Summary of Fish captures in Big Creek in 2012 to 2017

Year	Method	Effort	Summary Statistics	Units	Juvenile Chinook Salmon	All Other Species
2012	Backpack Electrofishing	273 secs	Catch	#	1	23
			CPUE	Fish/min	0.22	5.05
	Baited Gee Minnow Trapping	11.8 days	Catch	#	7	2
			CPUE	Fish/day	0.59	0.17
2013	Backpack Electrofishing	911 secs	Catch	#	0	27
			CPUE	Fish/min	0	1.78
	Baited Gee Minnow Trapping	14.8 days	Catch	#	19	2
			CPUE	Fish/day	1.28	0.14
2014	Baited Gee Minnow Trapping	16.4 days	Catch	#	96	3
			CPUE	Fish/day	5.86	0.18
2015	Baited Gee Minnow Trapping	17.1 days	Catch	#	58	5
			CPUE	Fish/day	3.39	0.15
2016	Baited Gee Minnow Trapping	22.2	Catch	#	51	11
			CPUE	Fish/day	2.30	0.49
2017	Baited Gee Minnow Trapping	13.4	Catch	#	27	8
			CPUE	Fish/day	2.01	0.60

3. Objectives

The objectives of the 2018 Fisheries Monitoring Program were to monitor, assess and characterize fish usage in Minto Creek during the open water season, and to provide data for the interpretation of the potential role and influence of the Minto Mine on the fish community. The 2018 fisheries program was a continuation of the previous year's components and targeted all species that have previously been encountered, as well as any new species. As part of the monitoring program since 2012, assessments at Big Creek were made concurrently with sampling in Minto Creek, to compare fish use in a neighboring system relative to Minto Creek. Fish monitoring studies were conducted in support of the requirements of Water Use License QZ14-031.

4. Methodology

4.1 Fish Monitoring

Fish monitoring of Minto Creek and Big Creek was conducted monthly during open water season, from June to September 2018, at trapping sites consistent with the 2010 mark-recapture study and the 2011 to 2017 fish monitoring programs (Figure 4-1). Capture effort included the use of Gee-type Minnow traps with 0.635 cm wire mesh size, baited with Yukon River origin chinook salmon roe. 2 to 15 minnow traps were set during each sampling event in Minto Creek, depending on water levels and availability of pools and backwater areas. Four traps were set during each event in Big Creek, near the Minto access road bridge.

All fish captured were identified, enumerated and measured for fork length or total length (± 1 mm), inspected for abnormalities, and released in the vicinity of their trapping location. JCS were also weighed (± 0.01 g) prior to being released.

Additional supporting information collected included:

- photo-documentation of the creek,
- water level readings at station W1 staff gauge,
- in situ water parameters in Minto Creek, Big Creek and the Yukon River - temperature, dissolved oxygen, conductivity, pH, ORP,
- flow discharge measured at W1, and once at MC1 due to W1 being dry in July.
- weather conditions at time of sampling.

Continuous temperature loggers (TidbiT) were deployed in the Yukon River and Big Creek for the duration of the project, however the Tidbit from the Yukon river was found to be out of the water on some visits due to low water and human interference. A Levellogger recorded continuous temperature and stage in Minto Creek. Supporting variables also included monitoring of the previously identified fish barrier (1.2 km upstream of the Yukon River confluence) and/or any new barriers that may have developed.

Selected photographs documenting field activities and site conditions are presented in Appendix A.

Figure 4-1: Minto Creek and Big Creek Fisheries Monitoring Stations

5. Results

The following sections present the fisheries statistics and effort in Minto Creek and Big Creek between June and September 2018.

5.1 Fish Usage and Distribution

5.1.1 Minto Creek

Minto Creek was assessed monthly between June and September 2018. No fish were captured in Minto Creek in 2018. A portion of Minto Creek was found to be dry during the fish monitoring event from June and August 2018, which could have played an important role in preventing fish movement up and down Minto Creek. The following table (Table 5-1) presents the effort applied and the summary of fish capture in Minto Creek in 2018.

Table 5-1: Summary Statistics of Minnow Trapping in Minto Creek

Month	Effort (trap-hours)	Effort(trap-days)	Juvenile Chinook Salmon (<i>Onchoryhnchus tshawytscha</i>)	
			Results	CPUE*
June	308	12.8	0	0
July	47.7	2	0	0
August	154.5	6.4	0	0
September	342	14.3	0	0
Total	852.1	41.9	0	0

* CPUE = fish/trap-day (for actual 24-hr period)

5.1.2 Big Creek

Fisheries sampling effort in Big Creek was initiated in June, and conducted monthly until September, concurrent with sampling in Minto Creek, resulting in the capture of 32 fish, 30 of which were JCS. JCS were captured in all sampling events in 2018, with highest numbers fourteen (14) captured in September. In addition, two (2) slimy sculpin were captured during the 2018 sampling season.

The average catch per unit effort for JCS in Big Creek was 0.081 JCS/trap-day and was highest in August (0.152 JCS/trap-day). In comparison, the average JCS CPUE (June to September) in 2017 was higher at 0.090 JCS/trap-day and was as high as 0.165 JCS/trap-day in August 2017. The following table (Table 5-2) presents the effort undertaken and the resulting fish capture in Big Creek in 2018.

Table 6-2: Summary Statistics of Minnow Trapping in Big Creek in 2018

Month	Effort (trap-hours)	Effort (trap-days)	Juvenile Chinook Salmon (<i>Onchoryhnchus tshawytscha</i>)		Slimy Sculpin (<i>Cottus cognatus</i>)	
			Results	CPUE*	Results	CPUE*
June	94	3.9	7	0.074	0	0
July	93.3	3.9	2	0.022	2	0.022
August	90	3.8	7	0.078	0	0
September	92	3.8	14	0.152	0	0

*CPUE = fish/trap-day (for actual 24-hr period)

Figure 5-1 presents a comparison between monthly JCS capture and CPUE in Minto Creek and Big Creek for 2018.

Figure 5-1: Monthly JCS capture in Minto Creek and Big Creek, 2018

5.2 Fish Metrics

Fork lengths of JCS captured in Big Creek ranged from 35 to 82 mm and their weights ranged from 0.98 to 7.40g. There was a notable difference between the JCS lengths and widths during each sampling event. The JCS observed in June were smaller than the JCS captured in September. The lengths and weights observed throughout the season were consistent with 0+ aged fish (young of year).

Figure 5-2 presents the monthly averages for both creeks. Individual results for all fish captured are presented in Appendix B.

Figure 5-2: Average JCS length (fork) in Big Creek, 2018

5.3 Water Quality Parameters

In situ data was collected in Minto Creek at station W2, and Big Creek (bridge) during each site visit and results are summarized in Table 5-3. In situ data was also collected at the Yukon River (W4) during the June, July and September sampling events. In situ parameters were collected with a YSI Professional Plus multimeter, which was calibrated prior to each trip.

Table 7-3: In situ data from Minto Creek, Big Creek, and Yukon River, 2018

Site	Date	Time	Temperature (°C)	Dissolved Oxygen (%)	Dissolved Oxygen (m/L)	Specific Conductance (µS/cm)	pH
Minto Creek	24-Jun-18	13:55	11.7	103.9	11.28	7.69	160.9
	21-Jul-18	15:45	5.6	57.2	6.91	7.34	195.1
	18-Aug-18	15:05	5	111.6	14.09	7.89	200.4
	15-Sep-18	16:28	1.4	90.8	12.71	8.07	237.2
Big Creek	24-Jun-18	15:55	5.8	102.9	12.87	7.98	165
	20-Jul-18	14:25	11.8	105.4	11.42	8.16	150.8
	18-Aug-18	11:15	8.6	109.8	12.81	7.74	182.1
	15-Sep-18	14:35	3.4	90.1	11.98	7.71	188.4

	20-Jul-18	14:50	13.8	103.4	10.67	7.96	159.6
	18-Aug-18	15:00	11.8	119	12.56	7.95	207.8
	15-Sep-18	14:55	6.4	95.3	11.73	7.77	164.1

Tidbit water temperature loggers were deployed in the Yukon River at station W4 (between the barge landing and the mouth of Minto Creek) and in Big Creek (near the bridge) during the open water season, while a continuous logger located at W1 records the water temperature and stage of lower Minto Creek.

Figure 5-3 presents the three temperature curves. This figure indicates that the temperature of Minto Creek is generally colder than that of the Yukon River. The average difference in water temperature over this period between the Yukon River and Big Creek was 2.73°C, while the difference between Big Creek and Minto Creek was 5.94°C.

As shown in figure 5-3 sections of Minto creek ran dry during the fisheries monitoring season. The Yukon river tidbit was also found out of the water on occasion during the season.

The 2018 data record does not indicate that the water temperature of Minto Creek equilibrated with that of the Yukon River during the 2018 open water season, although this has occasionally been observed to happen for a short period in June in the past. In 2013 for example, the maximum water temperature observed in Minto Creek was 15.7°C in late June, at which time the temperature of the Yukon River was very similar. In 2014 and 2015 however, the water temperature in Minto Creek did not exceed 10.6°C and 9.7°C respectively, and did not reach equilibrium with the Yukon River. In 2018 the maximum water temperature observed in Minto Creek was 9.0°C.

Figure 5-3: Water Temperature, Minto Creek, Big Creek, and Yukon River, 2018

Figure 5-4 presents Total Suspended Solids (TSS) values measured at W2 from June 6th to September 26th, 2018; the dotted line indicates the decreasing trend. As shown in the graph the creek ran dry from July 10th to August 9th and from August 19-22nd during the 2018 Fisheries program season.

Figure 5-4: Total Suspended Solids (mg/L) measured at W2 in 2018

W2 TSS records for the open water season from 2011 to 2018 are presented in Figure 5-5 for comparison.

Figure 5-5: Total Suspended Solids (mg/L) measured at W2 during open water, 2011 to 2018

5.4 Stage and Discharge

The staff gauge located at W1 in Minto Creek was read during each trip, and discharge was measured at W1 with a Hach FH950 electromagnetic flow meter. A continuously logging water level and temperature recorder is also located at W1.

Water levels and discharge for Minto Creek and Big Creek are presented in Table 5-4 below, for dates when fisheries surveys occurred. Big Creek values were obtained through the Water Survey of Canada on-line database (Water Survey Canada, 2018) and are subject to change as they have not yet been validated by Water Survey Canada.

Table 8-4: Stage and Discharge in Minto Creek and Big Creek, 2018

Date	Time (PDT)	Minto Creek		Big Creek	
		Stage (m)	Discharge (m ³ /s)	Stage (m)	Discharge (m ³ /s)
6/24/2018	15:40	0.155	0.013	6.313	14
7/21/2018	15:30	0	0	6.141	6.52
8/18/2018	15:50	0.228	0.005	6.392	18.2
9/16/2018	16:13	0.216	0.026	6.393	18.3

Figure 5-6 displays the continuous stage and discharge record available from April to early October in Minto Creek. As shown in the graph the creek ran dry from July 10th to August 9th and from August 19-22nd during the 2018 Fisheries program season. Minto Creek (W1) froze in late September, the last manual flow measurement was taken on September 25th 2018.

Figure 5-6: Stage and discharge in Minto Creek at monitoring station W1, 2018

The Big Creek hydrometric station (Water Survey of Canada station ID # 09AH003) is located downstream of the Minto access road bridge, near its confluence with the Yukon River, at the following coordinates: 62° 34' 07" N; 137° 00' 58" W. It records continuous water level and discharge. Figure 5-7 presents data from June to October 2018.

Figure 5-7: Water Level Discharge in Big Creek 2018 (Source: Water Survey of Canada, 2018)

5.5 Fish Barrier

The fish barrier located approximately 1.2 km upstream of the Yukon River (MCF-B1 on Figure 5-8), which was documented in previous years, was re-confirmed in 2018. Another fish barrier exists approximately 200m downstream of MCF-B1 at MCF-21. Fish use upstream of the barriers, which consists of a log jam (Figure 5-9), was assessed by setting traps upstream of it during each sampling event. No fish were captured upstream of the barrier during 2018.

Figure 5-8: Fish Barrier and Minnow Trap at MCF-B1

Figure 5-9: Fish Barrier at MCF-21

6. Discussion

A section of lower Minto Creek was dry during the June sampling event at MFC-12 and MCF-13 trapping locations. These stations are our most downstream trapping sites which indicates fish would have no way of entering Minto creek. Additionally, from July 10 and August 9, 2018, the creek was dry as far as the W1 hydrology station, preventing fish movement up the system. The period which this section of the creek was going dry is unknown, however this could have occurred on other occasions throughout the summer.

In 2018, no JCS were captured in Minto Creek during all sampling events. This may be related in part to the higher water temperatures observed in Big Creek and the lower temperatures observed in Minto Creek during this season. More generally this supports previous findings that JCS do not tend to enter Minto Creek (or Big Creek) until the water temperature has equilibrated with that of the Yukon River or reached a minimum threshold temperature, which was not observed in 2018.

The highest JCS catch per unit effort (CPUE) was observed in September in Big Creek. Figure 6-1: shows the CPUE trends since 2008 for JCS (Minnow trapping only) in Minto Creek and since 2012 in Big Creek. The average CPUE in Minto Creek has shown some variability since 2008 but has generally been relatively low. One exception is the year 2010 where the average CPUE in Minto Creek was 15.7 JCS/trap-day and some trapping events returned over 400 JCS. Those high numbers are thought to be associated with mine water discharge occurring throughout the open water season in Minto Creek that year (ACG, 2010), the more consistent temperature and flow regimes possibly acting as attractants to fish.

No fish were caught in Minto Creek in 2018. This could be explained by a section of the lower creek going dry for periods from June through August, preventing fish movement up or down the creek, combined with a relatively low temperature profile in 2018. In some years, water temperature of Minto Creek and Yukon River reach equilibrium for a short period in June, however this did not happen from 2014 to 2018. In 2018, Minto Creek's maximum water temperature stayed below 9°C, whereas the Yukon River minimum temperature largely stayed above 11°C throughout the summer. The colder temperature profile of Minto Creek in 2018 may have deterred the movement of JCS into the system.

In Big Creek, the average CPUE for 2018 was the lowest recording since 2012. The CPUE was generally higher in Big Creek than in Minto Creek, except in 2013 where it was the opposite. A higher CPUE in Big Creek than in Minto Creek could be explained by the fact that Big Creek is a larger system, with a higher water temperature, generally providing better rearing conditions for JCS. The CPUE has also been noted as following the same trend within both Minto Creek and Big Creek since 2008.

Figure 6-1: JCS Average CPUE, Minnow Trapping, Minto Creek(2008-2018) and Big Creek(2012-2018)

In 2009 and 2010, the mine was discharging water throughout the open water season into Minto Creek, causing higher and more consistent flow and temperature regimes in lower Minto Creek, conditions which may have been more attractive to JCS. Mine water discharge only occurred during spring freshet from 2012 to 2015 and no discharge occurred in 2011. In 2016 the new permitted discharge rate (Q_{EFF}), as per the WUL QZ14-031, was calculated as follows:

- Initial discharge rate: $1/3 (Q_{MC} + Q_{RO}) \geq Q_{EFF-C}$
- Rate after discharge has commenced: $1/3 (Q_{MC} + Q_{RO} - Q_{EFF-M}) \geq Q_{EFF-C}$

Where:

Q_{MC} = daily flow rate in Lower Minto Creek (represented by either W1 or MC1),
 Q_{RO} = daily flow rate of discharged from the RO
 Q_{EFF-M} = measured daily rate of discharge from mine site
 Q_{EFF-C} = calculated rate of water discharge from mine site

In 2018 Minto mine was discharging throughout the open water season. However, this year's discharge was at much lower rates than in 2009 and 2010 because of the new discharge formula.

Following a forest fire in 2010, more sediment entered Minto Creek through runoff in 2011 and 2012, thereby increasing turbidity. A small landslide was also documented by Minto personnel in an upstream tributary in May 2012, likely contributing to high TSS levels observed downstream. The elevated turbidity may have deterred fish from entering Minto Creek. Average TSS values at W2 in 2016 were the lowest since 2011, with the highest being observed in 2012 (see Appendix C for details). Average TSS values at W2 in 2017 were the lowest since 2011, with the highest being observed in 2012 (see Figure 8 for details). Turbidity and TSS did not likely influence fish presence or absence in Minto Creek in 2018 as values remained low throughout the season.

The natural fish barrier identified in Minto Creek in previous years was again confirmed in 2018, as well as a second natural fish barrier 200m downstream. Therefore, the area of usable fish habitat in Minto Creek is limited to the lower 1 km of the creek.

Aerial surveys for spawning fish were carried out near the Minto Creek/Yukon River confluence from 2010 to 2014 and no spawning activity was ever observed or suspected. Bottom substrate in the confluence area consists primarily of silt and mud which is not suitable substrate for salmon spawning.

Minto Mine is under temporary closure as of November 2018 and going into Care and Maintenance in 2019. All mining activities are ceased at this time. The fisheries program is unaffected by this closure and the fisheries study will continue in 2019 as required by the water use license.

1 Geochemical Monitoring Program Objectives

This report is submitted to meet requirements under Minto Explorations Ltd., (a subsidiary of Capstone Mining Corporation), Minto Mine (Minto) Type “A” Water Licence QZ14-031-1 (WUL) and Quartz Mining Licence QML-0001.

The WUL specifically addresses the requirement in clause 95 which states *“The Licensee shall implement the updated Geochemical Monitoring Program, including the Waste Rock Verification Program, and the results from this program are to be included in the Annual Report.”*

The QML addresses the requirement in Schedule D – Annual Reporting Requirements, under the Environmental Monitoring section, subsection a) which states *“a summary of the programs undertaken for environmental monitoring and surveillance as outlined in the Environmental Monitoring, Surveillance and Reporting Plan”*.

Details regarding the Geochemical Monitoring Program can be found in Minto’s Environmental Monitoring, Surveillance and Reporting Plan (EMSRP) that was approved by the Yukon Water Board and Yukon Government, Energy Mines and Resources Branch on October 4th, 2016 and December 13th, 2016 respectively. In general, the Geochemical Monitoring Program is comprised of the following components:

- The Acid Base Accounting (ABA) Program, the primary focus of this document;
- The Waste Rock Management Verification Program; and
- Low Grade and Oxide Ore Metals Leaching Characterization Program (Leach Pads).

The objective of the ABA Program is to determine the Neutralization Potential Ratio, otherwise referred to as the NPR (Neutralizing Potential divided by Acid Potential [NP/AP]) for overburden and waste rock. An NPR value of 3 or greater generally indicates non-acid generating material. During 2018, 110 waste rock and overburden samples were collected and analyzed from the Area 2 Stage 3 Pit, and another 5 samples of waste rock was sampled from the Minto East and Copper Keel underground developments.

A separate, parallel ABA program was administered to determine the NPR of the tailings solids. During 2018, 9 Tailing samples were collected and analyzed. A sample was analyzed for each month until October 2018. The mill was shut down on October 20th, 2018

The objective of the Waste Rock Management Verification Program is to verify that the on-site waste rock segregation system is performing as expected. The results of the Waste Rock Management Verification Program are available in a separate report and will therefore not be discussed further in this document.

There are currently no details or results for the Low Grade and Oxide Ore Metals Leaching Characterization Program. The leach pad structures were built in August 2017, and ore was added in November 2017 and January 2018. Results from this program are expected to be analyzed in 2019 and will not be discussed further in this document.

2 ABA Program - Waste Rock and Overburden

2.1 Internal Frequency of Sampling – On-site Analysis

On-site total carbon (C(T)) and total sulphur (S(T)) analysis are carried out on drill cuttings from every blast hole. Samples are collected for grade control purposes, and a portion of each sample is sent for S(T) and total carbon C(T) analyses at the on-site laboratory.

2.2 External Frequency of Sampling

External laboratory analysis were completed for composites samples from open pit mining. A sample of drill cuttings was collected from waste blasts with a frequency of approximately one sample for every seven holes drilled. Composite samples from each waste class for each blast are formed from approximately 4-5 individual samples.

External analysis were also carried out for underground ABA samples. The sampling procedure assembles a composite sample every 3300 tonnes (equivalent to approximately 50 m of development) using a grab sample or wall chipping technique.

2.3 Sample Preparation

All composite samples were reduced to 1-2 kg in mass using a riffle splitter. The resulting split sample was labeled according to the ABA Program sample naming standards and shipped to an accredited laboratory. The labeling methodology was consistent with the Mine Environmental ABA Database throughout the reporting period.

2.4 Test Work and Evaluation

Internal samples are analyzed for S(T) and C(T) using an Eltra CS-800 induction furnace with infrared detectors. The resultant S(T) and C(T) data are converted to equivalent acid and neutralization potential and ultimately, NP:AP ratios are calculated. The calculated NP:AP ratios are used for characterization and segregation of waste rock on-site. This data is used for internal classification and waste rock segregation only, therefore, the results of that program will not be reported in this report.

In 2018, ALS Minerals conducted ABA analysis using the MEND (1991) Modified NP method as detailed in the EMSRP for all external samples. Reported results were entered into the Mine Environmental ABA Database. Waste rock and overburden composite samples were also analyzed for total metals for the entire duration of the reporting period.

For the reporting period, the results obtained from ALS were compared against past results found in the Mine Environmental ABA Database and the results are presented in Section 2.6. Sulphide sulphur ($S(S^{-2})$) results from ALS Minerals were calculated using the difference between total sulphur and sulphate sulphur (HCl Leach). In the event that the $S(S^{-2})$ value was zero or negative, the detection limit of <0.01% was used. The acid potential (AP) results from ALS Mineral were calculated using the calculated $S(S^{-2})$ value.

2.5 Discussion

Blasts are numbered by bench (denoted by the toe elevation) and by the sequential blast number for that bench (e.g. 784-01; 784 being the toe elevation of the bench and 01 being the first blast of the bench).

The primary lithology of the deposit is granodiorite. The granodiorite is divided into sub-units and classified as equigranular granodiorite (eG), porphyroblastic granodiorite (pG), and foliated granodiorite (fG). Locally, very highly-weathered granodiorite near the surface is described as residuum, and surface materials comprised of organics and soil is termed overburden. Other minor lithological units are described as pegmatite (Peg), Andesite (And) and Aplite (Ap).

2.6 Results

The 115 samples collected in the reporting period were analyzed by ALS Minerals and results were reported according to the Modified NP method (MEND 1991). In the reporting period, the NPR values ranged from 0.96 to 131.2 with a mean NP/mean AP of 6.13 and a median of 25.60. A summary of the results for ABA analysis are attached as Appendix A. Additionally, the ALS raw lab result files are provided in Appendix B.

2.6.1 NPR

The 2018 NPR results are compared to the results from 2014-2018 in Table 2-1, below.

Table 2-1. NPR Results Summary for 2014 to 2018.

NPR Values from SGS (2014-2016) and from ALS (2016-2018)				
Period Ending	Minimum (NPR)	Maximum (NPR)	(Mean NP)/(Mean AP)	Median (NPR)
2014 (January to December, 2014)	0.60	167.20	5.31	23.80
2015 (January to December, 2015)	-6.10	102.10	5.08	18.70
2016 (January to December, 2016)	0.80	134.40	14.49	35.20
2017 (January to December, 2017)	0.67	208.0	15.26	28.80
2018 (January to September, 2018)	0.96	131.2	6.13	25.60

During the reporting period, 17 samples returned NPR values below the threshold of 3.0. Of the 17 samples with a NPR value less than 3:

- 12 were found to have an increased sulphide sulphur content (and therefore AP) consequently decreasing the NPR;

And of the remaining samples:

- 3 samples represented material classified as NAG (or waste);
- 2 samples represented material that was placed in the SAT dump;
- 1 samples represented material that was placed in the constrution grade;

All waste rock and overburden was dispatched based on Minto's *Waste Rock and Overburden Management Plan*.

2.6.2 Paste pH

The paste pH results for 2018 were between 7.90 and 9.50 with a mean value of 8.90 and a median value of 8.90. The paste pH results for 2018 are compared to 2014-2017 and displayed in Table 2-3, below.

Table 2-2. Paste pH Results Summary for 2014 to 2018.

Paste pH from SGS (2014-2016) and from ALS (2016-2018)				
Period Ending	Minimum (pH)	Maximum (pH)	Mean (pH)	Median (pH)
2014 (January to December, 2014)	6.44	9.43	8.56	8.66
2015 (January to December, 2015)	5.23	9.47	8.70	8.78
2016 (January to December, 2016)	7.61	9.39	8.75	8.77
2017 (January to December, 2017)	7.50	9.20	8.50	8.50
2018 (January to September, 2018)	7.90	9.50	8.90	8.90

The results from 2018 are comparable to previous years results.

2.6.3 Sulphide Sulphur

The sulphide sulphur content $S(S^{2-})$ results for 2018 ranged from <0.01 to 1.40%, with a mean value of 0.124% and a median value of 0.03% as summarized and compared with 2014-2018 values in Table 2-4.

Table 2-3. Sulphide Sulphur Results Summary for 2014 to 2017

Sulphide-Sulphur % from SGS (2014-2016) and from ALS (2016-2018)				
Period Ending	Minimum ($S(S^{2-})$)	Maximum ($S(S^{2-})$)	Mean ($S(S^{2-})$)	Median ($S(S^{2-})$)
2014 (January to December, 2014)	0.01	3.26	0.12	0.02
2015 (January to December, 2015)	<0.01	1.09	0.09	0.02
2016 (January to December, 2016)	<0.01	0.75	0.05	0.02
2017 (January to December, 2017)	<0.01	1.38	0.082	0.03
2018 (January to September, 2018)	<0.01	1.40	0.124	0.03

A total of 14 samples exceeded the sulphide sulphur threshold for construction rock of 0.3% during 2018. Furthermore, 12 samples also had a NPR of less than 3 and therefore represented SAT material. The 2 remaining samples had an NPR greater than 3 and exceeded the sulphide sulphur threshold (1 MEUG and 1 A2S3).

Figure 2-2-1, below, is a plot of sulphide sulphur versus (vs) NPR for all samples analyzed during 2018. Figure 2-1 illustrates that 14 samples had sulphide sulphur content greater than 0.3% and 17 samples had a NPR threshold of less than 3.

Figure 2-2-1. Minto Waste Rock and Overburden Sulphide Sulfur vs NPR, 2018

3 Tailings

3.1 Frequency of Sampling and Sample Preparation

Minto collects a weekly sample of final tailings. The weekly samples have been filtered and dried in the onsite lab and then combined into a monthly sample which is then riffled down to produce a 1-2 kg composite. Samples are labelled according to the labeling protocol established in the Mine Environmental ABA Database. The last complete sample was collected in September 2018, as the Mill shut down on October 20th, 2018.

3.2 Test work and Evaluation

Mirroring the waste rock and overburden analysis, ALS Minerals conducted ABA analysis using the MEND (1991) Modified NP method as detailed in the EMSRP. Reported results were entered into the Mine Environmental ABA Database. Monthly tailings composite samples were also analyzed for total metals for the 9 months of available samples.

3.3 Results

The results from the ALS Minerals laboratory analyses indicate that 2018 tailings samples were within the threshold of NPR greater than 4 and contain lower than 0.3% sulphide sulphur content as presented in Figure 3-1, below. The tailings results are summarized in Appendix C and the raw lab results are presented in Appendix B.

Figure 3-1: Tailings Sulphide Sulphur vs NPR, 2018

4 Conclusion

The results displayed in this report combined with the previous reporting periods are the foundation for the Mine Environmental ABA Database. Overburden and waste rock development will continue through the subsequent phases of mining and milling and will be sampled, analyzed and reported as required by the WUL and QML and in accordance with the EMSRP if mining resumes.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO2	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

18-02

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO ₂	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

18-01

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO ₂	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

18-3

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CERTIFICATE VA18024484

Project: L2050182

This report is for 10 Crushed Rock samples submitted to our lab in Vancouver, BC, Canada on 1-FEB-2018.

The following have access to data associated with this certificate:

CASDG ALSE

ALSEV DATASUBLET

SHANE STACK

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
SPL-21	Split sample - riffle splitter
LOG-22	Sample login - Rcd w/o BarCode
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
C-GAS05	Inorganic Carbon (CO2)	
C-IR07	Total Carbon (Leco)	LECO
S-GRA06	Sulfate Sulfur - carbonate leach	WST-SEQ
ME-MS41	Ultra Trace Aqua Regia ICP-MS	
OA-VOL08m	Modified NP	
S-IR08	Total Sulphur (Leco)	LECO
OA-ELE07	Paste pH	
S-CAL06a	Sulfide Sulfur (calculated*)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ

QC CERTIFICATE VA18024484

Project: L2050182

This report is for 10 Crushed Rock samples submitted to our lab in Vancouver, BC, Canada on 1-FEB-2018.

The following have access to data associated with this certificate:

CASDG ALSE

ALSEV DATASUBLET

SHANE STACK

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
SPL-21	Split sample - riffle splitter
LOG-22	Sample login - Rcd w/o BarCode
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
C-GAS05	Inorganic Carbon (CO2)	
C-IR07	Total Carbon (Leco)	LECO
S-GRA06	Sulfate Sulfur - carbonate leach	WST-SEQ
ME-MS41	Ultra Trace Aqua Regia ICP-MS	
OA-VOL08m	Modified NP	
S-IR08	Total Sulphur (Leco)	LECO
OA-ELE07	Paste pH	
S-CAL06a	Sulfide Sulfur (calculated*)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ

To: **ALS ENVIRONMENTAL**
ATTN: ALSEV DATASUBLET
100 - 8081 LOUGHEED HWY.
BURNABY BC V5A 1W9

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO2	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

18-4

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO2	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

18-5

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CERTIFICATE VA18030191

Project: L2054143

This report is for 10 Other samples submitted to our lab in Vancouver, BC, Canada on 9-FEB-2018.

The following have access to data associated with this certificate:

CASDG ALSE

ALSEV DATASUBLET

SHANE STACK

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
SPL-21	Split sample - riffle splitter
LOG-22	Sample login - Rcd w/o BarCode
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
C-GAS05	Inorganic Carbon (CO2)	
C-IR07	Total Carbon (Leco)	LECO
S-GRA06	Sulfate Sulfur - carbonate leach	WST-SEQ
ME-MS41	Ultra Trace Aqua Regia ICP-MS	
OA-VOL08m	Modified NP	
S-IR08	Total Sulphur (Leco)	LECO
OA-ELE07	Paste pH	
S-CAL06a	Sulfide Sulfur (calculated*)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO ₂	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

18-6

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CERTIFICATE OF ANALYSIS VA18042881

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

C-GAS05	C-IR07	LOG-22	ME-MS41
OA-ELE07	OA-VOL08m	PUL-31	S-CAL06a

QC CERTIFICATE VA18042881

Project: L2059205

This report is for 10 Other samples submitted to our lab in Vancouver, BC, Canada on 26-FEB-2018.

The following have access to data associated with this certificate:

CASDG ALSE

ALSEV DATASUBLET

SHANE STACK

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI - 21	Received Sample Weight
SPL - 21	Split sample - riffle splitter
LOG - 22	Sample login - Rcd w/o BarCode
PUL - 31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
C - GAS05	Inorganic Carbon (CO2)	
C - IR07	Total Carbon (Leco)	LECO
S - GRA06	Sulfate Sulfur - carbonate leach	WST - SEQ
ME - MS41	Ultra Trace Aqua Regia ICP - MS	
OA - VOL08m	Modified NP	
S - IR08	Total Sulphur (Leco)	LECO
OA - ELE07	Paste pH	
S - CAL06a	Sulfide Sulfur (calculated*)	
S - GRA06a	Sulfate Sulfur (HCl leachable)	WST - SEQ

To: **ALS ENVIRONMENTAL**
ATTN: ALSEV DATASUBLET
100 - 8081 LOUGHEED HWY.
BURNABY BC V5A 1W9

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO ₂	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

18-7

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CERTIFICATE OF ANALYSIS VA18044893

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

QC CERTIFICATE VA18044893

Project: L2059209

This report is for 11 Other samples submitted to our lab in Vancouver, BC, Canada on 26-FEB-2018.

The following have access to data associated with this certificate:

CASDG ALSE

ALSEV DATASUBLET

SHANE STACK

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI - 21	Received Sample Weight
SPL - 21	Split sample - riffle splitter
LOG - 22	Sample login - Rcd w/o BarCode
PUL - 31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
C - GAS05	Inorganic Carbon (CO2)	
C - IR07	Total Carbon (Leco)	LECO
S - GRA06	Sulfate Sulfur - carbonate leach	WST - SEQ
ME - MS41	Ultra Trace Aqua Regia ICP - MS	
OA - VOL08m	Modified NP	
S - IR08	Total Sulphur (Leco)	LECO
OA - ELE07	Paste pH	
S - CAL06a	Sulfide Sulfur (calculated*)	
S - GRA06a	Sulfate Sulfur (HCl leachable)	WST - SEQ

To: **ALS ENVIRONMENTAL**
ATTN: ALSEV DATASUBLET
100 - 8081 LOUGHEED HWY.
BURNABY BC V5A 1W9

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO ₂	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

18-8

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO ₂	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

18-09

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO2	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

18-10

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO ₂	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

18-11

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CERTIFICATE VA18072656

Project: L2072113

This report is for 10 Crushed Rock samples submitted to our lab in Vancouver, BC, Canada on 29-MAR-2018.

The following have access to data associated with this certificate:

CASDG ALSE

ALSEV DATASUBLET

SHANE STACK

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
SPL-21	Split sample - riffle splitter
LOG-22	Sample login - Rcd w/o BarCode
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
C-GAS05	Inorganic Carbon (CO2)	
C-IR07	Total Carbon (Leco)	LECO
S-GRA06	Sulfate Sulfur - carbonate leach	WST-SEQ
ME-MS41	Ultra Trace Aqua Regia ICP-MS	
OA-VOL08m	Modified NP	
S-IR08	Total Sulphur (Leco)	LECO
OA-ELE07	Paste pH	
S-CAL06a	Sulfide Sulfur (calculated*)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ

To: **ALS ENVIRONMENTAL**

QC CERTIFICATE VA18072656

Project: L2072113

This report is for 10 Crushed Rock samples submitted to our lab in Vancouver, BC, Canada on 29-MAR-2018.

The following have access to data associated with this certificate:

CASDG ALSE

ALSEV DATASUBLET

SHANE STACK

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
SPL-21	Split sample - riffle splitter
LOG-22	Sample login - Rcd w/o BarCode
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
C-GAS05	Inorganic Carbon (CO2)	
C-IR07	Total Carbon (Leco)	LECO
S-GRA06	Sulfate Sulfur - carbonate leach	WST-SEQ
ME-MS41	Ultra Trace Aqua Regia ICP-MS	
OA-VOL08m	Modified NP	
S-IR08	Total Sulphur (Leco)	LECO
OA-ELE07	Paste pH	
S-CAL06a	Sulfide Sulfur (calculated*)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ

To: **ALS ENVIRONMENTAL**
ATTN: ALSEV DATASUBLET
100 - 8081 LOUGHEED HWY.
BURNABY BC V5A 1W9

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO ₂	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

18-12

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO2	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

1018-14

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

ALS CODE	DESCRIPTION	
C-GAS05	Inorganic Carbon (CO2)	
C-IR07	Total Carbon (Leco)	LECO
S-GRA06	Sulfate Sulfur - carbonate leach	WST-SEQ
ME-MS41	Ultra Trace Aqua Regia ICP-MS	
OA-VOL08m	Modified NP	
S-IR08	Total Sulphur (Leco)	LECO
OA-ELE07	Paste pH	
S-CAL06a	Sulfide Sulfur (calculated*)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

QC CERTIFICATE VA18241695

Project: L2169464

This report is for 5 Crushed Rock samples submitted to our lab in Vancouver, BC, Canada on 26-SEP-2018.

The following have access to data associated with this certificate:

ALSE VANCOUVER WEBTRIEVE
SHANE STACK

ALSEV DATASUBLET

SOFTWARE DEVELOPMENT GROUP

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85% <75 um
SPL-21	Split sample - riffle splitter

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
C-GAS05	Inorganic Carbon (CO2)

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO2	C-GAS05
CARBON-C-IR07-AX	Soil	Carbon (C) using LECO analyzer	Total Carbon - Method Code C-IR07
Total Carbon & Sulfur - Method Codes C-IR07 & S-IR08			
A 0.1g sample is heated to approximately 1350°C in an induction furnace while passing a stream of oxygen through the sample. Carbon dioxide & sulfur dioxide released from the sample are measured by an IR detection system (Leco analyzer) and the total carbon & sulfur results are provided.			
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS
A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.			
PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A
Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.			
SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06
A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A
A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).			
SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08
The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

2018-15

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85% <75 um
SPL-21	Split sample - riffle splitter

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
C-GAS05	Inorganic Carbon (CO2)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ
C-IR07	Total Carbon (Leco)	LECO
ME-MS41	Ultra Trace Aqua Regia ICP-MS	
S-CAL06a	Sulfide Sulfur (calculated*)	
OA-VOL08	Basic Acid Base Accounting	
S-IR08	Total Sulphur (Leco)	LECO
OA-ELE07	Paste pH	
S-GRA06	Sulfate Sulfur-carbonate leach	WST-SEQ

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Appendix O – Wildlife and Hazing Tracking Report

Date	Time	Type of Animal	Number of Animals	Location	Description: Size/Color/Markings and Additional Notes	Reported By (Name)	Was the animal hazed?	What hazing technique was used?	What was the animals response?	Who performed the hazing?	Has this animal been hazed in 2018?	Reportable Incident (Yes/No)	Notes
4-Jan-18	12:00	Fox	1	Portal road Main ahul road intersection	Scrambled up bank and watched as the truck drove past	D. Avar	No				No		
9-Mar-18	13:30	Lynx	1	TDD	Adult, Calm	Nathan	No						
19-Mar-18	18:30	Black Bear	1	TDD	Black bear	Ryan Silverfox	No				No	No	Early sighting on a warm afternoon (above freezing), heavy snow later
5-Apr-18	5:30	Lynx	1	Haul Road-W15	Healthy	Dale/Gerard	No						
19-Apr-18	9:30	Black Bear	1	Landfill	Dark black, see photos - they're good	Danny	yes	Enviro fired 3 bangers and safety fired 2 bangers and 2 rubber bullets	Bangers had no effect on it, The first rubber bullet made contact with its back, and the second made contact with its butt. He took off, rather slowly above the berm he was headed west (towards Dyno)	Enviro and Safety	No	No	First official bear encounter at Minto!
19-Apr-18	17:30	Black Bear	1	WMA	Dark brown	Site Services	Yes	Enviro fired 3 bangers	The bear got into a tote that had been cut out and filled with garbage (including plenty of food waste) But he did mosy on when the bangers were fired	Enviro	Yes	No	Totes were sorted through the following day - 2 totes were found with garbage waste and enviro has brought up the issue to management
20-Apr-18	15:00	Black Bear	1	WMA	Dark brown	Site Services	Yes	Safety got him with bangers	Same bear came back for the totes that were gone, he went around the incinerator - and through the back toward the core shack. We intercepted him there, fired 2 bangers, he took off down the hill behind the propane tanks there.	Safety	Yes	No	
20-Apr-18	17:40	Black Bear	1	Dumas Shop	Dark Brown	Dumas Mechanic	Yes	Fired off 2 bangers	Same bear, he was close to Dumas shop in the lay down area. We pushed him off towards the Dry Stack Tailings and he was walking along toward the hill	Enviro	Yes	No	
20-Apr-18	20:30	Black Bear	1	Sewage Treatment Plant	Dark Brown	Ryan Herbert	Yes	Fired 4 bangers	Same bear, he was playing with hoses at the STP. When Ryan H. and Rob P. were walking back to camp spotted him and scared him off. He was walking up the hill towards camp when environment arrived at the scene. Fired off 2 bangers, he walked up the valley, safety showed up but no good shots could be taken. Safetv fired off 2 more bangers	Enviro and Safety	Yes	No	
22-Apr-18	20:00	Black Bear (named him Stew)	1	Camp	Dark Brown	Jeff Hewko	yes	Fired only 1 banger	Same bear, came up to the back door (North side) of the Selkirk Towers. He seemed confused , Safety Dave did some yelling. He mosied on up the hill, northly.	Enviro	Yes	No	
22-Apr-18	21:00	Black Bear (named him Stew)	1	Camp	Dark Brown	Gene	yes	Air horn, rubber bullets and bangers	Same bear, came into the Selkirk parking lot. Walked along the Arctic Corridor. And onto the ice rink, tried to come up to the door (smoke shack door) Enviro Emilie fired the air horn to get him away from the building. Safety got a bullet on him, he took off down the hill (towards the STP). Fired off bangers to scare him off further.	Enviro and Safety	Yes	No	
24-Apr-18	18:30	Black Bear	1	Camp	Dark Brown	Travis	yes	Fired 2 Bangers	Animal moved away from the banger, but couldn't escape due to steep hill, upon seeing ENV person, he retreated up a shallower slope, fire second banger as he went out of site.	Enviro	Yes	No	
24-Apr-18	20:30	Black Bear	1	Camp - Selkirk	Dark Brown	Todd	Yes	Safety fired a banger	Was seen again in the North site of the arctic cooridor, near the blue garbage seacan. Walked around towards the front parking lot, but went over the berm and down the hil upon seeing Enviro. Waited until Safety arrived in case rubber bullets would act a s better deterrent.	Safety	Yes	No	
24-Apr-18	21:30	Bear	1	Smoke shelter by capstone			Yes	Banger, Yelling	Went towards the hill and up and out of the camp area		Unknown	No	
25-Apr-18	13:30	Black Bear	1	Landfill	Dark Brown	Danny	Yes	Safety hit him with rubber bullets (x2)	Bear had found a small amount of food waste (from	Safety	Yes	No	Had Pelly push, compact, and cover the landfill on April 26 to remove
2-May-18	6:30	Fox	1	Portal entrance	grey fox, healthy looking, hanging around the waste bins and portal. No	Doug. M	No						
5-May-18	0:00	Black Bear	1	Core Shack	Dark Brown	Benoit Gervais	yes	Honking and chasing with a vehicle	Bear was just wandering around the core shack	Ben	Unknown	No	
6-May-18	10:15	Black Bear	1	Dyno Access	Black	Austin /Dyno	No	N/A			No	No	Austin Called to notify of a bear on dyno access area, not moving
7-May-18	9:45	Black bear	1	Road up to coreshack /	Brown, lean	Tim	Yes	Multiple bangers by Envrio. X1 rubber	Bear travelled >400m from point of hazing, following	Env / Safety KR	No	No	bear
7-May-18	17:00	Black bear	1	Far side of WSP	Black	Dale H.	No	N/A			No	No	Far side of the WSP not near people
7-May-18	18:45	Black bear	1	1km	Black	Tony M.	No	N/A					Same bear that was at WSP earlier.
11-May-18	11:00	Black bear	1	7 km	dark ruddy brown	Colin P, Corey R	No	N/A	Bear began running from the truck before any action was	N/A	Unknown	No	bear looked very healthy, appeared to be afraid of humans without any
13-May-18	19:00	moose and calf	2	dumas corner	no discernable identifiable markings		No	N/A		N/A	No	No	

13-May-18	13:00	Bear	1	Silos in dyno area	Large, brown coloured black bear	Gerard B							
15-May-18	15:00	Moose and calf	2	4 km	no discernable identifiable markings	Ryan Silverfox	No	N/A		N/A	No	No	
16-May-18	12:15	Bear	2	Dyno yard	Black sow and a brown cub	Lewis Mcleod							
17-May-18	16:15	black bear	1	dry stack near dumas	dark red/brown	Doug Harris	yes	yelling, bangers	ran from bangers. Appeared to be wary of humans.	SR/CP	Yes	No	appeared to be eating vegetation. Was not moving deliberately
18-May-18	11:30	Black Bear	1	Hillside near WSP	Black	Doug Harris	No	N/A		N/A	Unknown	No	Bear looked very healthy, grazing and far enough from site to not be a
18-May-18	17:15	Black Bear	1	West end of WSP	Black with grey face small but fat	Todd Swenson	Yes	Honking horn, yelling	Cocked it's head and looked curious. No fear	TS	Unknown	No	Might possibly be the bear described as "aggressive" in 2017, due to
20-May-18	16:00	Black Bear	1	13KM	Black	Doug Harris	No	N/A	N/A	N/A	Unknown	No	Bear looked healthy in the bush on the hill side.
22-May-18	8:00	moose and calf	2	air strip	no discernable identifiable markings	Jean Lagarde	No	N/A	N/A	N/A	No	No	
22-May-18	7:00	Bear	2	8 km	brown	Bob Alexander	No	N/A	N/A	N/A	Yes	No	reported as "brown bear", currently uncertain if it was grizzly or brown black bear
22-May-18	9:15	Black Bear	1	KM 1.5	Black	Shaun	No	N/A	N/A	N/A	Unknown	No	Eating vegetation up on the hill across the road from the WSP
22-May-18	8:40	moose and calf	2	Driftwood laydown	wandering towards airstrip	Curt (S.S)	No						
23-May-18	9:50	Black Bear	1	KM 1.5	Black	Shaun	No	N/A	N/A	N/A	Unknown	No	Eating vegetation up on the hill across the road from the WSP
23-May-18	10:05	Deer	3	KM 0.8		Shaun	No	N/A	N/A	N/A	No	No	Walking down access road towards WSP and ran up the hill as I drove by
26-May-18	0:00	Black Bear	1	Dumas	Black large	Shawn (mechanic)	yes	Honking horn, truck, yelling and bear banger	Ran away at sight and sound of truck.	CH	Yes	No	Bear reported going to Dumas shop, responded and bear ran up the hill towards portal. Chased bear off with truck and shot banger and yelled. The bear then ran into the bush/ Exploration roads.
27-May-18	14:00	Moose	1	Km 19	adult, healthy, bull moose	Trever Harris	No						
29-May-18	15:00	Black Bear	1	Behind Selkirk towers	large, fat, black	Colin P	yes	voice	ran away when people charged and yelled at it	CP	Yes	No	This bear has been hazed several times this year, and seems to be very responsive to hazing.
29-May-18	14:00	Black Bear	1	W2	Small, young, brown	Chris H, Shaun R	yes	Voice, bear banger	did not respond to voice, shot banger twice, ran away after second shot	SR/CH	No	No	Bear must have followed us out of W1 trail, was behind us when we got to the truck and didn't run when we yelled. Shot bear banger twice and it ran away after second shot.
29-May-18	14:45	Black Bear	1	KM7	Large, black	Chris H, Shaun R	No				No	No	Walking on road, ran into bush when truck approached.
29-May-18	19:20	Black Bear	1	Pumphouse near camp		Stanley	No						
30-May-18	13:40	Bear	1	Dyno	Medium ,brown, dark legs	Dale	Yes	Airhorn	ran away but came back to dynos laydown later	CH/CR	No	No	after we hazed the bear it came back to its spot 30 mins later but ran
31-May-18	11:15	Bear	1	Dyno yard	Large Black Bear / Bold walked up to loader an operator in it	Lewis Mcleod	Yes	Bangers	Ran off but came back later	CR/CH	Potentially	No	Once it ran off it came back later. Dyno called again but it wondered off before enviro got to the scene.
3-Jun-18	14:00	Bear	1	WMA	Medium black	Corey	yes	Bear banger, yelling	Did not come out of bush	CH	n/a	No	saw bear by where nitirc barrels are stored, when I walked over it was in the bush. I yelled and fired a bear banger and the bear did not come back while we were there.
3-Jun-18	15:50	Bear	2	Exploration roads behind	MED. One brown, one black	Chris	No				Yes	No	Went for ride on roads for bear check as one was seen earlier and saw
4-Jun-18	15:00	Hawk - Sharp-shinned	1	Warehouse	Approx. 8" long, light coloured underbelly with stipes on wings and tail, back, head and wings are dark in colour	Devon	No				No		Door was left open for the bird to leave, fans and lights were turned off. Bird remained in the Warhouse rafters (overnight). Bird left Warehouse June 5th about 1pm. See photos.
5-Jun-18	10:00	Fox	1	Portal	Black in colour / healthy	Lewis Mcleod							
9-Jun-18	7:30	Deer	1	Airport road by W35	Meduim white-tail	Emilie	Yes	yelling	Took off when I yelled at it	EB	No	No	
9-Jun-18	8:40	moose and calf	2	5.5 km	Very young calf, lean cow	Emilie / Deborah	No				No	No	
10-Jun-18	18:00	Hawk - Sharp-shinned	1	Washbay	Found deceased. Preserved in freezer for CO if needed.	Driftwood	No						
11-Jun-18	12:30	Deer	1	near propane farm	curious walked up close to pick-up	Mark (Driftwood)	No						
13-Jun-18	7:00	Deer	1	up on hill behind	Chilling on the hill behind camp	Stan G	No						
27-Jun-18	16:25	Deer	1										
27-Jun-18	15:50	Bear	1	N.Communication Tower	Big Black Bear; not aggressive, sniffing	Shawn - IT	No				Unknown	No	
27-Jun-18	16:25	Deer	1	Just above capstone	eating minding his own buisness	Stan G	No						
28-Jun-18	13:00	Deer	1	Beside ERT building	calm, walking through camp area	Roger H	No						
1-Jul-18	5:15	Deer	1	Portal	Walking up the road		No						
3-Jul-18	9:15	Deer	2	Km 15	Doe and fawn on road. Very young fawn	Shelby/Emilie	No				N/a	No	

4-Jul-18	10:00	Black Bear	1	KM 11	Large Black Bear	Robert Proc	No					No	
4-Jul-18	11:30	Black Bear	1	km 6	Small black bear, still shedding his winter coat	Emilie	Yes	Yelling, throwing rocks, and honking.	He had no reaction, moved very slowly until I got a rock on his head. He didn't like it. His ears went back and he seemed confused. He walked off slowly. - I wanted to ensure he associated humans with not a good thing.	EB	No	No	
5-Jul-18	9:30	Black Bear	2	Pelly Yard	One small black bear, and one small light brown black bear	Gene - Pelly	Yes	Honking.	They both moved on quickly.	EB	No	No	It was noticed afterwards that the bears (not sure which one) had gotten into a garbage bag full of old food in their outdoor plywood bin.
5-Jul-18	13:30	Black Bear	1	Pelly office	Small light brown black bear	Gene - Pelly	Yes	Yelling and air horn	He moved on very slowly at first and with the airhorn he	Gene	Yes	No	He was scratching and pulling on the plywood holding the office
6-Jul-18	7:00	Black Bear	1	Pelly office		Gene - Pelly							A bear (I am assuming the same light brown that has been hanging
7-Jul-18	2:15	Black Bear	1	Dumas Shop	Small light brown black bear	Dumas Mechanic	No		He wandered inside the shop and checked it out, took off	EB	Yes	No	Core shack also seems to have been entered by the bear at some point
7-Jul-18	5:40	Black Bear	1	Camp	Small light brown black bear	Nona	Yes	Bear banger, yelling	He took off in the woods behind the ERT building. First	EB	Yes	No	He'll be back for sure. Sodexo employees were warned to be on the
7-Jul-18	10:00	Grizzly bear	1	22km		Adam Vlastimil	No						
7-Jul-18	10:00	Bear	1	KM 22			No						
8-Jul-18		Black bear	1	Camp	medium (>5') chocolate brown black bear	Kevin Rookes	Yes	Rubber bullet, banger, yelling	He took off in the woods behind the ERT building.	KR	Yes	No	KR seems to think it wasn't the same bear, it seemed larger than the pictures enviro had provided.
8-Jul-18	10:00	Mule deer	1	22km		David Petkovich	No						
8-Jul-18	10:00	Mule deer	1	KM 22.5	healthy standing at side of road		No						
8-Jul-18	9:30	Deer	3	Km 10.5	Doe and two fawns		No						
9-Jul-18	7:00	Deer	1	Warehouse		Kevin Rookes	No						She moved off the the MVFE
10-Jul-18	9:30	Black Bear	1	km 10	Medium size black	EB	No						
10-Jul-18	10:00	Mule Deer	4	Dry stack tailings facility	Mule deer with doe and two fawns		No						
12-Jul-18	8:00	Black Bear	1	Pelly Yard	Light body and dark legs. Bear was spotted multiple times through out the day.	SB	Yes	bangers, yelling, honking	Went into woods by W15	DC	Yes	Yes	Bear broke into Pelly office, core shack, and Dumas. Caused property damage and attempted to re-enter when workers were cleaning up the office.
13-Jul-18	1:00	Black Bear	1	Multiple Locations	Same light body bear	SB	Yes	Bangers, honking	Went to other buildings	SB/DC	Yes	Yes	Same bear. 4 bear calls at night. Dumas, Core Shack, Mill Building, and Camp. CO called.
15-Jul-18	11:00	Lynx	1	North side of the Selkirk	Looked healthy - Adult	Curt (S.S)	Yes						
20-Jul-18	15:30	Deer	2	Mill Pond	Running around not caring about	Brandon Brown	No						
27-Jul-18	10:10	Bear	1	Driftwood laydown	Black bear - Looked healthy - Adult	S.S	No						
29-Jul-18	14:00	Deer	2	Portal road	Doe and fawn on road. Very young fawn	CH	no					No	doe and fawn running on portal road. Went up towrds tent on bank
2-Aug-18	10:00	Black Bear	1	Ridgetop Road	Black bear	Mike Ethelston	Yes	honking	took off behind the UG fuel farm	EB/SMB	Unknown	No	Small black
2-Aug-18	10:30	Deer	1	STP	Light brown deer	EB	No			EB/SMB			
2-Aug-18	12:30	Black Bear	1	Old Pelly Laydown	Light brown	SS	Yes	Bear bangers	Took off towards MN	EB/SMB	Unknown	No	Looks like our problematic bear, but I am not sure
3-Aug-18	8:00	Black bear	1	Airstrip and WMA corner	unknown	Brandon Brown	No			EB/SMB			We couldn't find it by the time we got up there.
5-Aug-18	9:40	Black Bear	1	WMA area	Small black bear.	Brandon Brown	No						
8-Aug-18	14:00	Black bear	1	WMA area / Airstrip	small black bear	Curt (S.S)	No					No	Not found once enviro got up there
8-Aug-18	13:58	Deer	1	Between mine tech and	Adult doe	Everett P	No						
8-Aug-18	10:30	Deer	3	Selkirk Towers	Doe and 2X fawn drinking water	Ryan Herbert	No						
19-Aug-18	5:45	Fox	1	Between dry and safety		Ian L	No						
26-Aug-18	17:40	Bear	1	KM 9	Black bear with blonde hair	Dave G	No						
27-Aug-18	16:00	Black bear	1	8km	Black bear with white patch on head	David Grennen	No				No	No	
29-Aug-18	13:30	Black bear	1	Dyno Road	Black bear	Brandon Brown	No				No	No	
6-Sep-18	5:30	Fox	1	By the rink	Red body black tail - large in size -	Peter M	No						
7-Sep-18	5:50	Fox	1	Behind ERT		Don Patterson	No						
11-Sep-18	14:20	Brown bear	1	km 19	Medium size dark brown bear	Shaheen Baker	No						
12-Sep-18	11:00	Eagle	1	km 23	Sitting on a tree near road	Shaheen Baker	No						
14-Sep-18	16:00	Fox	1	Main pit dump		Ian L	No						
20-Sep-18	10:15	Deer	5	Warehouse laydown	1 Adult deer and 4 samller fawns	Tim C	Yes	Honking, Truck engine	Took off toward mill valley	CR	No	No	
24-Sep-18	13:10	Fox	1	Area 2 pit bench	Red in colour - unintrested in humans	Cobalt	No						
26-Sep-18	8:20	Lynx	1	11.5km	Found dead on the road; likely hit by a	Ryan Silverfox	No					Yes	Found on the road dead by Site Services this morning. Pull at the side
3-Oct-18	10:30	Deer	3	Mine Tech	1 doe with 2 fawns	Ryan F.	No						
5-Oct-18	11:00	Deer	3	Mine Tech	1 doe with 2 fawns	Bob G.	No						
5-Oct-18	17:20	Bear	1	W62 Road	Light brown, large black bear	Bob G.	Yes	Honking	Mosied off into the wooden area (diagonally away from	Bob G.	Probably	No	
6-Oct-18	11:45	Bear	1	Burn pile	Light brown, large black bear	Ryan S.	Yes	Yelling	Mosied on	Ryan S.	Probably	No	
6-Oct-18	13:45	Fox	1	ERT Building	Healthy, red fox	Lesley S.	No				No	No	
20-Oct-18	3:35	Fox/Coyote	1	Behind kitchen	Healthy/Non Aggressive	Randy R	No						
2-Nov-18	8:15	Fox	1	Mobile Maint Shop (Mill)	Healthy red fox	Brett Austin	Yes	Yelling, Clapping	Took a lot to make it move on. Aggressively curious	Brett A. Todd S.	Unknown	No	Tried to follow Brett inside the shop. Looks very people friendly, possibly has been fed, or just more brave and curious now that activities/noise has slowed down.
2-Nov-18	15:30	Black bear	1	Km 10	Tracks in fresh snow	Doug Harris	No						Bear not seen, only tracks observed in 2 day old snow.
2-Nov-18	15:35	Wolves	2	Km 9	Tracks in fresh snow	Doug Harris	No						Wolves were tracking/following Moose. Not seen, only tracks observed in 2 day old snow.
2-Nov-18	15:35	Moose	1	Km 9	Tracks in fresh snow	Doug Harris	No						"
18-Nov-18	11:00	Lynx	1	Km 20	healthy	Greg S	No						
19-Nov-18	14:00	Wolf	1	Barge Landing	healthy	Greg S	No						
24-Nov-18	12:00	Doe and 2 fawns	3	Km 0.5	Healthy	Emilie	Yes	Honking	Mosied on up the hill	Emilie B	No	No	
Nov 16 2018	11:00	fox	1	Dumas shop	Healthy full coat	Dan Fries	Yes	threw my hard hat at it	ran away	Dan Fries	Unknown	No	Fox ran towards me when I opened vehicle door. It appears it may have
Nov 18 2018	8:15	Fox	1	outside mill/ ERT	healthy	Dan Fries	Yes	3 shots with bangers	ran away initially but returned in short order.	Dan Fries	Yes	No	Noticed same fox as Nov 16 scrounging outside mill entrance, I

Appendix P – 2018 Update Minto Mine Constructed Wetland Treatment Research Program

Minto Mine Constructed Wetland Treatment Research Program – Demonstration-Scale 2018 Update Report

Document #011_0119_13B

Prepared for:

Minto Explorations Ltd.
Capstone Mining Corp.
PO Box 11
Whitehorse Central PO.
Whitehorse, Yukon Y1A 5X9
Y1A 2V3

Prepared by:

Contango, an AEG company
104-411 Downey Road
Saskatoon, SK
S7N 4L8

Date: February 2019

Executive Summary

The Minto Mine is an open pit and underground copper mine located 240 km northwest of Whitehorse in the Yukon Territory. As a result of mining activities, cadmium, copper, molybdenum, selenium, and zinc are slightly elevated beyond background concentrations and have been identified as constituents of concern in the Reclamation and Closure Plan for the Minto Mine. As part of the Reclamation and Closure Plan, a constructed wetland treatment system (CWTS) was designed by Contango with the objective of attaining suitable passive treatment of water quality at mine closure. In October 2018, Capstone announced that due to unfavourable equity market conditions, the Minto Mine would be placed into temporary care and maintenance (Capstone, 2018), and that condition is currently in effect.

A phased approach is being followed to guide the site-specific design and implementation of a CWTS at closure. The phased approach for Minto Mine was initiated with a site assessment in 2013 followed by pilot-scale testing to confirm and provide proof-of-concept before constructing the on-site demonstration-scale wetland.

The demonstration-scale constructed wetland treatment system was constructed at Minto in 2014, commissioned from 2015 through mid-2017 and transitioned into the operational period in August 2017. In 2018 it was planned that the demonstration-scale CWTS would continue in the operational period with the primary objective being to assess performance under conditions that would be similar to the full-scale CWTS. However, this objective shifted to assessing the CWTS ability to recover and perform under the unintentionally imposed stresses of a winter/freshet drought and elevated nitrate concentrations (on average 3 times higher than 2017 concentrations in early spring) in the inflow water (feed). This double stress test provided an opportunity to evaluate mitigation strategies for returning the CWTS to an operational status. Recovery period from the double stress test in 2018 was variable for each COC. Additional recovery strategies were attempted on the systems, including stagnation (both series), and addition of iron (Series 1). These recovery strategies are applicable to full-scale operation and are detailed in this report. Recovery periods ranged from 0 days (treatment likely unaffected) to 93 days for different constituents and recovery strategies.

Additional aspects of the performance and operation of the system were measured in 2018 and are detailed in this report including: treatment performance, fate and distribution of treated metals, evapotranspiration, detritus decomposition, microbial community characterization (catalyzing treatment reactions), and pest control.

During the operational period Series 1, (which received an additional recovery intervention strategy of iron addition) achieved an average decrease of 0.0214 µg/L for cadmium, 53.3 µg/L for copper, 8.16 µg/L for molybdenum, 3.15 µg/L for selenium, and 16.1 µg/L for zinc. Series 2, an average decrease of 0.0214 µg/L for cadmium, 49.7 µg/L for copper, 7.06 µg/L for molybdenum, 3.20 µg/L for selenium, and 16.1 µg/L for zinc. Additional positive results were also documented; plant uptake of constituents remained minimal throughout operation, maintenance of high abundance of beneficial sulphide-producing bacteria for metals treatment, and nitrate- and selenium-treating bacteria associated with plant roots.

The operational period of the demonstration CWTS confirmed that the predicted water quality for the Minto Mine at closure is amenable to treatment by these methods. Results from ongoing monitoring of the system in 2019 will be used to inform the designs for the full-scale constructed wetland treatment system.

Table of Contents

Abbreviations and Definitions	7
1. Introduction	10
2. Demonstration-Scale CWTS Operations 2018	12
2.1 Overview of operations.....	12
2.2 Recovery period and definition of operational period	12
2.3 Start-up.....	13
2.4 Water Depth	15
2.5 Flow Rates.....	16
2.6 Health and Establishment of CWTS Vegetation	18
2.6.1 Carex aquatilis	18
2.6.2 Moss.....	18
3. Timeline and Sampling Schedule	22
4. Results	24
4.1 Monitoring Explanatory Parameters	24
4.2 Water	27
4.2.1 Metal Leaching from Soils into Overlaying Water.....	27
4.2.2 Performance During 2018 Double Stress Test Period	29
4.2.3 Performance During 2018 Operational Period	32
4.3 Hydraulic Retention Time	40
4.4 Treatment Effectiveness	40
4.4.1 Performance Limit	40
4.4.2 Removal Rate Coefficients	41
4.5 Evapotranspiration in the Demonstration-Scale CWTS.....	44
4.6 Soils	45
4.7 Metals Uptake.....	49
4.8 Pesticide Application (and Monitoring of Aphids)	51
4.9 Detritus Study	53
4.10 Vegetation Productivity Study	56
4.11 Beneficial Microbes	57
4.11.1 Sulphide-producing Bacteria	57
4.11.2 Selenium-reducing Bacteria	63
4.11.3 Denitrifying Bacteria	63
5. Summary of Results	64
6. Next Steps for 2019.....	67

7. Closure	71

List of Appendices

Appendix A – Methods

Appendix B – Additional Tables and Figures

Appendix C – Multi-year Workplan

Abbreviations and Definitions

Accretion – The process of growth or increase of sediments through deposition and accumulation of organic material deposited solids (such as minerals) within a wetland.

Acid volatile sulphide (AVS) – Sulphide complexed with Fe (FeS) where the sulphide can preferentially exchange Fe for heavy metals (Ni, Zn, Cd, Pb, Cu, Hg) which are then more stably bound.

Amendment – A chemical or organic material added to encourage specific conditions (e.g., aerobic/anaerobic, pH, ORP) or as a source of something that is needed for passive treatment (e.g., nutrients, alkalinity, binding sites, etc).

Bio-Banked – Samples received were stored frozen for potential future DNA extraction and MCP analysis.

Biofilm(s) – A visible and often slimy-looking film (community) of bacteria (may contain other microbes).

Biochemical oxygen demand (BOD) – The amount of dissolved oxygen needed by aerobic microorganisms to break down organic material in water.

Carbon source – A source of carbon (energy/electrons) for microbes (see electron donors). Examples include ethanol, methanol, acetate, sugar (glucose), molasses, wood chips, detritus (dead plant matter).

***Carex aquatilis* (*C. aquatilis*)** – A plant (emergent macrophyte) commonly known as water sedge.

Chemical oxygen demand (COD) – A measurement of all organic and inorganic material in the water than can be oxidized.

Contango – Contango Strategies Ltd.

Constituent of Concern (COC) – Specific elements that have been identified for evaluation, including cadmium, copper, molybdenum, selenium, and zinc.

Constructed wetland treatment system (CWTS) – Wetlands that are designed and constructed to remove compounds from water, using natural processes to sequester them into the soils rendering them less bioavailable. They are different from wetlands that provide habitat for wildlife.

Denitrification – Where nitrate (NO_3^-) is reduced by microorganisms to form nitrite (NO_2^-), nitric oxide (NO), or nitrous oxide (N_2O), or nitrogen gas (N_2) (see nitrate reduction).

Dissolved organic carbon (DOC) – Organic (carbon based) molecules in water, that have passed through a filter of 0.45 μm .

Dissolved oxygen (DO) – Diatomic oxygen (O_2) dissolved in water; oxygen can dissolve in water by diffusion from surrounding air, as a product of photosynthesis, or through forced aeration.

Explanatory parameters – Quantifiable parameters that describe how water treatment reactions take place.

Evapotranspiration – The process by which water is transferred to the atmosphere by evaporation from the surface of water and by transpiration from plants.

Forebay – A Forebay is an artificial pool of water in front of a larger body of water. The larger body of water may be natural or man-made. In the context of a CWTS a forebay can allow for the addition of supplementary amendments (e.g. organics, iron) as needed.

Genetic analysis/sequencing – Analysis to assess the presence, identity, and diversity of different microbes in a sample.

Hydraulic retention time (HRT) – The residence time of the inflow water to outflow.

ICP-MS – Inductively coupled plasma mass spectrometry.

Microbes – Microscopic organisms that can be uni- or multi-cellular. This includes algae, bacteria, fungi, viruses, and yeast.

Most probable number (MPN) – A statistical value representing the viable population of microbes in a sample through use of dilution and multiple inoculations.

Nitrate reduction – Where microbes reduce nitrate (NO_3^-) to form nitrite (NO_2^-); the first step in denitrification (see denitrification).

Nominal HRT – The targeted HRT calculated based on the targeted flow rate for a given size of wetland.

Oxidation – The loss of electrons, or increase in valence state, by a molecule, atom, or ion. Can be driven by microbes. Process is complementary to chemical reduction.

Oxidation-reduction potential (ORP) – A measure of the tendency of a chemical species to acquire or donate electrons, thus becoming reduced or oxidized, respectively, measured in millivolts.

Redox – Oxidation-reduction potential (in sediment), a measure of the tendency of a chemical species acquire or donate electrons, thus becoming reduced or oxidized, measured in millivolts. This measurement is relative to the water ORP.

Reduction (chemical) – The gain of electrons, or a decrease in valence state, by a molecule, atom, or ion. Can be catalyzed by microbes. Process is complementary to chemical oxidation.

Selenium reduction – Microbially mediated reduction of soluble Se(VI) and Se(IV) to insoluble elemental selenium.

Simultaneously extracted metals (SEM) – amounts of heavy metals such as Ni, Zn, Cd, Pb, Cu, Hg in sediment, assessed in the context of AVS for excess sulphide. (also see acid volatile sulphide)

Sorption – The physical and/or chemical process by which one substance becomes attached to another substance.

Specific conductivity (SPC) – A measurement of electrical conductivity in water that is typically expressed in $\mu\text{S}/\text{cm}$, which has been adjusted for temperature (25°C).

Species (sp.) – One of the basic units of biological classification and a taxonomic rank. Rank in the classification of organisms below genus and above strain. Also can be used to refer to the oxidation state of a mineral (e.g., selenate and selenite are species of selenium).

SPLP – Synthetic precipitation leachate procedure.

Sulphide – An inorganic anion of sulphur that can form stable complexes with metals and make them insoluble in water (remove them from the water).

Sulphide producing bacteria (SPB) – Microbial reduction of sulphur compounds, such as sulphate, sulphite, thiosulphate, and sulphur, which produces sulphides and alkalinity. (see also SRB).

Sulphate reducing bacteria (SRB) – a form of sulphide producing bacteria that specifically uses sulphate for reduction (see sulphide producing bacteria).

Sulphide production – Microbial reduction of sulphur compounds, such as sulphate, sulphite, thiosulphate, and sulphur, which produces sulphides and alkalinity.

Total dissolved solids (TDS) – A measure of the combined organic and inorganic salts dissolved in water.

Total kjeldahl nitrogen (TKN) – The sum of organic nitrogen, ammonia (NH_3), and ammonium (NH_4^+) in water (or soil). To calculate the total nitrogen, the concentrations of nitrate as N (NO_3^- -N) and nitrite (NO_2^- -N) are added to TKN.

Total organic carbon (TOC) – A measurement of the total organic carbons present in water.

Total suspended solids (TSS) – A measurement of all particles in water that are larger than 2 μm (anything smaller than 2 μm considered a dissolved solid).

Transfer – Processes that treat water by transferring a constituent to another location without changing its form. For example: absorption, adsorption, dilution, dispersion, filtration, precipitation (aqueous to solid), and volatilization.

Transform – Processes that change the chemical form or state of a constituent. For example: biodegradation, biotransformation, hydrolysis, ionization, oxidation, photolysis, and reduction.

1. Introduction

The Minto Mine, owned and operated by Capstone Mining Corp. (Capstone), is located 240 km northwest of Whitehorse on the west side of the Yukon River. The Minto Mine is a combination open pit/underground copper mine that has been mining since October 2007. In October 2018, Capstone announced that due to unfavourable equity market conditions, the Minto Mine would be placed into temporary care and maintenance (Capstone, 2018), and that condition is currently in effect.

The Minto Mine has been in commercial operation since October 2007 and the deposits being mined are copper sulphide mineralized zones. Surface and groundwater water quality is a key consideration in the evaluation of potential effects of mining and mineral development projects and changes to water quality parameters have the potential to affect aquatic and human use of water resources. A Reclamation and Closure Plan (RCP) is required under both the Water Use License and the Quartz Mining License. The RCP is intended to address the long-term physical and chemical stability of the site and closure of the proposed features and disturbances associated with the mine. As a part of the RCP, a Constructed Wetland Treatment System (CWTS) is being designed, evaluated, and optimized for water treatment at closure through a phased program approved during the Minto Phase V/VI Expansion Project (Yukon Online Registry Project Number 2013-0100).

The CWTS is currently undergoing a phased design approach, including design, evaluation, and optimization for post-closure water treatment. Constituents of concern that are being evaluated through the CWTS program include cadmium, copper, molybdenum, selenium, and zinc. Nitrate is also being evaluated as it impacts treatment rates by consuming electrons (Contango, 2014b).

The phased design used at the Minto Mine include:

- 1) Site assessment and information gathering (complete);
- 2) Technology selection and conceptual design (complete);
- 3) Pilot-scale testing and optimization (controlled environment, off-site; complete);
- 4) Demonstration-scale confirmation and optimization (on-site; current scope); and
- 5) Full-scale implementation (future scope).

Phases 1 to 3 have been completed, and this work is summarized in the Site Assessment, and Pilot-Scale reports (Contango, 2014a and 2014b). Phase 4 of the project is currently underway, with the on-site demonstration-scale CWTS constructed at the Minto Mine during fall 2014. Commissioning was conducted from 2015-2017 and operations beginning in late 2017 with update reports provided annually (Contango, 2015, 2016; 2017a; 2017b).

The primary objective of the demonstration-scale program in 2018 was to assess performance under conditions that would be similar to the full-scale CWTS. However, this objective shifted to assess the CWTS ability to recover and perform under the unintentionally imposed stresses of a drought and elevated nitrate concentrations in the inflow water (feed). These imposed stresses will be herein referred to as the double stress test period.

Due to delays in running water to the system, the cells had dried out significantly by May 2018 and soils were exposed to air. This was problematic as the demonstration-scale CWTS was designed to operate under reducing conditions requiring constant water cover. This spring drought scenario is highly unlikely to occur in full-scale operation as that system would have water entering from gravity flow from freshet, rather than the pumped scenario of the demonstration-scale CWTS. Even though the freshet drought scenario is unlikely to occur at full-scale, the information gathered could generally inform about recovery from drought scenarios for other times of year. Furthermore, upon analysis of data, it was determined that nitrate concentrations in the influent (feed) from May to mid-June 2018 were on average 14.5 mg/L, which is about three times higher than nitrate concentrations in the same timeframe in 2017. While elevated nitrate concentrations are a potential stress that could occur on the full-scale CWTS in early closure, it is not expected to be a concern in long term closure as the residues from blasting will deplete over time.

The recovery from the double stress test period and subsequent calculation of operational removal rate coefficients (RRC; k) were the focus of the 2018 program documented in this report. Other ongoing activities that have been reported on in previous years and continued in 2018 included:

- Evaluating CWTS performance, and determining achievable concentrations of contaminants of concern (COCs; performance limits);
- Updating site-specific RRCs with data from the operational period;
- Determining the amount of water loss due to evapotranspiration and the effect on outflow concentrations;
- Monitoring metals leaching from the mineralized soils used in construction;
- Monitoring for the presence of aphids in the CWTS, and implementing a routine insect pest control plan (for aphids);
- Determining the rate and extent of detritus decomposition (*Carex aquatilis* leaves) in the CWTS over time;
- Assessing treatment mechanisms (including microbes).

Other activities completed in 2018 included:

- Adding sandbags to the end and along the perimeter of each CWTS cell to increase the water depth (to enhance reducing conditions) and minimize short circuiting (would be achieved by rip rap armouring in full-scale system);
- Replanting areas in the CWTS that had been impacted by aphid infestation in 2017;
- Monitoring of explanatory parameters and performance to determine when the double stress test recovery was complete, and full operational capacity had returned;
- Assessing the stability of COCs in soils and production of acid volatile sulphides (AVS) with the addition of iron to Series 1; and
- Harvesting of a vegetation plot to determine amount of growth of above water biomass of *C. aquatilis* in a 1 m² plot.

Results and recommendations are presented within this main document, while background information and methods are provided in Appendix A, data in Appendix B, and summary of past and future recommended activities in Appendix C. Operations of the CWTS are detailed

in Section 2, timeline and sampling schedule in Section 3, and results in Section 4. Summary of results and next steps for 2019 are summarized in Sections 5 and 6, respectively.

2. Demonstration-Scale CWTS Operations 2018

2.1 Overview of operations

The demonstration-scale CWTS was constructed in 2014 and commissioned throughout 2015 - 2017 (Table 1). The completion of commissioning and the start of operations was marked by the achievement of the expected treatment performance objectives on August 18, 2017 (Table 1). Details on the construction and commissioning can be found in past Contango reports (Contango, 2015; 2016; 2017a; 2017b). In 2018, it was anticipated that the CWTS would continue with the operational period; however, due to the unintentionally imposed stresses of drying out of the CWTS and the elevated nitrate concentrations in the spring (May to mid-June), an opportunity arose to determine the effects these stresses on CWTS performance and assess the amount of time needed for the CWTS to recover. Beginning of the operational period (and, therefore recovery from the double stress test) was marked by meeting the same criteria used to determine the end of commissioning period in 2017 and by achieving consistent extent of removal of COCs, comparable or better removal than what was observed during the operational period in 2017 (Contango, 2017b). The following criteria were used to evaluate stress test recovery and are further discussed in the sections as listed:

- Plant establishment and maturation such that the plants have grown in to densities visually similar to natural wetlands in the area, but in monoculture (Section 2.6),
- Establishment of reducing conditions within the CWTS soils (i.e., average soil redox was below -100 mV consistently in 2018; Section 4.1),
- No increase in aqueous copper concentrations through the CWTS (due to leaching from copper containing soils used in construction; Sections 4.2.1 and 4.6),
- Achieving consistent extent of removal of COCs, comparable or better than removal observed during the operational period in 2017 (Section 4.2.3), and
- Microbial population establishment and maturation to levels similar or better to 2017 operational period (Section 0).

Once the above criteria were met, the CWTS was deemed to be returned to operational status. The same criteria, other than the copper leaching (which would be avoided by proper substrate selection), could be used for the full-scale CWTS.

2.2 Recovery period and definition of operational period

Recovery period from the double stress test in 2018 was variable for each series and COC and is further discussed in Section 4.2.2. Additional recovery strategies were attempted on the systems, including stagnation (both series), and addition of iron (Series 1). Recovery periods ranged from 0 days (treatment likely unaffected) to 54 days for Series 1 and 0 days (treatment likely unaffected) to 93 days for Series 2. For consistency of data analysis and comparison of performance between series, only data from when recovery criteria were met for all COCs in both series, and flows were at target levels was used (August 17 to September 9, 2018). This 24 day period will be referred to as the 2018 operational period (Table 1). Flow to the CWTS continued until September 28, 2018; however, intermittent flow occurred after September 9, 2018 due to pumps and waterlines freezing. Although treatment

continued to occur, it was not possible to calculate accurate retention times therefore removal rate coefficients were not calculated for this time period. Discussions in this document are focused on the defined operational period of August 17 to September 9, 2018.

Table 1 – Days of operation of demonstration-scale CWTS.

Scale	Year	Period (days)	Date	
			Start	End
Commissioning-A ²	2014 ¹	23	Aug 27	Sep 19
	2015	135	May 16	Sep 29
	2016	87	May 2	Jul 28
Commissioning-B ³	2016	63	Jul 29	Sep 30
	2017	82	May 27	Aug 17
Operational Period ³	2017	35	Aug 18	Sep 22
Double Stress Test Period - Series 1 ⁴	2018	0-54	May15	Jul 8
Double Stress Test Period - Series 2 ⁴	2018	0-93	May15	Aug 16
Operational Period ⁴	2018	24	Aug 17	Sep 9

¹ The CWTS was constructed in 2014, but no water testing occurred during this first month of commissioning-A.
² The end of the commissioning-A period and beginning of the commissioning-B period was marked by the addition of organics on July 28, 2016.
³ The end of the commissioning-B period and beginning of the operational period in 2017 was marked by stabilization of flow rates and resolution of feed water delivery complications.
⁴ The end of the double stress test period and beginning of the operational period in 2018 was marked by re-establishment of commissioning criteria. Series 1 recovered sooner than Series 2.

2.3 Start-up

The Minto Mine typically experiences fully frozen conditions from October to March, with overnight freezing temperatures beginning in September and persisting until May (Access, 2013). To start-up the demonstration-scale CWTS at the Minto Mine, temperatures must be sufficiently above freezing to operate the water supply pumps from monitoring station W62. In 2018, the criteria for the pumps was met on May 11, 2018 and water was pumped from station W62 to the header tank and subsequently into the CWTS on May 14, 2018 (Figure 2).

Once the ice and snow as melted from the CWTS, it was also observed on May 11, 2018 that the standing water in the CWTS had receded from all four cells (Figure 1), exposing the soils to oxygen for a period of time, and potentially releasing metals from the soils once the flow of water was re-introduced to the system. Ideally, a reducing CWTS such as that at Minto should operate under a constant water cover to maintain reducing conditions. This scenario of spring freshet drought is not expected to occur during full-scale operations as water will be flowing into the wetland by gravity as spring melt occurs and will not rely on pumps with seasonal constraints to supply water to the CWTS.

Figure 1 – Demonstration-Scale CWTS prior to start-up on May 11, 2018.

No standing water in cells as water dried out in early spring/freshet. Although vegetation is brown, other vegetation around the area is also brown at this time of year. Therefore, actual effects of drought on vegetation could not be evaluated at this time.

Figure 2 – Demonstration-Scale CWTS after water was pumped into the system on May 14, 2018.

2.4 Water Depth

Sandbags were added to the end and along the perimeter of each CWTS cell on May 18, 2018 to increase the water depth and minimize short circuiting, respectively. At full-scale short circuiting would be achieved by rip rap armouring around the edges of the wetland. The increase in water depth was conducted to promote reducing conditions and speed recovery of the cells from the drought. The depths were increased by 1 to 5 cm in each of the four cells (Table 2).

Table 2 – Demonstration-scale CWTS water depths.

CWTS Cell	Water Depth 2017 (cm)	Water depth 2018 (cm)
1A	15.2	20.2
1B	16.0	20.3
2A	15.9	18.6
2B	14.4	15.6

2.5 Flow Rates

To facilitate recovery of the CWTS cells from the double stress test, a long hydraulic retention time (HRT) was required to reintroduce reducing conditions. The targeted nominal HRT was calculated using the actual depth in each series (after adding sandbags on May 18, 2018; Section 2.4), plus the correction factor obtained from the 2017 tracer study. The targeted HRT was 7.25 days. Actual flow rates varied from the targeted flow rates and are presented with their corresponding HRTs in Table 3.

Once the CWTS had recovered from the double stress test, the targeted flow rates were continued into the operational period (August 17 to September 9, 2018) to continue monitoring the extent of treatment of COCs at a low flow. Due to flow meter fluctuations, the actual flow rates varied from targeted flow rates as outline in Table 3 below.

The flow rates were increased on September 10 to obtain a nominal HRT of 5 days to mimic the nominal HRT in 2017. However, due to unintentional changes in flow rates and shutdown of the demonstration-scale CWTS on September 28, 2018, there was limited data provided at the increased flow rate and the data collected from September 10 – 28, 2018 was omitted from further interpretation.

Table 3 – 2018 targeted and actual flow rates and corresponding HRTs.

Testing Period	Series 1				Series 2			
	Flow		HRT		Flow		HRT	
	GPM (m ³ /day)		days		GPM (m ³ /day)		days	
	Target	Actual	Target ³	Actual ⁴	Target	Actual	Target ¹	Actual ²
Double Stress Test Period ³	0.37 (2.02)	0.32 (1.76)	7.25	8.42	0.31 (1.69)	0.25 (1.39)	7.25	7.61
Operational Period ⁴	0.37 (2.02)	0.36 (1.95)	7.25	7.60	0.31 (1.69)	0.27 (1.49)	7.25	7.09

¹ Targeted HRTs were calculated with the targeted depth of 0.2 m corrected with the 0.01 m depth correction factor from the tracer study of 2017 (Contango, 2017b).
² Actual HRTs were calculated with the actual measured depth corrected with the 0.01 m depth correction factor from the tracer study of 2017 (Contango, 2017b).
³ Actual HRT and flow rate are an average from May 15 to August 16, 2018.
⁴ Actual HRT and flow rate are an average from August 17 to September 9, 2018.

Figure 3 – Flow rates during CWTS operations in 2018.

Blue bars indicate flow rates displayed on flow meter, while green dots are flow rates calculated from the totalizer values (values from meter were recorded by Minto personnel). Specific flow rates of 0.37 and 0.31 gallons per minutes (GPM) for Series 1 and Series 2, respectively, were targeted where the lower flow rates in Series 2 are due to the smaller size of Series 2 cells. Due to flow meter fluctuations, the actual flow rates during the drought recovery period averaged 0.32 and 0.25 GPM for Series 1 and Series 2, respectively. The totalizer value is the cumulative volume of water passing through the flow meter between two measurement dates. Areas with no blue bars or green dots are time periods where flow rates and totalizer values were not recorded. Areas shaded grey indicate dates of interrupted flow due to evapotranspiration trials. Areas shaded blue indicate the 2018 operational period. Further details are outlined in Table 3.

2.6 Health and Establishment of CWTS Vegetation

2.6.1 *Carex aquatilis*

During the commissioning period, plants establish and mature, with density expected to increase over time. From planting in 2014 to the last site visit in July 2017, *Carex aquatilis* thrived in the CWTS creating a dense emergent macrophyte monoculture, supplemented with aquatic mosses (Figure 4). Due to the location of the CWTS on the waste rock dump being in a relatively isolated area, away from other vegetation and potential sources of predatory insects, in July 2017, an aphid infestation occurred in the CWTS which affected the growth of *C. aquatilis* (September 2017 and May 2018 photos in Figure 4, Contango, 2017b). The biomass above water partially died off, however, the plants continued to send out new shoots suggesting the *C. aquatilis* were resilient to the infestation. To assist with plant recovery in 2018, the CWTS was sprayed with pesticide biweekly starting on May 14, 2018 (Section 4.8), and on July 8, 2018, *C. aquatilis* was replanted where vegetation was sparse. Plant re-establishment and maturation such that the plants had grown in to densities visually similar to natural wetlands in the area, but in monoculture, was reached after replanting *C. aquatilis* (Figure 4), with the exception of cell 1A which was still recovering. Weekly pesticide application was conducted starting on August 24, 2018 to control a small aphid population in cell 2A (Section 4.8). It is recommended that pictures of the CWTS cells are taken from all four corners to better monitor plant growth and development in the cells in 2019.

Generally, the *C. aquatilis* has been successful in creating the desired conditions for water treatment, and the results of the 2018 operations confirm that *C. aquatilis* is a good candidate for use in the full-scale CWTS at Minto.

2.6.2 Moss

Aquatic mosses have also continued to mature and expand in size from 2014 through 2018 (Figure 5). The mature mosses show signs of successful transfer (sorption, filtration) and transformation (mineralization, reduction) processes such as new green biomass at the top of moss and black decomposition at the bottom of the moss.

Figure 4 – Maturation of the CWTS from construction through operations.
2015 pictures show cell 2A. 2016 pictures show cell 1B.

Figure 4 continued – Maturation of the CWTS from construction through operations.
2017 and 2018 pictures show cell 1B. September 12, 2017 shows increased yellowing and die off in cell 1B due to aphid infestation.

Figure 5 – Moss maturation in CWTS from construction through operations.

3. Timeline and Sampling Schedule

Major events and operational adjustments or amendments for 2018 are listed in Table 4. Details for events up to 2018 can be found in the Minto Demonstration-scale 2017 Update Report (Contango, 2018). The actual dates as well as effective days of operation are provided, which adjusts for time that the CWTS was not receiving water when it was frozen. The effective days of operation allows for comparison to expected timelines from the pilot-scale testing, and for planning and scheduling to be done for full-scale construction and commissioning. The sampling schedule for 2018 was conceptually developed prior to beginning construction of the demonstration-scale CWTS (Appendix A). Actual dates of sampling were adjusted for timing of spring thaw and winter freeze-up, and the associated ability to have the pumps operating at the W62 sump to supply water to the demonstration-scale CWTS.

Table 4 – Events and sampling activities in 2018.

Event	Key Activity	Flow Rate Recorded m ³ /day (GPM)		Dates	Effective Days of Operation (start date = August 27, 2014)
		Series 1	Series 2		
Aphid spraying started	Applied insecticide biweekly	n/a	n/a	May 14, 2018	439
CWTS refilled	Re-established water level post drought	No flow	No flow	May 14, 2018	439
Drought recovery period started	Flow started	2.07 (0.38)	1.74 (0.32)	May 15, 2018	440
Water level raised	Added sandbags	2.02 (0.37)	1.64 (0.30)	May 18, 2018	443
Spring seasonal sampling	Tested soils, water & sampled microbiology ¹	1.74 (0.32)	1.64 (0.30)	May 27, 2018	452
Spring microbiology re- sampling	Tested microbiology ¹	2.13 (0.39)	0.98 (0.18)	June 25, 2018	481
Evaporation Study #1	Flow stopped	No flow	No flow	June 27, 2018	483
	Flow re-started	1.96 (0.36)	1.20 (0.22)	July 3, 2018	489
Contango Site Visit #9 & summer seasonal sampling	Tested microbiology, soils, water, detritus bags, and vegetation plot	1.96 (0.36)	1.74 (0.32)	July 7 – 9, 2018	493 – 495
Sedge transplanted	Replenished aphid devastated areas	No flow	No flow	July 8, 2018	494

4. Results

4.1 Monitoring Explanatory Parameters

Key findings (detailed below):

- Dissolved oxygen (DO) increased during the double stress test period and operations in 2018. Elevated DO is likely the result of photosynthesis of algae, which had increased growth due to fertilizer addition. Despite the DO levels being in aerobic ranges, stable reducing conditions were achieved in CWTS soils within the targeted range.
- Other than the day that the CWTS was refilled (May 14, 2018), soil redox was unaffected by the drought. Average soil redox values were more reducing (and stable in the targeted range) in 2018 than 2017.

Average water temperature of the demonstration-scale CWTS in 2018 were similar to those in 2015 (12.9°C), 2016 (10.2°C), and 2017 (9.7°C). The average water temperature during the operational period in 2018 was 9.8°C, ranging from 6.4°C to 12.6°C. Conductivity decreased slightly since 2017, and as expected, pH remained circumneutral. Water oxidation-reduction potential (ORP) was similar to 2017 (Table 5).

During operations, DO concentrations in the CWTS cells in 2018 were on average 7.9 mg/L, which is higher than the operational period in 2017 (Table 5). DO measurements at Minto were taken mainly during the day, between 8 am and 4 pm, when DO concentrations have been shown to be higher (SRCSD, 1998). Furthermore, DO fluctuations are generally more extreme in open (such as the demonstration-scale CWTS in this phase where vegetation is still growing in) versus densely vegetated waters and may vary based on distance through the wetland (SRCSD, 1998). Algae can also cause DO levels to fluctuate through their photosynthetic cycles, which peak during the afternoon and are at a minimum in the early morning (SRCSD, 1998). Algae growth increased compared to 2017, particularly in cell 1A, due to the addition of fertilizer, and average DO was notably higher than other cells (10.0 mg/L in 1A, compared to 8.1, 5.1, and 8.5 mg/L in 1B, 2A, and 2B, respectively). The elevated DO in cell 1A is associated with decreased performance in that cell, specifically for selenium and copper (Section 4.2.3). Despite the elevated DO concentrations, treatment in Series 1 still occurred by the end of the B cells. Due to the fluctuations in DO, it is recommended that DO is measured at various locations and water depths through the CWTS in 2019 for a more thorough understanding of aerobic zones within the CWTS.

Table 5 – Average *in situ* measurements from the demonstration-scale CWTS.

Testing Period		DO (mg / L)	Conductivity (μ S / cm)	pH	ORP (mV)	Soil redox (mV)
Demonstration-scale 2015		10.0	817.9	8.11	147.9	-52
Demonstration-scale 2016	Commissioning-A ¹	15.9	890.9	7.79	143.7	-85
	Commissioning-B ²	8.4	1020	7.59	157.6	-89

	Operational period ⁶	7.9	703.4	7.45	143.1	-178
DO – dissolved oxygen; ORP – oxidation-reduction potential. ¹ Data for commissioning-A period is from May 2-July 28, 2016. ² Data for commissioning-B period is from July 29-September 30, 2016. ³ Data for commissioning-B period is from May 27-August 17, 2017. ⁴ Data for operational period is from August 18-September 22, 2017. ⁵ Data for double stress test is from May 15-August 16, 2018. ⁶ Data for operational period is from August 17-September 9, 2018.						

As expected from the pilot-scale testing, the soil redox in all the demonstration-scale CWTS cells has decreased and stabilized to within the targeted range (-100 and -250 mV; Contango, 2014b), indicating maturation of the CWTS (Figure 6). At the end of 2016, the demonstration-scale CWTS had begun achieving soil redox values that are conducive to sulphide production due to the decomposition of the organics that were added on July 28, 2016 (Contango, 2017). By the end of 2017, the CWTS had matured and became self-sufficient in producing enough organic matter to maintain reducing soil redox conditions between -100 and -250 mV. In 2018, the average soil redox in Series 1 was unaffected by the CWTS drying out in early spring/freshet, while Series 2 was above -100 mV on May 14, 2018. However, the average soil redox in Series 2 decreased to ideal reducing conditions by May 27, 2018 without additional carbon amendments. The average soil redox for Series 1 and 2 was -176 mV during the double stress test period and remained in the targeted range (-178 mV) throughout the operational period in 2018, indicating a matured CWTS. Soil redox will continue to be monitored throughout operation in 2019.

Figure 6 – Soil redox potential of each CWTS cell over time.

All demonstration-scale CWTS soil redox measurements are plotted. Targeted soil redox values based on pilot-scale testing are indicated with dotted lines. The blue dotted line indicates break in measurements for winter 2015, 2016, and 2017. Grey shading corresponds to periods of nominal HRT (days) in 2015 and 2016 indicate the nominal HRT. Grey shading corresponds to periods of nominal HRT (days) in 2017 and 2018 indicate the actual HRT (average of Series 1 and 2) using recorded water depths and flow rates during those time periods.

4.2 Water

Key findings (detailed below):

- While leaching of copper from substrates used in construction was remedied by the end of the commissioning-B period in 2017, copper leached from the soils into the water in early 2018, likely due to the drying out of the CWTS in the early spring/freshet of 2018. However, leaching had subsided by July 8, 2018 as the rate of treatment exceeded the rate of leaching. Copper is not expected to leach in 2019 operations provided that the CWTS remains flooded.
- Stagnation and iron addition can be used at full-scale to mitigate recovery length after periods of drought (or stagnation/slower HRT for high nitrate concentrations).
- During the 2018 operational period the demonstration-scale CWTS successfully treated all COCs.

4.2.1 Metal Leaching from Soils into Overlaying Water

Due to metals leaching from the soils, the treatment occurring within the CWTS was far greater than what was being observed by simply measuring the inflow and outflow points. Therefore, additional sampling locations were tested throughout the CWTS in 2017 and 2018 to identify these fluctuations. Details of the sampling methods can be found in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b). Graphs showing concentrations of copper throughout the CWTS are presented in Figure 7, while graphs for the remaining COCs can be found in Appendix B (Figures B1 to B4).

Since the beginning of operations of the demonstration-scale CWTS, significant concentrations of copper have been leaching from the CWTS soils used in construction (Contango, 2016, 2017a, and 2017b; Section 4.6). Once sufficient reducing conditions were established at the end of the 2017 commissioning-B period, copper leaching subsided as treatment occurred at a faster rate than leaching (Contango, 2017b). However, due to the drying out of the CWTS in early 2018, copper once again began leaching from the soils into the water in Series 2 (June 22, 2018 sampling date; Figure 7).

As corners in Series 1 are deeper than Series 2, it is likely that Series 2 dried out first and was therefore more affected by the drought than Series 1. However, at later sampling dates (July 8, 2018 onwards), copper was no longer leaching at a rate that the CWTS could not keep up with for treatment. Copper concentrations generally decreased by the end of the A cells and stabilized through B cells (Figure 7), indicating that treatment of copper was occurring and that copper leaching from the soils had subsided to a slower rate than treatment. Leaching of copper is not expected to be a concern in 2019 operations provided that the CWTS remains flooded throughout the 2018/2019 winter and early spring season. Therefore, it is recommended that the CWTS be periodically monitored throughout the 2018/2019 winter and early spring, with close observation in the spring to add water immediately once thawed, should the CWTS be dry. Leaching of constituents from the substrates used in construction is further described in Section 4.6.

Figure 7 – Copper concentrations through the demonstration-scale CWTS.

Dissolved copper concentrations along the length of the CWTS in 2015 through 2018. Data shown for 11 timepoints, where water was sampled at seven locations through the flow path of the CWTS to assess for treatment fronts within the CWTS, or possible leaching of constituents from the soils into the CWTS. The Maxxam (2015 results) and ALS (2016 – 2018 results) detection limit (DL; black line) for copper is 0.0002 mg/L. Spikes in copper concentrations were observed in early sampling points in Series 2 of the CWTS in 2018 indicating leaching from the soils is occurring; however, later sampling points do not show any copper spikes and, therefore, leaching has subsided.

4.2.2 Performance During 2018 Double Stress Test Period

Due to the drying out of the CWTS as well as higher nitrate concentrations in early 2018, the performance of the CWTS was impacted, resulting in decreased removal of COCs. While these risks are unlikely to occur for an extended period of time during full-scale operations, there are measures that can be taken to mitigate the risks, based on data from the demonstration-scale CWTS. The issues identified, along with the risk to the CWTS, impact on performance, and mitigation actions are outlined in Table 6 and will be considered for full-scale CWTS implementation.

Table 6 – Risks, impacts, and mitigation measures based on issues identified during operations of the demonstration-scale CWTS.

Issue	Risk to CWTS	Potential Impact on Performance	Mitigation Measures for Full-Scale CWTS
High nitrate concentrations	Increase electron (carbon) demand	Dependent on time of year, may overcome vegetation's ability to use as nutrient, forming an oxidative redox buffer, which increases carbon demand needed to treat metals and metalloids.	- Run at slower flow rates (longer HRT) to decrease the load of electron demand to the CWTS - Add organics (carbon) to forebay (at full-scale) to produce excess electrons for treatment to account for unexpectedly high concentrations - Prevent effects on metal treatment by having a strong pool of AVS to continue treatment through AVS buffering while Nitrate uses electrons from carbon in system (outcompeting sulphate for sulphides).
Drought in spring thaw	Soil exposure to oxygen, potential change in redox status if prolonged	- Oxidizing conditions may establish, impacting treatment of COCs. - When water returns, no vegetation to draw water into root zone and commence treatment.	- Stagnate or increase HRT to re-establish reducing conditions - Add iron to remove metals/metalloids with iron oxyhydroxides (which will eventually form sulphide minerals) - Prevent effects by having strong AVS pool to provide redox buffering
Drought in summer		- Oxidizing conditions may establish, impacting treatment of COCs. - When water returns, vegetation can rapidly draw water through root zone to return treatment.	

The period of time required for the CWTS to recover from the double stress test was variable for each series and COC based on treatment front, and amendments added to the CWTS (Table 7). During the double stress test period, while the CWTS recovered, the percent load removal of all COCs, except cadmium, were lower than the 2017 operational period (Table 8; Figure 8 to Figure 13). Additionally, with the exception of molybdenum, percent load removal in the drought recovery period for remaining COCs was higher in Series 1 (Table 8).

In both series, nitrate treatment was likely unaffected as the amount of removal remained stable throughout 2018 and the extent of removal was better than previous years, where the CWTS was not affected by a drought in the spring (Contango, 2017b). Treatment of selenium followed the same trend as nitrate, however, it was not treated until nitrate was depleted. This is due to the reaction order in an anaerobic system where nitrate is easier to reduce than selenium.

In Series 1, treatment of cadmium and zinc resumed concurrently (July 8, 2018) while in Series 2, zinc recovered before cadmium (Table 7). While zinc is expected to be treated following copper and cadmium via metal-sulphide formation, it can also sorb to mosses, thereby decreasing its recovery time. Copper and molybdenum treatment began improving in both series following the first evapotranspiration trial when flow to the CWTS was stopped and reducing conditions further established (Figure 9). However, the addition of iron to Series 1 enhanced the recovery of copper and molybdenum by 33 and 20 days, respectively, compared to Series 2 (no added iron; Table 7). Although copper treatment is expected to occur prior to cadmium, zinc, and molybdenum, leaching of copper from the soils in early 2018 increased the load of copper needing treatment (Section 4.2.1; Table 8). However, this is not expected to occur in the full-scale system provided soils with low concentrations of leachable copper are used.

Based on the recovery of COCs from the double stress test, stagnating the CWTS (demonstration-scale or full-scale) immediately following an upset may increase time of recovery by promoting re-establishment of reducing conditions (to aid in the formation of metal-sulphides.) Furthermore, while iron isn't expected to be added in the full-scale CWTS long-term, it may also be used in conjunction with stagnation to decrease recovery time of the CWTS. Addition of iron promotes production of AVS for future use in metals treatment in an on-demand manner. To further encourage AVS production in the full-scale CWTS iron could be incorporated into the soils during construction.

Table 7 – Date of COC recovery from double stress test for Series 1 and 2.

COC	Series 1 (with iron)		Series 2 (without iron)	
	Period (days)	Date of recovery	Period (days)	Date of recovery
Cd	45	29-Jun-18	45	29-Jun-18

Se	12	27-May-18	24	08-Jun-18
Zn	45	29-Jun-18	31	15-Jun-18
Nitrate	Not applicable	Likely unaffected	Not applicable	Likely unaffected

4.2.3 Performance During 2018 Operational Period

In the 2018 operational period for the demonstration-scale CWTS (August 17 to September 9, 2018), dissolved cadmium, copper, selenium, and zinc treatment improved from the double stress test period (Table 8). Dissolved metals concentrations rather than total metals concentrations were used for the discussion in this report as total values are not representative of the metals concentrations in the CWTS water. During the operational period Series 1, which also received an additional recovery intervention strategy of iron addition achieved of the CWTS achieved an average decrease of 0.0214 µg/L for cadmium (Figure 8), 53.3 µg/L for copper (Figure 9), 8.16 µg/L for molybdenum (Figure 10), 3.15 µg/L for selenium (Figure 11), 16.1 µg/L for zinc (Figure 12) and 8.94 mg/L for nitrate. Series 2, an average decrease of 0.0214 µg/L for cadmium (Figure 8), 49.7 µg/L for copper (Figure 9), 7.06 µg/L for molybdenum (Figure 10), 3.20 µg/L for selenium (Figure 11), 16.1 µg/L for zinc (Figure 12) and 8.98 mg/L for nitrate. Percent removal of COCs are presented in Table 8 below, including percent removal of COCs adjusted for evapotranspiration. Evapotranspiration is further discussed in Section 4.5. Furthermore, nitrate outflow concentrations also decreased from feed water concentrations throughout the demonstration-scale CWTS. As nitrate concentrations were low during the operational period, nitrate was likely taken up by plants as a nutrient source (Figure 13). These results indicate that the CWTS can recover quickly from an upset event (double stress test). Beneficial conditions for the removal of constituents in the CWTS were re-established following the double stress test, and treatment of these constituents should continue through 2019.

Table 8 – Percent removal of dissolved constituents in the demonstration-scale CWTS.

COC (µg/L)		Operational period ¹	Double Stress Test Period ²		Post-Double Stress Test Period ³		Operational Period ⁴

% removal – percent load removal, not adjusted for evapotranspiration; % ET – percent load removal adjusted for evapotranspiration, calculated by methods described in Contango, 2017b; '-' – indicates that percent load removal adjusted for evapotranspiration was not calculated as it is not applicable to full-scale.

¹ Data for operational period was from August 18 to September 22, 2017.

² Data for double stress test period varied by COC and series, as shown in Table 7, with nitrate reported in this table as May 18-June 15, 2018 where nitrate concentrations were elevated causing stress on the system.

³ Period after the double stress test and includes data to the end of the operational period (referred to here as post-double stress test period; varied by COC and series; Table 7).

⁴ Operational period occurred from August 17, 2018 to September 9, 2018.

⁵ Data from 2017 averaged for series 1 and 2 as both series were operated the same in 2017.

⁶ Percent load removal for Cd and Zn are artificially low in 2018 due to outflow concentrations below the detection limit.

⁷ Extent of copper removal was influenced by higher copper concentrations in the soils (Figure 14, Table 7).

⁸ Data from June 22, 2018 was erroneous and therefore removed from calculations (dissolved concentration exceeded total concentration).

Figure 8 – Dissolved cadmium concentrations in the demonstration-scale CWTS in 2018.

‘*’ – The operational period refers to the time period when all COCs in Series 2 (no iron added) were being treated. However, cadmium recovered before this date (Table 7). The ALS detection limit for cadmium is 0.000005 mg/L. ET – evapotranspiration. Flow to the CWTS was shut off for the addition of iron to cells 1A and 1B on July 8, 2018. Flow was restarted on July 15, 2018.

Figure 9 – Dissolved copper concentrations in the demonstration-scale CWTS in 2018.

‘*’ – The operational period refers to the time period when all COCs in Series 2 (no iron added) were being treated. However, copper in Series 1 recovered before this date (Table 7). The ALS detection limit for copper is 0.0002 mg/L. ET – evapotranspiration. Flow to the CWTS was shut off for the addition of iron to cells 1A and 1B on July 8, 2018. Flow was restarted on July 15, 2018.

Figure 10 – Dissolved molybdenum concentrations in the demonstration-scale CWTS in 2018.

‘*’ – The operational period refers to the time period when all COCs in Series 2 (no iron added) were being treated. However, molybdenum recovered before this date (Table 7). The ALS detection limit for molybdenum is 0.000050 mg/L. ET – evapotranspiration. Flow to the CWTS was shut off for the addition of iron to cells 1A and 1B on July 8, 2018. Flow was restarted on July 15, 2018.

Figure 11 – Dissolved selenium concentrations in the demonstration-scale CWTS in 2018.

‘*’ – The operational period refers to the time period when all COCs in Series 2 (no iron added) were being treated. However, selenium recovered before this date (Table 7). The ALS detection limit for selenium is 0.000050 mg/L. ET – evapotranspiration. Flow to the CWTS was shut off for the addition of iron to cells 1A and 1B on July 8, 2018. Flow was restarted on July 15, 2018.

Figure 12 – Dissolved zinc concentrations in the demonstration-scale CWTS in 2018.

‘*’ – The operational period refers to the time period when all COCs in Series 2 (no iron added) were being treated. However, zinc recovered before this date (Table 7). The ALS detection limit for zinc is 0.001 mg/L. ET – evapotranspiration. Flow to the CWTS was shut off for the addition of iron to cells 1A and 1B on July 8, 2018. Flow was restarted on July 15, 2018. Data from June 22, 2018 was removed as the total zinc was higher than dissolved.

Figure 13 – Nitrate as N concentrations in the demonstration-scale CWTS in 2018.

The ALS detection limit for nitrate is 0.025 mg/L. ET – evapotranspiration. Flow to the CWTS was shut off for the addition of iron to cells 1A and 1B on July 8, 2018. Flow was restarted on July 15, 2018.

4.3 Hydraulic Retention Time

The operational hydraulic retention time (HRT) of the demonstration-scale CWTS for 2018 was calculated for each series using Equation 1. Equation 1 uses the flow rate (Q) from the operational period and the actual depth of each CWTS cell. The actual depth is calculated using the measured depths (an average of two depth sticks in each cell and, therefore, depths may vary) and a water depth correction factor of 0.01 meters determined from the tracer study conducted in 2017 (Contango, 2017b). Therefore, the average HRT for the operational period calculated separately for each series was 7.60 days and 7.09 days, for Series 1 and 2, respectively. The operational HRTs were then used in the calculation of removal rate coefficients in Section 4.4.2.

$\text{Operational HRT} = \frac{A \times \text{actual depth}}{Q}$
Equation 1 – Equation for calculation of hydraulic retention time. Operational HRT is the confirmed hydraulic retention time; A is the area of the CWTS; actual depth was calculated from the measured depth + 0.01 m correction factor; Q is the flow rate.

4.4 Treatment Effectiveness

Key findings (detailed below):

- The lowest concentrations consistently achievable for the treatment design (performance limits confirmed by t-test) were reached for cadmium after 3.80 days for Series 1 and 3.54 days for Series 2 and for copper after 3.54 days (Series 2 only).
- Removal rate coefficients (RRCs, *k*) have been developed that can be used for full-scale sizing.
- Copper leaching from soils decreased from the drought recovery period but is still likely making the RRC artificially low in this CWTS; however, the RRC is expected to improve in 2019 as leaching continues to decrease.

4.4.1 Performance Limit

The performance limit (referred to as thermodynamic minimum in previous reports) is the lowest concentration consistently achievable for a given treatment design and water chemistry. Once the performance limit is reached, making the CWTS bigger will not result in further decrease of outflow concentration (although outflow load may continue to decrease as water volume decreases through evapotranspiration). The performance limit was determined for each COC using the operational period, and were then also visually compared to the average concentrations of COCs at seven sampling locations throughout the CWTS from one time point during the operational period, to further evaluate and confirm whether concentrations appeared to have leveled off (Appendix B, Figures B5 to B9 for remaining COCs). Unfortunately, due to the double stress test, there were not enough time points in the operational period in 2018 for this data to be used in the statistical analyses to further refine the expected HRT for the performance limits. This can be refined in 2019, by varying flow rates.

Based on the results of the t-test for A cell and B cell concentrations, it was determined that the performance limit was achieved for dissolved cadmium (both series) and copper (Series 2 only), by the end of the A cells in the demonstration-scale CWTS. The detection limit was

reached for all except one timepoint during the operational period for cadmium by the outflow of cell A, suggesting that faster flows would be needed to accurately determine the HRT at which the performance limit was met. The performance limits for copper (Series 1 only), molybdenum, nitrate, selenium, and zinc were not yet statistically achieved, suggesting that a larger CWTS would achieve lower concentrations of these constituents (Appendix B, Figures B5 to B9). Results for copper should also be taken with consideration if leaching of residual copper from the soil continues, as there is more copper treatment ongoing than can be noted by just the water concentrations. However, by July 8, 2018, copper soil leaching had decreased (Section 4.2.1).

Interestingly, once nitrate, cadmium, and copper were treated, zinc, selenium and molybdenum begin to have an increase in treatment. This phenomenon is referred to as a treatment front, which generally abides by reaction orders (i.e., nitrate treatment before sulphate, sulphide exchange reaction kinetics, etc.; Morse and Luther III, 1999). Additionally, as selenium is easier to reduce than sulphate, it is often thought that selenium would be reduced before the remaining chalcophiles. However, due high concentrations of sulphate, sulphate and selenium reduction occurred concurrently (which is expected). Furthermore, due to copper leaching from soils, copper was not treated exclusively before other chalcophile metals, which would generally be expected in a full-scale CWTS with stable soils.

4.4.2 Removal Rate Coefficients

An important factor for CWTS design is the rate of treatment, also known as the removal rate coefficient (RRC; k). The RRC is based on the treatability of a specific compound and the HRT of the CWTS, both of which are site-specific based on water chemistry, CWTS designs, and characteristics of the CWTS. Information regarding calculation of RRCs can be found in previous reports (Contango, 2017b).

In pilot-scale testing specific for the Minto CWTS, the RRC for selenium was a zero-order reaction kinetic; however, optimizations of the operation of the system through the demonstration-scale commissioning enabled a first-order RRC to be maintained in 2017 (both series) and in Series 2 in 2018. The reaction kinetic of selenium in Series 1 was not reported as iron dosing in Series 1 temporarily changed the treatment mechanism and reaction order. Additionally, higher DO in cell 1A could affect microbial reduction of selenium, thereby changing the reaction kinetic (Section 0). Therefore, cadmium, copper, nitrate, selenium (Series 2), and zinc, are calculated as first-order kinetics, while molybdenum followed a zero-order kinetic. In other words, the reaction rate for molybdenum is a linear rate and does not depend on concentration, whereas the reaction rates for cadmium, copper, selenium (Series 2), zinc, and nitrate are proportional to concentration (a half-life type of reaction).

In 2017 and 2018, RRCs for cadmium and copper (Series 2 only in 2018) were calculated using outflow concentrations and HRT from the A cells as they had reached their performance limit at the end of A cells (Section 4.4.1; Table 9; Contango, 2017b). RRCs for the remaining COCs in 2017 were therefore calculated using outflow concentrations and HRTs from the B cells (Contango, 2017b; Table 9). Although the performance limit was not reached in the B cells for zinc (both series) and nitrate (Series 2), RRCs were calculated using outflow concentrations and HRTs from the A cells as outflow concentrations from the B cells were

consistently at the detection limit. The remaining constituents did not reach their performance limit and were not consistently at the detection limit in the A or B cell. Therefore, outflow concentrations and HRTs from the B cells were used. RRCs for selenium and nitrate for Series 1 were not calculated in 2018 as nitrate treatment in Series 1 was impacted by decreased plant growth and the addition of iron to Series 1 temporarily changed the treatment mechanism and reaction order for selenium. The RRCs were therefore not representative of what would be expected in a fully functioning system.

Table 9 – Cells used for removal rate coefficient calculations.

COC	2017		2018	
	Series 1	Series 2	Series 1	Series 2
Cadmium	A	A	A	A
Copper	A	A	B	A
Molybdenum	B	B	B	B
Selenium	B	B	-	B
Zinc	B	B	A	A
Nitrate	B	B	-	A
A cells were used if COCs reached their performance limit by the end of the A cell or were consistently achieving detection limit concentrations in the B cell. '-' indicates that an RRC was not calculated.				

An RRC was calculated for all COCs during the operational period (August 17 to September 9, 2018) which can be used to refine future sizing and performance estimations of a full-scale CWTS (Table 10). RRCs were then compared to the average RRCs calculated from another pilot-scale copper study completed in the Yukon and the demonstration-scale CWTS operational period of 2017 (Table 10). RRCs for cadmium in the 2018 demonstration-scale CWTS were depressed because flow rates did not provide the resolution needed to determine an accurate RRC. Additionally, RRCs for copper in the demonstration-scale CWTS are also depressed due to copper leaching from soils used in construction of the system. While the treatment rate for copper exceeded the leaching rate by August 17, 2018 (i.e., leaching was said to have subsided), it is likely that some copper continued to leach from the soils but was masked by increased performance of the CWTS. Therefore, the RRCs for copper are expected to continue to improve in 2019. In general, RRCs are generally similar to those in 2017 (Table 10; Contango, 2017b). Treatment of molybdenum is notable as the RRC nearly doubled in 2018 compared to 2017. The RRCs applied here are intended to be conservative estimates for conceptual sizing purposes and will need to be refined through further demonstration-scale (on site) testing.

Table 10 – Removal rate coefficients (k) for constituents of concern.

COC	Pilot ¹ $k \cdot \text{day}^{-1}$	Other Yukon Cu Pilot $k \cdot \text{day}^{-1}$	2017 Demonstration ² (Operational) $k \cdot \text{day}^{-1}$		2018 Demonstration ³ (Operational) $k \cdot \text{day}^{-1}$		Recommended ⁴ $k \cdot \text{day}^{-1}$
	Total	Dissolved	Dissolved	Total	Dissolved Series 1	Dissolved Series 2	Dissolved
First order removal rate coefficients

Zero order removal rate coefficients							
Mo	N/A	N/A	0.0006	0.0006	0.0011	0.0010	0.0010
Se	0.0018	N/A	N/A	N/A	- ⁸	N/A	N/A
N/A – an RRC is not available. All RRCs are for first-order reaction kinetics except for molybdenum in the 2017 & 2018 demonstration-scale CWTS, which has a zero-order reaction rate kinetic. The A cells were used for RRC calculations for cadmium and copper for Series 1 and 2 in 2017 and cadmium and zinc in 2018. Additionally, the A cells were used for RRC calculations for Series 2 in 2018 only, as well as for copper and nitrate. The B cells were used for all other RRC calculations. ¹ Values calculated from data in Contango, 2014b (pilot-scale report) for <i>C. aquatilis</i> + moss with low nitrogen scenario. ² Analytical results from August 18 – September 22, 2017 were used. ³ Analytical results from August 18 – September 14, 2018 were used. ⁴ Recommended RRCs are developed from averaged dissolved concentrations of 2017 & 2018 demonstration-scale CWTS operational periods. This is a modification and correction to the erroneous dissolved recommended RRCs as reported in Table 5 of the 2017 Demonstration-Scale Report (Contango, 2017b). ⁵ RRCs for cadmium in 2017 and 2018 were artificially low because low flow rates did not provide the resolution needed to determine a RRC, so the lowest potential k value based on available data is reported here. The available data had 100% and 75% of sample points at the detection limit in 2017 and 2018 respectively. ⁶ RRC's for copper in demonstration-scale CWTS are artificially low due to copper leaching from soils used in construction of the system. Therefore, RRCs are expected to improve once leaching has subsided. ⁷ An RRC was not calculated for NO_3 in Series 1 due to extensive plant damage and less NO_3 being used as a nutrient. ⁸ An RRC was not calculated for selenium in Series 1 due iron addition temporarily changing the treatment mechanism and reaction order.							

4.5 Evapotranspiration in the Demonstration-Scale CWTS

Key findings (detailed below):

- The 2018 evapotranspiration trials were unsuccessful due to precipitation throughout each trial; however, the 2017 trials revealed a significant loss of water, which will impact calculations of loads to the receiving environment (making them lower than previously estimated).
- Unlike 2017 trials, leaching of copper was not observed during periods of no flow in 2018, indicating copper leaching has improved.

Total evapotranspiration from the system is the combined effects of open water evaporation and plant transpiration and is further described in previous reports (Beebe et al., 2014; Contango, 2017b). The purpose of calculating the evapotranspiration of a system is to understand the amount of water lost, which in turn concentrates elements measured at the outflow. Thus, the actual outflow load reduction performed by the wetland should consider the difference in concentration at outflow, corrected for evapotranspiration. Due to significant precipitation during each evapotranspiration trial conducted in 2018 (two trials total), we were unable to calculate an evapotranspiration rate. Therefore, the rate of water lost by evapotranspiration determined in 2017 (5.4 L/m²/day) was used to adjust load removal calculations as previously described (Contango, 2017b). The average ambient temperature on-site for this time period was 9.2°C, and so the evapotranspiration rates from the 2017 trials (average ambient temperature of 9.6°C during the first evapotranspiration trial in 2017) are expected to be relevant to the operational period in 2018.

Evapotranspiration has shown to have a significant effect on the calculation of constituent load to the receiving environment (Table 8). Therefore, future models for assimilative capacity in the downstream receiving environment should take into account not only the predicted outflow concentrations from the CWTS using removal rate coefficients (Section 4.4.2), but also adjust the load accounting for evapotranspiration.

4.6 Soils

Key findings (detailed below):

- In 2018, leachable copper concentrations in soils decreased in the top 0-10 cm while total copper concentrations were within ranges previously measured.
- Most constituents, including copper, have shifted primarily into stable reduced and residual minerals fractions in the soil.
- Acid volatile sulphides (AVS) provide buffering capacity to the soils and continued treatment through cold temperatures. AVS concentrations have been non-detectable in the CWTS due to low iron concentrations in substrates and water. While a small amount was detected in 2017 and 2018, Series 1 was amended with iron in attempt to improve AVS concentrations.
- While Series 1 was amended with iron, it is unclear if the addition of iron was sufficient to increase AVS concentrations, but it is planned to add more in 2019.

Although unintentional, the high initial leachable copper concentrations in the CWTS soils allowed for additional testing to be carried out on the CWTS (Appendix B, Table B1, and B2). Results of these test methods during the operational period are discussed in the following sections, while definitions of extractable fractions from the sequential extraction procedure for the speciation of metals can be found in Appendix B, Table B3 (Tessier et al., 1979).

When compared to early 2016 and 2017 results, leachable copper concentrations in soils decreased in the CWTS through 2018 (Figure 14), while total copper concentrations remained within ranges previously measured. In general, soils in the demonstration-scale CWTS continued to reduce leachable copper throughout 2018. Additional soil sampling locations and more frequent sampling is recommended in 2019 to confirm that copper leaching from the soils has stopped.

Sequential extraction analysis shows that despite elevated initial leachable copper concentrations, the soils have become more stable (less leachable) over time in the CWTS setting as the soils have aged, shifting from oxidized to reduced, mineral forms (Figure 15; Appendix B, Figures B10 and B11). This beneficial aging of soils to a less soluble mineralized form of sulphide is expected for this type of treatment CWTS design (Contango, 2017b). It should also be noted that copper leached from the original substrate into the water and therefore put additional treatment demands on the CWTS.

Additional reserve treatment capacity can be stored in a CWTS through creation of a reserve of AVS (newly formed amorphous iron sulphides; Contango, 2017b). An excess of AVS suggests the metals would be non-bioavailable and not likely to leach. In the case of Minto, where the soils used in construction had excess copper, the appearance of measurable AVS would also indicate that the copper in the soils is nearing an endpoint of transformation to sulphide forms.

AVS has not been measured in desired concentrations in the demonstration-scale CWTS (small amounts measured in 2017 for the first time; Contango, 2017b) as much of it was used to sequester total copper in the copper-rich soils. AVS can also serve as a buffer to

oxidation should the soils of a reducing (sulphide producing) CWTS be exposed to oxygen (e.g., briefly drying out), thereby making sequestered metals less likely to re-solubilize. Therefore, iron was added to Series 1 in 2018 to create excess AVS to combat impacts of the drought in early 2018. However, only small amounts of AVS were measured in cell A in both series (September), indicating that the added iron was not sufficient to treat constituents in the water, as well as produce AVS. As ratios of simultaneously extractable metals to AVS (Σ SEM:AVS) were similar in both series, it is unclear if the addition of iron increased AVS in cell 1A. However, as there was an observed difference in treated copper between Series 1 and 2 after the addition of iron (i.e., treatment was better in Series 1), it is recommended that iron be stoichiometrically added in 2019 (Section 4.2.2).

In October 2018, Σ SEM:AVS ratios for cells 1A and 2A increased to greater than one, indicating AVS depletion in the colder temperatures due to decreased microbial activity. As leachable copper in the soils is still consuming the sulphides, treatment performance is expected to improve as copper is transformed into more stable fractions. Once the Σ SEM:AVS ratio of all cells is consistently less than one, we do not expect any further copper leaching to occur, and overall treatment within the CWTS should improve until this benchmark is reached.

Zinc mineral forms have become stable over time, with most of these constituents found in the reduced or mineral form (fraction 4 and 5) by the end of 2018 (Appendix B, Figures B12 and B13). Cadmium concentrations are at or near detection limits for all fractions (Appendix B, Figures B14 and B15). Molybdenum was mostly found in the most stable residual mineral fraction 5, which contained around 40% of the total molybdenum in the samples (Appendix B, Figures B16 and B17). Selenium was at or near the detection limit for all fractions at the end of 2018 (Appendix B, Figures B18 and B19).

Figure 15 – Copper as sequential leach fraction 4 over time.

Copper in the form of the targeted Fraction 4 (sulphide mineral form and bound to organics), increased in the CWTS over time as the soils matured. Additional information can be found in Appendix B.

4.7 Metals Uptake

Key findings (detailed below):

- Overall, uptake of metals in *C. aquatilis* was low and generally lower in 2018 than in 2017 demonstration-scale CWTS, with the exception of selenium in cell 1A which was slightly higher in 2018.
- Targeted treatment mechanisms are becoming more robust, rendering elements non-bioavailable.

Concentrations of the COCs in *C. aquatilis* and moss from the demonstration-scale CWTS in 2018 were compared to previous years. *C. aquatilis* and moss in the demonstration-scale CWTS, from 2015 to 2018, had greater copper concentrations than the pilot CWTS, likely reflecting the bioavailable copper that was in the soils used for construction (Contango, 2014b). Concentrations of copper in *C. aquatilis* at the end of 2018 were similar or lower than 2016 and 2017 concentrations (Figure 16), indicating reduced copper bioavailability. In 2017, the moss had higher copper concentrations in the A cells than in the B cells, indicating more treatment earlier in the CWTS as it matures (Figure 16). In 2018, however, the copper sorbed to moss was lower than in 2017 with the exception of cell 1B. Over time, constituents sorbed to mosses will form reduced minerals, rendering them less bioavailable.

Cadmium concentrations in *C. aquatilis* and moss were similar or lower in 2018 compared to 2017, except for higher concentrations in moss in cell 1B (Appendix B, Figure B20). Similar or higher selenium concentrations were observed in *C. aquatilis* in 2018 as in 2017, however, similar or lower selenium concentrations were sorbed to moss (Appendix B, Figure B21). Concentrations of molybdenum in moss generally increased from 2017 to 2018 with the exception of cell 1A, indicating more molybdenum was treated through sorption in 2018. Concentrations of molybdenum in *C. aquatilis* were similar or decreased (Appendix B, B22). In 2018, concentrations of zinc were generally similar in *C. aquatilis* from 2017 (Appendix B, Figure B23); however, uptake in *C. aquatilis* was higher in cell 1A. As moss in cell 1A was sparse compared to other cells, it is likely that more zinc was taken up by plants to accommodate the lower sorption area available in 2018. Concentrations of zinc were similar or lower in moss from 2017, except for cells 1B in where concentrations of zinc increased. It is recommended that more moss be added to cell 1A in 2019 to provide area for sorption of COCs.

4.8 Pesticide Application (and Monitoring of Aphids)

Key findings (detailed below):

- An aphid infestation occurred in 2016 and 2017. While some efforts were made in 2017 to control the aphid population, the spraying regimen was not maintained and, therefore, aphids remained. However, no long-term detrimental effect on *C. aquatilis* viability was observed, despite the persistence of aphids.
- In 2018, early and consistent application of insecticidal soap greatly reduced the abundance and length of an aphid infestation as well as improved containment of the aphids.
- Pesticide application is not expected to be needed in the full-scale CWTS as it will not be in an isolated location (Contango, 2017b).

Since the demonstration-scale CWTS is constructed of an emergent macrophyte monoculture of *C. aquatilis* in a relatively isolated area (i.e., away from other vegetation and potential sources of insects), it is more susceptible to infestation by pests such as aphids (Dixon, 1971; Riley et al., 1995; Footitt and Maw, 1997; Contango, 2017b). Furthermore, due to its isolated location, the CWTS it is unlikely to attract predatory insects such as ladybugs, lacewings, and parasitic wasps to control aphid populations (Flint, 2001; Russel and Diaz, 2015; Finnamore, 1997; Contango, 2017b).

An aphid infestation of the CWTS occurred in 2016 and 2017 and, while efforts were made in 2017 to control population (through application of insecticide), the ongoing spraying regimen was not maintained and aphids remained. However, no short-term detrimental effect on *C. aquatilis* viability was observed. Therefore, due to the aphid infestation in 2017, vegetation was replanted in areas with sparse *C. aquatilis* on July 8, 2018. The stronger insecticidal soap (Trounce's Yard and Garden Insecticide) was applied biweekly starting May 14, 2018 and switched to Safer's End-All insecticidal soap on July 16, 2018 (when Trounce ran out at site). This treatment was effective until early August 2018 (exact date unknown) when aphids appeared in cell 2A only. To control the aphid population in cell 2A and to protect the other cells, insecticidal soap was then applied to all cells on a weekly schedule (starting August 24, 2018). The applied insecticide was switched to Scott's EcoSense Bug B Gone on September 21, 2018 when End-all ran out at site. By September 24, 2018, live aphids were no longer observed in cell 2A. Therefore, early application of insecticidal soap greatly reduced the abundance and length of an aphid infestation as well as improved containment of the aphids. In 2019, it is recommended to continue applying Trounce's Yard and Garden Insecticide early in the season on a biweekly schedule, as well as to ensure enough Trounce is supplied on site for the year (approximately 100 L).

While the demonstration-scale CWTS has experienced aphid infestations, this is not expected to occur in the full-scale CWTS and minimal insect control is expected (Rodgers et al., 2002). The full-scale CWTS will be built in an area with surrounding vegetation, thereby providing habitat for natural predators of aphids. With the demonstration CWTS currently located 50 m away from trees or other vegetation, there is little to no opportunity for natural predators to inhabit the area or incentive to travel the distance to the CWTS. The large buffer area

(MVFE) around the demonstration-scale CWTS allows the aphids to colonize more robustly than anticipated in the full-scale CWTS onsite, which would not have the same buffer zone.

Figure 17 – Aphids observed on *C. aquatilis* of cell 2A.
Presence of aphids on *C. aquatilis* leaves observed in August 2018.

4.9 Detritus Study

Key findings (detailed below):

- Decomposition of *C. aquatilis* is occurring in the CWTS and contributing to reducing conditions.
- Only partial decomposition of total *C. aquatilis* biomass from the previous year is occurring in an operational season, resulting in an accumulation of organic matter over time (accretion) which is an important process in the CWTS as it buries treated minerals making them more stable.
- Decomposition of *C. aquatilis* occurs quickly when initially submerged in the CWTS with 56% decomposition occurring after 34 days. Decomposition slows overtime with an average of 85% decomposition occurring after 446 days (including one winter season/freezing period).

The detritus study initiated in 2017 was continued through 2018 to assess decomposition rates of *C. aquatilis* in the CWTS over time as well as to determine the steady state of carbon contribution from algae growth on CWTS materials (Chimney and Pietro, 2006; Hammerly et al., 1989). Additional details describing the methods can be found in Appendix A. The study began on June 21, 2017 when six bags of oven dried *C. aquatilis* and six of polyester filter fiber material were submerged into each cell of the CWTS to determine the algae growth rate (Figure 18).

On July 25, 2017, September 11, 2017, July 9, 2018, and September 10, 2018 (after 34, 82, 383, and 446 days of submersion in the CWTS, respectively) one bag filled with *C. aquatilis* and one bag with the polyester fiber were sacrificed from each CWTS cell and the dried weights compared to initial sample weights. This resulted in four replicates for each treatment and sampling date.

The results show that decomposition occurs quickly immediately after *C. aquatilis* is submerged into the CWTS, with 56% decomposition occurring after 34 days. This detritus decomposition rate (and all other decomposition rates discussed herein) has been adjusted for by subtracting the weights of algal growth from the corresponding polyester fiber filled bag (Table 11). After 82 days (on September 11, 2017), 64% of *C. aquatilis* had decomposed and is representative of the decomposition that would be expected after one operational season of the CWTS (i.e., from start up in the spring to shut down in the fall). This suggests that the plant material is successfully being broken down in the CWTS promoting reducing conditions. Additionally, as plant material did not completely decompose after 446 days, this suggests that accretion in the wetland is also occurring as it indicates more organics are produced in a year than decomposes. This accretion, which is the gradual accumulation of additional layers of organic matter, aids in building new soils in the CWTS. Accretion is an important process in the CWTS as it buries treated minerals making them more stable and maintains low overall concentrations of metals.

Three bags of each material remain in each cell for future sampling. The detritus study will continue in 2019 to continue monitoring decomposition and accretion rates over time.

Figure 18 – Detritus study bags.

Left are mesh bags filled with sedges and polyester fiber fill stuffing in 2017, prior to submersion in the CWTS (June 21, 2017). Right is a mesh bag with decomposed sedges and polyester fiber fill stuffing on July 8, 2018.

Table 11 – Results of the 2018 *C. aquatilis* detritus study.

Days since beginning of study	Decrease in weight of <i>C. aquatilis</i> through decomposition ¹								Average Decomposition					
	1A		1B		2A		2B		A Cells		B Cells		All Cells	
	g	%	g	%	g	%	g	%	g	%	g	%	g	%
2017

Initial weight of bags prior to being placed in CWTS was 5 g.														
¹ Weight decrease of <i>C. aquatilis</i> corrected by subtracting the increase in weight from the polyester fiber fil to account for algae growth.														
² May have been affected by more algae growth than on control bags.														

Figure 19 – *C. aquatilis* decomposition over time.

Decomposition was measured by the decrease in weight over time of the *C. aquatilis* samples compared to the initial weight. The decomposition rate was corrected for algae growth by subtracting the increase in weight of the polyester filter foam from the dry weight of the *C. aquatilis* samples over time. Error bars indicate the variation in results for each time point.

4.10 Vegetation Productivity Study

Key findings (detailed below):

- The *C. aquatilis* in the CWTS produced 0.802 kg/m² (dry weight) of above water biomass per year.
- This same amount of dry biomass should be supplemented to the full-scale CWTS (e.g., as straw) while going through maturation and filling in with vegetation for first 1-3 years after initial planting to expedite commissioning.

A 1 m² plot of above water *C. aquatilis* was harvested in 2018 (Appendix A, Section A6.7) to determine the amount of organic matter that is input into the wetland each year. The tests indicated that approximately 0.802 kg/m² (dry weight) of above water biomass is produced by the *C. aquatilis* per year. This same amount of dry biomass should be supplemented to the full-scale CWTS (e.g., as straw) while going through maturation and filling in with vegetation for first 1-3 years after initial planting to expedite commissioning.

4.11 Beneficial Microbes

Key findings (detailed below):

- Similar to 2017, root samples harboured the highest abundances of sulphide-producing bacteria (SPB), selenium-reducing bacteria (SeRB), and denitrifying bacteria in 2018.
- Microbial communities were not affected by the double stress test period, with the exception of SPB in roots, where proportions were lower following the drought. However, by the end of 2018, proportions of SPB in roots increased to levels measured in the 2017 operational period.

4.11.1 Sulphide-producing Bacteria

Sulphide production is a key biogeochemical mechanism for water treatment in the CWTS at Minto Mine and is carried out by sulphide-producing bacteria (SPB) through the reduction of sulphur-containing compounds. These SPB thrive in anaerobic conditions with soil redox ranges between -100 and -250 mV (Contango, 2015b; Mitsch and Gosselink 2007). In these redox ranges, bacterial sulphide-production through reduction of sulphur compounds is expected, alongside increases in the proportion (percentage) and abundance of these microbes. Further information regarding these mechanisms can be found in the Minto Demonstration-scale 2017 Update Report (Contango, 2018).

Diversity of SPB in all sample types (soil, roots, moss, and detritus) was generally similar to the 2017 operational period, where soil harboured the highest number of SPB, followed by root and detritus, then moss (Table 12).

Table 12 – Average number of different types of sulphide-producing bacteria in 2014/2015, 2016, 2017, and 2018.

Sample Type	2014 & 2015	2016	2017	2018
Detritus	NT	11	16	15
Moss	11	9	15	14
Root	11	13	14	15
Soil	13	17	18	17

NT – not tested. The number of different types is based on counting the number of operational taxonomic units (clustered at 97% identity) that are classified as known sulphide-producing bacteria. Organism classifications and data analysis methods have been updated from previous memo (Contango, 2017b). Therefore, additional bacteria were identified as sulphide-producing bacteria in historical samples at Minto and numbers presented herein are higher than those reported in the Minto Demonstration-scale 2017 Update Report (Contango, 2018).

Proportions of SPB in root, detritus, and moss, were generally similar to 2017, while SPB in soils were similar to or higher than 2017 (Figure 20). Proportions in *C. aquatilis* roots were initially lower than 2017 but increased to within 2017 ranges (Figure 21), while inferred abundances remained stable (Appendix B, Figure B24). Lower initial proportions of SPB indicates that roots were likely more impacted by the initial drying out of the CWTS in the early spring/freshet but began to recover by September. However, on average, roots harboured the highest inferred abundances of SPB (followed by detritus, moss, and soils; Appendix B, Figure B24). Proportions and inferred abundances of SPB in detritus were more variable within the different cells but generally remained within ranges observed in 2017 (Figure 22; Appendix B, Figure B24).

Proportions of SPB in moss in July were similar to 2017, while proportions in September were substantially lower (Figure 23). Inferred abundances of SPB in moss in September were also lower than July, however, they were within ranges observed in 2017. While sampling methods for moss requires a composite of the top (oxidizing zones) and bottom (sulphide reducing zones; Section 2.6.2) of moss, it is possible that samples collected in September contained more of the top of the moss than the bottom where SPB would be expected to thrive.

The microbial analysis of various sample types in the CWTS therefore indicates that despite the drought, SPB proportions and inferred abundances were able to recover in most sample types and diversity of SPB was unaffected by the double stress test. Soil redox and microbial populations will continue to be monitored for stability or further improvement in 2019. Additionally, a sampling procedure will be provided to Minto staff in 2019 to ensure consistency of sampling methods, particularly for moss.

Figure 20 – Percentage and identity of sulphide-producing bacteria in soil and corresponding soil redox measurements.

The primary y-axis provides the percentage of the bacterial population (relative abundance) that corresponds to sulphide-producing bacteria through the reduction of sulphate, sulphite, thiosulphate, and sulphur. The secondary y-axis provides the soil redox measurements corresponding to the microbiology sampling date. Where soil redox measurements were not available, the date closest to the sampling date was plotted. Horizontal dashed lines indicate the targeted soil redox range. Organism classifications and data analysis methods have been updated from previous memo (Contango, 2017b). Therefore, additional bacteria were identified as sulphide-producing bacteria in historical samples at Minto. Percentage of bacteria is based on identification via genetic sequencing. Organisms are either classified to the genus (g) or family level (f). An asterisk (*) indicates dates where microbiological samples were collected by Minto staff. Remaining samples were collected by Contango. A sampling standard operating procedure will be provided in 2019 to standardize sampling methods.

Figure 22 – Percentage and identity of sulphide-producing bacteria in detritus and corresponding soil redox measurements.

The primary y-axis provides the percentage of the bacterial population (relative abundance) that corresponds to sulphide-producing bacteria through the reduction of sulphate, sulphite, thiosulphate, and sulphur. The secondary y-axis provides the soil redox measurements corresponding to the microbiology sampling date. Where soil redox measurements were not available, the date closest to the sampling date was plotted. Horizontal dashed lines indicate the targeted soil redox range. Organism classifications and data analysis methods have been updated from previous memo (Contango, 2017b). Therefore, additional bacteria were identified as sulphide-producing bacteria in historical samples at Minto. Percentage of bacteria is based on identification via genetic sequencing. Organisms are either classified to the genus (g) or family level (f). An asterisk (*) indicates dates were microbiological samples were collected by Minto staff. Remaining samples were collected by Contango. A sampling standard operating procedure will be provided in 2019 to standardize sampling methods.

4.11.2 Selenium-reducing Bacteria

The targeted selenium treatment pathways in the Minto CWTS include direct reduction in the water column of selenate (Se(VI)) to selenite (Se(IV)) and sorption to moss, detritus, and soils, and subsequent microbial reduction of soluble (sorbed) selenite (Se(IV)) to insoluble elemental selenium (Se (0)). This reductive process can also be achieved directly in the water column, but is more effective when associated with mosses and biofilms due to their sorptive properties that bring the selenium in contact with beneficial selenium-reducing bacteria (SeRB). Selenium reduction biogeochemical processes are achieved within the range of soil redox conditions targeted for sulphate-reduction as suggested by pilot-scale testing and literature (Contango, 2014b).

SeRB were detected in all sample types, with *C. aquatilis* roots harbouring the highest inferred abundances of SeRB on average in 2018, followed by moss, detritus, and soil (Appendix B, Figure B25). While analytical methods for quantification in 2018 and previous years are not directly comparable, inferred abundances of SeRB are generally similar or higher to abundances the operational period in 2017 (Contango, 2017b). The high inferred abundances of SeRB in the CWTS indicates that environmental conditions conducive to SeRB proliferation have been created within the CWTS. Moreover, the abundances of SeRB were unaffected by the CWTS drying out and remained stable over time in through 2018. SeRB will continue to be monitored through 2019 operation of the demonstration-scale CWTS.

4.11.3 Denitrifying Bacteria

Nitrate is not a COC however it is being evaluated as it has the potential to be elevated during operations and early closure owing to residuals from blasting activities. Even if not in exceedance of water quality guidelines in terms of receiving environment objectives, nitrate often requires treatment to subsequently achieve treatment of other constituents such as selenium and metals through sulphide production. Nitrate can be removed from water through denitrification by different types of microbes, including nitrate reducing bacteria which can reduce nitrate (NO₃) to nitrite (NO₂), and also denitrifying organisms that are capable of fully reducing nitrate to nitric oxide (NO), nitrous oxide (N₂O), and dinitrogen gas (N₂, which is the most abundant gas in air).

As observed in 2016 and 2017, denitrifying organisms were found associated with all sample types in the demonstration-scale CWTS (Appendix B, Figure B26). *C. aquatilis* roots harboured the highest inferred abundance of denitrifiers, followed by moss, detritus, and soil. These results indicate denitrifying bacteria were not affected by the drought and have continued to establish in the CWTS as expected. Denitrifying bacteria will continue to be monitored in 2019, alongside performance testing.

5. Summary of Results

When designed and implemented in a strategic and scientifically guided manner, a CWTS can treat many constituents in a predictable manner. The design incorporates processes to precipitate insoluble species of these constituents for sequestration into the soils of the wetland. This treatment mechanism captures the constituents and stores them in stable form in the soil. This study addressed several important operating considerations and provided new management tactics to recover from drought and high nitrate scenarios. A summary of key findings from the 2018 studies and recommendations to meet the objectives are listed in Table 13.

Table 13 – Key findings and corresponding section for 2018 demonstration-scale CWTS testing.

Key Finding	Section
▪ Dissolved oxygen (DO) increased during the double stress test period and operations in 2018. Elevated DO is likely the result of photosynthesis of algae, which had increased growth due to fertilizer addition. Despite the DO levels being in aerobic ranges, stable reducing conditions were achieved in CWTS soils within the targeted range. ▪ Other than the day that the CWTS was refilled (May 14, 2018), soil redox was unaffected by the drought. Average soil redox values were more reducing (and stable in the targeted range) in 2018 than 2017.	4.1
▪ While leaching of copper from substrates used in construction was remedied by the end of the commissioning-B period in 2017, copper leached from the soils into the water in early 2018, likely due to the drying out of the CWTS in the early spring/freshet of 2018. However, leaching had subsided by July 8, 2018 as the rate of treatment exceeded the rate of leaching. Copper is not expected to leach in 2019 operations provided that the CWTS remains flooded. ▪ Stagnation and iron addition can be used at full-scale to mitigate recovery length after periods of drought (or stagnation/slower HRT for high nitrate concentrations). ▪ During the 2018 operational period the demonstration-scale CWTS successfully treated all COCs.	4.2
▪ The lowest concentrations consistently achievable for the treatment design (performance limits confirmed by t-test) were reached for cadmium after 3.80 days for Series 1 and 3.54 days for Series 2 and for copper after 3.54 days (Series 2 only). ▪ Removal rate coefficients (RRCs, k) have been developed that can be used for full-scale sizing. ▪ Copper leaching from soils decreased from the drought recovery period but is still likely making the RRC artificially low in this CWTS; however, the RRC is expected to improve in 2019 as leaching continues to decrease.	4.4
▪ The 2018 evapotranspiration trials were unsuccessful due to precipitation throughout each trial; however, the 2017 trials revealed a significant loss of water, which will impact calculations of loads to the receiving environment (making them lower than previously estimated). ▪ Unlike 2017 trials, leaching of copper was not observed during periods of no flow in 2018, indicating copper leaching has improved.	4.5
▪ In 2018, leachable copper concentrations in soils decreased in the top 0-10 cm while total copper concentrations were within ranges previously measured. ▪ Most constituents, including copper, have shifted primarily into stable reduced and residual minerals fractions in the soil.	4.6

Key Finding	Section
- Acid volatile sulphides (AVS) provide buffering capacity to the soils and continued treatment through cold temperatures. AVS concentrations have been non-detectable in the CWTS due to low iron concentrations in substrates and water. While a small amount was detected in 2017 and 2018, Series 1 was amended with iron in attempt to improve AVS concentrations. - While Series 1 was amended with iron, it is unclear if the addition of iron was sufficient to increase AVS concentrations, but it is planned to add more in 2019.	
- Overall, uptake of metals in <i>C. aquatilis</i> was low and generally lower in 2018 than in 2017 demonstration-scale CWTS, with the exception of selenium in cell 1A which was slightly higher in 2018. - Targeted treatment mechanisms are becoming more robust, rendering elements non-bioavailable.	4.7
- An aphid infestation occurred in 2016 and 2017. While some efforts were made in 2017 to control the aphid population, the spraying regimen was not maintained and, therefore, aphids remained. However, no long-term detrimental effect on <i>C. aquatilis</i> viability was observed, despite the persistence of aphids. - In 2018, early and consistent application of insecticidal soap greatly reduced the abundance and length of an aphid infestation as well as improved containment of the aphids. - Pesticide application is not expected to be needed in the full-scale CWTS as it will not be in an isolated location (Contango, 2017b).	4.8
- Decomposition of <i>C. aquatilis</i> is occurring in the CWTS and contributing to reducing conditions. - Only partial decomposition of total <i>C. aquatilis</i> biomass from the previous year is occurring in an operational season, resulting in an accumulation of organic matter over time (accretion) which is an important process in the CWTS as it buries treated minerals making them more stable. - Decomposition of <i>C. aquatilis</i> occurs quickly when initially submerged in the CWTS with 56% decomposition occurring after 34 days. Decomposition slows overtime with an average of 85% decomposition occurring after 446 days (including one winter season/freezing period).	4.9
- The <i>C. aquatilis</i> in the CWTS produced 0.802 kg/m² (dry weight) of above water biomass per year. - This same amount of dry biomass should be supplemented to the full-scale CWTS (e.g., as straw) while going through maturation and filling in with vegetation for first 1-3 years after initial planting to expedite commissioning.	4.10
- Similar to 2017, root samples harboured the highest abundances of sulphide-producing bacteria (SPB), selenium-reducing bacteria (SeRB), and denitrifying bacteria in 2018. - Microbial communities were not affected by the double stress test period, with the exception of SPB in roots, where proportions were lower following the drought. However, by the end of 2018, proportions of SPB in roots increased to levels measured in the 2017 operational period.	0

6. Next Steps for 2019

A conceptual testing plan was developed at the beginning of the demonstration-scale CWTS program and has been refined and adapted based on performance and scientific findings during the commissioning and operational periods of the demonstration-scale CWTS. The demonstration-scale CWTS is expected to run until at least the end of 2019 to assess performance under a wider range of conditions. In 2019, a flow rate schedule will be developed targeting different HRTs based on predicted HRTs for full-scale performance. The overriding objective of the demonstration-scale program in 2019 is to assess performance under conditions that would be similar to the full-scale CWTS. Table 11 outlines the action plan for CWTS optimization and testing for 2019 based on the performance results through 2018.

A multi-year plan is provided in Appendix C, and includes work performed to date, as well as a schedule of activities for 2019.

Table 14 – Minto 2019 demonstration-scale CWTS action items.

Timing	Task	Purpose
Jan – Apr 2019	Visually inspect CWTS monthly	The CWTS is recommended to be monitored monthly to ensure there is consistent ice cover.
Apr 2019	Develop a flow rate schedule for 2019	The flow rates will fluctuate based on expected amounts of water for full-scale CWTS (scaled to size) to evaluate the performance of the CWTS at different key periods.
	Develop sampling plan for 2019	- The sampling plan will include sampling types, parameters, frequency, and locations. These results will inform the performance of the CWTS. - Sampling of the in, mid, and out locations for water and two locations through each cell (near depth sticks) for soil to better assess removal of constituents through the CWTS cells. - Dissolved oxygen measurements will be taken at various locations and depths through the CWTS cells to obtain a more thorough understanding of aerobic zones within the CWTS. - Pictures of the CWTS will be taken from all four corners of each cell to better monitor plant growth and development, as well as monitor algae growth and aphid presence.
	Provide Minto with updated standard operating procedures (SOPs) for monitoring and sampling the CWTS and training for microbial sampling	- SOPs will include how to take progress pictures of each CWTS cell, take YSI and depth stick measurements, re-install depth stick that had fallen over in 2018 (cell 1A), record data and label samples, collect water, soil, moss, and plants for ALS and Contango microbial samples, sample bags for detritus study, and spray for aphids. - Training will be provided for microbial sampling to ensure consistent methods are used (either during first Contango site visit, or by video conference).
May 2019	Add sandbags to the end of the CWTS cells to increase the water depth to 20-30cm.	Raising the water levels will maintain desired reducing conditions in the CWTS and make for better consistency of depths in all cells.

Timing	Task	Purpose
	Monitor water levels in CWTS, add water with water truck if needed	The CWTS is recommended to be monitored weekly to add water to each cell immediately upon spring thaw to prevent the CWTS from drying out.
	Start water flow to the CWTS	Begin 2019 demonstration-scale CWTS program.
	Contango site visit (provide training, add iron to Series 1, conduct spring microbial sampling event)	- Provide training for new Minto staff for monitoring and sampling of CWTS to ensure consistency of methods. - Collect seasonal microbial samples. - Add iron as instructed by Contango to Series 1 to aid in creation of excess acid volatile sulphides.
	Implement aphid control using insecticide on a routine schedule	Begin applications in early May when vegetation begins to turn green to control the aphid population before an infestation occurs.
Ongoing through 2019 sampling season	Routine sampling program	Follow sampling plan from May to September 2019 for routine collection of water, soil, microbial, plant, and detritus samples.
	Monitor for the presence of aphids in the CWTS	Determine if the aphid presence is isolated to the CWTS (if present at all), and if more aggressive control measures are needed.
	Fertilize plants (if necessary) and add moss to cell 1A	To help plant growth and development if needed. To revegetate areas where moss is sparse.
Jul 2019	Conduct evapotranspiration trial	Although 2017 data suggests minimal release of metals from soils, another evapotranspiration trial during the operational period needs to be conducted to confirm metals leaching has subsided. Completing the evapotranspiration study in July will provide information on evapotranspiration rates in warmer months and the effects of seasonality.
	Contango site visit (conduct summer microbial sampling event)	Collect seasonal microbial samples.
Aug 2019	Develop plan for final sampling event	Additional samples will be collected upon termination of the demonstration-scale CWTS to evaluate parameters such as mass balance of constituents.

Timing	Task	Purpose
Sep 2019	Contango site visit (harvest soil and moss for additional tests off-site, conduct fall microbial sampling event)	- Collect soil sample (volume not yet determined) and bring back to Contango's temperature-controlled facilities. Soil will be subjected to several stress tests (stagnation, drought, flood, freezing, and leach tests) to assess stability of metals in the event of an upset event. - Collect all above water biomass of <i>C. aquatilis</i> and all moss in a 1 m² plot to determine quantity of biomass per m² for each <i>C. aquatilis</i> and moss. - Collect seasonal microbial samples.
	Final sampling event	Additional samples will be collected prior to decommissioning of the CWTS.
February 2020	Report	Final Demonstration-scale CWTS Report.

7. Closure

We trust the information herein satisfies your present requirements. Should you have any questions, please contact the persons listed below. We appreciate the opportunity to provide the services detailed in this report, and look forward to discussing any comments you may have.

Appendix A**A1. System Layout and Dimensions**

The demonstration-scale CWTS includes two systems in parallel with two cells in each series and a final catchment basin that both systems flow into. Dimensions and construction details are available in the Minto Mine Constructed Wetland Treatment Research Program – Demonstration Scale (Contango, 2015). The two parallel systems serve as a replicate for data analysis, and as testing has progressed, the two systems have also allowed for comparison of different management techniques, such as the effect of iron addition on drought recovery in series 1.

A2. Soils Used in Construction

Soils used to construct the CWTS are described in the initial report that outlines construction (Contango, 2015). A brief summary is described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b).

A3. Vegetation Used in Planting

The demonstration-scale CWTS was planted with *Carex aquatilis* (aquatic sedge) and aquatic mosses from the W10 area of the Minto Site. The plant selection and borrow source was previously determined through the site assessment (Contango, 2014). Five *C. aquatilis* plants were planted per square meter, with moss tied to stakes that outlined the 1 m x 1 m grid for planting (details provided in Contango, 2015).

A4. Water Source

The same water source was used for the demonstration-scale CWTS in 2018 as was used in 2017. A brief summary of the water source is described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b).

A5. Flow Rates

Flow rates were consistent over the majority of the 2018 test period to evaluate the following conditions:

- A drought recovery period (May 15 – August 16, 2018); and
- An operational period (August 17-September 9, 2018).

Flow rates were increased near the end of the 2018 test period from September 10 – September 28, 2018, to evaluate the following operational period under faster flowing conditions, using a 5 day HRT.

The drought recovery period was stimulated by restricting flows to 0.37 gallons per minute (GPM) for series 1 and 0.31 GPM for series 2. Targeted flow rates were chosen based on the minimum range of the flow meter to simulate a drought recovery period and encourage reducing conditions. Flow rates, as well as the totalizer values, were periodically recorded throughout 2018 from the flow meters installed on the feed into the demonstration-scale CWTS, consistent with the 2017 flow rate measurement methodology (Contango, 2017b). The flow rates recorded by Minto Mine personnel represent the instantaneous flow rate at the flow meter while actual averaged flow rates were calculated based on the continuous totalizer

Appendix A

values. The actual average flow rates calculated from continuous totalizer values from May 15, 2018 to September 10, 2018 were 0.34 GPM for series 1 and 0.29 GPM for series 2.

Once the drought recovery period was completed and the operations period was initiated on September 10, 2018, the targeted flow rates were increased to 0.52 GPM for series 1 and 0.36 GPM for series 2. Since the water levels were raised in each cell in spring 2018, the targeted flow rates were increased to achieve the same hydraulic retention time (HRT) as the 2017 target (5 days). However, the flow rates were unintentionally decreased back to 0.37 GPM for series 1 and 0.31 GPM for series 2 from September 14 to September 19, 2018. On September 19, 2018 the flow rate was returned to 0.52 GPM for series 1 and 0.36 GPM for series 2 and operated at that flow rate until the demonstration-scale CWTS was shut down for the year (September 28, 2018). Figure 1 in the main document of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2018 Update illustrates the actual and targeted flow rates throughout 2018.

A6. Sampling and Analyses Methods**A6.1 Routine Monitoring of Explanatory Parameters**

Explanatory parameters are quantifiable aspects of a CWTS environment that can be used to assess feasibility of treatment for a range of constituents, and therefore ‘explain’ the performance of a CWTS. These parameters and methods are described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b).

A6.2 Water Sampling and Analyses

Water sampling occurred on a weekly basis from spring thaw in May 2018 to freeze up in September 2018, with additional parameters tested monthly. Frequencies and sampling parameters are outlined in Table A1. Grab samples were collected as described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b).

Due to copper leaching from the CWTS substrates into the water in 2015, an additional sampling structure was designed to sample at the inflow, mid-point, and outflow of each cell. Details of this sampling method are described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b). Water was sampled from the inflow, mid-point, and outflow of each cell at four timepoints in 2018 (June 22, July 8, August 2, and September 9, 2018).

Appendix A

Table A1 – Summary of 2018 water sampling analytical parameters, frequencies and locations.

Analytical Parameters	Frequency of Sampling	Sample Locations
Dissolved and total metals	Weekly	Outflow of each cell and feed
Ammonia		
Nitrate		
Nitrite		
Hardness (CaCO ₃)		
Sulphate (SO ₄)		
Flow rate	Weekly	Feed
pH, DO, ORP, Conductivity (in situ)	Weekly	All cells and feed
Anion Sum ¹	Monthly	Outflow of each cell and feed
Cation Sum ¹		
Ion Balance ¹		
Total Dissolved Solids (TDS) ¹		
Chloride (Cl)		
Nitrogen (Total)		
Alkalinity ^{1,2}		
pH ^{1,2}		
Conductivity ^{1,2}		
Chemical Oxygen Demand (COD)		
Total Organic Carbon (TOC)		
Total Kjeldahl Nitrogen (TKN)		
Total Suspended Solids (TSS)		
Dissolved Organic Carbon (DOC)		
Bicarbonate (HCO ₃) ^{1,2}		
Carbonate (CO ₃) ^{1,2}		
Hydroxide (OH) ^{1,2}		

¹ For samples collected on July 8, 2018, a log in error occurred by ALS; these parameters were initially not tested.

² For samples collected on July 8, 2018, a log in error occurred by ALS, these parameters were subsequently tested past the holding time.

A6.3 Soil Sampling and Analyses

Soil sampling was conducted four times in 2018 (May 27, July 8, September 9, and October 17 for acid volatile sulphides (AVS) and simultaneously extracted metals (SEM) only), while *in situ* relative soil redox was measured monthly. A sample of the top 0-10 cm of CWTS soil was collected into a 1 L glass jar for analyses. Analyses are outlined in Table A2. Each CWTS cell was sampled during each sampling event.

Appendix A

Table A2 – Summary of 2018 soil sampling analytical parameters, frequencies and locations.

Parameters	Frequency of Sampling	Sample Locations
Relative soil redox (in situ)	Monthly	All probes (6 per cell)
Analyses completed on soil sample		
SAR ¹ , pH, EC, %sat, Ca ¹ , Mg ¹ , Na ¹ , K ¹ , Cl, SO4	Seasonally (3x per year)	From a depth of 0-10 cm.
Available NPK and sulphur		
Bicarbonate (HCO ₃) ¹		
Carbonate (CO ₃) ¹		
Total Organic Carbon (TOC)		
Metals Analysis (Total)		
Sulfur by LECO		
Metals Leach		
Acid Volatile Sulphides (AVS) and Simultaneously Extracted Metals (SEM)		
Sequential Leaching (5 Acid Test)		
Analyses completed on special leach		
Bromide (Br)	Seasonally (3x per year)	From a depth of 0-10 cm.
Chloride (Cl)		
Sulphate (SO ₄)		
Fluoride (F)		
Alkalinity		
Bicarbonate (HCO ₃)		
Carbonate (CO ₃)		
Hydroxide (OH)		
Dissolved Organic Carbon (DOC)		
Ammonia		
Nitrate		
Nitrite		
Total Dissolved Solids (TDS)		
¹ Parameters were not tested for the July 8, 2018 sample as the sample jar broke during shipment, resulting in low sampling volume for cell 1B.		

The high initial leachable copper concentrations in the CWTS soils allowed for additional types of testing to be carried out on these systems. To assess the effect of the elevated metals (copper) in the soils used in construction on CWTS functionality, four soil analytical test methods were used as described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b). Three of these analytical test methods were used in 2018:

1. Total concentration of elements in the soils by CRC ICPMS (EPA 200.2/6020A).
2. The concentration of metals that are being released from the soil into the overlying water column by leach method (EPA 6020A and EPA 300.1).

Appendix A

3. Stability and form of elements in soils by a sequential extraction procedure for the speciation of particulate trace metals (Tessier et al., 1979; EPA 6020A).

A6.4 Plant Sampling and Analyses

Both *C. aquatilis* and moss samples were collected for metals analysis at the final sampling period of the demonstration-scale CWTS. Above water vegetation for *C. aquatilis* samples were collected from each cell in the CWTS. Analyses are outlined in Table A3. Analyses of the tissue samples followed EPA 200.3/6020A and were reported in mg/kg dry weight. The tissue samples were homogenized and sub-sampled prior to digestion.

Table A3 - Summary of 2018 plant sampling analytical parameters, frequencies and locations.

Analytical Parameters	Plants Sampled	Location	Frequency of Sampling
Total Metals by ICPMS	<i>Carex aquatilis</i> and aquatic moss	Each cell	Year end

A6.5 Microbial Sampling and Analysis

Microbial sample collection was completed for four sample types: soil, roots, detritus, and moss. Soil, roots, detritus, and moss were collected from each cell in the CWTS for microbial analysis three times in 2018: June, July, and September. However, as moss, root, and detritus samples collected in June were received frozen, no further analyses were conducted. Quantification and DNA based analyses (genetic sequencing) were therefore conducted for all sample types collected in July and September, as well as for soil samples collected in June. Methods for sample collection for each sample type is described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017).

A6.5.1 Quantification Analyses

In 2018, Contango's microbial quantification analyses had evolved away from growth-based analyses (MPN) to a more efficient quantification analyses (quantitative polymerase chain reaction; qPCR). Consequently, the soil samples collected in June 2018, and all samples collected in July 2018 were analyzed for both growth-based microbial analysis, as well as qPCR to compare the two analyses. While not directly comparable, the results of the comparison indicated that quantification analyses were an appropriate technique to move forward with. Therefore, only results from 2018 qPCR analyses are shown in graphs and overall trends for all years are described.

Growth-based Analyses (MPN)

The most-probable number (MPN) of bacteria was determined for selected microbial samples as described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b).

Quantification Polymerase Chain Reaction (qPCR) Analyses

Appendix A

Organisms of interest were quantified using quantitative polymerase-chain reaction (qPCR). All bacteria in a sample were quantified through qPCR for the 16S ribosomal RNA (rRNA) gene (normalized for gene copy number).

A6.5.2 Genetic Sequencing Analyses

DNA was extracted and sequenced as described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b).

A6.6 Detritus Decomposition Trials

A detritus decomposition trial was developed and established in 2017 and will continue through 2019 to assess decomposition rates of *C. aquatilis* in the demonstration-scale CWTS over time, as well as evaluate the algae growth on CWTS organic materials within the water column (Chimney and Pietro, 2006; Hammerly et al., 1989). Methods are described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b).

On July 9 and September 10, 2018 (after 383 and 446 days of submersion in the CWTS, respectively), one bag filled with polyester filter fiber and one bag filled with *C. aquatilis* was removed from each cell, dried, and weighed as described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b).

A6.7 Vegetation Study

A vegetation plot harvest was completed in 2018 to assess the amount of above water biomass (*C. aquatilis*) that grows per year per m² in a mature CWTS. The results from the vegetation plot harvest were applied to the area of each cell in the CWTS to estimate the amount of *C. aquatilis* that would contribute organic matter into the CWTS each year. A 1 m² quadrant was delineated in cell 2B of the demonstration-scale CWTS and all the above water *C. aquatilis* was harvested within the quadrant (Figure A1). The *C. aquatilis* was weighed and placed in a drying oven (at 50°C) until a constant mass was observed. The dry-weight of the *C. aquatilis* was then adjusted for the estimated size of the CWTS (estimated area of CWTS multiplied by 1 m² of *C. aquatilis*) to calculate the total biomass of *C. aquatilis* added to the CWTS in a year. Finally, the total biomass addition was compared to the decomposition rate and algal addition rates (Section A6.6) to establish a more accurate rate of organic matter addition to a CWTS of a given size.

Figure A1 – Vegetation plot harvest 2018.

Photo on the left shows vegetation plot harvest area delineated with wooden stakes. Photo on the right shows the area that was harvested. Photos were taken July 8, 2018.

A6.8 Water depth measurements

Depth sticks installed in the CWTS in June 2016 were used to measure the water depth over time (Contango, 2017a). One of the depth sticks in cell 1A had fallen over on June 15, 2018 and was subsequently re-installed by Minto staff. However, measurements after June 15, 2018 were higher than previously recorded. Therefore, the recorded depths for this depth stick have been corrected by subtracting 5 cm from the measured value. The corrected depths were used for further calculations regarding cell volume and HRT (Section A9). It is recommended that the depth sticks in cell 1A are corrected to the proper depth in 2019.

A6.9 Evapotranspiration Trials

In 2018, the evapotranspiration studies were performed on-site from June 27 to July 3 (trial 1) and August 3 to August 10 (trial 2). However, approximately 9.6 mm of rain occurred during trial 1 (although weather station data was unavailable on the first day of the trial) and 33 mm of rain occurred during trial 2. As it rained for the majority of trial 1 and trial 2, data obtained from this year's evapotranspiration trials were unreliable and, therefore, load removal calculations were adjusted using the 2017 evapotranspiration rate (5.4 L/m²/day water loss).

A7. Performance Limit Calculations

The performance limit (previously referred to as thermodynamic minimum) is the lowest concentration consistently achievable for a given treatment design and water chemistry. These calculations were conducted as described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b).

A8. Load Removal Calculations

Load removals are calculated both without adjustment for evapotranspiration and adjusting for evapotranspiration. The evapotranspiration adjustment converts the calculation of load removed during each flow period to the actual amount of load removed, taking into consideration the amount of water lost from the demonstrations-scale CWTS through

Appendix A

evapotranspiration. Load removal was determined using equations to calculate the initial load removed without adjustment for evapotranspiration and with adjustment for evapotranspiration as described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b).

A9. Removal rate coefficients and HRT calculations

An important factor for CWTS design is the rate of treatment, also known as the removal rate coefficient (k). The removal rate coefficient is based on the treatability of a specific compound and the HRT of the CWTS, both of which are site-specific based on water chemistry, CWTS designs, and characteristics of the CWTS. These calculations were conducted using removal rate coefficients (k) equations as described in Appendix A of the Minto Constructed Wetland Treatment Research Program – Demonstration Scale 2017 Update (Contango, 2017b).

A10. Iron Addition

Iron, in the form of ferrous sulphate, was added to the CWTS to promote AVS production, which in turn would serve as a redox buffer should the soils be exposed to oxygen (e.g., briefly drying out) and would also continue to treat metals and metalloids during periods of low microbial activity (e.g., cooler temperatures). Prior to adding iron to the CWTS a bench top test was conducted, and the methods for conducting the bench top test and the direct addition to the CWTS are detailed below.

A10.1 Bench Trial for Iron Addition

A bench trial was completed prior to adding the ferrous sulphate solution into cell 1A and 1B of the demonstration-scale CWTS to determine if there would be an associated drop in pH. The bench top test consisted of adding 0.050 g of ferrous sulphate heptahydrate to 1 L of water from cell 1A, for a final iron concentration of 10 mg/L. The pH of the water from cell 1A was measured using a YSI hand held meter prior to adding the ferrous sulphate and the pH was recorded at 7.59. The ferrous sulphate was then added to the 1 L container of water from cell 1A and the container was inverted three times. pH readings were recorded at 1 min, 3 min, 5 min, 10 min, 15 min, 20 min, 30 min, and 1 hour 30 mins to determine if there would be an effect on the pH. The pH remained circumneutral at 7.23 after 1 hour 30 minutes. Therefore, it was determined that a 10 mg/L concentration of iron was appropriate to add to the cells 1A and 1B.

A10.2 Iron Addition to the Demonstration-scale CWTS

On July 8, 2018, flow to series 1 was stopped and 303 g and 304 g of ferrous sulphate was added to cell 1A and 1B, respectively, to achieve a final iron concentration of 10 mg/L. Flow remained off until July 15, 2018 to promote reducing conditions and generation of AVS in the soil, which was monitored during the seasonal soil analyses on September 9, 2018 and on October 17, 2018 (Section A6.3).

A11. Aphid Monitoring and Pesticide Application

Application of pesticide (Trounce, End-All, and Bug-B-Gone) on *C. aquatilis* in each cell occurred bi-weekly, starting on May 14, 2018 as a preventative measure due to an aphid infestation identified during the 2017 test period (Contango, 2017b). Aphids were not observed in the CWTS until early August 2018 (exact date unknown), when small amounts of

aphids were observed in cell 2A. Application of pesticide on *C. aquatilis* was subsequently conducted weekly starting August 24, 2018.

A12. Fertilizer addition calculations

Due to the impacts of the aphid infestation in 2017, fertilizer, in the form of monopotassium phosphate (MKP), was added bi-weekly to each cell in the CWTS to help with *C. aquatilis* growth, starting July 14, 2018. The quantity of MKP added to each cell is shown in Table A4 and was based on the volume of water in each cell to achieve a final concentration of 1 mg/L phosphorus. MKP application occurred bi-weekly by dissolving dry MKP into 1 L of water. The MKP solution was emptied along the inflow of each cell where the flow of water then spread the fertilizer throughout the cell.

Table A4 – Quantity of MKP added bi-weekly to each CWTS cell.

CWTS Cell	Dry MKP Quantity (g)
1A	26.74
1B	26.96
2A	20.44
2B	18.56

A13. Aphid Monitoring and Sedge Transplantation

Due to the impacts of the aphid infestation in 2017, areas of the demonstration-scale CWTS were devoid of dense *C. aquatilis* plants. Therefore, on July 8, 2018, Minto and Contango personnel transplanted approximately 25 *C. aquatilis* plants from water quality monitoring station W10 into cells 1A, 1B and at the outflow of 2A.

B1. Water Results

Figure B1 – Cadmium concentrations through the demonstration-scale CWTS. 2015 (top), 2016 (second down), 2017 (third down), and 2018 (bottom) dissolved cadmium concentrations. Data shown for 11 timepoints, where water was sampled at seven locations through the flow path of the CWTS to assess for treatment fronts within the CWTS, or possible leaching of constituents from the soils into the CWTS. The Maxxam (2015 results) detection limit (DL; black line) for cadmium is 0.020 µg/L. The ALS (2016 – 2018 results) DL for cadmium is 0.005 µg/L. The graphs indicate that leaching is not occurring as there are no spikes in cadmium concentrations throughout the CWTS. Data from August 2, 2018 for 1B IN and from September 9, 2018 for 1B IN and 2B IN were erroneous and therefore removed from the plot (dissolved concentration exceeded total concentration).

Figure B2 – Molybdenum concentrations through the demonstration-scale CWTS. 2015 (top), 2016 (second down), 2017 (third down), and 2018 (bottom) dissolved molybdenum concentrations. Data shown for 11 timepoints, where water was sampled at seven locations through the flow path of the CWTS to assess for treatment fronts within the CWTS, or possible leaching of constituents from the soils into the CWTS. The Maxxam (2015 results) detection limit (DL; black line) for molybdenum is 0.00020 mg/L. The ALS (2016 – 2018 results) DL for molybdenum is 0.000050 mg/L.

Appendix B

Figure B3 – Selenium concentrations through the demonstration-scale CWTS. 2015 (top), 2016 (second down), 2017 (third down), and 2018 (bottom) dissolved selenium concentrations. Data shown for 11 timepoints, where water was sampled at seven locations through the flow path of the CWTS to assess for treatment fronts within the CWTS, or possible leaching of constituents from the soils into the CWTS. The Maxxam (2015 results) detection limit (DL; black line) for selenium is 0.00020 mg/L. The ALS (2016 – 2018 results) DL for copper is 0.000050 mg/L. The graphs indicate that leaching is not occurring as there are no spikes in selenium concentrations throughout the CWTS. Data from June 22, 2018 for 2B IN was erroneous and therefore removed from the plot (dissolved concentration exceeded total concentration).

Figure B4 – Zinc concentrations through the demonstration-scale CWTS. 2015 (top), 2016 (second down), 2017 (third down), and 2018 (bottom) dissolved zinc concentrations. Data shown for 11 timepoints, where water was sampled at seven locations through the flow path of the CWTS to assess for treatment fronts within the CWTS, or possible leaching of constituents from the soils into the CWTS. The Maxxam (2015 results) detection limit (DL; black line) for zinc is 0.0030 mg/L. The ALS (2016 – 2018 results) DL for zinc is 0.0010 mg/L. The graphs indicate that leaching is not occurring as there are no spikes in zinc concentrations throughout the CWTS.

Appendix B

Appendix B

Figure B7 – Dissolved molybdenum concentrations through Series 1 and Series 2. Circles represent the feed water entering the wetland, diamonds represent the outflow of cell A and squares represent the outflow of cell B. The ALS detection limit for molybdenum is 0.00005 mg/L.

Appendix B

Figure B8 – Dissolved selenium concentrations through Series 1 and Series 2. Circles represent the feed water entering the wetland, diamonds represent the outflow of cell A and squares represent the outflow of cell B. The ALS detection limit for selenium is 0.00005 mg/L.

B4. Microbiology Results

Figure B24 – Inferred abundance of sulphide-producing bacteria in soil, root, moss, and detritus in the demonstration-scale CWTS in 2018.

Inferred abundance is calculated based on a combination of genetic and quantification data. Methods for quantification changed from growth-based analyses (most probable number) from 2014 to 2017 to quantitative polymerase chain reaction (qPCR) analyses in 2018. As methods are not directly comparable (Appendix A, Section A6.5), only results from 2018 analyses are shown here and overall trends for all years are described in the main report.

Appendix B

Figure B25 – Inferred abundance of selenium-reducing bacteria in soil, root, moss, and detritus in the demonstration-scale CWTS in 2018.

Inferred abundance is calculated based on a combination of genetic and quantification data. Methods for quantification changed from growth-based analyses (most probable number) from 2014 to 2017 to quantitative polymerase chain reaction (qPCR) analyses in 2018. As methods are not directly comparable (Appendix A, Section A6.5), only results from 2018 analyses are shown here and overall trends for all years are described in the main report.

Appendix B

Figure B26 – Inferred abundance of denitrifying bacteria in soil, root, moss, and detritus in the demonstration-scale CWTS in 2018.

Inferred abundance is calculated based on a combination of genetic and quantification data. Methods for quantification changed from growth-based analyses (most probable number) from 2014 to 2017 to quantitative polymerase chain reaction (qPCR) analyses in 2018. As methods are not directly comparable (Appendix A, Section A6.5), only results from 2018 analyses are shown here and overall trends for all years are described in the main report.

Appendix C

Appendix C – Multi-year Workplan

Table C1 – Schedule of work and activities for demonstration-scale CWTS.

Item	Date	Activities	Actual
Construction	2014	Identify potential location for demonstration scale CWTS (Contango site visit – 1 scientist)	Completed June 2014
		Engineering and geotechnical (Minto)	Completed July 2014
		Construction (Minto)	Completed July 2014
		Planting and bringing system online (Contango site visit – 1 scientist, 1 technologist), coordinate for local students to assist	Completed August 2014 (no students available, brought 2 technologists)
Commissioning	2014	Acclimation and maturation at constant flow rate, ~20 hr HRT	Completed
		September - Contango site visit/checkup (1 technologist, 1 scientist)	Did not occur because construction was last week of August
	2015	Continued commissioning. Operation at constant flow rate, ~20 hr HRT	Completed (at shorter HRT)
		Spring – Contango site visit/checkup (1 technologist, 1 scientist), includes micro sampling	Completed
		Summer - Increase depth from 10 cm to 20 cm (1 technologist), includes micro sampling	Completed (scientist)
		Fall – Contango site visit/checkup (1 technologist), includes micro sampling	Completed (scientist)
	2016	Minto to add sandbags prior to first site visit and begin W15 creek monitoring	Completed May/June 2016
		Spring – Contango site visit (1 scientist, 1 technologist), includes microbial sampling and tasks outlined in Table 5 of report. HRT tracer study completed, outlined in section 7 of report.	Completed June 2016
		Summer - Contango site visit/checkup (1 scientist, 1 technologist), includes microbial sampling and tasks outlined in Table 5 of report. Evapotranspiration study completed as outlined in section 9 of report. Organics were added to the CWTS as outlined in section 5.1 of report.	Completed July 2016

Appendix C

Item	Date	Activities	Actual
	2017	Fall - Contango site visit/checkup (1 technologist), includes microbial sampling and tasks outlined in Table 5 of report	Completed September 2016
		Continued commissioning operations at constant flow rate.	Completed May 2017
		Two evapotranspiration studies were completed	Completed May/June 2017
		Spring – Contango site visit (1 scientist, 1 technologist), includes microbial sampling and tasks outlined in Appendix A of report. Completed HRT tracer study. Sample for AVS to assess if the added organics are having the desired effect.	Completed June 2017
		Summer - Contango site visit/checkup (1 scientist), includes microbial sampling and tasks outlined in Appendix A of report.	Completed July 2017. Seasonal water sampling was not completed due to flow interruptions. Seasonal water sampling was completed by Minto in August.
Commissioning		Minto added sandbags to outflows of CWTS cells to increase water depth	Completed August 2017
		Commissioning completed and beginning of operational period	Completed August 2017
Operations		Fall – Contango site visit/checkup (1 scientist), includes microbial sampling and tasks outlined in Table 5 of report.	Completed by Minto, after being taught microbial sampling by Contango. No site visit needed by Contango.
		Monitor soil redox. Determine when it consistently reaches targeted range.	Completed throughout 2017
Performance monitoring		Develop a sampling plan, and aphid control and monitoring plan for 2018	Completed March, 2018
Drought recovery	2018	Start water flow to CWTS; add sandbags to end and along perimeter of each CWTS cell to increase water depth by 1 to 5 cm; aphid control using more powerful insecticide on a routine schedule	Completed May 2018
		Assess recovery of CWTS from drought	Completed throughout 2018
		Summer – Contango site visit (1 scientist); conduct a vegetation plot harvest and assessment of biomass produced; collect one bag of <i>C. aquatilis</i> and one bag of polyester filter	Completed July 2018

Appendix C

Item	Date	Activities	Actual
		foam from each CWTS cell; replant <i>C. aquatilis</i> in areas with sparse vegetation	
		Iron added to Series 1	Completed July 2018
		Two evapotranspiration studies were attempted (were not informative due to precipitation during trials)	Completed July/August 2018
Performance monitoring	2019	Fluctuate flow rates, based on expected amount of water for full-scale wetland (scaled to size). Evaluate performance of CWTS at different key periods. Fertilize plants (if necessary).	Throughout 2019
Operations		Develop a flow rate schedule and sampling plan for 2019	April 2019
		Provision of updated standard operating procedures for new staff responsible for monitoring and sampling CWTS	
		Start water flow to CWTS; continue aphid control using insecticide on a routine schedule	April/May 2019
		Spring – Contango site visit; training of new staff responsible for monitoring and sampling CWTS, monitor for presence of aphids, add iron to Series 1, collect one bag of <i>C. aquatilis</i> and one bag of polyester filter foam from each CWTS cell	May/June 2019
		Summer – Contango site visit; conduct a vegetation plot harvest and assessment of biomass produced; conduct evapotranspiration trial for warmer months	July/August 2019
		Fall – Contango site visit (if necessary), replanting if needed, soil harvesting for additional off-site stress tests, final sampling event.	September, 2019
Reporting	2014-2020	Reporting will be performed annually, with verbal and/or emailed interim updates	On Schedule

1 Introduction

This report has been prepared by Minto Explorations Ltd., a subsidiary of Capstone Mining Corp., in regard to the Minto Mine property (Minto), located in central Yukon. The following report summarizes the results of the socio economic available data at Minto for 2018, as required by the Socio-Economic Monitoring Program framework.

The Minto Mine Socio-economic Monitoring Program (Minto Explorations, Yukon Government, Selkirk First Nation, 2014) is a program that has been developed in conjunction with Selkirk First Nation and the Yukon Government to monitor the socio-economic effects of Minto Mine on SFN. The primary components of the program include; the mine providing information relating to SFN (e.g. employment data, training information etc.), a community based survey (conducted by SFN and YG), and information from SFN and YG relating to Pelly Crossing or SFN. The information from all of those components is then used in the preparation of an annual report produced by a third-party consultant.

Not all of the data that has been requested from historical records is available. Going forward Minto will collect the required and necessary data in order to provide more accurate information for the bi-annual reports. Minto has given best efforts to collect and obtain historical data and going forward accuracy of information and data collection will continue to be further refined.

1.1 Factors at Minto that may have a socio-economic impact

The Minto Mine is an open pit and underground copper mine located 240 kilometres north of Whitehorse in central Yukon, Canada. Minto is located on Selkirk First Nation Category “A” land.

An initial cooperation agreement (CA) between Selkirk First Nation and Minto was agreed upon and signed in 1997, and was later amended in 2009. The agreement serves as a formal document that covers governance, business partnerships, training and employment, and royalties of the Minto Mine on Selkirk First Nations land.

The community of Pelly Crossing is located along the Klondike Highway on the banks of the Pelly River, 282 kilometers northwest of Whitehorse. Pelly Crossing is home to SFN people which includes 353 people (2016 Stats Can census), an increase of 5.1% from the 2011 census of 336 people, of which, 305 identify as being North American First Nations/Metis. The 2015 median total individual income of population aged 15 years and over in Pelly Crossing is \$24,576 with the average house price being \$265,909 (2016 Stats Can census). The average population age of Pelly Crossing is 37 years of age (2016 Stats Can census).

The city of Whitehorse is the capital of Yukon and is the largest community in the territory with a population of 28,225 (2016 Stats Can census) or 78.7% of the total Territorial population.

The remote location and access to Minto dictates a fly in fly out (FIFO) camp operation. In Yukon, there is a general shortage of available professional and skilled workers. The location is also impacted by low amounts of locally manufactured goods and materials.

The advanced and post-secondary education and training opportunities available in Yukon, is generally lower than opportunities further south. This impacts the local labour pool resulting in a shortage of

potential workers with mining career related experience, and educational backgrounds. Recruitment of local candidates is also impacted by lower overall literacy rates in the North, and a shortage of local candidates possessing a valid driver's license.

Other factors that may have impacted socio-economic indicators include:

- Implementation of socio-economic monitoring program
- Permitting and Regulatory delays
- Declining copper prices
- Mine life uncertainty
- News of potential sale of Minto Explorations Ltd. announced in February 2018. This sale inevitably did not occur due to unfavourable equity market conditions.

Furthermore, on March 20, 2018, Minto Explorations Ltd announced that a careful and calculated decision was made to not mine the Ridgetop open pit. After reviewing infill drilling results of the Ridgetop deposit, it was determined that the returns from the pit at the current copper prices were marginal. As a result, significant lay offs of Minto personnel occurred, as well, the Pelly Construction contract was not renewed and the milling time was reduced to 50%.

On October 11, 2018, the decision was made by Capstone to put Minto on temporary care and maintenance, while continuing to explore value maximizing alternatives. Mining operations ceased immediately, followed by milling; the property was then carefully mothballed and by the end of 2018, the majority of the workforce was laid off, with a small crew kept on to oversee the care and maintenance of the property and its assets.

2 Minto and Contractors Safety Statistics

The below table (Table 2-1) summarises the safety statistics for Minto Employees and site contractors for 2018. The total incidents include minor first aids treated at the site, any property damage, near-misses that could have resulted in an incident, medical aids (where treatment is required off site) and lost-time accidents where a worker would be unable to return to their duties and had to miss work. In 2018, there was 1 contractor employee lost time accident.

2018 Total incidents	Minto	Contractors
41	16	25

3 Employment

Minto utilizes a preferential hiring recruitment approach as outlined in our Cooperation Agreement, with Selkirk First Nation. Our preferential hiring involves the following: Positions are first advertised and offered in the following order of priority: SFN, NTC (Northern Tutchone) Pelly Crossing Resident, OFN, Yukon, and Western Canada.

3.1 Employment Income and Distribution

The following sections outline information and figures that demonstrate salaries are higher for those who are in major centres and/or employed outside of Yukon. Potential reasons for this for Minto include:

- During the course of 2018, 7 out of 8 Managerial staff (Department Heads) staff lived outside Yukon.
- The majority of professional, supervisory and designated staff are residents of the rest of Canada (Non-Yukon residents)

Other factors for this could potentially be linked to a lack of potential candidate pools in Yukon of professional and managerial experienced staff. Further, the post-secondary education requirements for these roles cannot be obtained in Yukon.

The Company operates a fly in fly out (FIFO) camp model which is attractive to employees who can stay in their current hometowns and not have to move North. This approach has become somewhat standard practice for the mining industry in Western Canada, our peer group, and Minto operates in a fashion to be competitive in this market. Employees expect a FIFO in a remote mining location.

Major centres of Whitehorse and Rest of Canada have the highest income. One of the possible reasons for this is that those areas have a larger qualified candidate pool. Outlying areas including Pelly Crossing and Rest of Yukon have less availability of qualified candidates for skilled, professional and managerial positions.

3.1.1 Minto - Average employment income by Residency

	Pelly Crossing	Whitehorse	Yukon	Rest of Canada
Minto (as of Dec 31, 2018)	\$0	\$34.74/hr	\$35.66/hr	\$50.21/hr
Minto (Separated in 2018)	\$28.75/hr	\$35.27/hr	\$34.55/hr	\$43.00/hr

3.1.2 Contractors - Average employment income by Residency (not including OT or UG Bonus)

	Pelly Crossing	Whitehorse	Yukon	Rest of Canada
Pelly Construction	\$27.63/hr	\$30.16/hr	\$28.89/hr	\$31.93/hr
Dumas	\$18.50/hr	\$20.75/hr	\$20.75/hr	\$23.29/hr
Sodexo	\$16.29/hr	\$16.14/hr	\$16.74/hr	\$18.19/hr
				\$55,000 (salaried)

Potential contributing factors include:

- Dumas Contracting is located in eastern Canada indicating hiring from a preferred talent pool in this location.
- Most Sodexo employees are entry-level non-skilled workers. Sodexo, like many Remote Site Service providers, has a high turnover rate. Sodexo's voluntary turnover at Minto for 2018 was 28.3%, down from 39% in 2017. In total there were 24 new hires in 2018 and 33 exits (including voluntary and involuntary).

- Pelly Construction, located out of Whitehorse, averaged an 89% Yukon employee base for 2018 (January – August). By September 2018, there were no more Pelly Construction personnel on site. Total voluntary turnover was 124%, with the bulk of the turnover happening after the announcement of no more open pit mining. In total, there were only 6 new hires in 2018 and the full workforce of 78 exits (including voluntary and involuntary)

3.1.3 Minto and Contractors – Annual and cumulative total employee income by Group

	Pelly Crossing	Whitehorse	Yukon	Rest of Canada
Minto (as of Dec 31, 2018)	\$0	\$591,253.34	\$694,355.39	\$1,368,926.44
Minto (Separated in 2018)	\$418,093.36	\$2,507,545.08	\$3,677,302.60	\$6,469,001.11
TOTAL Minto for 2018	\$418,093.36	\$3,098,798.42	\$4,371,657.99	\$7,837,927.55
Pelly	\$184,361.01	\$948,592.38	\$1,307,672.28	\$470,507.98
Dumas	\$97,769.02	\$615,017.00	0	\$6,748,337.74
Sodexo	\$73,041.05	\$381,663.77	\$7,282.33	\$201,999.88

3.1.4 Minto – Northern Employment by Group

	SFN	Yukon FN	OFN	Other Yukon	Other Canadians	Total
Minto (as of Dec 31, 2018)	2	2	0	6	11	21
Minto (Separated in 2018)	21	18	2	40	80	161
TOTAL Minto for 2018	23	20	2	46	91	182

3.1.5 Minto - Employment by Residency

	Pelly Crossing	Whitehorse	Other Yukon	Canada	Total
Minto (as of Dec 31, 2018)	0	9	1	11	21
Minto (Separated in 2018)	12	52	15	82	161
TOTAL Minto for 2018	12	61	16	93	182

3.1.6 Contractor - Employment by Residency

	Pelly Crossing	Yukon	Canada	Total
Pelly Construction	6	60	18	78
Dumas	2	8	76	86
Sodexo	4	18	9	31

3.1.7 Minto – 2018 New Hires by Group

	SFN	Yukon FN	OFN	Other Yukon	Other Canadians	Total
Minto	6	4	1	12	16	39

3.1.8 Minto - Employment by Job Categories and Group (including employees separated in 2018)

	SFN	Yukon FN	Other Yukon	OFN	Other Canadians	Total
Management			2		11	13
Professional		3	14		38	55
Skilled	4	10	18	2	38	72
Semi-skilled	16	7	10		4	37
Entry Level	3		2			5
TOTAL	23	20	46	2	91	182

3.1.9 Minto and Contractors – Annual and cumulative total employees by group

	Aboriginal	Yukon (Non-FN)	Total Yukon	Other Canadian	Total
Minto (as of Dec 31, 2018)	4	6	10	11	21
Minto (Separated in 2018)	41	40	79	82	161
TOTAL Minto for 2018	45	46	89	93	182
Pelly	28	36	60	18	78
Dumas	8	3	11	76	86
Sodexo	21	6	22	9	31

3.2 Voluntary Exits

In 2018, due to the announcement that the Minto Mine was up for sale, that Ridgetop would not be mined and later that the mine was going into care and maintenance, Minto had an increase in our voluntary turnover rate from the 2017 rate of 27.6%. A total of 39 employees voluntarily left Minto, which represents a voluntary turnover rate of 36.6%.

The results of voluntary exit surveys indicate the following main reasons for resignations:

- Most of the voluntary turnover was due to a combination of factors, such as:
 - the Company announcing in February that Minto was in the process of being sold;
 - that open pit mining was ceasing in April; and
 - that the mine was going in to temporary care and maintenance at the end of the year.
- Enhanced opportunity at other Mines coming on line, as other commodity prices picked up.

4 Business

As part of Minto and SFN's cooperation agreement there is a requirement for the company to provide preferred opportunity notification to SFN to negotiate and potentially be awarded a contract to supply the requirement. SFN has developed partnerships with a number of Minto's vendors for which the details of financial benefit Minto is not privy to. As such, this section summarizes expenditures by the company that is the primary vendor and does not account for any SFN proportional expenditures as a result of those partnerships.

In 2015, Minto and SFN worked jointly to establish new or maintained contracts to ensure involvement from SFN and support our First Nations partners. The contractual arrangements highlighted below represent the majority of the opportunities that SFN and Minto share with service providers. As well as financial gain, SFN also does benefit from employment opportunities on some contracts.

- Air North – Air Service
- Boreal Shuttle – Pelly Crossing Shuttle Service
- Capital Helicopters- Helicopter Support
- Cobalt Construction – Ore haul, equipment & reclamation
- DMC Mining Services – Raise Bore & Mining Services
- Driftwood Drilling- Exploration Diamond Drilling
- Dumas- UG Mining
- Dyno Nobel Canada- Blasting supplies and services
- Glacier Water Services- Water Hauling
- Manitoulin Transport- Freight Hauling
- Northwest Vacuum Services- Vacuum Truck Rental
- Nuway Crushing- Crushing Services
- Parkland Industries - Fuel Supply
- Pelly Construction- 988 loader rental
- Pelly Construction- Mining Services
- Quantum Machine Works – Custom machining services
- RC Crane – Cranes/equipment
- Sodexo- Catering and Janitorial Services
- Standard Bus- Transportation of Staff/Contractors
- Tintina Air- Secondary Air Support
- Underhill Geomatics – Survey & Engineering
- Yukon Inn - Employee lodging

The six rights of procurement must be met in selection of such vendor relationships.

- Right Materials (to fill need)
- Right Place (Yukon preference)
- Right Quantity and Quality (High quality and ability to supply)
- Right Supplier (Service, technical and aftermarket support, value added service)
- Right moment (product available when needed)
- Right price (competitive commercial price)

In total Minto spent \$36,942,913.67 on Yukon vendors in 2018. This represented 37% of total spend that stayed in the Yukon, supporting local business and developing partnerships for long term mutual benefit. Minto selects the appropriate local vendors based on vendors that meet selection criteria that support Minto's corporate social responsibility. Such partnerships are built on transparency, human rights and labor compliance, supplier status, financial, geographical, and environmental compliancy. The framework for successful local suppliers is based on common shared goals, continuous improvement, and vendors that support Minto's policies and procedures.

In addition to support of our First Nations partners, Minto also strives to support Yukon based companies and service providers based on ability to service our needs and meets commercial acceptance criteria. In analyzing a business for suitability Minto follows best practice guidelines and the six rights of procurement in selecting potential suppliers.

Minto will continue to maintain and increase its spend with local suppliers as they invest in supporting the mining industry and Minto is committed to sustainability in developing the relationships for long term mutual benefit.

4.1 Mine Capital and Operating Expenditures

Indicator #33: Minto Explorations operations & capital expenditures by group					
		Pelly Crossing	Other Yukon	Canada	Total
2018	Capital expenditures	\$136,342.20	\$1,726,767.71	\$8,406,943.55	\$10,270,053.46
2018	Operating expenditures	\$1,730,740.99	\$31,116,177.44	\$50,925,701.13	\$83,772,619.56

4.2 Yukon business names by group

See attached **Appendix "A"** noting all Yukon Business Names by group. Note that not all business have been captured due to some expenditure by employees and reimbursed through expenses and all contractor purchased items.

4.3 Minto Royalty Payments

Indicator #36: Minto royalty payments				
		SFN	Yukon	Total
Minto Royalties Paid 2018		\$	\$	\$
Net Smelter Royalties		\$1,612,892.43		\$1,612,892.43
Quartz Mining Act Royalties			\$3,531,955.48	\$3,531,955.48
Total		\$1,612,892.43	\$3,531,955.48	\$5,144,847.91

4.4 Minto Property Tax Payments and Other Fees

Indicator #37: Minto property tax payments and other fees					
	SFN	Yukon	Other Canada	Other	Total
Minto Fees & taxes Paid 2018	\$	\$	\$	\$	\$
Property Taxes		\$289,397.61			\$289,397.61
Landing Fees	\$25,000.00				\$25,000.00
Skagway Municipal Taxes				\$51,380.71	\$51,380.71
Total	\$25,000.00	\$289,397.61	\$0.00	\$51,380.71	\$365,778.32

5 Capacity, Training and Education

Minto, working with our major contractor partners, supported different capacity building, training and educational initiatives in 2018. Through a combination of “on-the- job” training and mentoring, combined with sponsoring apprenticeships, pre-apprenticeships and other educational initiatives, we continued to build upon work done starting in past years - to create a workplace that enhances our current employees skills and also supports the ongoing development towards a more advanced local labour force.

5.1.1 Selkirk First Nation and Other First Nation specific training in 2018

Mill Competency Program

- Minto continued with the Mill Operator Competency Program in 2018, specifically targeting, local entry-level workers.

Apprenticeship training

- Minto continued sponsoring one SFN student in apprenticeship training (Warehouse Parts person) however this employee failed the exam levels and is in the process of rewriting his level 1 training within that program of study.

- Additionally, Minto is sponsoring another Northern Tutchone citizen within the Warehouse Parts Person Apprenticeship program, and this employee has now successfully completed his program, and is a Certified Red Seal Warehouse Parts person.

SFN Summer Student

- Unfortunately, with the number of layoffs occurring in the Spring due to the announcement that Minto would cease open pit mining, we were not able to bring on additional SFN Summer students this year.

Environmental Monitor-in-Training

- Minto offered an Environmental Monitor-in-Training program to local a SFN citizen from July to October. The Trainee learned specific skills, such as how to: inspect and coordinate site waste management; monitor wildlife activity and deterrent on site; participate in small scale reclamation activities; proper chain-of-command for water and soil samples leaving site for testing; assist and conduct routine environmental monitoring activities according to Environmental Monitoring Plan and established protocols, including:
 - Surface water, groundwater and soil sampling;
 - Flow measurements;
 - Fisheries and other biological monitoring

6 Cultural Well-being

Minto's approach to community investment is based upon opportunities to further build and maintain our social license, maintain good relationships with our partners and maintain a local presence and good reputation in the communities where we operate and where our employees live and work. The goal of this is to strengthen accountability and working partnerships with stakeholders while providing a foundation to understand and consider the needs, opinions and interests of the community.

In the past years, Minto employed several methods of community engagement with different levels of involvement from the community and other stakeholders. These methods included formal and informal ways that were best suited for the various stakeholders. Minto employed many different engagement methods, they were, however, largely utilized in an ad hoc way. In the absence of signed, guiding document the general strategy was that management reviewed ways of engagement and used management best efforts and discretion for methods of engagement.

A community engagement plan was prepared and signed off by Minto management in 2015. A method of engagement and frequency table was prepared and presented to Selkirk First Nation Chief and Council.

Examples of community and cultural engagement initiatives included the following over the years:

- Fort Selkirk educational tours with Selkirk citizens and Minto employees and contractors
 - In August 2018, Minto organized a tour with our SFN/Minto Liaison and brought 8 Minto Employees, 2 SFN Elders and our SFN/Minto Liaison to Fort Selkirk for a day trip, including a stop at an elder fish harvesting camp. It was an informative trip, full of colourful stories narrated by the Elders on the tour, and provided us a historic and cultural glimpse of what life at Ft. Selkirk would've been like many years ago.

- Sports Sponsorship
- Christmas Turkey Distribution
- High school Bursaries, and attendance by Senior Minto Management at Graduation ceremonies.
- Selkirk First Nation Elder's workshops held at the Mine site, whereby Minto employees and Contractors get to participate in traditional cultural activities, such as beading workshops, birch bark crafts and traditional sewing.

In 2018 Capstone spending included the following designed to enhance and protect SFN cultural and community wellbeing;

- \$670 for lunch, boat trip to Fort Selkirk and honorarium for 2 elders to participate in the trip
- \$200 provided to each of the 3 SFN citizens who helped deliver the Christmas turkeys door to door in Pelly Crossing
- \$9,800 worth of turkeys, delivered to each home in Pelly Crossing for Christmas
- \$2,500 to support Yukon sports
- \$1,000 to support the SFN General Assembly that took place at Minto Landing
- \$1,500 in contributions to SFN events, including the Selkirk Bears Hockey team.

Minto also continued to support the primary industry event in the territory - the 2018 Geoscience Forum and Trade Show which is the territory's largest conference and industry event. We also continued to support the Yukon Chamber of Commerce, the Yukon Branch of the Special Olympics and the Yukon Hospital Foundation.
